	<table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>UPN (Subject Alternative Name: User Principal Name)</td> <td>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly “@keyexample.com”: <pre>^[a-zA-Z0-9' _ \. \-]*@keyexample\.com\$</pre> </td> </tr> </tbody> </table>	Subject Part	Example	UPN (Subject Alternative Name: User Principal Name)	This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly “@keyexample.com”: <pre>^[a-zA-Z0-9' _ \. \-]*@keyexample\.com\$</pre>														
Subject Part	Example																		
UPN (Subject Alternative Name: User Principal Name)	This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly “@keyexample.com”: <pre>^[a-zA-Z0-9' _ \. \-]*@keyexample\.com\$</pre>																		
Error	A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p> Note: The error message already includes a leading string with the subject part (e.g. “Common Name:” or “Invalid CN provided:” depending on the interface used). Your custom message follows this.</p> </div>																		
ExtendedKeyUsages	Currently not in use.																		
EnrollmentTemplatePolicy	An object containing the individual template-level template policy settings. Template policies defined on a template apply to enrollments made with that template only. Template-level policies, if defined, take precedence over system-wide template policies. For

Value	Description												
	accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.												
KeySize	A string indicating the minimum supported key size of the template.												
Curve	A string indicating the OID of the elliptical curve algorithm configured for the template, for ECC templates.												
StandaloneCAs	An array of objects containing enrollment information for standalone certificate authorities available for enrollment for the current user. Information about the CA includes:												

Name	Description
Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.com\\CorpStandaloneCA1.
RFCEenforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). <div style="border: 1px solid #8ebf8e; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 609 for more information.</p> </div>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.16.3 GET Enrollment PFX Content My

The GET /Enrollment/PFX/Context/My method is used to check the templates and CAs available for PFX enrollment for the current user. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)). It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor

Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for PFX enrollment in Keyfactor Command.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/enrollment/pfx/

Table 389: GET Enrollment PFX Content My Response Data

Name	Description

Value	Description												
	accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.												
KeySize	A string indicating the minimum supported key size of the template.												
Curve	A string indicating the OID of the elliptical curve algorithm configured for the template, for ECC templates.												
StandaloneCAs	An array of objects containing enrollment information for standalone certificate authorities available for enrollment for the current user. Information about the CA includes:												

Name	Description
Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.com\\CorpStandaloneCA1.
RFCEnforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). <div style="border: 1px solid green; border-radius: 10px; padding: 5px; background-color: #e0f2f1;"> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 609 for more information.</p> </div>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.16.4 GET Enrollment Available Renewal ID

The GET /Enrollment/AvailableRenewal/ID/{id} method is used to check a specific certificate by ID to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/Thumbprint method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the note under the *CollectionId* input parameter, below.

Table 390: GET Enrollment Available Renewal ID {id} Input Parameters

Name	In	Description
id	Path	Required. An integer specifying the Keyfactor Command reference ID of the certificate on which to check the renewal status. Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

Table 391: GET Enrollment Available Renewal ID {id} Response Data

Name	Description								
AvailableRenewalType	<p>An integer indicating the supported renewal type. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None—renewal is not supported for this certificate.</td> </tr> <tr> <td>1</td> <td>Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.</td> </tr> <tr> <td>2</td> <td> <p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> • The certificate is located together with its private key in one or more managed certificate store(s). • The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See Certificate Templates on page 379 for more information. </td> </tr> </tbody> </table> <p> Tip: If the <i>AvailableRenewalType</i> is 2, 1 is also supported for the certificate.</p>	Value	Description	0	None—renewal is not supported for this certificate.	1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.	2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> • The certificate is located together with its private key in one or more managed certificate store(s). • The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See Certificate Templates on page 379 for more information.
Value	Description								
0	None—renewal is not supported for this certificate.								
1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.								
2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> • The certificate is located together with its private key in one or more managed certificate store(s). • The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See Certificate Templates on page 379 for more information. 								
Message	A message providing more details about the available renewal type result (e.g. “One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.”).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.16.5 GET Enrollment Available Renewal Thumbprint

The GET /Enrollment/AvailableRenewal/Thumbprint/{thumbprint} method is used to check a specific certificate by thumbprint to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/ID method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the note under the *CollectionId* input parameter, below.

Table 392: GET Enrollment Available Renewal Thumbprint {thumbprint} Input Parameters

Name	In	Description
thumbprint	Path	Required. The thumbprint of the certificate on which to check the renewal status. Use the <i>GET /Certificates</i> method to determine the certificate thumbprint. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

Table 393: GET Enrollment Available Renewal Thumbprint {thumbprint} Response Data

Name	Description								
AvailableRenewalType	<p>An integer indicating the supported renewal type. Possible values are:</p> <table border="1" data-bbox="553 380 1403 1157"> <thead> <tr> <th data-bbox="553 380 716 443">Value</th> <th data-bbox="716 380 1403 443">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 443 716 506">0</td> <td data-bbox="716 443 1403 506">None—renewal is not supported for this certificate.</td> </tr> <tr> <td data-bbox="553 506 716 632">1</td> <td data-bbox="716 506 1403 632">Seeded PFX is supported. See Certificate Templates on page 379 for more information.
Value	Description								
0	None—renewal is not supported for this certificate.								
1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.								
2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> • The certificate is located together with its private key in one or more managed certificate store(s). • The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See Certificate Templates on page 379 for more information. 								
Message	A message providing more details about the available renewal type result (e.g. “One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.”).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.16.6 POST Enrollment CSR

The POST /Enrollment/CSR method is used to enroll for a certificate using a certificate signing request (CSR). This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/enrollment/csr/

Tip: Use the GET /Enrollment/CSR/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions on page 230](#)).

Table 394: POST Enrollment CSR Input Parameters

Name	In	Description
CSR	Body	Required. The base-64 encoded CSR that will be passed in for enrollment.
PrivateKey	Body	A string containing the base-64 encoded private key that corresponds to the CSR to be saved with the enrollment. This is done to support private key retention in Keyfactor Command for requests made through CSR enrollment. The key should be provided in unencrypted PKCS#8 format. The private key option is only supported for enrollments done using templates configured in Keyfactor Command for private key retention.
Timestamp	Body	Required. The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Template	Body	Required* A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is required unless the enrollment is being done against a standalone CA.
CertificateAuthority	Body	Required* A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>host-name\logical name</i> format or as just the <i>logical name</i> . For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; background-color: #f0f0f0; display: inline-block; margin: 10px 0;"> corpca01.keyexample.com\CorpIssuingCA1 OR CorpIssuingCA1 </div> If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i> . This field is optional unless the enrollment is being done against a standalone CA, in which case it is required .
IncludeChain	Body	A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>false</i> .
Metadata	Body	An object of key/value pairs that set the values for the metadata fields that will be associated with the certificate

Name	In	Description																
		<p>once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre data-bbox="748 365 1403 884"> "Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "willi- am.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. } </pre> <p>See Certificate Metadata on page 710 for more information.</p>																
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p> <table border="1" data-bbox="748 1205 1403 1696"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> <tr> <td>directory</td> <td>Directory Name</td> </tr> <tr> <td>uri</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>ip4</td> <td>IP v4 Address</td> </tr> <tr> <td>ip6</td> <td>IP v6 Address</td> </tr> <tr> <td>registeredid</td> <td>Registered ID (an OID)</td> </tr> </tbody> </table>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)
Value	Description

dns	DNS Name																	
directory	Directory Name																	
uri	Uniform Resource Identifier																	
ip4	IP v4 Address																	
ip6	IP v6 Address																	
registeredid	Registered ID (an OID)																	

Name	In	Description						
		<table border="1" data-bbox="753 275 1398 533"> <thead> <tr> <th data-bbox="753 275 1019 338">Value</th> <th data-bbox="1019 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="753 338 1019 432">ms_ntprincipalname</td> <td data-bbox="1019 338 1398 432">MS_NTPrincipalName (a string)</td> </tr> <tr> <td data-bbox="753 432 1019 533">ms_ntdsreplication</td> <td data-bbox="1019 432 1398 533">MS_NTDSReplication (a GUID)</td> </tr> </tbody> </table> <p data-bbox="753 569 889 594">For example:</p> <pre data-bbox="753 625 1398 953"> { "SANS": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] } } </pre> <div data-bbox="753 982 1398 1415" style="background-color: #e0f0ff; padding: 10px;"> <p> Note: Entering SANs with this option may either append or overwrite the SANs in the CSR request depending on how the issuing CA is configured. Please be sure to check that the certificate has the correct SANs after issuance. Any SAN added automatically as a result of the RFC 2818 compliance settings (see GET Templates on page 2422) will still be added alongside anything you add here. Review the SAN Attribute Policy Handler for the Keyfactor CA Policy Module (see Installing the Keyfactor CA Policy Module Handlers on page 2846) for more information.</p> </div>	Value	Description	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description							
ms_ntprincipalname	MS_NTPrincipalName (a string)							
ms_ntdsreplication	MS_NTDSReplication (a GUID)							
AdditionalEnrollmentFields	Body	<p data-bbox="753 1451 1398 1577">An object that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre data-bbox="797 1583 1398 1703"> { "AdditionalEnrollmentFields": { "CustomStringOne": "ValueOne", "CustomMultiChoiceTwo": "ValueTwo" } } </pre> <p data-bbox="753 1730 1398 1759">See Certificate Template Operations on page 381 for more</p>						

Name	In	Description
		information.
x-CertificateFormat	Header	Required. A string indicating the desired output format for the certificate. Available options are DER and PEM.

Table 395: POST Enrollment CSR Response Data

Value	Description																
CertificateInformation	<p>An object containing information about the certificate that was requested. CSR information includes:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SerialNumber</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the issuer DN of the certificate.</td> </tr> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the certificate.</td> </tr> <tr> <td>KeyfactorID</td> <td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td> </tr> <tr> <td>Certificates</td> <td> <p>An array of certificates in the order of:</p> <ul style="list-style-type: none"> • end entity • intermediate CA • Root CA <p>Intermediate CA and root CA certificates will only be included if the request parameter <i>IncludeChain</i> was set to <i>true</i>.</p> </td> </tr> <tr> <td>WorkflowInstanceid</td> <td> <p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <div style="border: 1px solid green; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <p> Tip: Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p> </div> </td> </tr> <tr> <td>WorkflowReferenceid</td> <td>An integer containing the Keyfactor Command reference ID of the workflow instance.</td> </tr> </tbody> </table>	Value	Description	SerialNumber	A string indicating the serial number of the certificate.	IssuerDN	A string indicating the issuer DN of the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.	KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.	Certificates	<p>An array of certificates in the order of:</p> <ul style="list-style-type: none"> • end entity • intermediate CA • Root CA <p>Intermediate CA and root CA certificates will only be included if the request parameter <i>IncludeChain</i> was set to <i>true</i>.</p>	WorkflowInstanceid	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <div style="border: 1px solid green; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <p> Tip: Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p> </div>	WorkflowReferenceid	An integer containing the Keyfactor Command reference ID of the workflow instance.
Value	Description																
SerialNumber	A string indicating the serial number of the certificate.																
IssuerDN	A string indicating the issuer DN of the certificate.																
Thumbprint	A string indicating the thumbprint of the certificate.																
KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.																
Certificates	<p>An array of certificates in the order of:</p> <ul style="list-style-type: none"> • end entity • intermediate CA • Root CA <p>Intermediate CA and root CA certificates will only be included if the request parameter <i>IncludeChain</i> was set to <i>true</i>.</p>																
WorkflowInstanceid	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <div style="border: 1px solid green; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <p> Tip: Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p> </div>																
WorkflowReferenceid	An integer containing the Keyfactor Command reference ID of the workflow instance.																

Value	Description												
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>  Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer. </td> </tr> <tr> <td>KeyfactorRequestId</td> <td>An integer indicating the Keyfactor Command reference ID of the request.</td> </tr> <tr> <td>RequestDisposition</td> <td>A string indicating the state of the request (e.g. ISSUED).</td> </tr> <tr> <td>DispositionMessage</td> <td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td> </tr> <tr> <td>EnrollmentContext</td> <td>An internally used Keyfactor Command field.</td> </tr> </tbody> </table>	Value	Description		 Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.	RequestDisposition	A string indicating the state of the request (e.g. ISSUED).	DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	EnrollmentContext	An internally used Keyfactor Command field.
Value	Description												
	 Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.												
RequestDisposition	A string indicating the state of the request (e.g. ISSUED).												
DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).												
EnrollmentContext	An internally used Keyfactor Command field.												
Metadata	<p>An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>MetadataFieldName</td> <td>A string containing the name of the metadata field in Keyfactor Command.</td> </tr> <tr> <td>Value</td> <td>The value of the metadata.</td> </tr> </tbody> </table> <p>See Certificate Metadata on page 710 for more information.</p>	Name	Description	MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.						
Name	Description												
MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.												
Value	The value of the metadata.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.16.7 POST Enrollment PFX

The POST /Enrollment/PFX method is used to enroll for a certificate by supplying data in the desired fields. This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/enrollment/pfx/

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store (see the [x-CertificateFormat on page 1679](#) parameter) using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 1685](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 1691](#)).

 **Tip:** Use the GET /Enrollment/PFX/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

 **Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions on page 230](#)).

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the POST /Enrollment/PFX method redesigns how enrollment flow works to handle require approval functionality in a Keyfactor Command workflow with support for delivery into certificate stores. Users who are planning to use require approval workflow functionality *and* deliver enrolled certificates into certificate stores must use version 2 of this endpoint.

 **Note:** The supported key algorithms for a certificate template are determined based on global template policy, individual template policy, and the template's supported algorithm. When configuring template-level policies for key information, only key sizes that are valid for the algorithm will be available, according to the global template policy, the template policy, and the supported key sizes. For PFX and CSR enrollment, you must select a valid Key Length and Key Type for the enrollment.

 **Note:** The *PopulateMissingValuesFromAD* parameter has been removed from the version 2 endpoint.

Table 396: POST Enrollment PFX v2 Input Parameters

Name	In	Description
AdditionalEnrollmentFields	Body	<p>An object that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre>"AdditionalEnrollmentFields": { "CustomStringOne": "MyValue", "CustomMultiChoiceOne": "ValueTwo" }</pre> <p>See Certificate Template Operations on page 381 for more information.</p>
CertificateAuthority	Body	<p>Required*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\CorpIssuingCA1 OR CorpIssuingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is required.</p>
ChainOrder	Body	<p>A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i>. Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i>.</p>
Curve	Body	<p>A string indicating the elliptic curve for the requested key. ECC curves may be specified using the well-known OIDs for ECC algorithms. Well-known OIDs include:</p> <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1
CustomFriendlyName	Body	<p>Required*. A string that sets a custom friendly name for the certificate.</p> <p>This field is required if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See Application Settings: Enrollment Tab on page 609 for more information.</p>
IncludeChain	Body	<p>A Boolean that sets whether to include the certificate chain in</p>

Name	In	Description
		the response (true) or not (false). The default is <i>true</i> .
InstallIntoExistingCertificateStores	Body	<p>A Boolean that sets whether to deploy the certificate to certificate stores (true) or not (false). The default is <i>true</i>.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIntoExistingCertificateStores</i> is <i>true</i>, the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.</p>
KeyLength	Body	<p>A string indicating the key size for the requested key. Supported key sizes are:</p> <ul style="list-style-type: none"> • 255 • 256 • 384 • 448 • 521 • 2048 • 3072 • 4096 • 8192
KeyType	Body	<p>A string indicating the algorithm for the request. Supported values are:</p> <ul style="list-style-type: none"> • RSA • ECC • Ed448 • Ed25519
Metadata	Body	<p>An object that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. For example:</p> <pre> "Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "william.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. } </pre>

Name	In	Description						
		<pre> "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. } </pre> <p>See Certificate Metadata on page 710 for more information.</p>						
Password	Body	<p>Required. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is 12. See Application Settings: Enrollment Tab on page 609 for more information.</p>						
RenewalCertificateId	Body	<p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIntoExistingCertificateStores</i> is <i>true</i>, the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.</p>						
Stores	Body	<p>An array of objects indicating the certificate stores to which the certificate should be distributed. Store details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreId</td> <td> <p>A string indicating the GUID of the certificate store to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 1327) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p> </td> </tr> <tr> <td>Alias</td> <td> <p>A string containing the alias of the certificate upon entry into the store. The format of and</p> </td> </tr> </tbody> </table>	Name	Description	StoreId	<p>A string indicating the GUID of the certificate store to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 1327) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>	Alias	<p>A string containing the alias of the certificate upon entry into the store. The format of and</p>
Name	Description							
StoreId	<p>A string indicating the GUID of the certificate store to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 1327) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>							
Alias	<p>A string containing the alias of the certificate upon entry into the store. The format of and</p>							

Name	In	Description								
		<table border="1"> <thead> <tr> <th data-bbox="699 275 854 338">Name</th> <th data-bbox="854 275 1401 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="699 338 854 506"></td> <td data-bbox="854 338 1401 506"> <p>requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. 	<p>Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p>							
Subject	Body	<p>Required*. A string containing the subject name using X.500 format. For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\ "Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <code>.+</code>. See Application Settings: Enrollment Tab on page 609 for more information.</p>						
Timestamp	Body	<p>Required. A string indicating the current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>						
Template	Body	<p>Required*. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.</p> <p>This field is required unless the enrollment is being done against a standalone CA.</p>						
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p>						

Name	In	Description																				
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> <tr> <td>directory</td> <td>Directory Name</td> </tr> <tr> <td>uri</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>ip4</td> <td>IP v4 Address</td> </tr> <tr> <td>ip6</td> <td>IP v6 Address</td> </tr> <tr> <td>registeredid</td> <td>Registered ID (an OID)</td> </tr> <tr> <td>ms_ntprincipalname</td> <td>MS_NTPrincipalName (a string)</td> </tr> <tr> <td>ms_ntdsreplication</td> <td>MS_NTDSReplication (a GUID)</td> </tr> </tbody> </table> <p>For example:</p> <pre> "SANs": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] } </pre>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registeredid	Registered ID (an OID)																					
ms_ntprincipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					
UseLegacyEncryption	Body	A Boolean that sets whether legacy encryption should be used in generating the PKCS#12 file resulting from the enrollment request (true) or not (false). Legacy encryption algorithms include PBE-SHA1-RC2-40 and PBE-SHA1-3DES. When legacy is not selected, encryption algorithms include AES-256-CBC, PBES2 with PBKDF2, and PBE-SHA1-3DES. The default is <i>false</i> .																				
x-CertificateFormat	Header	<p>Required. A string containing the desired output format for the certificate. Available options are:</p> <ul style="list-style-type: none"> JKS <p>Select the JKS option when you intend to create a Java</p>																				

Name	In	Description
		<p>keystore with the returned PKCS12Blob.</p> <ul style="list-style-type: none"> • PEM Select the PEM option when you intend to create a PEM file with the returned PKCS12Blob. • PFX Select the PFX option when you intend to create a PKCS#12 (PFX/P12) file with the returned PKCS12Blob. • Replace The Replace option is designed to be used when pushing an updated certificate to a certificate store (see POST Enrollment PFX Replace on page 1691). Selecting this item causes data to be staged in preparation for the replace step. • Store The Store option is designed to be used when pushing a newly obtained certificate to a certificate store (see POST Enrollment PFX Deploy on page 1685). Selecting this item causes data to be staged in preparation for the deploy step. • Zip Select the Zip option when you intend to output the returned PKCS12Blob as separate PEM-encoded certificate, private key, and optional chain certificate files wrapped together in a zip file.

Table 397: POST Enrollment PFX v2 Response Data

Value	Description												
SuccessfulStores	An array of strings containing a comma delimited list of certificate stores, referenced by certificate store GUID, to which the certificate was successfully scheduled for deployment.												
CertificateInformation	<p>An object containing information about the certificate that was requested. Certificate information includes:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SerialNumber</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the issuer DN of the certificate.</td> </tr> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the certificate.</td> </tr> <tr> <td>KeyfactorID</td> <td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td> </tr> <tr> <td>PKCS12Blob</td> <td> <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> \$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String (\$b64) [IO.File]::WriteAllBytes (\$targetFile, \$bytes) </pre> </td> </tr> </tbody> </table>	Value	Description	SerialNumber	A string indicating the serial number of the certificate.	IssuerDN	A string indicating the issuer DN of the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.	KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.	PKCS12Blob	<p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> \$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String (\$b64) [IO.File]::WriteAllBytes (\$targetFile, \$bytes) </pre>
Value	Description												
SerialNumber	A string indicating the serial number of the certificate.												
IssuerDN	A string indicating the issuer DN of the certificate.												
Thumbprint	A string indicating the thumbprint of the certificate.												
KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.												
PKCS12Blob	<p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> \$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String (\$b64) [IO.File]::WriteAllBytes (\$targetFile, \$bytes) </pre>												

Value	Description						
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DispositionMessage</td> <td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td> </tr> <tr> <td>EnrollmentContext</td> <td>An internally used Keyfactor Command field.</td> </tr> </tbody> </table>	Value	Description	DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	EnrollmentContext	An internally used Keyfactor Command field.
Value	Description						
DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).						
EnrollmentContext	An internally used Keyfactor Command field.						
Metadata	<p>An object containing the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>MetadataFieldName</td> <td>A string containing the name of the metadata field in Keyfactor Command.</td> </tr> <tr> <td>Value</td> <td>The value of the metadata.</td> </tr> </tbody> </table> <p>See Certificate Metadata on page 710 for more information.</p>	Name	Description	MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.
Name	Description						
MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.						
Value	The value of the metadata.						

Version 1

Version 1 of the POST /Enrollment/PFX method includes the same capabilities as version 2 except when used in conjunction with Keyfactor Command workflows that require approval with an intended end goal of delivering the resulting certificate into a certificate store. In this specific case, version 2 must be used.

Table 398: POST Enrollment PFX v1 Input Parameters

Name	In	Description
AdditionalEnrollmentFields	Body	<p>An object that provides values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre> "AdditionalEnrollmentFields": { "CustomStringOne": "MyValue", "CustomMultiChoiceOne": "ValueTwo" } </pre> <p>See Certificate Template Operations on page 381 for more information.</p>
CertificateAuthority	Body	<p>Required*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre> corpca01.keyexample.com\CorpIssuingCA1 OR CorpIssuingCA1 </pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is required.</p>
ChainOrder	Body	<p>A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i>. Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i>.</p>
CustomFriendlyName	Body	<p>Required*. A string that sets a custom friendly name for the certificate.</p> <p>This field is required if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See Application Settings: Enrollment Tab on page 609 for more information.</p>
Curve	Body	<p>A string indicating the elliptic curve for the requested key.</p> <p>ECC curves may be specified using the well-known OIDs for ECC algorithms. Well-known OIDs include:</p> <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-

Name	In	Description
		256/prime256v1/secp256r1 <ul style="list-style-type: none"> • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1
IncludeChain	Body	A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>true</i> .
KeyLength	Body	A string indicating the key size for the requested key.
KeyType	Body	A string indicating the algorithm for the request. Supported values are: <ul style="list-style-type: none"> • RSA • ECC • Ed448 • Ed25519
Metadata	Body	<p>An object that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre> "Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "willi- am.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. } </pre> <p>See Certificate Metadata on page 710 for more information.</p>
Password	Body	Required. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> applic-

	field.						
Metadata	<p>An object containing the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>MetadataFieldName</td> <td>A string containing the name of the metadata field in Keyfactor Command.</td> </tr> <tr> <td>Value</td> <td>The value of the metadata.</td> </tr> </tbody> </table> <p>See Certificate Metadata on page 710 for more information.</p>	Name	Description	MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.
Name	Description						
MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.						
Value	The value of the metadata.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.16.8 POST Enrollment CSR Parse

The POST /Enrollment/CSR/Parse method takes a CSR in the body, parses it, and returns all elements that were found in the CSR. This method returns HTTP 200 OK on a success with the parsed CSR contents.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
None

Table 400: POST Enrollment CSR Parse Input Parameters

Name	In	Description
CSR	Body	Required. Base-64-encoded CSR with the Begin and End Certificate Request tags.

Table 401: POST Enrollment CSR Parse Response Data

Name	Description																																				
(CSR Contents)	An array of strings in the form Name=Value containing all the elements in the CSR. Possible values include:																																				
<table border="1"> <thead> <tr> <th data-bbox="412 411 732 468">Name</th> <th data-bbox="735 411 1399 468">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="412 472 732 569">Key Length</td> <td data-bbox="735 472 1399 569">An integer indicating the desired key size of the certificate.</td> </tr> <tr> <td data-bbox="412 573 732 669">Key Type</td> <td data-bbox="735 573 1399 669">A string indicating the desired key encryption of the certificate.</td> </tr> <tr> <td data-bbox="412 674 732 730">CN</td> <td data-bbox="735 674 1399 730">The common name of the certificate.</td> </tr> <tr> <td data-bbox="412 735 732 791">O</td> <td data-bbox="735 735 1399 791">The organization of the certificate.</td> </tr> <tr> <td data-bbox="412 795 732 852">OU</td> <td data-bbox="735 795 1399 852">The organizational unit of the certificate.</td> </tr> <tr> <td data-bbox="412 856 732 913">L</td> <td data-bbox="735 856 1399 913">The city of the certificate.</td> </tr> <tr> <td data-bbox="412 917 732 974">ST</td> <td data-bbox="735 917 1399 974">The state of the certificate.</td> </tr> <tr> <td data-bbox="412 978 732 1035">C</td> <td data-bbox="735 978 1399 1035">The country (two characters) of the certificate.</td> </tr> <tr> <td data-bbox="412 1039 732 1096">E</td> <td data-bbox="735 1039 1399 1096">The email address of the certificate.</td> </tr> <tr> <td data-bbox="412 1100 732 1157">DNS Name</td> <td data-bbox="735 1100 1399 1157">A SAN value containing a DNS name.</td> </tr> <tr> <td data-bbox="412 1161 732 1218">IP Address</td> <td data-bbox="735 1161 1399 1218">A SAN value containing an IP v4 or IP v6 address.</td> </tr> <tr> <td data-bbox="412 1222 732 1278">RFC822 Name</td> <td data-bbox="735 1222 1399 1278">A SAN value containing an email message.</td> </tr> <tr> <td data-bbox="412 1283 732 1339">URL</td> <td data-bbox="735 1283 1399 1339">A SAN value containing a uniform resource identifier.</td> </tr> <tr> <td data-bbox="412 1344 732 1400">Directory Name</td> <td data-bbox="735 1344 1399 1400">A SAN value containing a directory name.</td> </tr> <tr> <td data-bbox="412 1404 732 1461">Registered ID</td> <td data-bbox="735 1404 1399 1461">A SAN value containing a registered ID.</td> </tr> <tr> <td data-bbox="412 1465 732 1562">Other name:Principal Name</td> <td data-bbox="735 1465 1399 1562">A SAN value containing a user principal name (UPN) value.</td> </tr> <tr> <td data-bbox="412 1566 732 1663">Other name:DS Object Guid</td> <td data-bbox="735 1566 1399 1663">A SAN value containing the MS_NTDSReplication value.</td> </tr> </tbody> </table>		Name	Description	Key Length	An integer indicating the desired key size of the certificate.	Key Type	A string indicating the desired key encryption of the certificate.	CN	The common name of the certificate.	O	The organization of the certificate.	OU	The organizational unit of the certificate.	L	The city of the certificate.	ST	The state of the certificate.	C	The country (two characters) of the certificate.	E	The email address of the certificate.	DNS Name	A SAN value containing a DNS name.	IP Address	A SAN value containing an IP v4 or IP v6 address.	RFC822 Name	A SAN value containing an email message.	URL	A SAN value containing a uniform resource identifier.	Directory Name	A SAN value containing a directory name.	Registered ID	A SAN value containing a registered ID.	Other name:Principal Name	A SAN value containing a user principal name (UPN) value.	Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.
Name	Description																																				
Key Length	An integer indicating the desired key size of the certificate.																																				
Key Type	A string indicating the desired key encryption of the certificate.																																				
CN	The common name of the certificate.																																				
O	The organization of the certificate.																																				
OU	The organizational unit of the certificate.																																				
L	The city of the certificate.																																				
ST	The state of the certificate.																																				
C	The country (two characters) of the certificate.																																				
E	The email address of the certificate.																																				
DNS Name	A SAN value containing a DNS name.																																				
IP Address	A SAN value containing an IP v4 or IP v6 address.																																				
RFC822 Name	A SAN value containing an email message.																																				
URL	A SAN value containing a uniform resource identifier.																																				
Directory Name	A SAN value containing a directory name.																																				
Registered ID	A SAN value containing a registered ID.																																				
Other name:Principal Name	A SAN value containing a user principal name (UPN) value.																																				
Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.																																				
 Note: Some of these fields cannot be added to a CSR generated within Keyfactor																																					

Name	Description
	 Command (e.g. URL) and will only be found in CSRs generated outside Keyfactor Command.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.16.9 POST Enrollment PFX Deploy

The POST /Enrollment/PFX/Deploy method is used to put a certificate into a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 1665](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

- /certificate_stores/schedule/
- /certificates/enrollment/pfx/
- OR
- /certificate_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)
- /certificates/enrollment/pfx/

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

 **Tip:** The POST /Enrollment/PFX/Deploy method must be used within 5 minutes of acquiring a certificate with the POST /Enrollment/PFX or POST /Enrollment/Renew method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 402: POST Enrollment PFX Deploy Input Parameters

Name	Type	Description										
Stores	Body	<p>Required*. An array of objects indicating the certificate stores to which the certificate should be deployed with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. Store parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreId</td> <td> <p>A string indicating the GUID of the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 1327) with a query of “Approved - eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p> </td> </tr> <tr> <td>Alias</td> <td> <p>A string indicating the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See PFX Enrollment on page 146 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </td> </tr> <tr> <td>Overwrite</td> <td> <p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see GET Certificates Locations ID on page 1116) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p> </td> </tr> <tr> <td>Properties</td> <td> <p>An object containing the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET</i></p> </td> </tr> </tbody> </table>	Name	Description	StoreId	<p>A string indicating the GUID of the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 1327) with a query of “Approved - eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>	Alias	<p>A string indicating the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See PFX Enrollment on page 146 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Overwrite	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). 		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p><i>CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": { "NetscalerVserver": "MyVirtualServerName" }</pre> </td> </tr> <tr> <td></td> <td> <p>Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p> </td> </tr> </tbody> </table> <p>This replaces the StoresIDs and StoreTypes parameters as of Keyfactor Command version 9.4.</p>	Name	Description		<p><i>CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": { "NetscalerVserver": "MyVirtualServerName" }</pre>		<p>Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p>
Name	Description							
	<p><i>CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": { "NetscalerVserver": "MyVirtualServerName" }</pre>							
	<p>Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p>							
Password	Body	Required* . A string with a password used to secure the certificate in the certificate store. This field is required for store types that require an entry password, such as PEM stores.						
CertificateId	Body	Required* . The integer for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorId</i> .						
RequestId	Body	Required* . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorRequestId</i> .						

Name	Type	Description														
		See the note under <i>CertificateId</i> regarding when this field is required and when it is not.														
JobTime	Body	A string containing the date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.														
StoreIds	Body	An array of strings containing the certificate store GUIDs for the stores to which the certificate should be added. The StoreIds parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the Stores parameter. It is still supported for backward compatibility, but no longer required.														
StoreTypes	Body	An array of objects indicating the store types used with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. The StoreTypes parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the Stores parameter. It is still supported for backward compatibility, but is no longer required. Store type parameters are: <div data-bbox="548 1073 1403 1612" data-label="Table"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreTypeId</td> <td>An integer indicating the type of certificate store the certificate is being deployed to. Properties		An array of objects with the unique parameters																																			

Name	Type	Description				
		<table border="1"> <thead> <tr> <th data-bbox="548 275 751 338">Name</th> <th data-bbox="751 275 1403 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="548 338 751 1348"></td> <td data-bbox="751 338 1403 1348"> <p>defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre data-bbox="824 730 1377 779">"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre data-bbox="824 961 1377 1073">"Properties": [{"NetscalerVserver": "MyVirtualServerName"}]</pre> <div data-bbox="781 1108 1382 1339" style="background-color: #e1f5fe; padding: 10px;"> <p> Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p> </div> </td> </tr> </tbody> </table>	Name	Description		<p>defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre data-bbox="824 730 1377 779">"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre data-bbox="824 961 1377 1073">"Properties": [{"NetscalerVserver": "MyVirtualServerName"}]</pre> <div data-bbox="781 1108 1382 1339" style="background-color: #e1f5fe; padding: 10px;"> <p> Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p> </div>
Name	Description					
	<p>defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre data-bbox="824 730 1377 779">"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre data-bbox="824 961 1377 1073">"Properties": [{"NetscalerVserver": "MyVirtualServerName"}]</pre> <div data-bbox="781 1108 1382 1339" style="background-color: #e1f5fe; padding: 10px;"> <p> Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p> </div>					

Table 403: POST Enrollment PFX Deploy Response Data

Name	Description
SuccessfulStores	<p>An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div style="border: 1px solid #add8e6; padding: 10px; margin-top: 10px;"> <p> Note: Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store.</p> </div>
FailedStores	<p>An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.16.10 POST Enrollment PFX Replace

The POST /Enrollment/PFX/Replace method is used to replace a certificate in a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Replace* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 1665](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

- /certificate_stores/schedule/
- /certificates/enrollment/pfx/
- OR
- /certificate_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)
- /certificates/enrollment/pfx/

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Note: You could achieve the same end using the *POST /Enrollment/PFX/Deploy* method, but in that case you would need to provide the certificate store GUID(s), the alias of the current certificate in the certificate store(s), the certificate store type(s), and set the overwrite flag to true (as well as the certificate ID of the new certificate). To achieve a replacement with the *POST /Enrollment/PFX/Replace* method you only need to provide the certificate IDs of the certificate being replaced and the new certificate. All the rest of the work is done for you. The certificate will be replaced in all locations in which the certificate is found. If you want to replace the certificate in only some of the locations in which it is found, you will need to use the *POST /Enrollment/PFX/Deploy* method (see [POST Enrollment PFX Deploy on page 1685](#)).

Tip: The *POST /Enrollment/PFX/Replace* method must be used within 5 minutes of acquiring a certificate with the *POST /Enrollment/PFX* or *POST /Enrollment/Renew* method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 404: POST Enrollment PFX Replace Input Parameters

Name	In	Description
ExistingCertificateId	Body	Required . The integer of the certificate that will be replaced that is already in the store(s). A management job will be created to replace the certificate in all stores in which it is found. Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CertificateId	Body	Required* . The integer for the certificate that needs to be deployed. This is returned in the response to the POST /Enrollment/PFX request. Either the <i>CertificateId</i> or the <i>RequestId</i> is required but not both.
RequestId	Body	Required* . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the POST /Enrollment/PFX request. Either the <i>CertificateId</i> or the <i>RequestId</i> is required but not both.
Password	Body	Required* . A string with a password used to secure the certificate in the certificate store. This field is required for store types that require an entry password, such as PEM stores.
JobTime	Body	A string containing the date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.

Table 405: POST Enrollment PFX Replace Response Data

Name	Description
SuccessfulStores	<p>An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div style="border: 1px solid #add8e6; padding: 10px; margin-top: 10px;"> <p> Note: Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store.</p> </div>
FailedStores	An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.16.11 POST Enrollment Renew

The POST /Enrollment/Renew method is used to enroll for a certificate renewal for a certificate that exists in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new certificate. For certificates in a certificates store, this method does not automatically deploy the new certificate to the certificate store. In this case, the renew request should be followed by a call to either the POST /Enrollment/PFX/Deploy method or POST /Enrollment/PFX/Replace method to deploy the new certificate to the certificate store.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

- /certificates/collections/read/
- /certificates/enrollment/pfx/
- OR
- /certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)
- /certificates/enrollment/pfx/

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 1685](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 1691](#)).

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions on page 230](#)).

Table 406: POST Enrollment Renew Input Parameters

Name	In	Description
CertificateId	Body	Required* . The integer for the certificate in Keyfactor Command that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is required but not both.
Thumbprint	Body	Required* . The thumbprint for the certificate that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is required but not both.
Timestamp	Body	Required . The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).
CertificateAuthority	Body	Required* . A string that sets the name of the certificate authority that will be used to enroll against. The certificate authority name should be provided in <i>hostname\logical name</i> format. For example: <pre>corpca01.keyexample.com\CorplIssuingCA1</pre> This field is required if one-click renewal is not supported for the certificate (see GET Enrollment Available Renewal ID on page 1653 or GET Enrollment Available Renewal Thumbprint on page 1656).
Template	Body	Required* . A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is required if one-click renewal is not supported for the certificate (see GET Enrollment Available Renewal ID on page 1653 or GET Enrollment Available Renewal Thumbprint on page 1656).

Table 407: POST Enrollment Renew Response Data

Name	Description
KeyfactorID	ID of the certificate in Keyfactor Command.
KeyfactorRequestID	ID of the request in Keyfactor Command.
Thumbprint	Thumbprint of the certificate.
SerialNumber	Serial number of the certificate.
IssuerDN	Issuer DN of the certificate.
RequestDisposition	State of the request (e.g. issued).
DispositionMessage	Enrollment message (e.g. The private key was successfully retained.).
Password	A password generated for convenience for use on installation to a certificate store. This password may be used when deploying the certificate to a certificate store using the POST /Enrollment/Deploy method, though an alternate password may be used. The passwords do not need to match.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.17 Event Handler Registration

EventHandlerRegistration endpoints includes methods necessary to list, add, edit and delete event handler registrations for Alerts in Keyfactor Command.

Table 408: EventHandlerRegistration Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes an event handler.	DELETE Event Handler Registration ID on page 1704
/id}	GET	Returns a registered event handler that matches the provided ID.	GET Event Handler Registration ID on page 1701
/id}	PUT	Updates a registered event handler's information.	PUT Event Handler Registration ID on page 1702
/	GET	Returns all registered event handlers according to the provided filter and output parameters.	GET Event Handler Registration below
/	POST	Registers an event handler.	POST Event Handler Registration on page 1700

3.6.17.1 GET Event Handler Registration

The GET /EventHandlerRegistration method is used to retrieve a list of the Event Handler Registrations in Keyfactor Command (see [Event Handler Registration on page 739](#)). This method returns HTTP 200 OK on a success with details of the event handler. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/handlers/registration/read/

Table 409: GET Event Handler Registration Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • <i>DisplayName</i> • <i>Enabled</i>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 410: GET Event Handler Registration Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <i>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</i>).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	A string indicating which application events the event handler supports. Built-in events include: <ul style="list-style-type: none"> • Certificate Expiration Handler • Denied Certificate Request Handler • Issued Certificate Handler • Key Rotation Handler • Pending Certificate Handler

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.17.2 POST Event Handler Registration

The POST /Event Handler Registration method is used to register an event handler (see [Event Handler Registration on page 739](#)). This method returns HTTP 200 OK on a success with details of the added event handler(s).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/handlers/registration/modify/

Table 411: POST Event Handler Registration Input Parameters

Name	In	Description
AssemblyName	Body	Required. A string containing the assembly name of the event handler to register. The handler file must be in the configured extensions directory on the machine running the Management Portal (see Application Settings: Console Tab on page 602).

Table 412: POST Event Handler Registration Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <i>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</i>).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	A string indicating which application events the event handler supports. Built-in events include: <ul style="list-style-type: none"> • Certificate Expiration Handler • Denied Certificate Request Handler • Issued Certificate Handler • Key Rotation Handler • Pending Certificate Handler

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.17.3 GET Event Handler Registration ID

The GET `/EventHandlerRegistration/{id}` method is used to retrieve a registered event handler that matches the provided ID in Keyfactor Command (see [Event Handler Registration on page 739](#)). This method returns HTTP 200 OK on a success with details of the specified event handler.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/monitoring/handlers/registration/read/`

Table 413: GET Event Handler Registration {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the event handler. Use the <i>GET /EventHandlerRegistration</i> method (see GET Event Handler Registration on page 1698) to retrieve a list of all the event handlers to determine the ID.

Table 414: GET Event Handler Registration Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <i>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</i>).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	A string indicating which application events the event handler supports. Built-in events include: <ul style="list-style-type: none"> • Certificate Expiration Handler • Denied Certificate Request Handler • Issued Certificate Handler • Key Rotation Handler • Pending Certificate Handler

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.17.4 PUT Event Handler Registration ID

The *PUT /EventHandlerRegistration/{id}* method is used to update the indicated registered event handler's *DisplayName* or *Enabled* status (see [Event Handler Registration on page 739](#)). This method returns HTTP 200 OK on a success with details of the updated event handler.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/handlers/registration/modify/

Table 415: PUT Event Handler Registration {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the event handler. Use the <i>GET /EventHandlerRegistration</i> method (see GET Event Handler Registration on page 1698) to retrieve a list of all the event handlers to determine the ID.
DisplayName	Body	A string indicating the display name of the event handler.
Enabled	Body	A Boolean indicating whether the event handler is enabled (true) or not (false).

Table 416: PUT Event Handler Registration {id} Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <i>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</i>).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	A string indicating which application events the event handler supports. Built-in events include: <ul style="list-style-type: none"> • Certificate Expiration Handler • Denied Certificate Request Handler • Issued Certificate Handler • Key Rotation Handler • Pending Certificate Handler

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.17.5 DELETE Event Handler Registration ID

The DELETE /EventHandlerRegistration/{id} method is used to delete the event handler with the provided ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/handlers/registration/modify/

Table 417: DELETE Event Handler Registration {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the event handler. Use the <i>GET /EventHandlerRegistration</i> method (see GET Event Handler Registration on page 1698) to retrieve a list of all the event handlers to determine the ID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.18 Extensions Scripts

The Extensions Scripts component of the Keyfactor API includes methods necessary to create, update, retrieve and delete scripts configured for certificate requests, SSH alerts, and workflows. The Extensions Scripts endpoints are new as of Keyfactor Command version 11 and replace previous functionality which stored scripts for alert event handlers and workflow PowerShell steps in files in the directory structure on the server. The new method of storing the scripts in the database ensures they are stored safely and accessed only with appropriate permissions. Also see [PowerShell Scripts on page 219](#) for important information about working with scripts in Keyfactor Command.

 **Important:** When upgrading from a version of Keyfactor Command prior to version 11, the upgrade process will search the file location defined in the *Application settings > Console Tab > Extension Handler Path* setting and add all the files found in that directory to the database with the naming convention of *foldername (_subfolder name, if applicable)_filename* so it is clear which scripts were imported from which location (e.g., *net6.0_Workflow_CustomPowerShellExample*). The upgrade process will also identify which, if any, of the categories the script is configured for and add that information to the database with the script.

Table 418: Extensions Scripts Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a script.	DELETE Extensions Scripts ID below
/id}	GET	Returns a single script that matches the provided ID.	GET Extensions Scripts ID on the next page
/	GET	Returns all scripts according to the provided filter and output parameters.	GET Extensions Scripts on page 1707
/	POST	Adds a new script.	POST Extensions Scripts on page 1709
/	PUT	Updates a script.	PUT Extensions Scripts on page 1713

3.6.18.1 DELETE Extensions Scripts ID

The DELETE /Extensions/Scripts/{id} method is used to delete a script. Scripts cannot be deleted if configured for an alert or workflow. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/scripts/modify/

Table 419: DELETE Extensions Scripts Input Parameters

Name	In	Description
id	Path	Required. In integer indicating the Keyfactor Command reference ID for the script to be deleted. Use the <i>GET /Extensions/Scripts</i> method (see GET Extensions Scripts on page 1707) to retrieve a list of all the scripts to determine the ID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.18.2 GET Extensions Scripts ID

The GET /Extensions/Scripts/{id} method is used to return the details of the script that matches the provided ID. This method returns HTTP 200 OK on a success with details of the specified script record.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/scripts/read/

Table 420: GET Extensions Scripts {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the script to be retrieved. Use the GET /Extensions/Scripts method (see GET Extensions Scripts on the next page) to retrieve a list of all the scripts to determine the ID.

Table 421: GET Extensions Scripts {id} Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	A JSON-escaped string containing the contents of the script on a single line.														
Categories	An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are: <table border="1" data-bbox="422 1333 1404 1774"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.18.3 GET Extensions Scripts

The GET /Extensions/Scripts method is used to return a list of all scripts configured in Keyfactor Command according to the provided filter and output parameters. This method returns HTTP 200 OK on a success with details of the script records.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/scripts/read/

Table 422: GET Extensions Scripts Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Name</i> • <i>Category</i> <p>Use the equal (-eq) operator; the -ne operator is not supported. For example: <i>Category -eq "Expiration"</i> will return any scripts that have Expiration in their categories.</p>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 423: GET Extensions Scripts Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Categories	An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are: <table border="1" data-bbox="423 600 1403 1041"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.18.4 POST Extensions Scripts

The POST /Extensions/Scripts method is used to add a new script to the database. This method returns HTTP 200 OK on a success with details of the newly created script record.

 **Important:** This is the only means to add a script to the database. There is no UI equivalent for security reasons. (Upgrading from a version previous to version 11 will import existing scripts into the database as the only other means of adding scripts to the database).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

Table 424: POST Extensions Scripts Input Parameters

Name	In	Description														
Name	Body	Required. A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	Body	Required. A JSON-escaped string containing the contents of the script on a single line. <div style="background-color: #e0f2f1; padding: 5px; margin-top: 10px;">  Tip: See below for examples of creating and handling this string. </div>														
Categories	Body	Required. An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are: <table border="1" style="margin-top: 10px; width: 100%;"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name															
1	Expiration															
2	Pending															
3	Denied															
4	Issued															
5	KeyRotation															
6	Workflow															

Two Approaches to Importing Scripts to the Database

To create a string value for the *Contents* field, you need to take your script, turn it into a string, and JSON-escape the string so that CR/LFs, tabs and the like will be encoded appropriately and the string will be on a single line. For example, the following string contains escaped CR/LFs (`\r\n`):

```
$MyVar = \"Hello, World!\"\\r\\n\\r\\nWrite-Host $MyVar
```

One approach to doing this uses a PowerShell script similar to the following, which takes the script to be uploaded as input and creates an output file with the JSON-escaped string:

```

# Path to the input file
$filePath = "C:\Stuff\UpdateSubjectSANS.ps1"

# Get the contents of the input file as a string (as opposed to an array of strings) into a variable
$fileContent = Get-Content -Path $filePath -Raw

# Set variables for the other body parameters - for multiple categories, use commas (e.g. 2,3,4)
$ScriptName = "UpdateSubjectSANS"
[int32[]]$Categories = 6

# Build the body
$body = @{
    "Name" = $ScriptName
    "Contents" = $fileContent.ToString()
    "Categories" = $Categories
}

# JSON escape the body elements
$JSONbody = ConvertTo-JSON $body

# Output the body elements including the escaped Contents string to a file
Set-Content -Value $JSONbody -Path C:\Stuff\MyOutFile.txt

```

The contents of the output file will look something like (the Contents field is shown truncated here):

```

{
  "Categories": [
    6
  ],
  "Contents": "# Declare your parameters at the beginning ($CSRSubject, $CSRSANS)\r\nparam(\r\n
[string]$CSRSubject,\r\n [string]$CSRSANS,\r\n",
  "Name": "UpdateSubjectSANS"
}

```

You can then open the output file, display the content without line wrapping the Contents field, and copy either the entire body or the JSON-escaped Contents string for pasting into your API command. Any line wraps that display on the screen in the Contents field will be interpreted by copy/paste as CR/LF, which will cause the API command to fail. If your script is long, you will need to be sure to use a text editor to open the file that can display the entire length of the Contents string as a single line. The built-in Windows Notepad application will display a maximum of 1024 characters on a line before wrapping even if word wrap is disabled. A tool such as the third-party Notepad++ is much less limited.

Alternately, you can do the JSON-escaping and update to the Keyfactor Command database in a single PowerShell script and skip the file output with copy/paste. The following script will JSON-escape a script and add it to the database:

```
# Prompt for credentials to authenticate to the Keyfactor API
$cred = Get-Credential

# Encode credentials (assumes the Keyfactor API is using Basic authentication)
$pair = "$($cred.Username): $($cred.GetNetworkCredential().Password)"
$encodedCreds = [System.Convert]::ToBase64String([System.Text.Encoding]::ASCII.GetBytes($pair))
$basicAuthValue = "Basic $encodedCreds"

# Path to the input file
$filePath = "C:\Stuff\UpdateSubjectSANS.ps1"

# Keyfactor Command server name and optional port for API request
$APIServer = "keyfactor.keyexample.com"

# Set variables for the other body parameters - for multiple categories, use commas (e.g. 2,3,4)
$ScriptName = "UpdateSubjectSANS"
[int32[]]$Categories = 6

# Get the contents of the input file as a string (as opposed to an array of strings) into a variable
$fileContent = Get-Content -Path $filePath -Raw

# Build the headers
$headers = @{
    "Authorization"=$basicAuthValue
    "Accept"="application/json"
    "x-keyfactor-requested-with"="APIClient"
}

# Build the body
$body = @{
    "Name" = $ScriptName
    "Contents" = $fileContent.ToString()
    "Categories" = $Categories
}

# Make the API request to create a new script in the database
Invoke-WebRequest -Uri "https://$APIServer/KeyfactorAPI/Extensions/Scripts" -Method:Post -Headers
$headers -ContentType "application/json" -Body ($body|ConvertTo-Json) -ErrorAction:Stop -TimeoutSec
60
```

Table 425: POST Extensions Scripts Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	A JSON-escaped string containing the contents of the script on a single line.														
Categories	<p>An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are:</p> <table border="1"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.18.5 PUT Extensions Scripts

The PUT /Extensions/Scripts method is used to update a script. This method returns HTTP 200 OK on a success with details of the updated script record.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/scripts/modify/

Note: You cannot change the name of a script once it has been created, so that field is not available as an input parameter to the PUT method.

Table 426: PUT Extensions Scripts Input Parameters

Name	In	Description														
id	Body	<p>Required. An integer indicating the Keyfactor Command reference ID for the script. Use the GET /Extensions/Scripts method (see GET Extensions Scripts on page 1707) to retrieve a list of all the scripts to determine the ID.</p>														
Contents	Body	<p>A JSON-escaped string containing the contents of the script on a single line. If the contents field is not provided or is an empty string, the field will be ignored. (The contents of a script in the database cannot be cleared.)</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 5px;"> <p> Tip: See POST Extensions Scripts on page 1709 for examples of creating and handling this string.</p> </div>														
Categories	Body	<p>Required. An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 5px; margin-top: 10px;"> <p> Tip: The list of categories provided will completely replace any previously supported categories for the script. However, you cannot remove a category if the script is configured to be used by that category. You can add additional categories to a script that is already in use by select categories by including the existing categories in the parameter entry and adding any others as desired.</p> </div>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name															
1	Expiration

5	KeyRotation															
6	Workflow															

Table 427: PUT Extensions Scripts Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	A JSON-escaped string containing the contents of the script on a single line.														
Categories	<p>An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are:</p> <table border="1"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.19 Identity Providers

The Identity Providers component of the Keyfactor API includes methods necessary to programmatically edit and retrieve identity providers within Keyfactor Command.

Table 428: Identity Providers Endpoint

Endpoint	Method	Description	Link
/id}	GET	Returns the identity provider with the specified ID.	GET Identity Providers ID on the

Endpoint	Method	Description	Link
			next page
/id}	PUT	Updates the identity provider with the specified ID.	PUT Identity Providers ID on page 1730
/	GET	Returns all identity providers defined within Keyfactor Command with filtering and output options.	GET Identity Providers on page 1760
/Types	GET	Returns details for all the identities provider types defined within Keyfactor Command.	GET Identity Providers Types on page 1775

3.6.19.1 GET Identity Providers ID

The GET /Identity/Providers/{id} method is used to return an identity provider by ID. This method returns HTTP 200 OK on a success with details for the specified identity provider.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/identity_providers/read/

Table 429: GET Identity Providers{id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID of the identity provider to retrieve. Use the <i>GET /Identity/Providers</i> method (see GET Identity Providers on page 1760) to retrieve a list of all the identity providers to determine the provider's ID.

Table 430: GET Identity Providers {id} Response Data

Name	Description								
Id	A string containing the Keyfactor Command reference GUID for the identity provider.								
AuthenticationScheme	A string indicating the authentication scheme for the identity provider.								
DisplayName	A string indicating the display name for the identity provider.								
TypeId	A string indicating the Keyfactor Command reference GUID for the type of identity provider. Possible values are: <ul style="list-style-type: none"> DFB94650-E4EB-402A-B807-4F3CC91F712D (Active Directory) F96B6464-11B7-4499-BEA7-B5AA6BA1571D (Generic—select this for Keyfactor Identity Provider) 5AA04122-CD7C-48BA-AC11-F39E30AE8720 (Auth0) 								
Parameters	<p>An array of objects containing information for each parameter set for the identity provider. Each parameter (Table 431: Identity Provider Parameters) contains the data shown in Table 432: Identity Provider Parameter Structure.</p> <p>Each parameter (Table 431: Identity Provider Parameters) contains the data shown in Table 432: Identity Provider Parameter Structure.</p> <p><i>Table 431: Identity Provider Parameters</i></p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Admin Querying Client Id</td> <td>1 - String</td> <td>Command-API-Query</td> <td> <p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see Service Accounts on page 2730). Keyfactor recommends that you use a different client for this purpose than the client used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>).</p> <p>This parameter is required.</p> </td> </tr> </tbody> </table>	Name	Type	Example	Description	Admin Querying Client Id	1 - String	Command-API-Query	<p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see Service Accounts on page 2730). Value	A string indicating the value set for the parameter, for parameters of type 1 or 3.												
SecretValue	A string indicating the value set for the parameter, for parameters of type 2. Due to its sensitive nature, this value is not returned in responses.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.19.2 PUT Identity Providers ID

The PUT /Identity/Providers/{id} method is used to update an identity provider in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the identity provider.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/identity_providers/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected

data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 433: PUT Identity Providers {id} Input Parameters

Name	In	Description								
Id	Path	Required. A string containing the Keyfactor Command reference GUID for the identity provider.								
AuthenticationScheme	Body	Required. A string indicating the authentication scheme for the identity provider.								
DisplayName	Body	Required. A string indicating the display name for the identity provider.								
TypeId	Body	Required. A string indicating the Keyfactor Command reference GUID for the type of identity provider. Possible values are: <ul style="list-style-type: none"> DFB94650-E4EB-402A-B807-4F3CC91F712D (Active Directory) F96B6464-11B7-4499-BEA7-B5AA6BA1571D (Generic—select this for Keyfactor Identity Provider) 5AA04122-CD7C-48BA-AC11-F39E30AE8720 (Auth0) 								
Parameters	Body	<p>Required. An array of objects containing information for each parameter set for the identity provider. Each parameter (Table 434: Identity Provider Parameters) contains the data shown in Table 435: Identity Provider Parameter Structure. Each parameter (Table 434: Identity Provider Parameters) contains the data shown in Table 435: Identity Provider Parameter Structure.</p> <p><i>Table 434: Identity Provider Parameters</i></p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Admin Querying Client Id</td> <td>1 - String</td> <td>Command-API-Query</td> <td> <p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see Service Accounts on page 2730). SecretValue	A string indicating the value set for the parameter, for parameters of type 2. Due to its sensitive nature, this value is not returned in responses.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.19.3 GET Identity Providers

The GET /Identity/Providers method is used to return the list of security identity providers configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the identity providers.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
SecuritySettings: *Read*

Table 439: GET Identity Providers Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Identity Provider Search Feature on page 763 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • DisplayName • Name • Private • ProviderTypes
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Provider</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 440: GET Identity Provider Response Data

Name	Description								
Id	A string containing the Keyfactor Command reference GUID for the identity provider.								
AuthenticationScheme	A string indicating the authentication scheme for the identity provider.								
DisplayName	A string indicating the display name for the identity provider.								
TypeId	A string indicating the Keyfactor Command reference GUID for the type of identity provider. Possible values are: <ul style="list-style-type: none"> DFB94650-E4EB-402A-B807-4F3CC91F712D (Active Directory) F96B6464-11B7-4499-BEA7-B5AA6BA1571D (Generic—select this for Keyfactor Identity Provider) 5AA04122-CD7C-48BA-AC11-F39E30AE8720 (Auth0) 								
Parameters	<p>An array of objects containing information for each parameter set for the identity provider. Value	A string indicating the value set for the parameter, for parameters of type 1 or 3.												
SecretValue	A string indicating the value set for the parameter, for parameters of type 2. Due to its sensitive nature, this value is not returned in responses.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.19.4 GET Identity Providers Types

The GET /Identity/Providers/Types method is used to list the types of identity providers defined in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the identity provider types and their type parameters. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/identity_providers/read/

Table 443: GET Identity Providers Types Response Data

Name	Description												
Id	A string containing the Keyfactor Command reference GUID for the identity provider type.												
Name	A string containing the name for the identity provider type.												
TypeParameters	<p>An object containing information about the identity provider types. Identity provider type information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the identity provider type.</td> </tr> <tr> <td>Name</td> <td>A string containing the short reference name for the identity provider type.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the display name for the identity provider type.</td> </tr> <tr> <td>DataType</td> <td> <p>An integer indicating the data type of the identity provider type. Name	A string containing the short reference name for the identity provider type.												
DisplayName	A string containing the display name for the identity provider type.												
DataType	<p>An integer indicating the data type of the identity provider type. Possible values are:</p> <ul style="list-style-type: none"> • 1 - String • 2 - Secret • 3 - Boolean 												
Required	A Boolean that indicates whether the identity provider type has been marked as required (true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.20 License

The License component of the Keyfactor API is primarily intended to view the current license through the API with the GET /License Method.

Table 444: License Endpoint

Endpoint	Method	Description	Link
/	GET	Returns the current license.	GET License below

3.6.20.1 GET License

The GET /License method is used to view the current license. This method returns HTTP 200 OK on a success with the license details. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)). For more information regarding licensing, see [Licensing on page 768](#).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
SystemSettings > Read

Table 445: GET License Response Data

Name	Description												
KeyfactorVersion	A string indicating the Keyfactor Command version number in the format: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin-top: 5px;"> majorversion.incrementalversion.patchnumber </div>												
LicenseData	<p>An object containing your Keyfactor customer information. License data details are:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LicenseId</td> <td>A string indicating the internal reference GUID of your Keyfactor license.</td> </tr> <tr> <td>Customer</td> <td>An object containing identifying information about your organization. <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing your company name as per your Keyfactor account.</td> </tr> <tr> <td>Id</td> <td>An integer containing your Keyfactor account number.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	LicenseId	A string indicating the internal reference GUID of your Keyfactor license. DisplayName	A string indicating the name of the feature as displayed on the license page in the Management Portal.	Enabled	A Boolean that indicates whether the feature is enabled (true) or not (false).	Quantity	An integer indicating one of: <ul style="list-style-type: none"> How many of the elements you are licensed for. For those features which have no licensing limits, <i>null</i>. Unlimited is indicated by 999999999.	ExpirationDate	This field is unused and will always return <i>null</i> .
Name	Description												
FeatureID	A string indicating the ID code of feature.												
DisplayName	A string indicating the name of the feature as displayed on the license page in the Management Portal.												
Enabled	A Boolean that indicates whether the feature is enabled (true) or not (false).												
Quantity	An integer indicating one of: <ul style="list-style-type: none"> How many of the elements you are licensed for. For those features which have no licensing limits, <i>null</i>. Unlimited is indicated by 999999999.												
ExpirationDate	This field is unused and will always return <i>null</i> .												

Name	Description
	 Tip: Currently there is only one licensed product offered, which is Keyfactor Command.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.21 MacEnrollment

The MacEnrollment component of the Keyfactor API includes methods to edit and retrieve the configuration for Mac auto-enrollment.

Table 446: MacEnrollment Endpoints

Endpoint	Method	Description	Link
/	GET	Returns the current Mac auto-enrollment configuration.	GET MacEnrollment below
/	PUTT	Updates the Mac auto-enrollment configuration.	PUT MacEnrollment on the next page

3.6.21.1 GET MacEnrollment

The GET /MacEnrollment method is used to retrieve details for the Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /agents/management/mac/auto-enrollment/management/read/

Table 447: GET MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See Certificate Metadata on page 710 for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.21.2 PUT MacEnrollment

The PUT /MacEnrollment method is used to update the existing Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/agents/management/mac/auto-enrollment/management/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected

data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 448: PUT MacEnrollment input Parameters

Name	In	Description
Id	Body	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	Body	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	Body	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	Body	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See for more information about metadata fields.
MetadataField	Body	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is <i>true</i> .
MetadataValue	Body	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is <i>true</i> . This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Table 449: PUT MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See Certificate Metadata on page 710 for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.22 MetadataFields

MetadataFields contains definitions for metadata that can be associated with certificates in Keyfactor Command.

Table 450: MetadataFields Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes an existing metadata field.	DELETE Metadata Fields ID on the next page
/id}	GET	Returns detailed information for the specified	GET Metadata

Endpoint	Method	Description	Link
		metadata field.	Fields ID on page 1785
/ {name}	GET	Returns detailed information for the specified metadata field.	GET Metadata Fields Name on page 1788
/ {id}/InUse	GET	Returns a Boolean stating whether the metadata type is associated with a certificate.	GET Metadata Fields ID In Use on page 1792
/	DELETE	Deletes multiple metadata fields specified in the request body.	DELETE Metadata Fields on page 1793
/	GET	Returns all metadata field types with paging (number of pages to return and number of results per page) options.	GET Metadata Fields on page 1794
/	POST	Creates a new metadata field using values supplied in the request body.	POST Metadata Fields on page 1798
/	PUT	Updates an existing metadata field using values supplied in the request body.	PUT Metadata Fields on page 1804

3.6.22.1 DELETE Metadata Fields ID

The DELETE /MetadataFields/{id} method is used to delete a metadata field by ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/metadata/types/modify/

Table 451: DELETE Metadata Fields {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the metadata field to be deleted. Use the <i>GET /MetadataFields</i> method (see GET Metadata Fields on page 1794) to retrieve a list of all the metadata fields to determine the metadata field's ID.
Force	Query	A Boolean that sets whether to force deletion of the metadata field even if it is in use by one or more certificates (true) or not (false). The default is <i>false</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see GET Metadata Fields ID In Use on page 1792) to determine whether a metadata field is in use.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.22.2 GET Metadata Fields ID

The *GET /MetadataFields/{id}* method is used to return details for the metadata field with a specified unique ID. This method returns HTTP 200 OK on a success with details for the requested metadata field.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/metadata/types/read/`

Table 452: GET Metadata Fields {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see GET Metadata Fields on page 1794) to retrieve a list of all the metadata fields to determine the metadata field's ID.

Table 453: GET Metadata Fields {id} Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	An integer indicating the data type of the metadata field. Possible values are: <table border="1" data-bbox="462 730 1404 1171"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .														
Validation	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin: 10px 0;"> <code>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</code> </div> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description								
	<p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div data-bbox="462 331 1404 493" style="border: 1px solid #c8e6c9; padding: 10px; margin-top: 10px;"> <p> Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="462 611 1404 1129" style="margin: 10px auto; border-collapse: collapse;"> <thead> <tr> <th data-bbox="469 619 626 674">Value</th> <th data-bbox="626 619 1398 674">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="469 674 626 806">0</td> <td data-bbox="626 674 1398 806">Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td data-bbox="469 806 626 968">1</td> <td data-bbox="626 806 1398 968">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td data-bbox="469 968 626 1121">2</td> <td data-bbox="626 968 1398 1121">Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <div data-bbox="462 1165 1404 1327" style="border: 1px solid #c8e6c9; padding: 10px; margin-top: 10px;"> <p> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div data-bbox="462 1486 1404 1648" style="border: 1px solid #c8e6c9; padding: 10px; margin-top: 10px;"> <p> Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	<p> Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p>
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p>
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.22.3 GET Metadata Fields Name

The GET `/MetadataFields/{name}` method is used to return details for the metadata field with the specified unique name. This method returns HTTP 200 OK on a success with details for the requested metadata field.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/metadata/types/read/

Table 454: GET Metadata Fields {name} Input Parameters

Name	In	Description
name	Path	Required. A string that indicates the name of the metadata field. This value is not case sensitive.

Table 455: GET Metadata Fields {name} Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	An integer indicating the data type of the metadata field. Possible values are: <table border="1" data-bbox="462 730 1404 1171"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .														
Validation	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin: 10px 0;"> <code>^[a-zA-Z0-9' _\. \-]*@(keyexample\.org keyexample\.com)\$</code> </div> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description								
	<p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div data-bbox="464 331 1406 495" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="464 615 1406 1129" style="margin: 10px auto; border-collapse: collapse;"> <thead> <tr> <th data-bbox="464 615 626 678">Value</th> <th data-bbox="626 615 1406 678">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="464 678 626 810">0</td> <td data-bbox="626 678 1406 810">Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td data-bbox="464 810 626 968">1</td> <td data-bbox="626 810 1406 968">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td data-bbox="464 968 626 1129">2</td> <td data-bbox="626 968 1406 1129">Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <div data-bbox="464 1167 1406 1331" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation field</i>).</p> <div data-bbox="464 1486 1406 1650" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	<p> Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p>
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p>
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.22.4 GET Metadata Fields ID In Use

The GET `/MetadataFields/{id}/InUse` method is used to return a Boolean indicating whether the specified metadata field contains any data for any of the certificates in Keyfactor Command. This is useful to determine before attempting to delete a metadata field. This method returns HTTP 200 OK on a success with a value of true or false.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/metadata/types/read/

Table 456: GET Metadata Fields {id} In Use Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see GET Metadata Fields on the next page) to retrieve a list of all the metadata fields to determine the metadata field's ID.

Table 457: GET Metadata Fields {id} In Use Response Data

Name	Description
	A Boolean that indicates whether the specified metadata field contains data for any certificates within Keyfactor Command (true) or not (false). This value is returned without a parameter name.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.22.5 DELETE Metadata Fields

The DELETE /MetadataFields method is used to delete multiple metadata fields in one request. Delete operations will continue until the entire array of IDs has been processed. Note that metadata fields that are in use for any certificate cannot be deleted unless the force=true parameter is included in the request. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/metadata/types/modify/

Table 458: DELETE Metadata Fields Input Parameters

Name	In	Description
ids	Body	Required. An array of integers indicating the Keyfactor Command reference IDs for the metadata fields to be deleted. Use the <i>GET /MetadataFields</i> method (see GET Metadata Fields below) to retrieve a list of all the metadata fields to determine the metadata field IDs.
Force	Query	A Boolean that sets whether to force deletion of the metadata fields even if they are in use (true) or not (false). The default is <i>False</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see GET Metadata Fields ID In Use on page 1792) to determine whether a metadata field is in use.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.22.6 GET Metadata Fields

The GET /MetadataFields method is used to return a list of all metadata fields. This method returns HTTP 200 OK on a success with details for the metadata fields.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/metadata/types/read/

Table 459: GET Metadata Fields Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Logons Search on page 590 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> Name
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayOrder</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 460: GET Metadata Fields Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	An integer indicating the data type of the metadata field. Possible values are: <table border="1" data-bbox="462 730 1404 1171"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .														
Validation	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <pre>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description								
	<p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div data-bbox="464 331 1406 495" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="464 615 1406 1129" style="margin: 10px auto; border-collapse: collapse;"> <thead> <tr> <th data-bbox="464 615 626 678">Value</th> <th data-bbox="626 615 1406 678">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="464 678 626 810">0</td> <td data-bbox="626 678 1406 810">Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td data-bbox="464 810 626 968">1</td> <td data-bbox="626 810 1406 968">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td data-bbox="464 968 626 1129">2</td> <td data-bbox="626 968 1406 1129">Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <div data-bbox="464 1167 1406 1331" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation field</i>).</p> <div data-bbox="464 1486 1406 1650" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	<p> Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p>
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p>
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.22.7 POST Metadata Fields

The POST /MetadataFields method is used to create a new metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new metadata field.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/metadata/types/modify/

Table 461: POST Metadata Fields Input Parameters

Name	In	Description														
Name	Body	Required. A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	Body	Required. A string indicating the description for the metadata field.														
DataType	Body	<p>Required. An integer indicating the data type of the metadata field. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description															
1	String															
2	Integer															
3	Date															
4	Boolean															
5	Multiple Choice															
6	Big Text															
Hint	Body	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	Body	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, under-</p>														

Name	In	Description								
		<p>scores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div data-bbox="602 401 1406 600" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Enrollment	Body	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="602 722 1406 1304"> <thead> <tr> <th data-bbox="602 722 764 785">Value</th> <th data-bbox="764 722 1406 785">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="602 785 764 915">0</td> <td data-bbox="764 785 1406 915"> <p>Optional Users have the option to either enter a value or not enter a value in the field.</p> </td> </tr> <tr> <td data-bbox="602 915 764 1108">1</td> <td data-bbox="764 915 1406 1108"> <p>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p> </td> </tr> <tr> <td data-bbox="602 1108 764 1304">2</td> <td data-bbox="764 1108 1406 1304"> <p>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p> </td> </tr> </tbody> </table> <p>The default is <i>optional</i>.</p> <div data-bbox="602 1394 1406 1593" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>	Value	Description	0	<p>Optional Users have the option to either enter a value or not enter a value in the field.</p>	1	<p>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p>	2	<p>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p>
Value	Description									
0	<p>Optional Users have the option to either enter a value or not enter a value in the field.</p>									
1	<p>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p>									
2	<p>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p>									
Message	Body	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p>								

Name	In	Description
		 Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).
Options	Body	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is required for metadata fields with data type <i>multiple choice</i>. For other data types, it will be ignored.</p>  Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).
DefaultValue	Body	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).
AllowAPI	Body	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	Body	This is considered deprecated and may be removed in a future release.
DisplayOrder	Body	Required. An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

Table 462: POST Metadata Fields Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	An integer indicating the data type of the metadata field. Possible values are: <table border="1" data-bbox="462 730 1404 1171"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .														
Validation	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <pre>^[a-zA-Z0-9' _\. \-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description

The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="462 611 1404 1129" style="margin: 10px auto; border-collapse: collapse;"> <thead> <tr> <th data-bbox="469 619 626 674">Value</th> <th data-bbox="626 619 1398 674">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="469 674 626 806">0</td> <td data-bbox="626 674 1398 806">Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td data-bbox="469 806 626 968">1</td> <td data-bbox="626 806 1398 968">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td data-bbox="469 968 626 1121">2</td> <td data-bbox="626 968 1398 1121">Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <div data-bbox="462 1165 1404 1327" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation field</i>).</p> <div data-bbox="462 1486 1404 1648" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	<p> Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p>
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p>
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.22.8 PUT Metadata Fields

The PUT /MetadataFields method is used to update an existing metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the updated metadata field.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/metadata/types/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 463: PUT Metadata Fields Input Parameters

Name	In	Description														
ID	Body	Required. An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	Body	Required. A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	Body	Required. A string indicating the description for the metadata field.														
DataType	Body	<p>Required. An integer indicating the data type of the metadata field. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description															
1	String															
2	Integer															
3	Date															
4	Boolean															
5	Multiple Choice															
6	Big Text															
Hint	Body	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	Body	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre>														

Name	In	Description								
		<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div data-bbox="602 499 1406 701" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Enrollment	Body	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="602 821 1406 1409"> <thead> <tr> <th data-bbox="602 821 764 884">Value</th> <th data-bbox="764 821 1406 884">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="602 884 764 1016">0</td> <td data-bbox="764 884 1406 1016"> <p>Optional Users have the option to either enter a value or not enter a value in the field.</p> </td> </tr> <tr> <td data-bbox="602 1016 764 1209">1</td> <td data-bbox="764 1016 1406 1209"> <p>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation field</i>).</p> <div data-bbox="464 1486 1406 1650" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p> </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	<p> Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p>
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 2377).</p>
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.23 Monitoring

The Monitoring component of the Keyfactor API provides a set of methods to support management of CRL and OCSP monitoring locations.

Table 465: Monitoring Endpoints

Endpoint	Method	Description	Link
/Revocation/	POST	Creates a new revocation monitoring	POST Monitoring

Endpoint	Method	Description	Link
		location.	Revocation on page 1822
/Revocation/	PUT	Edits the revocation monitoring location with the specified ID.	PUT Monitoring Revocation on page 1830
/Revocation/	GET	Returns details for all revocation monitoring location according to the provided filter and output parameters.	GET Monitoring Revocation on page 1817
/ResolveOSCP	POST	Resolves the given OCSP certificate authority.	POST Monitoring Resolve OSCP on page 1838
/Revocation/{id}	GET	Returns details for the revocation monitoring location with the specified ID.	GET Monitoring Revocation ID on the next page
/Revocation/{id}	DELETE	Deletes the revocation monitoring location with the specified ID.	DELETE Monitoring Revocation ID below
/Revocation/Test	POST	Tests the revocation monitoring alert with the specified ID.	POST Monitoring Revocation Test on page 1839
/Revocation/TestAll	POST	Tests the revocation monitoring alerts.	POST Monitoring Revocation Test All on page 1841

3.6.23.1 DELETE Monitoring Revocation ID

The DELETE Monitoring/Revocation/{id} method is used to delete the revocation monitoring location with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

Table 466: DELETE Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see GET Monitoring Revocation on page 1817) to retrieve a list of all the revocation monitoring locations to determine the ID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.23.2 GET Monitoring Revocation ID

The *GET /Monitoring/Revocation/{id}* method is used to retrieve the revocation monitoring location with the specified ID. This method returns HTTP 200 OK on a success with details of the location.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 467: GET Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see GET Monitoring Revocation on page 1817) to retrieve a list of all the revocation monitoring locations to determine the ID.

Table 468: GET Monitoring Revocation {id} Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.								
Dashboard	<p>An object indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>WarningHours</td> <td>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.								

Name	Description																
	<table border="1"> <thead> <tr> <th data-bbox="451 275 695 338">Value</th> <th data-bbox="695 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="451 338 695 592"></td> <td data-bbox="695 338 1398 592"> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td> </tr> </tbody> </table>	Value	Description		<p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>												
Value	Description																
	<p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>																
Schedule	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table border="1"> <thead> <tr> <th data-bbox="451 709 591 772">Name</th> <th data-bbox="591 709 1398 772">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="451 772 591 835">Off</td> <td data-bbox="591 772 1398 835">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="451 835 591 1377">Interval</td> <td data-bbox="591 835 1398 1377"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th data-bbox="618 978 786 1041">Name</th> <th data-bbox="786 978 1377 1041">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="618 1041 786 1136">Minutes</td> <td data-bbox="786 1041 1377 1136">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="618 1230 1377 1360">"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td data-bbox="451 1377 591 1671">Daily</td> <td data-bbox="591 1377 1398 1671"> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th data-bbox="618 1482 786 1545">Name</th> <th data-bbox="786 1482 1377 1545">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="618 1545 786 1640">Time</td> <td data-bbox="786 1545 1377 1640">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th data-bbox="618 978 786 1041">Name</th> <th data-bbox="786 978 1377 1041">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="618 1041 786 1136">Minutes</td> <td data-bbox="786 1041 1377 1136">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="618 1230 1377 1360">"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th data-bbox="618 1482 786 1545">Name</th> <th data-bbox="786 1482 1377 1545">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="618 1545 786 1640">Time</td> <td data-bbox="786 1545 1377 1640">The date and time to next run the job. Name	Description	
	Value	Description
		Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the certificate used to identify the CA.
	FileName	A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used. This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.23.3 GET Monitoring Revocation

The GET /Monitoring/Revocation method is used to retrieve all revocation monitoring locations. This method returns HTTP 200 OK on a success with details of both OCSP and CRL revocation endpoint configurations.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 469: GET Monitoring Revocation Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • DashboardWarningValue (WarningHours value) • DisplayName (Name) • EndpointType (1-CRL, 2-OCSP) • SendWarning (emailreminder) (true, false) • ShowOnDashboard (true, false) • Url • WarningDays <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> Tip: To return all revocation monitoring locations of type CRL, use the following query:</p> <p style="text-align: center;"><code>EndpointType -eq 1</code></p> <p>To return locations of type OCSP, use this query:</p> <p style="text-align: center;"><code>EndpointType -eq 2</code></p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 470: GET Monitoring Revocation Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.								
Dashboard	<p>An object indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>WarningHours</td> <td>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.								

Name	Description																
	<table border="1"> <thead> <tr> <th data-bbox="451 275 695 338">Value</th> <th data-bbox="695 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="451 338 695 592"></td> <td data-bbox="695 338 1398 592"> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td> </tr> </tbody> </table>	Value	Description		<p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>												
Value	Description																
	<p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>																
Schedule	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table border="1"> <thead> <tr> <th data-bbox="451 709 591 772">Name</th> <th data-bbox="591 709 1398 772">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="451 772 591 835">Off</td> <td data-bbox="591 772 1398 835">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="451 835 591 1377">Interval</td> <td data-bbox="591 835 1398 1377"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. This value is found in the CA's certificate as the Subject Key</td> </tr> </tbody> </table>	Value	Description	CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.	AuthorityName	A string indicating the distinguished name of the CA. For example: <pre data-bbox="857 1409 1377 1482">CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>	AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .	AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key
Value	Description										
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.										
AuthorityName	A string indicating the distinguished name of the CA. For example: <pre data-bbox="857 1409 1377 1482">CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>										
AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .										
AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key										

Name	Description	
	Value	Description
		Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the certificate used to identify the CA.
	FileName	A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used. This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.23.4 POST Monitoring Revocation

The POST /Monitoring/Revocation method is used to add a revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

Table 471: POST Monitoring Revocation Input Parameters

Name	In	Description								
Id	Path	Required. An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	Required. A string indicating the name of the revocation monitoring location.								
EndpointType	Body	Required. A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p>Required. A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div style="border: 1px solid orange; background-color: #ffe4c4; padding: 10px; margin: 10px 0;"> <p> Important: Because a “+” (plus sign) in a URL can represent either a space or a “+” Keyfactor Command has chosen to read “+” as a space. For CRL URLs that require a “+” (plus sign), rather than a space, replace plus signs in your CRL’s URL with “%2B”. Only replace the plus signs you don’t wish to be treated as a space.</p> </div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	Body	<p>Required* for CRL endpoints. An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1" style="margin: 10px auto; border-radius: 15px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.									
Dashboard	Body	Required. An object indicating the configuration for display on the dashboard. Dashboard details are:								

Name	In	Description										
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.</td> </tr> <tr> <td>WarningHours</td> <td>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>. <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>. If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td> </tr> </tbody> </table>	Value	Description	Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.	WarningHours	Required* . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.				
Value	Description											
Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.											
WarningHours	Required* . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.											
Schedule	Body	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Off	Turn off a previously configured schedule.	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description											
Off	Turn off a previously configured schedule.											
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.											
Name	Description											
Minutes	An integer indicating the number of minutes between each interval.

This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>	SampleSerialNumber	<p>A string indicating the serial number of the certificate used to identify the CA.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>	FileName	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p>
Value	Description													
AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>													
AuthorityNameId	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>													
AuthorityKeyId	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>													
SampleSerialNumber	<p>A string indicating the serial number of the certificate used to identify the CA.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>													
FileName	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p>													

Table 472: POST Monitoring Revocation Response Data

Name	Description								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.								
Dashboard	<p>An object indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>WarningHours</td> <td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> </td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p>

SampleSerialNumber	A string indicating the serial number of the certificate used to identify the CA.	FileName	A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.
Value	Description														
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.														
AuthorityName	A string indicating the distinguished name of the CA. For example: <pre data-bbox="846 1157 1300 1220">CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>														
AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .														
AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).														
SampleSerialNumber	A string indicating the serial number of the certificate used to identify the CA.														
FileName	A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.														

Name	Description	
	Value	Description
		This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.23.5 PUT Monitoring Revocation

The PUT /Monitoring/Revocation method is used to modify the revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 473: PUT Monitoring Revocation {id} Input Parameters

Name	In	Description								
Id	Path	Required. An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	Required. A string indicating the name of the revocation monitoring location.								
EndpointType	Body	Required. A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p>Required. A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div style="border: 1px solid orange; background-color: #ffe4c4; padding: 10px; margin: 10px 0;"> <p> Important: Because a “+” (plus sign) in a URL can represent either a space or a “+” Keyfactor Command has chosen to read “+” as a space. For CRL URLs that require a “+” (plus sign), rather than a space, replace plus signs in your CRL’s URL with “%2B”. Only replace the plus signs you don’t wish to be treated as a space.</p> </div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	Body	<p>Required* for CRL endpoints. An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1" style="margin: 10px auto; border-radius: 15px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.									
Dashboard	Body	Required. An object indicating the configuration for display on the dashboard. Dashboard details are:								

Name	In	Description										
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>Required. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>	AuthorityNameId	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>	AuthorityKeyId	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>	SampleSerialNumber	<p>A string indicating the serial number of the certificate used to identify the CA.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>	FileName	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p>
Value	Description													
AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>													
AuthorityNameId	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>													
AuthorityKeyId	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>													
SampleSerialNumber	<p>A string indicating the serial number of the certificate used to identify the CA.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see POST Monitoring Resolve OSCP on page 1838) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>													
FileName	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p>													

Table 474: PUT Monitoring Revocation {id} Response Data

Name	Description								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.								
Dashboard	<p>An object indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>WarningHours</td> <td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> </td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p>

This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.	AuthorityName	A string indicating the distinguished name of the CA. For example: <pre data-bbox="846 1157 1300 1220">CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>	AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .	AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).	SampleSerialNumber	A string indicating the serial number of the certificate used to identify the CA.	FileName	A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.
Value	Description														
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.														
AuthorityName	A string indicating the distinguished name of the CA. For example: <pre data-bbox="846 1157 1300 1220">CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>														
AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .														
AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).														
SampleSerialNumber	A string indicating the serial number of the certificate used to identify the CA.														
FileName	A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.														

Name	Description	
	Value	Description
		This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.23.6 POST Monitoring Resolve OSCP

The POST /Monitoring/ResolveOCSP method is used to resolve the given OCSP certificate authority. This method returns HTTP 200 OK on a success with details of the location.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

Table 475: POST Monitoring Resolve OCSP Input Parameters

Name	In	Description
CertificateContents	Body	Required* . A string indicating the certificate contents of a base-64 encoded PEM issued by the CA that you wish to resolve. One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.
CertificateAuthorityId	Body	Required* . An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the <i>GET /CertificateAuthority</i> method (see GET Certificate Authority on page 1201) to retrieve a list of all the CAs to determine the ID. One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.

Table 476: POST Monitoring Resolve OCSP Response Data

Name	Description
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.
AuthorityName	A string indicating the resolved certificate authority's name in X.500 format.
AuthorityNameId	A string indicating the hash of the certificate authority's name in hex format.
AuthorityKeyId	A string indicating the public key of the certificate authority's certificate.
SampleSerialNumber	A string indicating the serial number of the certificate authority's certificate.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.23.7 POST Monitoring Revocation Test

The POST /Monitoring/Revocation/Test method is used to test email alerts for a single configured revocation monitoring endpoint. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

 **Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

- /monitoring/alerts/read/
- /monitoring/alerts/test/

Table 477: POST Monitoring Revocation Test Input Parameters

Name	Description
AlertId	Required. An integer indicating the reference ID of revocation monitoring alert to test.
EvaluationDate	Required. A string indicating the evaluation date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.
SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 478: POST Monitoring Revocation Test Response Data

Parameter	Description								
RevocationMonitoringAlerts	An array of objects containing alert details resulting from the test. Revocation monitoring alert details are: <table border="1" data-bbox="613 982 1404 1411"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject</td> <td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td> </tr> <tr> <td>Message</td> <td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings containing the recipient(s) for the alert.</td> </tr> </tbody> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An array of strings containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An array of strings containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.23.8 POST Monitoring Revocation Test All

The POST /Monitoring/Revocation/Test method is used to test email alerts for all configured revocation monitoring endpoints. Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting or when an OCSP endpoint is unreachable. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

Tip: Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/monitoring/alerts/read/
/monitoring/alerts/test/

Table 479: POST Monitoring Revocation Test All Input Parameters

Name	Description
EvaluationDate	Required. A string indicating the evaluation date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.
SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 480: POST Monitoring Revocation Test All Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An array of objects containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject</td> <td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td> </tr> <tr> <td>Message</td> <td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings containing the recipient(s) for the alert.</td> </tr> </tbody> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An array of strings containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An array of strings containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.24 Orchestrator Jobs

The Orchestrator Jobs component of the Keyfactor API includes methods necessary to schedule orchestrator jobs and view the results of jobs.

Table 481: Orchestrator Jobs Endpoints

Endpoint	Method	Description	Link
/JobStatus/Data	GET	Retrieves the results of a custom job using the provided information.	GET Orchestrator Jobs Job Status Data on the next page
/JobHistory	GET	Returns the details of history records on orchestrator jobs, including in-process jobs.	GET Orchestrator Jobs Job History on page 1844

Endpoint	Method	Description	Link
/ScheduledJobs	GET	Returns the details of active scheduled jobs, including in-process jobs.	GET Orchestrator Jobs Scheduled Jobs on page 1850
/Custom	POST	Schedules a custom job on the orchestrator using the provided information.	POST Orchestrator Jobs Custom on page 1854
/Reschedule	POST	Reschedules a failed orchestrator job.	POST Orchestrator Jobs Reschedule on page 1859
/Unschedule	POST	Unscheduled an active orchestrator job.	POST Orchestrator Jobs Unschedule on page 1861
/Acknowledge	POST	Sets the status of a failed orchestrator job to acknowledged.	POST Orchestrator Jobs Acknowledge on page 1863
/Custom/Bulk	POST	Schedules a custom job on multiple orchestrator using the provided information.	POST Orchestrator Jobs Reschedule on page 1859

3.6.24.1 GET Orchestrator Jobs Job Status Data

The GET /OrchestratorJobs/JobStatus/Data method is used to return the data generated from a completed custom orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with up to 2 MB of data from the job results.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/agents/management/read/

 **Tip:** This method is used to return the log results from a Fetch Logs job initiated for the Keyfactor Universal Orchestrator. When used to return results for a Fetch Logs job, the last 2 MB of data from the orchestrator's log file are returned as a string in the Data field.

 **Tip:** If jobs for the Keyfactor Universal Orchestrator fail with messages similar to the following:

2021-08-05 10:47:23.1940

Keyfactor.Orchestrators.JobExecutors.OrchestratorJobExecutor [Debug] - Response status code does not indicate success: 413 (Request Entity Too Large).

at System.Net.Http.HttpResponseMessage.EnsureSuccessStatusCode() in /_src/System.Net.Http/src/System/Net/Http/HttpResponseMessage.cs:line 172

at Keyfactor.Orchestrators.Services.HttpService.SendPostAsync[T](String uri, Object requestData, Dictionary`2 headers) in F:\BuildAgents\Default1\work\24\s\src\OrchestratorServices\HttpService.cs:line 38

This indicates that the amount of data being returned on the job is greater than IIS on the Keyfactor Command server is configured to accept. You will need to make modifications to the IIS settings on your Keyfactor Command server to allow it to accept larger incoming pieces of content. See [Fetch Logs on page 505](#) for more information.

Table 482: GET Orchestrator Jobs Job Status Data Input Parameters

Name	In	Description
jobHistoryId	Query	Required. The Keyfactor Command reference ID of the orchestrator job. Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History below) to retrieve a list of jobs to determine the job's history ID.

Table 483: GET Orchestrator Jobs Job Status Data Response Data

Name	Description
JobHistoryId	An integer indicate the Keyfactor Command reference ID used to track progress during orchestrator jobs.
Data	A string containing up to 2 MB of data returned from the custom job.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.24.2 GET Orchestrator Jobs Job History

The GET /OrchestratorJobs/JobHistory method is used to retrieve the status of an in progress or completed orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with details of the requested orchestrator jobs.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/agents/management/read/`

Table 484: GET Orchestrator Jobs Job History Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Job History Search Feature on page 518. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none">• AgentId (The GUID of the orchestrator. Run GET Agents on page 858 to find the ID.)• Agent (ClientMachine)• JobId• Result (Job result: 4-Failure, 3-Warning, 2-Success, 0-Unknown)• Status (Job status: 4-Acknowledged, 3-Completed, 2-InProcess, 1-Waiting, 0-Unknown, 5-CompletedWillRetry)• JobType (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync)• Message• OperationStart (DateTime)• ScheduleType (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_(Monthly), O_(Once))• TargetPath
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>JobHistoryId</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 485: GET Orchestrator Jobs Job History Response Data

Name	Description												
JobHistoryId	An integer indicating the Keyfactor Command reference ID used to track progress during orchestrator jobs.												
AgentMachine	A string indicating the name of the server on which the agent or orchestrator is installed. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.												
JobId	A string indicating the Keyfactor Command reference GUID assigned to the job.												
Schedule	<p>The inventory schedule for the most recently run instance of the orchestrator job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="422 275 607 336">Name</th> <th data-bbox="607 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="422 336 607 590"></td> <td data-bbox="607 336 1398 590"> <table border="1"> <thead> <tr> <th data-bbox="630 357 792 420">Name</th> <th data-bbox="792 357 1375 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="630 420 792 590">Time</td> <td data-bbox="792 420 1375 590">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th data-bbox="630 447 792 508">Name</th> <th data-bbox="792 447 1375 508">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="630 508 792 678">Time</td> <td data-bbox="792 508 1375 678">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="630 678 792 772">Day</td> <td data-bbox="792 678 1375 772">The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre data-bbox="630 863 1375 1024"> "Monthly": { "Day": 1 "Time": "2023-11-27T17:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
	<table border="1"> <thead> <tr> <th data-bbox="630 1152 792 1213">Name</th> <th data-bbox="792 1152 1375 1213">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="630 1213 792 1383">Time</td> <td data-bbox="792 1213 1375 1383">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre data-bbox="630 1474 1375 1604"> "ExactlyOnce": { "Time": "2023-11-27T11:45:00Z" } </pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										

Name	Description
JobType	A string indicating the job type (e.g. IISInventory).
OperationStart	The time, in UTC, at which the orchestrator job started.
OperationEnd	The time, in UTC, at which the orchestrator job finished.
Message	A string providing the error message for the operation, if any.
Result	A string indicating the result of the orchestrator job. Possible values are: <ul style="list-style-type: none"> • Unknown • Success • Warning • Failure
Status	A string indicating the status of the orchestrator job. Possible values are: <ul style="list-style-type: none"> • Unknown • Waiting • In Process • Completed • Acknowledged • Completed Will Retry
StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 for more information.
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.24.3 GET Orchestrator Jobs Scheduled Jobs

The GET /OrchestratorJobs/ScheduledJobs method is used to retrieve orchestrator (a.k.a. agent) jobs that have active schedules. This includes jobs with ongoing schedules, such as inventory jobs that run periodically, and jobs that have been scheduled but have not yet been completed, such as management or discovery jobs. Both jobs that have not yet started and in-progress jobs are returned by this method. This method returns HTTP 200 OK on a success with details of the scheduled orchestrator jobs.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/agents/management/read/

Table 486: GET Orchestrator Jobs Scheduled Jobs Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Job History Search Feature on page 518. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • AgentId (The GUID of the orchestrator. Run GET Agents on page 858 to find the ID.) • Agent Machine (ClientMachine) • AgentPlatform (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator) • JobType (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync) • AgentType (Use -contains comparison) (see capabilities in GET Agents on page 858) • Requested (DateTime) • ScheduleType (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly),M_(Monthly), O_(Once) • TargetPath
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Requested</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 487: GET Orchestrator Jobs Scheduled Jobs Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID assigned to the job.
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.
Target	A string indicating the server name and path to the certificate store on the target (e.g. appsvr162.keyexample.com - /opt/app/store.cer). The server name included in the <i>Target</i> is the value from the <i>ClientMachine</i> . The format for the path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). Some types of jobs (e.g. discovery) have no path. See Adding or Modifying a Certificate Store on page 413 for more information.

Name	Description
Schedule	

Name	Description
Requested	The time, in UTC, at which the orchestrator job was initiated and added to the job queue.
JobType	A string indicating the job type (e.g. IISInventory).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.24.4 POST Orchestrator Jobs Custom

The POST /OrchestratorJobs/Custom method is used to schedule a job with a custom job type on an orchestrator. This method returns HTTP 200 OK on a success with the GUID for the scheduled job.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/agents/management/modify/

 **Tip:** Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the *GET /OrchestratorJobs/JobHistory* method (see [GET Orchestrator Jobs Job History on page 1844](#)) to determine the *JobHistoryId* of the completed job and then use the *GET /OrchestratorJobs/JobStatus/Data* method (see [GET Orchestrator Jobs Job Status Data on page 1843](#)) to retrieve the data.

Table 488: POST Orchestrator Jobs Custom Input Parameters

Name	In	Description								
AgentId	Body	<p>Required. A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see GET Agents on page 858) with a query of <i>Status -eq 2 and Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrator for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see GET Agents on page 858) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrator for which you want to schedule a custom job with your custom job type.</p>								
JobTypeName	Body	<p>Required. A string indicating the reference name for the custom job type for the job.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 1598) to retrieve a list of your defined custom job types to determine the job type name to use.</p>								
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Weekly</td> <td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description									
Off	Turn off a previously configured schedule.									
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>

Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).													

Name	In	Description
		<p> Note: Although the Keyfactor API Reference and Utility—Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>The default is <i>Immediate</i>.</p>
JobFields	Body	<p>An object that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <pre data-bbox="597 722 1406 886">"JobFields": { "Favorite Type of Pet": "Rat", "Mother's Birthday": "1952-05-21" }</pre> <p> Note: If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value.</p> <p>Use the GET /JobTypes/Custom method (see GET Custom Job Types on page 1598) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <p> Tip: The built-in Fetch Logs job does not have any optional job fields.</p>

Table 489: POST Orchestrator Jobs Custom Response Data

Name	Description
JobId	A string indicating the Keyfactor Command reference GUID for the job.
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
JobTypeName	A string indicating the reference name for the custom job type for the job.
Schedule	An object containing the schedule for the custom job.
JobFields	An array of objects that set the values for any optional job fields configured for the custom job type.
RequestTimestamp	A string containing the date, in UTC, when the custom job was submitted.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.24.5 POST Orchestrator Jobs Reschedule

The POST /OrchestratorJobs/Reschedule method is used to reschedule a failed orchestrator job to retry. Jobs must have a result of Failed and a status of Completed or Acknowledged to be eligible for rescheduling. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for rescheduling, including:

- Certificate Store Management
- Reenrollment
- Mac Auto-enrollment
- JKS, PEM and F5 Certificate Store Discovery
- SSH Synchronization
- Custom Jobs scheduled to run Weekly or Monthly

The following types of jobs cannot be rescheduled with this method:

- Certificate Store Inventory
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 1462](#)).
- Custom Jobs scheduled to run Immediately or Exactly Once
A new custom job should be scheduled after the problem is resolved using POST

/OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 1854](#)).

- **Fetch Logs**
A new fetch logs job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 1854](#)).
- **SSL Discovery and Monitoring**
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 2347](#)).
- **CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator**
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 1248](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/agents/management/modify/

/certificate_stores/schedule/

OR

/agents/management/modify/

/certificate_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)

The required permissions will vary depending on the job type being rescheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Tip: Be sure to resolve the problem that caused the job to fail before rescheduling it.

Table 490: POST Orchestrator Jobs Reschedule Input Parameters

Name	In	Description
JobAuditIds	Body	<p>Required*. An array of integers indicating the job IDs of the failed jobs that should be scheduled to retry.</p> <p>Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History on page 1844) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for rescheduling:</p> <pre>JobType -ne "Inventory" AND Result -eq "4" AND (Status -eq "4" OR Status -eq "3")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to reschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, see to Scheduled Job Search Feature on page 512.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.24.6 POST Orchestrator Jobs Unschedule

The POST /OrchestratorJobs/Unschedule method is used to unschedule a scheduled orchestrator job. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for unscheduling, including:

- Certificate Store Discovery and Management
- Reenrollment
- Mac Auto-enrollment
- Fetch Logs
- Custom Jobs

The following types of jobs cannot be unscheduled with this method:

- Certificate Store Inventory
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule

(see [POST Certificate Stores Schedule on page 1462](#)).

- SSH Synchronization
Change the schedule on these using PUT /SSH/ServerGroups (see [PUT SSH Server Groups on page 2210](#)).
- SSL Discovery and Monitoring
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 2347](#)).
- CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 1248](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/agents/management/modify/

/certificate_stores/schedule/

OR

/agents/management/modify/

/certificate_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)

The required permissions will vary depending on the job type being unscheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 491: POST Orchestrator Jobs Unschedule Input Parameters

Name	In	Description
JobIds	Body	<p>Required*. An array of strings indicating the GUIDs for the job IDs of the jobs that should be unscheduled.</p> <p>Use the GET /OrchestratorJobs/ScheduledJobs method (see GET Orchestrator Jobs Scheduled Jobs on page 1850) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for unscheduling:</p> <pre>JobType -notcontains "SslDiscovery" AND JobType -notcontains "Monitoring" AND JobType -notcontains "Sync" AND JobType -notcontains "SSHSync" AND JobType -notcontains "Inventory"</pre> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to unschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, see to Scheduled Job Search Feature on page 512.</p> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is required, but not both.</p>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.24.7 POST Orchestrator Jobs Acknowledge

The POST /OrchestratorJobs/Acknowledge method is used to set an orchestrator job to a status of acknowledged. Jobs must have a result of Failed or Warning and a status of Completed or CompletedWillRetry to be eligible for acknowledgment. Jobs that are in process or that have completed successfully cannot be set to a status of acknowledged. Setting a job to a status of acknowledged removes it from the count on the job history tab in the Keyfactor Command Management Portal (if the job falls within the count period defined by the *Job Failures and Warnings Age Out (days)* application setting—see [Application Settings: Agents Tab on page 614](#)). This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/agents/management/modify/

Table 492: POST Orchestrator Jobs Acknowledge Input Parameters

Name	In	Description
JobAuditIds	Body	<p>Required*. An array of integers indicating the job IDs of the jobs that should be set to a status of acknowledged.</p> <p>Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History on page 1844) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for acknowledgment:</p> <pre>(Result -eq "4" OR Result -eq "3") AND (Status -eq "3" OR Status -eq "5")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to acknowledge (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, see to Scheduled Job Search Feature on page 512.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.24.8 POST Orchestrator Jobs Custom Bulk

The POST /OrchestratorJobs/Custom/Bulk method is used to schedule a job with a specified custom job type on multiple orchestrators at once. This method returns HTTP 200 OK on a success with the GUIDs for the scheduled jobs.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/agents/management/modify/

 **Tip:** Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the [GET /OrchestratorJobs/JobHistory](#) method (see [GET Orchestrator Jobs Job History on page 1844](#)) to determine the *JobHistoryId* of the completed job and then use the [GET /Orches-](#)

tratorJobs/JobStatus/Data method (see [GET Orchestrator Jobs Job Status Data on page 1843](#)) to retrieve the data.

Table 493: POST Orchestrator Jobs Custom Bulk Input Parameters

Name	In	Description														
OrchestratorIds	Body	<p>Required. A string indicating the Keyfactor Command referenced GUIDs of the orchestrators what will execute the jobs.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see GET Agents on page 858) with a query of <i>Status -eq 2 and Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrators for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see GET Agents on page 858) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrators for which you want to schedule a custom job with your custom job type.</p>														
JobTypeName	Body	<p>Required. A string indicating the reference name for the custom job type for the job. A single bulk operation can only execute one job type.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 1598) to retrieve a list of your defined custom job types to determine the job type name to use.</p>														
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</td> </tr> <tr> <td colspan="2"> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).	<p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>		Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description															
Off	Turn off a previously configured schedule.															
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).															
<p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>																
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.															
Name	Description															
Minutes	An integer indicating the number of minutes between each interval.															

Name	In	Description																		
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).					
Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).									
JobFields	Body	<p>An object that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <pre data-bbox="513 1493 1401 1661">"JobFields": { "Favorite Type of Pet": "Rat", "Mother's Birthday": "1952-05-21" }</pre> <p> Note: If a job field has been configured with a default value and you wish</p>								

Name	In	Description
		<p> to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value.</p> <p>Use the GET /JobTypes/Custom method (see GET Custom Job Types on page 1598) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <p> Tip: The built-in Fetch Logs job does not have any optional job fields.</p>

Table 494: POST Orchestrator Jobs Custom Bulk Response Data

Name	Description						
OrchestratorJobPairs	<p>An array of objects containing identifying information for each orchestrator on which the job will be run. Orchestrator job pair parameters include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>JobId</td> <td>A string indicating the Keyfactor Command reference GUID for the job.</td> </tr> <tr> <td>OrchestratorId</td> <td>A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</td> </tr> </tbody> </table>	Value	Description	JobId	A string indicating the Keyfactor Command reference GUID for the job.	OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
Value	Description						
JobId	A string indicating the Keyfactor Command reference GUID for the job.						
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.						
JobTypeName	A string indicating the reference name for the custom job type for the job.						
Schedule	An object containing the schedule for the custom job.						
JobFields	An array of objects indicating the values for any optional job fields configured for the custom job type.						
RequestTimestmap	A string indicating the date, in UTC, when the custom job was submitted.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.25 PAM Providers

Privileged Access Management (PAM) functionality in the Keyfactor API allows for configuration of third party PAM providers to secure certificate stores and provide access credentials for certificate authorities, workflows, and other functions. PAM functionality is provided using custom PAM extensions. Keyfactor provides several PAM extensions on the publicly-facing Keyfactor GitHub:

<https://keyfactor.github.io/integrations-catalog/content/pam>

The PAM component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list PAM providers and PAM provider types. PAM provider types must be created before PAM providers for them can be created.

Table 495: PamProviders Endpoints

Endpoint	Method	Description	Link
/	GET	Returns a list of all the configured PAM providers.	GET PAM Providers on page 1898
/	POST	Creates a new PAM provider.	POST PAM Providers on page 1916
/	PUT	Updates a PAM provider.	PUT PAM Providers on page 1935
/{id}	GET	Returns information for the specified PAM provider.	GET PAM Providers ID on the next page
/{id}	DELETE	Deletes a PAM provider.	DELETE PAM Providers ID below
/Types	GET	Returns a list of all available PAM provider types.	GET PAM Providers Types on page 1888
/Types	POST	Creates a new PAM provider type.	POST PAM Providers Types on page 1891
/Types	GET	Returns the PAM provider type with the specified ID.	GET PAM Providers Types ID on page 1954

3.6.25.1 DELETE PAM Providers ID

The DELETE /PamProviders/{id} method is used to delete a PAM provider by ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/pam/modify/

OR

/pam/modify/#!/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See [PAM Permissions on page 631](#) for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#).

Table 496: DELETE PamProviders {id} v1 & v2 Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the PAM provider to be deleted. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of all the PAM providers to determine the PAM provider's ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.25.2 GET PAM Providers ID

The GET /PamProviders/{id} method is used to return a PAM provider by ID. This method returns HTTP 200 OK on a success with details about the specified PAM provider.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/pam/read/

OR

/pam/read/#!/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See [PAM Permissions on page 631](#) for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the GET /PamProviders/{id} method has been redesigned to remove references to PAM associations with areas and containers.

Table 497: GET PamProviders {id} v2 Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the PAM provider to retrieve. Use the <i>GET /PAM/Providers</i> method (see GET PAM Providers on page 1898) to retrieve a list of all the PAM providers to determine the provider's ID.

Table 498: GET PamProviders {id} v2 Response Data

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																
ProviderType	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td> <p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Value	Description										
	PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.										
InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.										
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .										

Version 1

Version 1 of the GET `/PamProviders/{id}` method includes the same capabilities as version 2 except it includes references to the deprecated parameters related to the area of Keyfactor Command to which the PAM provider applies.

Table 499: GET `PamProviders {id}` Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the PAM provider to retrieve. Use the <code>GET /PAM/Providers</code> method (see GET PAM Providers on page 1898) to retrieve a list of all the PAM providers to determine the provider's ID.

Table 500: GET PamProviders {id} v1 Response Data

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. This is considered deprecated and may be removed in a future release.																
ProviderType	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td> <p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.	InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.				
Value	Description										
	PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.										
InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.										
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .										
SecureAreald	An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any. This is considered deprecated and may be removed in a future release.										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.25.3 GET PAM Providers Types

The GET /PamProviders/Types method returns a list of all the PAM provider types that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider type. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/pam/read/

OR

/pam/read/#/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See [PAM Permissions on page 631](#) for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#). The data returned in the response is the same for both versions.

Table 501: GET PamProviders Types v1 & v2 Response Data

Name	Description																												
Id	A string containing the Keyfactor Command reference GUID for the PAM provider type.																												
Name	A string containing the name of the PAM provider type.																												
Parameters	<p>An array of objects containing parameters set for the PAM provider type. Parameter details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td> <p>An integer indicating the ID of the parameter. Parameters will vary depending on your PAM extension. Built-in parameters include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Private Ark Safe</td> </tr> <tr> <td>2</td> <td>PrivateArk Folder Name</td> </tr> <tr> <td>3</td> <td>PrivateArk Protected Password Name</td> </tr> <tr> <td>4</td> <td>Application ID</td> </tr> <tr> <td>5</td> <td>Secret Server Url</td> </tr> <tr> <td>6</td> <td>Rule Name</td> </tr> <tr> <td>7</td> <td>Thycotic Secret ID</td> </tr> <tr> <td>8</td> <td>Rule Key</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM parameter.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name for the PAM parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the data type for the parameter. Possible values are:</td> </tr> </tbody> </table>	Value	Description	Id	<p>An integer indicating the ID of the parameter. Parameters will vary depending on your PAM extension. Built-in parameters include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Private Ark Safe</td> </tr> <tr> <td>2</td> <td>PrivateArk Folder Name</td> </tr> <tr> <td>3</td> <td>PrivateArk Protected Password Name</td> </tr> <tr> <td>4</td> <td>Application ID</td> </tr> <tr> <td>5</td> <td>Secret Server Url</td> </tr> <tr> <td>6</td> <td>Rule Name</td> </tr> <tr> <td>7</td> <td>Thycotic Secret ID</td> </tr> <tr> <td>8</td> <td>Rule Key</td> </tr> </tbody> </table>	Value	Description	1	Private Ark Safe	2	PrivateArk Folder Name	3	PrivateArk Protected Password Name	4	Application ID	5	Secret Server Url	6	Rule Name	7	Thycotic Secret ID	8	Rule Key	Name	A string indicating the internal name for the PAM parameter.	DisplayName	A string indicating the display name for the PAM parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).	DataType	An integer indicating the data type for the parameter. Possible values are:
Value	Description																												
Id	<p>An integer indicating the ID of the parameter. Parameters will vary depending on your PAM extension.  **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.25.4 POST PAM Providers Types

The POST /PamProviders/Types method creates a new PAM provider type. This method returns HTTP 200 OK on a success with details about the PAM provider type.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/pam/modify/

OR

/pam/modify/#!/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See [PAM Permissions on page 631](#) for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#). The input parameters and response data returned are the same for both versions.

	Value	<p data-bbox="678 373 1382 638">  When you configure a certificate store to use Delinea as a credential provider, you enter the name of the secret field in Delinea referencing the protected object and you enter the ID of the projected object containing the username or password used to access the certificate store. Because these fields are configured on the certificate store level, they appear as InstanceLevel= True like so: </p> <pre data-bbox="748 667 1370 1052"> { "Name": "SecretId", "DisplayName": "Secret Server Secret ID", "InstanceLevel": true, "DataType": "string" }, { "Name": "SecretFieldName", "DisplayName": "Secret Field Name", "InstanceLevel": true, "DataType": "string" } </pre> <p data-bbox="748 1079 1349 1209"> In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in Delinea where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array. </p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.25.5 GET PAM Providers

The GET /PamProviders method returns a list of all the PAM providers that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/pam/read/

OR

/pam/read/#/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See [PAM Permissions on page 631](#) for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the GET /PamProviders method has been redesigned to remove references to PAM associations with areas and containers.

Table 504: GET PamProviders v2 Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • Area • Name • ProviderType • SecuredAreald
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 505: GET PamProviders v2 Response Data

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																
ProviderType	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td> <p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Value	Description							
	PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.							
InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.							
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .							

Version 1

Version 1 of the GET /PamProviders method includes the same capabilities as version 2 except it includes references to the deprecated parameters related to the area of Keyfactor Command to which the PAM provider applies.

Table 506: GET PamProviders v1 Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • Area • Name • ProviderType • SecuredAreald
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 507: GET PamProviders v1 Response Data

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. This is considered deprecated and may be removed in a future release.																
ProviderType	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td> <p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.	InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.				
Value	Description										
	PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.										
InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.										
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .										
SecureAreald	An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any. This is considered deprecated and may be removed in a future release.										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.25.6 POST PAM Providers

The POST /PamProviders method creates a new PAM provider. This method returns HTTP 200 OK on a success with details for the new provider.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/pam/modify/

OR

/pam/modify/#!/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers and certificate stores can be set at either the global or PAM provider level. See [PAM Permissions on page 631](#) for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the POST /PamProviders method has been redesigned to remove references to PAM associations with areas and containers.

Table 508: POST PamProviders v2 Input Parameters

Name	In	Description								
Name	Body	<p>Required. A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.</p> <div style="border: 1px solid orange; background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p> Important: The name you give to your PAM provider in Keyfactor Command must match the name of the PAM provider as referenced in the manifest.json file (see Installing Custom PAM Provider Extensions on page 743).</p> </div>								
ProviderType	Body	<p>Required. An object containing details about the provider type for the provider. Only the provider type ID is needed on input. Provider type details include:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>Required. Name	A string indicating the internal name for the PAM provider type.	Provider-TypeParams	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.				
Value	Description												
	meter.												
Name	A string indicating the internal name for the PAM provider type.												
Provider-TypeParams	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.												
Provider-TypeParamValues	An array of objects containing the values for the provider types specified by Provider-TypeParam. The field does not return data on responses.												
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .												
SecureAreald	An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any. This is considered deprecated and may be removed in a future release.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.25.7 PUT PAM Providers

The PUT /PamProviders method updates an existing PAM provider. This method returns HTTP 200 OK on a success with details for the updated provider.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/pam/modify/

OR

/pam/modify/#!/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers and certificate stores can be set at either the global or PAM provider level. See [PAM Permissions on page 631](#) for more information about global vs PAM provider permissions.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#).

Version 2 of the PUT /PamProviders method has been redesigned to remove references to PAM associations with areas and containers.

Table 512: PUT PamProviders v2 Input Parameters

Name	In	Description						
Id	Body	Required. An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.						
Name	Body	<p>Required. A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.</p> <div style="border: 1px solid orange; border-radius: 10px; padding: 10px; background-color: #fff9e6;"> <p> Important: The name you give to your PAM provider in Keyfactor Command must match the name of the PAM provider as referenced in the manifest.json file (see Installing Custom PAM Provider Extensions on page 743).</p> </div>						
ProviderType	Body	<p>Required. An object containing details about the provider type for the provider. Only the provider type ID is needed on input. Provider type details include:</p> <table border="1" style="margin-left: 20px; border-radius: 10px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>Required. A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> </tbody> </table>	Value	Description	Id	Required. A string indicating the Keyfactor Command reference GUID for the provider type.		
Value	Description							
Id	Required. A string indicating the Keyfactor Command reference GUID for the provider type.							
Provider-TypeParamValues	Body	<p>Required*. An array of objects containing the values for the provider types specified by ProviderTypeParam. Values are only required in this field if the <i>Remote</i> parameter is set to <i>false</i>. Provider type parameter values include:</p> <table border="1" style="margin-left: 20px; border-radius: 10px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td>Required. A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).</td> </tr> <tr> <td>InstanceId</td> <td>An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used. This is considered deprecated and may</td> </tr> </tbody> </table>	Value	Description	Value	Required. A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).	InstanceId	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used. This is considered deprecated and may
Value	Description							
Value	Required. A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).							
InstanceId	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used. This is considered deprecated and may

Provider-TypeParams	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.				
Value	Description										
Name	A string indicating the internal name for the PAM provider type.										
Provider-TypeParams	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.										
Provider-TypeParamValues	An array of objects containing the values for the provider types specified by Provider-TypeParam. The field does not return data on responses.										
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .										

Version 1

Version 1 of the PUT /PamProviders method includes the same capabilities as version 2 except it includes references to the deprecated parameters related to the area of Keyfactor Command to which the PAM provider applies.

Table 514: PUT PamProviders v1 Input Parameters

Name	In	Description						
Id	Body	Required. An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.						
Name	Body	<p>Required. A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.</p> <div style="border: 1px solid orange; border-radius: 10px; padding: 10px; background-color: #fff9e6;"> <p> Important: The name you give to your PAM provider in Keyfactor Command must match the name of the PAM provider as referenced in the manifest.json file (see Installing Custom PAM Provider Extensions on page 743).</p> </div>						
ProviderType	Body	<p>Required. An object containing details about the provider type for the provider. Only the provider type ID is needed on input. Provider type details include:</p> <table border="1" style="margin-left: 20px; border-radius: 10px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>Required. A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> </tbody> </table>	Value	Description	Id	Required. A string indicating the Keyfactor Command reference GUID for the provider type.		
Value	Description							
Id	Required. A string indicating the Keyfactor Command reference GUID for the provider type.							
Provider-TypeParamValues	Body	<p>Required*. An array of objects containing the values for the provider types specified by ProviderTypeParam. Values are only required in this field if the <i>Remote</i> parameter is set to <i>false</i>. Provider type parameter values include:</p> <table border="1" style="margin-left: 20px; border-radius: 10px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td>Required. A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).</td> </tr> <tr> <td>Instanceid</td> <td>An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used. This is considered deprecated and may</td> </tr> </tbody> </table>	Value	Description	Value	Required. A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).	Instanceid	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used. This is considered deprecated and may

Provider-Type	An object containing details for the provider type. Provider type parameters include:															

Name	Description												
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>meter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Value	Description		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>meter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.</td> </tr> </tbody> </table>	Value	Description		meter.	Name	A string indicating the internal name for the PAM provider type.	Provider-TypeParams	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.
Value	Description												
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>meter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.</td> </tr> </tbody> </table>	Value	Description		meter.	Name	A string indicating the internal name for the PAM provider type.	Provider-TypeParams	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.				
Value	Description												
	meter.												
Name	A string indicating the internal name for the PAM provider type.												
Provider-TypeParams	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.												
Provider-TypeParamValues	An array of objects containing the values for the provider types specified by Provider-TypeParam. The field does not return data on responses.												
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .												
SecureAreald	An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any. This is considered deprecated and may be removed in a future release.												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.25.8 GET PAM Providers Types ID

The GET /PamProviders/Types/{id} method returns the PAM provider type with the specified ID. This method returns HTTP 200 OK on a success with details about the specified PAM provider type. This method has only a v2 version.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /pam/read/
 OR
 /pam/read/#/ (where # is a reference to a specific PAM provider ID)
 Permissions for PAM providers can be set at either the global or PAM provider level. See [PAM Permissions on page 631](#) for more information about global vs PAM provider permissions.

Table 516: GET PamProviders Types {id} v2 Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the PAM provider to be deleted. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of all the PAM providers to determine the PAM provider's ID.

Table 517: GET PamProviders Types {id} v2 Response Data

Name	Description																												
Id	A string containing the Keyfactor Command reference GUID for the PAM provider type.																												
Name	A string containing the name of the PAM provider type.																												
Parameters	<p>An array of objects containing parameters set for the PAM provider type. Name	A string indicating the internal name for the PAM parameter.																												
DisplayName	A string indicating the display name for the PAM parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).																												
DataType	An integer indicating the data type for the parameter. Possible values are:																												

Name	Description					
	<table border="1"> <thead> <tr> <th data-bbox="418 275 651 338">Value</th> <th data-bbox="651 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="418 338 651 443"></td> <td data-bbox="651 338 1398 443"> <ul style="list-style-type: none"> • 1 = String • 2 = Secret </td> </tr> </tbody> </table>	Value	Description		<ul style="list-style-type: none"> • 1 = String • 2 = Secret 	<p data-bbox="672 443 1398 590">A Boolean that sets whether the parameter is used to define the underlying PAM provider (false) or a field that needs to be set to a value when configuring a record (e.g. a certificate store) to use the PAM provider (true).</p> <div data-bbox="672 611 1398 1094" style="background-color: #fff9c4; padding: 10px;"> <p data-bbox="683 632 1386 688">Example: For Delinea when defining a PAM provider, you configure two Delinea-specific fields:</p> <ul data-bbox="760 695 1365 968" style="list-style-type: none"> • Secret Server URL: The URL to the Secret Server vault instance, including port number if applicable (e.g. https://web-srvr38.keyexample.com/SecretServer). • Secret Server Username: The name of the user that will be used to connect to SecretServer. • Secret Server Password: The password of the user that will be used to connect to SecretServer. <p data-bbox="748 995 1365 1087">Because these fields are configured on the PAM provider definition, they appear as InstanceLevel=False like so:</p> </div> <pre data-bbox="748 1115 1365 1661"> { "Name": "Host", "DisplayName": "Secret Server URL", "InstanceLevel": false, "DataType": "string" }, { "Name": "Username", "DisplayName": "Secret Server Username", "InstanceLevel": false, "DataType": "secret" }, { "Name": "Password", "DisplayName": "Secret Server Password", "InstanceLevel": false, "DataType": "secret" } </pre>
Value	Description					
	<ul style="list-style-type: none"> • 1 = String • 2 = Secret 					

Name	Description	
	Value	<p data-bbox="678 373 1382 638">  When you configure a certificate store to use Delinea as a credential provider, you enter the name of the secret field in Delinea referencing the protected object and you enter the ID of the projected object containing the username or password used to access the certificate store. Because these fields are configured on the certificate store level, they appear as InstanceLevel= True like so: </p> <pre data-bbox="748 667 1370 1052"> { "Name": "SecretId", "DisplayName": "Secret Server Secret ID", "InstanceLevel": true, "DataType": "string" }, { "Name": "SecretFieldName", "DisplayName": "Secret Field Name", "InstanceLevel": true, "DataType": "string" } </pre> <p data-bbox="748 1079 1349 1209"> In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in Delinea where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array. </p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.26 Permissions

The Permissions component of the Keyfactor API includes the GET method to list all of the area permissions that are available to use to configure security settings for access to Keyfactor Command. This is mostly used for reference when configuring security settings.

Table 518: Security Roles Endpoints

Endpoint	Method	Description	Link
/	GET	Returns a list of all of the area permissions that are available to use to configure security settings for access to Keyfactor Command.	GET Permissions below

3.6.26.1 GET Permissions

The GET /Permissions method is used to list all area permissions available for use to control user access to all aspects of Keyfactor Command. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 519: GET Permissions Response Data

Name	Description
n/a	<p>An array of strings listing the full permissions list in Keyfactor Command. For example:</p> <pre>["/", "/agents/", "/agents/auto_registration/", "/agents/auto_registration/modify/", "/agents/auto_registration/read/", "/agents/management/", "/agents/management/mac/", "/agents/management/mac/auto-enrollment/", "/agents/management/mac/auto-enrollment/management/", "/agents/management/mac/auto-enrollment/management/modify/", "/agents/management/mac/auto-enrollment/management/read/", ... "/certificate_stores/", ... "/ssl/read/", "/system_settings/", "/system_settings/modify/", "/system_settings/read/", "/workflows/", "/workflows/definitions/",]</pre>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.27 Permission Sets

The Permission Sets component of the Keyfactor API includes methods necessary to programmatically create, edit, retrieve, and delete permission sets within Keyfactor Command.

Permission sets are used to organize security roles (see [Security Roles on page 2081](#)) and provide compartmentalization on permissions. An unconfigured Keyfactor Command has one permission set—the *Global Permission Set*—that will contain all the security roles created in Keyfactor Command and allow users with administrative permissions to grant any of the possible permissions (see [Security Role Permissions on page 632](#)) in Keyfactor Command to other users. An implementation with two or more permission sets can be used to limit the actions that administrative users (or any users) can take.

Permission sets can only be managed with the Keyfactor API.

Example: An organization has a couple of administrators who should be allowed to make whatever changes are necessary to Keyfactor Command and a handful of other administrators who need full control to Keyfactor Command but should not be able to access certain sensitive features of the system. However, this second set of administrators do need to be able to change permissions of users on occasion. To meet this need, the organization decides to use permission sets:

- The *Global Permission Set* contains the following permission:

```
/
```

This is the base permission set that is created on installation. It allows any security roles created as part of the Global Permission Set to potentially contain any possible security permission within Keyfactor Command.

- The organization adds an *Operational Permission Set* which contains the following permissions:

```
/agents/  
/application_settings/  
/certificate_stores/  
/certificates/  
/certificate_authorities/
```

```
/certificate_templates/  
/dashboard/  
/metadata/  
/monitoring/  
/portal/  
/reports/  
/security/  
/scripts/  
/ssl/  
/workflows/
```

This allows any security roles created as part of the Operational Permission Set to potentially contain any of the permissions in the referenced areas of Keyfactor Command. Notice that security is among these areas. It does not allow security roles added to this permission set to be granted permissions in areas such as `/auditing/` and `/identity_providers/`.

The organization creates these security roles:

- A Global Administrators security role in the Global Permission Set which grants full control to the system. This is created by default during the installation.
- An Operational Administrators security role in the Operational Permission Set which grants all the permissions in the Operational Permission Set.
- A Power Users security role in the Operational Permission Set which grants a large subset of the permissions in the Operational Permission Set, more granularly than grants to the administrators (e.g. `/certificates/enrollment/csr/`).
- A Viewers security role in the Operational Permission Set which grants a small subset of the permissions in the Operational Permission Set, more granularly than grants to the administrators (e.g. `/certificates/collections/read/`).

In this configuration, users who hold the Operational Administrators security role:

- Can edit the Power Users and Viewers security roles and change the permissions granted to those roles, but they cannot add any permissions that are not in the Operational Permission Set.
- Can edit the Operational Administrators security role, but can't add any permissions that aren't in the Operational Permission Set.
- Can add new claims for users, groups and other entities.
- Can add new security roles in the Operational Permission Set, referencing only permissions in that set.

- Can associate users, groups and other entities with the Power Users, Viewers and Operational Administrators security roles.
- Can remove role associations for users, groups and other entities for the Power Users, Viewers and Operational Administrators security roles.
- Cannot edit the Global Administrators role because it's not in the permission set to which their own security role belongs.
- Cannot add or edit permission sets.

Table 520: Permission Sets Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns the permission set with the specified GUID.	GET Permission Sets ID below
/id}	DELETE	Deletes the permission set with the specified GUID.	DELETE Permission Sets ID on the next page
/	GET	Returns a list of all the permission sets.	GET Permission Sets on page 1963
/	POST	Adds a new permission set into Keyfactor Command.	POST Permission Sets on page 1964
/	PUT	Updates a permission set.	PUT Permission Sets on page 1965

3.6.27.1 GET Permission Sets ID

The GET /PermissionSets/{id} method is used to return a permission set by GUID. This method returns HTTP 200 OK on a success with details for the specified permission set.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 521: GET Permission Sets{id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID of the permission set to retrieve. Use the <i>GET /PermissionSets</i> method (see GET Permission Sets on page 1963) to retrieve a list of all the permission sets to determine the permission set's ID.

Table 522: GET Permission Sets {id} Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See Version Two Permission Model on page 632 for an overview of the possible permissions.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.27.2 DELETE Permission Sets ID

The DELETE /PermissionSets/{id} method is used to delete the permission set with the specified GUID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 523: DELETE Permission Sets{id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID of the permission set to delete. Use the <i>GET /PermissionSets</i> method (see GET Permission Sets on the next page) to determine the ID of the permission set you wish to delete.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.27.3 GET Permission Sets

The GET /PermissionSets method is used to return a list of the permission sets defined in Keyfactor Command (see [Permission Sets on page 1959](#)). This method returns HTTP 200 OK on a success with details for the permission sets.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 524: GET Permission Sets Input Parameters

Name	In	Description
QueryString	Query	There are no query parsers for this endpoint..
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 525: GET Permission Sets Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See Version Two Permission Model on page 632 for an overview of the possible permissions.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.27.4 POST Permission Sets

The POST /PermissionSets method is used to create a new permission set in Keyfactor Command (see [Permission Sets on page 1959](#)). This method returns HTTP 200 OK on a success with the details of the new permission set.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 526: POST Permission Sets Input Parameters

Name	In	Description
Name	Body	Required. A string indicating the short name for the permission set.
Permissions	Body	<p>Required. An array of strings containing the permissions assigned to the permission set. See Version Two Permission Model on page 632 for an overview of the possible permissions.</p> <p>For example:</p> <pre> "Permissions": ["/agents/", "/certificate_stores/", "/certificates/", "/certificate_authorities/", "/certificate_templates/", "/dashboard/", "/metadata/", "/monitoring/", "/portal/", "/reports/", "/ssl/", "/workflows/",] </pre>

Table 527: POST Permission Sets Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See Version Two Permission Model on page 632 for an overview of the possible permissions.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.27.5 PUT Permission Sets

The PUT /PermissionSets method is used to update a permission set in Keyfactor Command (see [Permission Sets on page 1959](#)). This method returns HTTP 200 OK on a success with the details of the updated permission set.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 528: PUT Permission Sets Input Parameters

Name	Description
Id	Required. A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	<p>Required. An array of strings containing the permissions assigned to the permission set. See Version Two Permission Model on page 632 for an overview of the possible permissions.</p> <p>For example:</p> <pre> "Permissions": ["/agents/", "/certificate_stores/", "/certificates/", "/certificate_authorities/", "/certificate_templates/", "/dashboard/", "/metadata/", "/monitoring/", "/portal/" "/reports/", "/ssl/", "/workflows/"] </pre>

Table 529: PUT Permission Sets Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See Version Two Permission Model on page 632 for an overview of the possible permissions.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.28 Reports

The Reports component of the Keyfactor API includes methods necessary to list, update, and schedule built-in reports as well as methods to create, update, list and delete custom reports.

Table 530: Reports Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns the built-in report with the specified ID.	GET Reports ID on the next page
/Custom/{id}	DELETE	Deletes the custom report with the specified ID.	DELETE Reports Custom ID on page 1976
/Custom/{id}	GET	Returns the custom report with the specified ID.	GET Reports Custom ID on page 1977
/Schedules/{id}	DELETE	Deletes the schedule for the built-in report with the specified schedule ID.	DELETE Reports Schedules ID on page 1978
/Schedules/{id}	GET	Returns the schedule for the built-in report with the specified schedule ID.	GET Reports Schedules ID on page 1979
/id}/Parameters	GET	Returns the parameters for the built-in report with the specified report ID.	GET Reports ID Parameters on page 1983
/id}/Parameters	PUT	Updates the parameters for the built-in report with the specified report ID.	PUT Reports ID Parameters on page 1986
/	GET	Returns all built-in reports with filtering and output options.	GET Reports on page 1988
/	PUT	Updates the built-in report with the specified ID. Only some fields can be updated.	PUT Reports on page 1991
/Custom	GET	Returns all custom reports with filtering and output options.	GET Reports Custom on page 1994
/Custom	POST	Creates a custom report.	POST Reports Custom on page 1996
/Custom	PUT	Updates the custom report with the specified ID.	PUT Reports Custom on page 1998
/id}/Schedules	GET	Returns the schedule for the built-in	GET Reports ID

Endpoint	Method	Description	Link
		report with the specified report ID.	Schedules on page 1999
<code>/id/Schedules</code>	POST	Creates a schedule for the built-in report with the specified report ID.	POST Reports ID Schedules on page 2004
<code>/id/Schedules</code>	PUT	Updates a schedule for the built-in report with the specified report ID.	PUT Reports ID Schedules on page 2014

3.6.28.1 GET Reports ID

The GET `/Reports/{id}` method is used to return the built-in report with the specified ID. This method returns HTTP 200 OK on a success with the details of the report.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/reports/read/`

Table 531: GET Reports {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID for the report that should be retrieved. Use the <code>GET /Reports</code> method (see GET Reports on page 1988) to retrieve a list of your built-in reports to determine the report ID to use.

Table 532: GET Reports {id} Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF).</p> </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplic-ates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certi-</p> </div>

Name	Description								
	<p> ficate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 1299). This corresponds to the Keyfactor Command Management Portal <i>Ignore renewed certificate results by</i> option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p>								
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).								
ReportParameter	<p>An array of objects containing the parameters for the report. . Report parameters include:</p> <table border="1" data-bbox="456 957 1398 1717"> <thead> <tr> <th data-bbox="462 957 753 1020">Name</th> <th data-bbox="753 957 1391 1020">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="462 1020 753 1119">Id</td> <td data-bbox="753 1020 1391 1119">An integer indicating the Keyfactor Command reference ID of the report parameter.</td> </tr> <tr> <td data-bbox="462 1119 753 1213">ParameterName</td> <td data-bbox="753 1119 1391 1213">A string containing the short reference name for the report parameter (e.g. EvalDate).</td> </tr> <tr> <td data-bbox="462 1213 753 1717">ParameterType</td> <td data-bbox="753 1213 1391 1717"> A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates </td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the report parameter .	ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).	ParameterType	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates
Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the report parameter .								
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).								
ParameterType	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates

StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Templatelds	The Keyfactor Command identifiers for the templates to include in the report.				
Name	Description												
SSHKeyType	The SSH key type(s) selected to report on.												
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).												
Templatelds	The Keyfactor Command identifiers for the templates to include in the report.												
AcceptedScheduleFormats	An array of strings containing the report formats supported for the report. Typically supported formats are PDF and Excel. Select reports support CSV format.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.28.2 DELETE Reports Custom ID

The DELETE /Reports/Custom/{id} method is used to delete the custom report link with the specified ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/reports/modify/

Table 533: DELETE Reports Custom {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID for the report link to be deleted. Use the <i>GET /Reports/Custom</i> method (see GET Reports Custom on page 1994) to retrieve a list of your custom report links to determine the report ID to use.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.28.3 GET Reports Custom ID

The *GET /Reports/Custom/{id}* method is used to return the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/reports/read/

Table 534: GET Reports Custom {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID for the report link that should be retrieved. Use the <i>GET /Reports/Custom</i> method (see GET Reports Custom on page 1994) to retrieve a list of your custom reports to determine the report ID to use.

Table 535: GET Reports Custom {id} Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.28.4 DELETE Reports Schedules ID

The DELETE `/Reports/Schedules/{id}` method is used to delete the schedule for the built-in report with the specified schedule ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/reports/modify/`

Table 536: DELETE Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see GET Reports on page 1988) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see GET Reports ID on page 1968) to retrieve the details for that report to determine the schedule ID to use.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.28.5 GET Reports Schedules ID

The *GET /Reports/Schedules/{id}* method is used to return the schedule for the built-in report with the specified **schedule** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the *GET /Reports/{id}/Schedules* method to return the schedule based on the **report** ID (see [GET Reports ID Schedules on page 1999](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/reports/read/`

Table 537: GET Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see GET Reports on page 1988) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see GET Reports ID on page 1968) to retrieve the details for that report to determine the schedule ID to use.

Table 538: GET Reports Schedules {id} Response Data

Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	An object providing the schedule for the report. The schedule can be one of: <table border="1" data-bbox="462 903 1404 1711"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="625 1134 1372 1365"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="625 1459 1372 1596">"Daily": { "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> <tr> <td>Weekly</td> <td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule. Name	Description																
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>OrchestratorPool</td> <td>The orchestrator pool selected to report on.</td> </tr> <tr> <td>PeriodCount</td> <td>The number of days, weeks or months selected to report on.</td> </tr> <tr> <td>PeriodSize</td> <td>The selected reporting period (day, weeks or months).</td> </tr> <tr> <td>Requesters</td> <td>The certificate requesters selected to include in the report.</td> </tr> <tr> <td>SSHKeyType</td> <td>The SSH key type(s) selected to report on.</td> </tr> <tr> <td>StartDate</td> <td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Templatelds</td> <td>The Keyfactor Command identifiers for the templates to include in the report.</td> </tr> </tbody> </table>	Name	Description	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Templatelds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																
OrchestratorPool	The orchestrator pool selected to report on.																
PeriodCount	The number of days, weeks or months selected to report on.																
PeriodSize	The selected reporting period (day, weeks or months).																
Requesters	The certificate requesters selected to include in the report.																
SSHKeyType	The SSH key type(s) selected to report on.																
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																
Templatelds	The Keyfactor Command identifiers for the templates to include in the report.																

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.28.6 GET Reports ID Parameters

The GET `/Reports/{id}/Parameters` method is used to return the parameters for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report parameters.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/reports/read/`

Table 539: GET Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the built-in report the parameter is associated with. Use the <i>GET /Reports</i> method (see GET Reports on page 1988) to retrieve a list of your built-in reports to determine the report ID to use.

Table 540: GET Reports {id} Parameters Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the report parameter .
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).
ParameterType	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
DefaultValue	A string containing the default value for the parameter. <div style="background-color: #e0f2f1; padding: 5px; border-radius: 10px; margin-top: 10px;">  Tip: Default values that are integers are also stored as strings in this parameter. </div>
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.28.7 PUT Reports ID Parameters

The PUT /Reports/{id}/Parameters method is used to update the parameters for the built-in report with the specified report ID. Only some fields can be updated. This method returns HTTP 200 OK on a success with the details of the report parameters.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/reports/modify/

Table 541: PUT Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the built-in report the parameter is associated with. Use the <i>GET /Reports</i> method (see GET Reports on page 1988) to retrieve a list of your built-in reports to determine the report ID to use.
Id	Body	Required. The Keyfactor Command reference ID of the report parameter . Use the <i>GET /Reports/{id}</i> (see GET Reports ID on page 1968) to retrieve the details for the desired report to determine the parameter ID to use.
DisplayName	Body	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	Body	A string containing the description for the parameter.
DefaultValue	Body	A string containing the default value for the parameter.  Tip: Default values that are integers are also stored as strings in this parameter.

Table 542: PUT Reports {id} Parameters Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the report parameter .
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).
ParameterType	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
DefaultValue	A string containing the default value for the parameter. <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 5px; margin-top: 10px;">  Tip: Default values that are integers are also stored as strings in this parameter. </div>
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.28.8 GET Reports

The GET /Reports method is used to return all built-in reports with filtering and output options. This method returns HTTP 200 OK on a success with selected details of the reports. To view details of schedules and parameters for a report, use the *GET /Reports/{id}* method (see [GET Reports ID on page 1968](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/reports/read/

Table 543: GET Reports Input Parameters

Name	In	Description
AmmendedQuery	Query	This parameter is not available for use and will be deprecated in version 12.
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Categories (CertificateCounts, CertificateLifecycle, Certificate Locations, PKIOperations, SecurityVulnerability,SSHKeys) • Favorite (true, false) • InNavigator (true, false) • Scheduled (Number of schedules) <div style="border: 1px solid green; border-radius: 10px; padding: 10px; background-color: #e0f2f1; margin-top: 10px;"> <p> Tip: This method offers limited searchable fields. The most useful search is probably by category. For example, to return all the reports tagged with the PKI Operations category: Categories -contains "PKIOperations"</p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 544: GET Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
Scheduled	An integer indicating the number of schedules configured for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF).</p> </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).

Name	Description
	<p> Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable.</p> <p>Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 1299). This corresponds to the Keyfactor Command Management Portal <i>Ignore renewed certificate results by</i> option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p>
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.28.9 PUT Reports

The PUT /Reports method is used to update the built-in report with the specified report ID. Only some fields can be updated. To create or update a report schedule, use the *POST /Reports/{id}/Schedules* (see [POST Reports ID Schedules on page 2004](#)) or *PUT /Reports/{id}/Schedules* (see [PUT Reports ID Schedules on page 2014](#)) method. To update parameters for a built-in report, use the *PUT /Reports/{id}/Parameters* method (see [PUT Reports ID Parameters on page 1986](#)). This method returns HTTP 200 OK on a success with the details of the report.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/reports/modify/

Table 545: PUT Reports Input Parameters

Name	In	Description
Id	Body	<p>Required. The Keyfactor Command reference ID of the built-in report that should be updated.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1988) to retrieve a list of your built-in reports to determine the report ID to use.</p>
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	Body	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div style="border: 1px solid #c8e6c9; padding: 10px; margin-top: 10px;"> <p> Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable.</p> <p>Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 1299). This corresponds to the Keyfactor Command Management Portal “Ignore renewed certificate results by” option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p> </div>

Table 546: PUT Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF).</p> </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one</p> </div>

Name	Description
	<p> certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable.</p> <p>Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 1299). Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p>
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.28.10 GET Reports Custom

The GET /Reports/Custom method is used to return all custom report links with filtering and output options. This method returns HTTP 200 OK on a success with the details of the report linkages.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/reports/read/

Table 547: GET Reports Custom Input Parameters

Name	In	Description
AmmendedQuery	Query	This parameter is not available for use and will be deprecated in version 12.
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • Favorite (true, false) • InNavigator (true, false)
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 548: GET Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.28.11 POST Reports Custom

The POST /Reports/Custom method is used to add a link within Keyfactor Command to an externally hosted custom report. This method returns HTTP 200 OK on a success with the details of the report linkage.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/reports/modify/

Table 549: POST Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	<p>Required. A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
DisplayName	Body	<p>Required. A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>
Description	Body	<p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>
InNavigator	Body	<p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i>.</p>
Favorite	Body	<p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i>.</p>

Table 550: POST Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	<p>An integer containing the Keyfactor Command reference ID for the report link.</p>
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>
Description	<p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>
InNavigator	<p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).</p>
Favorite	<p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.28.12 PUT Reports Custom

The PUT /Reports/Custom method is used to update the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/reports/modify/

Table 551: PUT Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	<p>Required. A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> Tip: Custom reports are automatically opened in a new browser tab.</p> </div>
Id	Body	<p>Required. An integer containing the Keyfactor Command reference ID for the report link.</p> <p>Use the <i>GET /Reports/Custom</i> method (see GET Reports Custom on page 1994) to retrieve a list of your custom report links to determine the report ID to use.</p>
DisplayName	Body	<p>Required. A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>
Description	Body	<p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>
InNavigator	Body	<p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i>.</p>
Favorite	Body	<p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i>.</p>

Table 552: PUT Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.28.13 GET Reports ID Schedules

The GET `/Reports/{id}/Schedules` method is used to return the schedule for the built-in report with the specified **report** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the `GET /Reports/Schedules/{id}` method to return the schedule based on the **schedule** ID (see [GET Reports Schedules ID on page 1979](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/reports/read/`

Table 553: GET Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the built-in report the schedule is associated with. Use the <i>GET /Reports</i> method (see GET Reports on page 1988) to retrieve a list of your built-in reports to determine the report ID to use.

Table 554: GET Reports {id} Schedules Response Data

Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	An object providing the schedule for the report. The schedule can be one of: <table border="1" data-bbox="462 903 1404 1711"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="625 1134 1372 1375"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="625 1459 1372 1596"> { "Daily": { "Time": "2023-11-25T23:30:00Z" } } </pre> </td> </tr> <tr> <td>Weekly</td> <td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="625 1134 1372 1375"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. Name	Description																
OrchestratorPool	The orchestrator pool selected to report on.																
PeriodCount	The number of days, weeks or months selected to report on.																
PeriodSize	The selected reporting period (day, weeks or months).																
Requesters	The certificate requesters selected to include in the report.																
SSHKeyType	The SSH key type(s) selected to report on.																
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																
Templatelds	The Keyfactor Command identifiers for the templates to include in the report.																

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.28.14 POST Reports ID Schedules

The POST `/Reports/{id}/Schedules` method is used to create a schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/reports/modify/`

Table 555: POST Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the built-in report the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1988) to retrieve a list of your built-in reports to determine the report ID to use.</p>
SendReport	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .
SaveReport	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .
SaveReportPath	Body	<p>Required*. A string containing the UNC path to which the report will be written, if configured.</p> <div style="background-color: #e1f5fe; padding: 10px; border-radius: 5px;"> <p> Note: The path for saved reports must be provided in UNC format (\\servername\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> • Do not use a trailing “\” in the report path. • Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved. • When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted. </div> <p>This field is required if <i>SaveReport</i> is set to <i>true</i>.</p>
ReportFormat	Body	<p>Required. A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV
KeyfactorSchedule	Body	<p>Required. An object providing the schedule for the report. The schedule can be one of:</p>

Table 556: POST Reports {id} Schedules Response Data

Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	An object providing the schedule for the report. The schedule can be one of: <table border="1" data-bbox="462 903 1404 1711"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="625 1134 1372 1365"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="625 1459 1372 1596"> { "Daily": { "Time": "2023-11-25T23:30:00Z" } } </pre> </td> </tr> <tr> <td>Weekly</td> <td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule. PeriodCount	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Templatelds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																
OrchestratorPool	The orchestrator pool selected to report on.																
PeriodCount	The number of days, weeks or months selected to report on.																
PeriodSize	The selected reporting period (day, weeks or months).																
Requesters	The certificate requesters selected to include in the report.																
SSHKeyType	The SSH key type(s) selected to report on.																
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																
Templatelds	The Keyfactor Command identifiers for the templates to include in the report.																

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.28.15 PUT Reports ID Schedules

The PUT /Reports/{id}/Schedules method is used to update the schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/reports/modify/

Table 557: PUT Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the built-in report the schedule is associated with. Use the <i>GET /Reports</i> method (see GET Reports on page 1988) to retrieve a list of your built-in reports to determine the report ID to use.
Id	Body	Required. An integer indicating the Keyfactor Command reference ID of the report schedule . Use the <i>GET /Reports/{id}</i> (see GET Reports ID on page 1968) to retrieve the details for the desired report to determine the schedule ID to use.
SendReport	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .
SaveReport	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .
SaveReportPath	Body	Required* . A string containing the UNC path to which the report will be written, if configured. <div style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> Note: The path for saved reports must be provided in UNC format (\\servername\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> • Do not use a trailing “\” in the report path. • Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved. • When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted. </div> <p>This field is required if <i>SaveReport</i> is set to <i>true</i>.</p>
ReportFormat	Body	Required. A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV
KeyfactorSchedule	Body	Required. An object providing the schedule for the report.

Name	In	Description

Table 558: PUT Reports {id} Schedules Response Data

Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	An object providing the schedule for the report. The schedule can be one of: <table border="1" data-bbox="462 903 1404 1711"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="625 1134 1372 1365"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="625 1459 1372 1596">"Daily": { "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> <tr> <td>Weekly</td> <td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="625 1134 1372 1365"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="625 1459 1372 1596">"Daily": { "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description												
Off	Turn off a previously configured schedule.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="625 1134 1372 1365"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="625 1459 1372 1596">"Daily": { "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).								
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:												

Name	Description										
	<table border="1"> <thead> <tr> <th data-bbox="462 275 602 336">Name</th> <th data-bbox="602 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="462 336 602 590"></td> <td data-bbox="602 336 1398 590"> <table border="1"> <thead> <tr> <th data-bbox="625 359 787 420">Name</th> <th data-bbox="787 359 1375 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="625 420 787 590">Time</td> <td data-bbox="787 420 1375 590">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="625 590 787 779">Days</td> <td data-bbox="787 590 1375 779">An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p data-bbox="625 821 1325 848">For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre data-bbox="625 877 1375 1150"> { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2023-11-27T17:30:00Z" } } </pre> </td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th data-bbox="625 359 787 420">Name</th> <th data-bbox="787 359 1375 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="625 420 787 590">Time</td> <td data-bbox="787 420 1375 590">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").										
Monthly	<p data-bbox="625 1188 1360 1245">A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th data-bbox="625 1272 787 1333">Name</th> <th data-bbox="787 1272 1375 1333">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="625 1333 787 1503">Time</td> <td data-bbox="787 1333 1375 1503">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="625 1503 787 1598">Day</td> <td data-bbox="787 1503 1375 1598">The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p data-bbox="625 1629 1195 1656">For example, on the first of every month at 5:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Monthly": { "Day": 1 "Time": "2023-11-27T17:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> Note: Although the Keyfactor API Reference and Utility—Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre>"Monthly": { "Day": 1 "Time": "2023-11-27T17:30:00Z" }</pre>								
Name	Description												
	<pre>"Monthly": { "Day": 1 "Time": "2023-11-27T17:30:00Z" }</pre>												
EmailRecipients	An array of strings containing the email addresses of users configured as recipients of the scheduled report, if any.												
RuntimeParameters	<p>An object containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertAuth</td> <td>The certificate authority or authorities selected to report on.</td> </tr> <tr> <td>EndDate</td> <td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td> </tr> <tr> <td>EvalDate</td> <td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Metadata</td> <td>The custom metadata fields selected to include in the report.</td> </tr> <tr> <td>MinCertCount</td> <td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td> </tr> </tbody> </table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Metadata	The custom metadata fields selected to include in the report.	MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.
Name	Description												
CertAuth	The certificate authority or authorities selected to report on.												
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).												
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).												
Metadata	The custom metadata fields selected to include in the report.												
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.												

Name	Description																
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>OrchestratorPool</td> <td>The orchestrator pool selected to report on.</td> </tr> <tr> <td>PeriodCount</td> <td>The number of days, weeks or months selected to report on.</td> </tr> <tr> <td>PeriodSize</td> <td>The selected reporting period (day, weeks or months).</td> </tr> <tr> <td>Requesters</td> <td>The certificate requesters selected to include in the report.</td> </tr> <tr> <td>SSHKeyType</td> <td>The SSH key type(s) selected to report on.</td> </tr> <tr> <td>StartDate</td> <td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Templatelds</td> <td>The Keyfactor Command identifiers for the templates to include in the report.</td> </tr> </tbody> </table>	Name	Description	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Templatelds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																
OrchestratorPool	The orchestrator pool selected to report on.																
PeriodCount	The number of days, weeks or months selected to report on.																
PeriodSize	The selected reporting period (day, weeks or months).																
Requesters	The certificate requesters selected to include in the report.																
SSHKeyType	The SSH key type(s) selected to report on.																
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																
Templatelds	The Keyfactor Command identifiers for the templates to include in the report.																

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.29 Scheduling

The Scheduling component of the Keyfactor API includes a method necessary to programmatically create and edit scheduled tasks in Keyfactor Command for task management that is not otherwise covered by an individual endpoint (e.g. PUT /Alerts/Expiration/Schedule).

Table 559: Scheduling Endpoints

Endpoint	Method	Description	Link
/	POST	Create or update task management schedules.	

3.6.29.1 POST Scheduling

The POST /Scheduling method is used to add or update the schedule for a task in the Keyfactor Command database. This method returns HTTP 200 OK on a success with details of the scheduled task.

This method is intended primarily to be used for updating CA health monitoring schedules. Although it is possible to update issued, expiration, key rotation, and pending alert schedules using this method, each of these has an endpoint dedicated to this purpose (see [PUT Alerts Issued Schedule on page 973](#), [PUT Alerts Expiration Schedule on page 934](#), [PUT Alerts Key Rotation Schedule on page 1008](#), and [PUT Alerts Pending Schedule on page 1042](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

Table 560: POST Scheduling Input Parameters

Name	In	Description												
Id	Body	<p>Required*. An integer indicating the Keyfactor Command reference ID of the schedule to create or update.</p> <p>This value is required if you're updating an existing schedule.</p> <p>Use a GET method to determine this ID. For example, use the GET /CertificateAuthority/HealthMonitoring/Schedule method (see GET Certificate Authority Health Monitoring Schedule on page 1286) to retrieve the schedule for CA health monitoring to determine the health monitoring schedule ID.</p>												
ScheduleType	Body	<p>Required. An integer indicating the type of schedule to be updated. Supported schedule types are:</p> <table border="1"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration Alert</td> </tr> <tr> <td>2</td> <td>Pending Alert</td> </tr> <tr> <td>10</td> <td>CA Health Monitoring Alert</td> </tr> <tr> <td>20</td> <td>Issued Alert</td> </tr> <tr> <td>22</td> <td>SSH Key Rotation Alert</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration Alert	2	Pending Alert	10	CA Health Monitoring Alert	20	Issued Alert	22	SSH Key Rotation Alert
Code	Category Name													
1	Expiration Alert													
2	Pending Alert													
10	CA Health Monitoring Alert													
20	Issued Alert													
22	SSH Key Rotation Alert													
Enabled	Body	A Boolean that indicates whether the schedule is enabled (true) or not (false). The default is <i>false</i> .												
Interval	Body	<p>Required*. An integer indicating a job scheduled to run every x minutes with x equal to the specified value.</p> <p>One of either <i>Interval</i> or <i>TimeOfDay</i> is required.</p>												
TimeOfDay	Body	<p>Required*. A string indicating a job scheduled to run daily at the specified time of day. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p> <p>One of either <i>Interval</i> or <i>TimeOfDay</i> is required.</p>												

Table 561: POST Scheduling Response Data

Name	Description												
id	An integer indicating the Keyfactor Command reference ID of the schedule.												
Schedule	A string indicating the schedule set for the item. For an interval schedule, this will look like I_mm where mm is the number of minutes (e.g. I_30 for every 30 minutes). For daily schedules, this will look like D_hh:mm where hh:mm is the time to run the job (e.g. D_14:30 for daily at 2:30 pm).												
ScheduleType	An integer indicating the type of schedule. Supported schedule types are: <table border="1" data-bbox="457 600 1404 978"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration Alert</td> </tr> <tr> <td>2</td> <td>Pending Alert</td> </tr> <tr> <td>10</td> <td>CA Health Monitoring Alert</td> </tr> <tr> <td>20</td> <td>Issued Alert</td> </tr> <tr> <td>22</td> <td>SSH Key Rotation Alert</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration Alert	2	Pending Alert	10	CA Health Monitoring Alert	20	Issued Alert	22	SSH Key Rotation Alert
Code	Category Name												
1	Expiration Alert												
2	Pending Alert												
10	CA Health Monitoring Alert												
20	Issued Alert												
22	SSH Key Rotation Alert												
Enabled	A Boolean that indicates whether the schedule is enabled (true) or not (false).												
Name	A string indicating the type of job.												
EntityId	This is considered deprecated and may be removed in a future release.												
LastRun	This is considered deprecated and may be removed in a future release.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔗) at the top of the Management Portal page next to the **Log Out** button.

3.6.30 Security

The Security component of the Keyfactor API includes methods necessary to list, add, and delete security identities and their permissions which are used to control access to aspects of Keyfactor Command.

Table 562: Security Endpoints

Endpoint	Method	Description	Link
/Identities	POST	Adds a new security identity into Keyfactor Command.	POST Security Identities on page 2038
/Identities	GET	Returns all security identities with with sorting and filter options.	GET Security Identities on page 2034
/Identities/Lookup	GET	Validates that the identity with the specified name exists.	GET Security Identities Lookup on page 2033
/Identities/{id}	DELETE	Deletes the security identity with the specified ID.	DELETE Security Identities ID below
/Identities/{id}	GET	Returns permission details for the security identity with the specified ID.	GET Security Identities ID on the next page
/Containers/{id}/Roles	GET	Returns permission details for the certificate store container with the specified ID.	GET Security Containers ID Roles on page 2039
/Containers/{id}/Roles	POST	Sets the permissions of the certificate store container with the specified ID.	POST Security Containers ID Roles on page 2040
/Audit/Collections/{id}	GET	Returns permission details for the certificate collection with the specified ID.	GET Security Audit Collections ID on page 2042
/My	GET	Returns permission details for the current user, including certificate collections and certificate store containers.	GET Security My on page 2045

3.6.30.1 DELETE Security Identities ID

The DELETE `/Security/Identities/{id}` method is used to delete the security identity with the specified ID from Keyfactor Command. Use the `GET /Security/Identities` method (see [GET Security Identities on page 2034](#)) to determine the ID of the security identity you wish to delete. The current user's identity may not be deleted. This endpoint returns 204 with no content upon success.

Note: This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 2027](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

Table 563: DELETE Security Identities {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID of the security identity that should be deleted from Keyfactor Command. Use the <i>GET /Security/Identity</i> method (see GET Security Identities on page 2034) to retrieve a list of all the security identities to determine the identity's ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.30.2 GET Security Identities ID

The *GET /Security/Identities/{id}* method is used to return the security identities configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details of the security identity's permissions.

Note: This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 2027](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 564: GET Security Identities {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security identity to retrieve. Use the <i>GET /Security/Identities</i> method (see GET Security Identities on page 2034) to retrieve a list of all the security identities to determine the identity's ID.

Table 565: GET Security Identities {id} Response Data

Name	Description						
Identity	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; background-color: #f9f9f9; margin: 10px 0;"> <p style="text-align: center;">KEYEXAMPLE\PKI Administrators</p> </div>						
SecuredAreaPermissions	<p>An array of objects containing information about the global permissions granted to the security identity. Global permission information includes:</p> <table border="1" data-bbox="584 598 1404 955" style="margin: 10px 0;"> <thead> <tr> <th data-bbox="584 598 852 661">Name</th> <th data-bbox="852 598 1404 661">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="584 661 852 861">Permission</td> <td data-bbox="852 661 1404 861">A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.</td> </tr> <tr> <td data-bbox="584 861 852 955">GrantedByRoles</td> <td data-bbox="852 861 1404 955">An object containing a list of roles that grant that permission.</td> </tr> </tbody> </table> <p>For example:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; background-color: #f9f9f9; margin: 10px 0;"> <pre> "SecuredAreaPermissions": [{ "Permission": "AdminPortal:Read", "GrantedByRoles": ["Read Only", "Staff"] }, { "Permission": "Reports:Read", "GrantedByRoles": ["Read Only"] },] </pre> </div> <p>For more information about global permissions, see Security Roles and Claims on page 622.</p>	Name	Description	Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.	GrantedByRoles	An object containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.						
GrantedByRoles	An object containing a list of roles that grant that permission.						
CollectionPermissions	<p>An array of objects containing information about the certificate collection permissions granted to the security identity. Collection permission information includes:</p>						

Name	Description						
	<table border="1" data-bbox="586 275 1399 604"> <thead> <tr> <th data-bbox="586 275 854 338">Name</th> <th data-bbox="854 275 1399 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="586 338 854 506">Permission</td> <td data-bbox="854 338 1399 506">A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.</td> </tr> <tr> <td data-bbox="586 506 854 604">GrantedByRoles</td> <td data-bbox="854 506 1399 604">An array containing a list of roles that grant that permission.</td> </tr> </tbody> </table> <p data-bbox="581 638 724 663">For example:</p> <pre data-bbox="607 720 1365 1136"> "CollectionPermissions": [{ "Permission": "Issued in the Last Week:Certificates_Read", "GrantedByRoles": ["Staff", "Power Users"] }, { "Permission": "Web Server Certs:Certificates_EditMetadata", "GrantedByRoles": ["Power Users"] },] </pre> <p data-bbox="581 1192 1399 1255">For more information about collection permissions, see Certificate Collection Permissions on page 627.</p>	Name	Description	Permission	A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.	GrantedByRoles	An array containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.						
GrantedByRoles	An array containing a list of roles that grant that permission.						
ContainerPermissions	<p data-bbox="581 1289 1399 1381">An array of objects containing information about the certificate store container permissions granted to the security identity. Container permission information includes:</p> <table border="1" data-bbox="586 1409 1399 1766"> <thead> <tr> <th data-bbox="586 1409 854 1472">Name</th> <th data-bbox="854 1409 1399 1472">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="586 1472 854 1671">Permission</td> <td data-bbox="854 1472 1399 1671">A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).</td> </tr> <tr> <td data-bbox="586 1671 854 1766">GrantedByRoles</td> <td data-bbox="854 1671 1399 1766">An array containing a list of roles that grant that permission.</td> </tr> </tbody> </table>	Name	Description	Permission	A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).	GrantedByRoles	An array containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).						
GrantedByRoles	An array containing a list of roles that grant that permission.						

Name	Description
	<p>For example:</p> <pre data-bbox="581 331 1403 856"> "ContainerPermissions": [{ "Permission": "IIS Personal:CertificateStoreManagement_ Read", "GrantedByRoles": ["Power Users", "Staff"] }, { "Permission": "F5 SSL Profiles REST:CertificateStoreManagement_Schedule", "GrantedByRoles": ["Power Users"] },] </pre> <p>For more information about container permissions, see Container Permissions on page 629.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.30.3 GET Security Identities Lookup

The GET `/Security/Identities/Lookup` method is used to confirm that the security identity specified is valid for the environment—the Active Directory forest in which Keyfactor Command is installed and any forests in a two-way trust (or one-way trust in a direction that allows the lookup to occur). It can be used to query an identity in the source identity store (Active Directory) to confirm its validity before using `POST /Security/Identities` (see [POST Security Identities on page 2038](#)) to create a new identity in Keyfactor Command with that user or group. This method returns HTTP 200 OK on a success with a response of true or false.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/security/read/`

Table 566: GET Security Identities Lookup Input Parameters

Name	In	Description
Name	Query	Required. The identity name in the source identity store. For Active Directory users and groups, this can be given either as DOMAIN\name or name@-domain.com. For users in the local domain (the domain in which the Keyfactor Command server is installed), the lookup may be done without a domain name.

Table 567: GET Security Identities Lookup Response Data

Name	Description
Valid	A Boolean that indicates whether the provided name is valid (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.30.4 GET Security Identities

The GET /Security/Identities method is used to return the list of security identities configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities.

 **Note:** This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 2027](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

Table 568: GET Security Identities Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> . <i>IdentityType</i> may be used as a sort order.
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.
Validate	Query	A Boolean that specifies whether the optional parameter of <i>validate</i> is false , which allows the AuditXML validation to be skipped when loading records, or true (or not specified) in which case validation will occur. The default is true .

Table 569: GET Security Identities Response Data

Name	Description																					
Id	An integer containing the Keyfactor Command reference ID for the security identity.																					
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>																					
IdentityType	A string indicating the type of identity—User or Group.																					
Roles	An array of objects containing information about the security roles assigned to the security identity. Role information includes: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>In</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>Body</td> <td>Required. An integer containing the Keyfactor Command identifier for the security role. Use the GET /Security/Roles method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role’s ID.</td> </tr> <tr> <td>Name</td> <td>Body</td> <td>Required. A string containing the short reference name for the security role.</td> </tr> <tr> <td>Description</td> <td>Body</td> <td>Required. A string containing the description for the security role.</td> </tr> <tr> <td>Enabled</td> <td>Body</td> <td>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>. This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Immutable</td> <td>Body</td> <td>A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.</td> </tr> <tr> <td>Valid</td> <td>Body</td> <td>A Boolean that indicates whether the security role’s audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it</td> </tr> </tbody> </table>	Name	In	Description	Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the GET /Security/Roles method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role’s ID.	Name	Body	Required. A string containing the short reference name for the security role.	Description	Body	Required. A string containing the description for the security role.	Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.	Immutable	Body	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.	Valid	Body	A Boolean that indicates whether the security role’s audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it
Name	In	Description																				
Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the GET /Security/Roles method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role’s ID.																				
Name	Body	Required. A string containing the short reference name for the security role.																				
Description	Body	Required. A string containing the description for the security role.																				
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.																				
Immutable	Body	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.

AccountName	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p>	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description											
Id	An integer containing the Keyfactor Command identifier for the security identity.											
AccountName	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p>											
IdentityType	A string indicating the type of identity—User or Group.											
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.											
	Permissions	Body	An array of strings containing the permissions assigned to									

Name	Description		
			<p>the role in a comma-separated list of Name:Value pairs. See Version One Permission Model on page 670 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>
Valid	<p>A Boolean indicating whether the security identity's audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.</p>		

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.30.5 POST Security Identities

The POST `/Security/Identities` method is used to create a new security identity in Keyfactor Command. Use the `GET /Security/Identities/Lookup` method (see [GET Security Identities Lookup on page 2033](#)) before creating the new identity to confirm that the identity you plan to create is valid. This method returns HTTP 200 OK on a success with the details of the new security identity.

 **Note:** This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 2027](#)).

 **Tip:** This method cannot be used to assign roles to an identity. Use the `PUT /Security/Roles` method (see [PUT Security Roles on page 2105](#)) to assign roles to an identity.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 570: POST Security Identities Input Parameters

Name	In	Description
AccountName	Body	Required. A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>

Table 571: POST Security Identities Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security identity.
AccountName	A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>
IdentityType	A string indicating the type of identity—User or Group.
Roles	An array of objects containing information about the security roles assigned to the security identity. For new security identities, this will be blank.
Valid	A Boolean that indicates whether the security identity’s audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.30.6 GET Security Containers ID Roles

The GET /Security/Containers/{id}/Roles method is used to return the list of security roles and permissions defined for the specified certificate store container. This method returns HTTP 200 OK on a success with details of the security roles and permissions for the container.

See also [GET Security Roles ID Permissions Containers on page 2069](#) to list permissions on certificate store containers for a specified security role.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 572: GET Security Containers {id} Roles Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the certificate store container for which to retrieve permission information. Use the <i>GET /CertificateStoreContainers</i> method (see GET Certificate Store Containers on page 1477) to determine the ID of the certificate store container you wish to evaluate.

Table 573: GET Security Containers {id} Roles Response Data

Name	Description
SecurityRoleId	An integer indicating the Keyfactor Command reference ID of the security role granted permissions to the certificate store container.
Name	A string containing the short reference name for the security role granted permissions to the certificate store container.
Permissions	A comma-delimited array of strings indicating the permissions granted to the role for the certificate store container. See Certificate Store Management on page 673 for an overview of the possible permissions.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.30.7 POST Security Containers ID Roles

The POST */Security/Containers/{id}/Roles* method is used to assign permissions for a security role to a certificate store container. This method returns HTTP 200 OK on a success with the details of the security role and permissions.

See also [POST Security Roles ID Permissions Containers on page 2070](#) to assign permissions for one or more certificate store containers to a security role.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 574: POST Security Containers {id} Roles Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the certificate store container to update. Use the <i>GET /CertificateStoreContainers</i> method (see GET Certificate Store Containers on page 1477) to determine the ID of the certificate store container.
SecurityRoleId	Body	Required. An integer indicating the Keyfactor Command reference ID of the security role granted permissions to the certificate store container. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to determine the ID of the security role.
Permissions	Body	Required. A comma-delimited array of strings indicating the permissions granted to the role for the certificate store container. See Certificate Store Management on page 673 for an overview of the possible permissions. For example: <pre>"Permissions": ["Read", "Modify"]</pre>

Table 575: POST Security Containers {id} Roles Response Data

Name	Description
SecurityRoleId	An integer indicating the Keyfactor Command reference ID of the security role granted permissions to the certificate store container.
Name	A string containing the short reference name for the security role granted permissions to the certificate store container.
Permissions	A comma-delimited array of strings indicating the permissions granted to the role for the certificate store container. See Certificate Store Management on page 673 for an overview of the possible permissions.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.30.8 GET Security Audit Collections ID

The GET /Security/Audit/Collections/{id} method is used to return the list of security roles and permissions defined for the specified certificate collection. This method returns HTTP 200 OK on a success with details of the security roles and permissions for the collection.

See also [GET Security Roles ID Permissions Collections on page 2074](#) to list permissions on certificate collections for a specified security role.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 576: GET Security Audit Collections {id} Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the certificate collection for which to retrieve permission information. Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 1296) to determine the ID of the certificate collection you wish to evaluate.

Table 577: GET Security Audit Collections {id} Response Data

Name	Description																		
QueryId	An integer indicating the Keyfactor Command reference ID of the certificate collection.																		
AccessControlList	<p>An array of objects containing the permissions granted to the user in a comma-separated list of arrays. See Version One Permission Model on page 670 for an overview of the possible permissions.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>RoleId</td> <td>An integer indicating the Keyfactor Command reference ID for the security role.</td> </tr> <tr> <td>AreaPermissions</td> <td> <p>An array of comma-delimited integers indicating the collection permissions assigned to the role. Name	A string containing the short reference name for the security role.
Name	Description						
RoleId	An integer indicating the Keyfactor Command reference ID for the security role.						
Name	A string containing the short reference name for the security role.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.30.9 GET Security My

The GET /Security/My method is used to return the list of security roles and permissions configured in Keyfactor Command for the current user. This method returns HTTP 200 OK on a success with the details of the security roles and permissions. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
None

Table 578: GET Security My Roles Response Data

Name	Description
Roles	An array of strings indicating the roles that the user holds.
GlobalPermissions	<p>An array of objects containing the permissions granted to the user. See Version One Permission Model on page 670 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"GlobalPermissions": [{ "Area": "AdminPortal", "Permission": "Read" }, { "Area": "Dashboard", "Permission": "Read" }],</pre>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.31 Security Claims

The Security Roles component of the Keyfactor API includes methods necessary to list, add, update, and delete security claims which are used to control user access to all aspects of Keyfactor Command.

Table 579: Security Claims Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns details for the security claim with the specified ID, including permissions granted to the role and claims assigned the role.	GET Security Claims ID on page 2056
/	GET	Returns all security claims with filtering and output options.	GET Security Claims below
/	POST	Adds a new security claim.	POST Security Claims on page 2049
/	PUT	Updates the security claim with the specified ID.	PUT Security Claims on page 2053
/id}	DELETE	Deletes the security claim with the specified ID.	DELETE Security Claims ID on page 2058
/Roles	GET	Returns the security claim assigned to the security claim identified by the selected parameters.	GET Security Claims Roles on page 2058

3.6.31.1 GET Security Claims

The GET /Security/Claims method is used to return the list of security claims configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security claims.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 580: GET Security Claims Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Security Claim Search Feature on page 698 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • ADClaimValue • ClaimType • ClaimValue • Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Provider</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 581: GET Security Claims Response Data

Name	In	Description																								
Id		An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	Body	A string indicating a description for the security claim.																								
ClaimType	Body	<p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuthOid</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuthRole</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuthSubject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuthClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																								
0	User	Active Directory user account																								
1	Group	Active Directory group.																								
2	Computer	Active Directory machine account																								
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																								
4	OAuthRole	An open authorization group claim																								
5	OAuthSubject	An open authorization user claim																								
6	OAuthClientId	An open authorization client application claim																								
ClaimValue	Body	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	Body	<p>An object containing information about the provider assigned to the security claim.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor																				
Name	Description																									
Id	A string indicating the Keyfactor																									

Name	In	Description								
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>Command reference GUID for the provider.</td> </tr> <tr> <td>AuthenticationScheme</td> <td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description		Command reference GUID for the provider.	AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).
Name	Description									
	Command reference GUID for the provider.									
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).									
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).									

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.31.2 POST Security Claims

The POST /Security/Claims method is used to create a new security claim in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the new security claim.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 582: POST Security Claims Input Parameters

Name	In	Description																								
Description	Body	Required. A string indicating a description for the security claim.																								
ClaimType	Body	<p>Required. A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuthOid</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuthRole</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuthSubject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuthClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																								
0	User	Active Directory user account																								
1	Group	Active Directory group.																								
2	Computer	Active Directory machine account																								
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																								
4	OAuthRole	An open authorization group claim																								
5	OAuthSubject	An open authorization user claim																								
6	OAuthClientId	An open authorization client application claim																								
ClaimValue	Body	Required. A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								

Name	In	Description
ProviderAuthenticationScheme	Body	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).

Table 583: POST Security Claims Response Data

Name	Description																								
Id	An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	A string indicating a description for the security claim.																								
ClaimType	<p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuthOid</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuthRole</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuthSubject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuthClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																							
0	User	Active Directory user account																							
1	Group	Active Directory group.																							
2	Computer	Active Directory machine account																							
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																							
4	OAuthRole	An open authorization group claim																							
5	OAuthSubject	An open authorization user claim																							
6	OAuthClientId	An open authorization client application claim																							
ClaimValue	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	An object containing information about the provider assigned to the security claim.																								

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>AuthenticationScheme</td> <td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).
Name	Description								
Id	A string indicating the Keyfactor Command reference GUID for the provider.								
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).								
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).								
ProviderAuthenticationScheme	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.31.3 PUT Security Claims

The PUT /Security/Claims method is used to update a security claim in Keyfactor Command. Only the claim description is editable for an existing claim. This method returns HTTP 200 OK on a success with the details of the security claim.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 584: PUT Security Claims Input Parameters

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the security claim.
Description	A string indicating a description for the security claim.

Table 585: PUT Security Claims Response Data

Name	Description																								
Id	An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	A string indicating a description for the security claim.																								
ClaimType	<p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuthOid</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuthRole</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuthSubject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuthClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																							
0	User	Active Directory user account																							
1	Group	Active Directory group.																							
2	Computer	Active Directory machine account																							
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																							
4	OAuthRole	An open authorization group claim																							
5	OAuthSubject	An open authorization user claim																							
6	OAuthClientId	An open authorization client application claim																							
ClaimValue	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	<p>An object containing information about the provider assigned to the security claim.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>AuthenticationScheme</td> <td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																
Name	Description																								
Id	A string indicating the Keyfactor Command reference GUID for the provider.																								
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																								
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.31.4 GET Security Claims ID

The GET `/Security/Claims/{id}` method is used to return a security claim by ID. This method returns HTTP 200 OK on a success with details for the specified security claim.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/security/read/`

Table 586: GET Security Claims{id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security claim to retrieve. Use the <code>GET /Security/Claims</code> method (see GET Security Claims on page 2046) to retrieve a list of all the security claims to determine the claim's ID.

Table 587: GET Security Claims{id} Response Data

Name	Description																								
Id	An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	A string indicating a description for the security claim.																								
ClaimType	A string indicating the type of claim. Supported values are: <table border="1" data-bbox="428 499 1403 1104"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuthOid</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuthRole</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuthSubject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuthClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																							
0	User	Active Directory user account																							
1	Group	Active Directory group.																							
2	Computer	Active Directory machine account																							
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																							
4	OAuthRole	An open authorization group claim																							
5	OAuthSubject	An open authorization user claim																							
6	OAuthClientId	An open authorization client application claim																							
ClaimValue	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	An object containing information about the provider assigned to the security claim. <table border="1" data-bbox="428 1352 1403 1745"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>AuthenticationScheme</td> <td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																
Name	Description																								
Id	A string indicating the Keyfactor Command reference GUID for the provider.																								
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																								
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.31.5 DELETE Security Claims ID

The DELETE /Security/Claims/{id} method is used to delete the security claim with the specified ID. This endpoint returns 204 with no content upon success.

Note: You cannot delete a claim that is used to grant permissions—via roles—to the user executing the delete command.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 588: DELETE Security Claims{id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the security claim that should be deleted from Keyfactor Command. Use the <i>GET /Security/Claims</i> method (see GET Security Claims on page 2046) to determine the ID of the security claim you wish to delete.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.31.6 GET Security Claims Roles

The GET /Security/Claims/Roles method is used to return the security roles assigned to the security claim identified by the selected parameters. Run [GET Security Claims ID on page 2056](#) to determine the parameter values. This method returns HTTP 200 OK on a success with the details of the roles assigned to the claim.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/security/read/`

Table 589: GET Security Claims Roles Input Parameters

Name	In	Description																								
ClaimType	Body	<p>Required. An integer indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuthOid</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuthRole</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuthSubject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuthClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																								
0	User	Active Directory user account																								
1	Group	Active Directory group.																								
2	Computer	Active Directory machine account																								
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																								
4	OAuthRole	An open authorization group claim																								
5	OAuthSubject	An open authorization user claim																								
6	OAuthClientId	An open authorization client application claim																								
ClaimValue	Body	<p>Required. A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).</p>																								
ProviderAuthenticationScheme	Body	<p>Required. A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate)</p>																								

Name	In	Description
		Authentication CA, or unknown). The value in the <i>Provider: AuthenticationScheme</i> : parameter from GET Security Claims on page 2046 or GET Security Claims ID on page 2056 .

Table 590: GET Security Claims Roles Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the security role.
Name	A string containing the short reference name of the security role.
Description	A string containing the description of the security role.
PermissionSetId	A string containing the Keyfactor Command reference GUID for the permission set assigned to the security role.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.32 Security Roles Permissions

The Security Roles Permissions component of the Keyfactor API includes methods necessary to list, add, and update security roles permissions at the role, global, provider, container and collection-level.

Table 591: Security Roles Permissions Endpoints

Endpoint	Method	Description	Link
/id/Permisssons	GET	Returns all permissions associated with the security role that matches the id	GET Security Roles ID Permissions on the next page
/id/Permisssons/Global	GET	Returns all global permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Global on page 2064
/id/Permisssons/Global	POST	Adds global permissions to the security role that matches the id. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively.	POST Security Roles ID Permissions Global on page 2065
/id/Permisssons/Global	PUT	Sets global permissions of the security role that matches the ID. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively.	PUT Security Roles ID Permissions Global on page 2067
/id/Permisssons/Containers	GET	Returns all container permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Containers on page 2069
/id/Permisssons/Containers	POST	Adds container permissions to the security role that matches the ID.	POST Security Roles ID Permissions Containers on page 2070
/id/Permisssons/Containers	PUT	Sets container permissions to the security role that matches the ID.	PUT Security Roles ID Permissions

Endpoint	Method	Description	Link
			Containers on page 2072
<code>/{id}/Permissions/Collections</code>	GET	Returns all collection permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Collections on page 2074
<code>/{id}/Permissions/Collections</code>	POST	Adds collection permissions to the security role that matches the ID.	POST Security Roles ID Permissions Collections on page 2075
<code>/{id}/Permissions/Collections</code>	PUT	Sets collection permissions to the security role that matches the ID.	PUT Security Roles ID Permissions Collections on page 2077
<code>/{id}/Permissions/PamProviders</code>	GET	Returns all PAM provider permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions PAM Providers on page 2079
<code>/{id}/Permissions/PamProviders</code>	PUT	Sets PAM provider permissions to the security role that matches the ID.	PUT Security Roles ID Permissions PAM Providers on page 2080

3.6.32.1 GET Security Roles ID Permissions

The GET `/Security/Roles/{id}/Permissions` method is used to return all permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/security/read/`

Table 592: GET Security Roles {id} Permissions Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.</p>

Table 593: GET Security Roles {id} Permissions Response Data

Name	Description								
	<p>An object containing information about the permissions granted to the security role. Details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Type</td> <td>A string containing the area at which the permission is applied to (global, container, or collection).</td> </tr> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. Certificates).</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. Read).</td> </tr> </tbody> </table>	Name	Description	Type	A string containing the area at which the permission is applied to (global, container, or collection).	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description								
Type	A string containing the area at which the permission is applied to (global, container, or collection).								
Area	A string containing the name of the permission (e.g. Certificates).								
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.32.2 GET Security Roles ID Permissions Global

The *GET /Security/Roles/{id}/Permissions/Global* method is used to return all global permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 594: GET Security Roles {id} Global Permissions Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve global permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.</p>

Table 595: GET Security Roles {id} Global Permissions Response Data

Name	Description						
	<p>An object containing information about the global permissions granted to the security role. Details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. Certificates).</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. Read).</td> </tr> </tbody> </table>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.32.3 POST Security Roles ID Permissions Global

The POST */Security/Roles/{id}/Permissions/Global* method is used to add global permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

Important: Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

Note: The API Endpoint utility header displays a list of valid global Area and Permission combinations.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 596: POST Security Roles {id} Global Permissions Input Parameters

Name	In	Description						
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set global permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.</p>						
globalPermissions	Body	<p>An object containing information about the global permissions granted for this security role.</p> <div style="border: 1px solid #0070c0; background-color: #e6f2ff; padding: 5px; margin: 10px 0;"> <p> Note: See the API endpoint header for a list of all the valid Area and Permission combinations.</p> </div> <p>Details include:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).</td> </tr> <tr> <td>Permission</td> <td>Required. A string indicating the permission level to grant (e.g. Read)</td> </tr> </tbody> </table>	Name	Description	Area	Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).	Permission	Required. A string indicating the permission level to grant (e.g. Read)
Name	Description							
Area	Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).							
Permission	Required. A string indicating the permission level to grant (e.g. Read)							

Table 597: POST Security Roles {id} Global Permissions Response Data

Name	Description						
	<p>An object containing information about the global permissions granted to the security role.</p> <p>Details include:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. Certificates).</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. Read).</td> </tr> </tbody> </table>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.32.4 PUT Security Roles ID Permissions Global

The PUT `/Security/Roles/{id}/Permissions/Global` method is used to update the global permissions granted to the specified security role by ID. Note that the areas *Certificates* and *CertificateStoreManagement* are reserved for collection and container permissions. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

Important: Any previously defined permissions of the given type (e.g. global) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/security/modify/`

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 598: PUT Security Roles {id}Global Permissions Input Parameters

Name	In	Description						
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set global permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.</p>						
globalPermissions	Body	<p>An object containing information about the global permissions granted for this security role.</p> <div style="border: 1px solid #add8e6; padding: 5px; margin: 10px 0;"> <p> Note: See the API endpoint header for a list of all the valid Area and Permission combinations.</p> </div> <p>Details include:</p> <table border="1" style="margin: 10px auto; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).</td> </tr> <tr> <td>Permission</td> <td>Required. A string indicating the permission level to grant (e.g. Read)</td> </tr> </tbody> </table>	Name	Description	Area	Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).	Permission	Required. A string indicating the permission level to grant (e.g. Read)
Name	Description							
Area	Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).							
Permission	Required. A string indicating the permission level to grant (e.g. Read)							

Table 599: PUT Security Roles {id} Global Permissions Response Data

Name	Description						
	<p>An object containing information about the global permissions granted to the security role.</p> <p>Details include:</p> <table border="1" style="margin: 10px auto; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. Certificates).</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. Read).</td> </tr> </tbody> </table>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.32.5 GET Security Roles ID Permissions Containers

The GET /Security/Roles/{id}/Permissions/Containers method is used to return all certificate store container permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 600: GET Security Roles {id} Permissions Containers Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve certificate store container permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.

Table 601: GET Security Roles {id} Permissions Containers Response Data

Name	Description								
	An object containing information about the certificate store container permissions granted to the security role. Details include: <table border="1"><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>ContainerId</td><td>An integer containing the container ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate store container.</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></tbody></table>	Name	Description	ContainerId	An integer containing the container ID.	Name	A string containing the name of the certificate store container.	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.32.6 POST Security Roles ID Permissions Containers

The POST `/Security/Roles/{id}/Permissions/Containers` method is used to add new container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Important: Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

`/security/modify/`

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 602: POST Security Roles {id} Permissions Containers Input Parameters

Name	A string containing the name of the certificate store container.	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.32.7 PUT Security Roles ID Permissions Containers

The PUT `/Security/Roles/{id}/Permissions/Containers` method is used to update container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Important: Any previously defined permissions of the given type (e.g. container) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/security/modify/`

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 604: PUT Security Roles {id} Permissions Containers Input Parameters

Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.32.8 GET Security Roles ID Permissions Collections

The GET /Security/Roles/{id}/Permissions/Collections method is used to return all certificate collection permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 606: GET Security Roles {id} Permissions Collections Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve certificate collection permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.

Table 607: GET Security Roles {id} Permissions Collections Response Data

Name	Description								
	An object containing information about the certificate collection permissions granted to the security role. Details include: <table border="1" data-bbox="381 1348 1404 1606"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CollectionId</td> <td>An integer containing the collection ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate collection .</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	CollectionId	An integer containing the collection ID.	Name	A string containing the name of the certificate collection .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	An integer containing the collection ID.								
Name	A string containing the name of the certificate collection .								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.32.9 POST Security Roles ID Permissions Collections

The POST/Security/Roles/{id}/Permissions/Collections method is used to add new collection permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

Important: Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 608: POST Security Roles {id} Permissions Collections Input Parameters

Name	In	Description						
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set certificate collection permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.</p>						
collectionPermissions	Body	<p>An object containing information about the permissions granted to certificate collection for this security role. Collection details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CollectionId</td> <td>Required. An integer containing the Keyfactor Command identifier for the certificate collection.</td> </tr> <tr> <td>Permission</td> <td>Required. A string indicating the permission granted on the collection for this role—<i>Read, EditMetadata, Recover, Revoke, or Delete.</i></td> </tr> </tbody> </table>	Name	Description	CollectionId	Required. Name	A string containing the name of the certificate collection .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	An integer containing the collection ID.								
Name	A string containing the name of the certificate collection .								
Permission	A string indicating the permission granted on the entity for this role.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.32.10 PUT Security Roles ID Permissions Collections

The PUT /Security/Roles/{id}/Permissions/Collections method is used to update collection permissions to the security role that matches the ID. It replaces the deprecated endpoint: POST /CertificateCollections/{id}/Permissions. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

 **Important:** Any previously defined permissions of the given type (e.g. collection) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

 **Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 610: PUT Security Roles {id} Permissions Collections Input Parameters

Name	In	Description						
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set certificate collection permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.</p>						
collectionPermissions	Body	<p>An object containing information about the permissions granted to certificate collection for this security role. Collection details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CollectionId</td> <td>Required. An integer containing the Keyfactor Command identifier for the certificate collection.</td> </tr> <tr> <td>Permission</td> <td>Required. A string indicating the permission granted on the collection for this role—<i>Read, EditMetadata, Recover, Revoke, or Delete.</i></td> </tr> </tbody> </table>	Name	Description	CollectionId	Required. 	<p>An object containing information about the certificate collection permissions granted to the security role. Details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CollectionId</td> <td>An integer containing the collection ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate collection .</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	CollectionId	An integer containing the collection ID.	Name	A string containing the name of the certificate collection .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	An integer containing the collection ID.								
Name	A string containing the name of the certificate collection .								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.32.11 GET Security Roles ID Permissions PAM Providers

The GET /Security/Roles/{id}/Permissions/PamProviders method is used to return all PAM provider permissions associated with the security role with the specified ID. This method returns HTTP 200 OK on a success with PAM provider permission details for the specified security role.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

Table 612: GET Security Roles {id} Permissions PAM Providers Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role for which to retrieve PAM provider permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.

Table 613: GET Security Roles {id} Permissions PAM Providers Response Data

Name	Description								
	An object containing information about the certificate permissions granted to the security role. Details include: <table border="1" data-bbox="373 1239 1396 1491"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate .</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the ID.	Name	A string containing the name of the certificate .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
Id	An integer containing the ID.								
Name	A string containing the name of the certificate .								
Permission	A string indicating the permission granted on the entity for this role.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.32.12 PUT Security Roles ID Permissions PAM Providers

The PUT /Security/Roles/{id}/Permissions/PamProviders method is used to update PAM provider permissions on the security role that matches the specified ID. This method returns HTTP 200 OK on a success with PAM provider permission details for the specified security role.

 **Important:** Any previously defined permissions of the given type (e.g.) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

Table 614: PUT Security Roles {id} Permissions PAM Providers Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.

Table 615: PUT Security Roles {id} Permissions PAM Providers Response Data

Name	Description								
	An object containing information about the certificate permissions granted to the security role. Details include: <table border="1" data-bbox="373 1386 1396 1638"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate .</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the ID.	Name	A string containing the name of the certificate .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
Id	An integer containing the ID.								
Name	A string containing the name of the certificate .								
Permission	A string indicating the permission granted on the entity for this role.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.33 Security Roles

The Security Roles component of the Keyfactor API includes methods necessary to list, add, update, and delete security roles which are used to control access to all aspects of Keyfactor Command.

Table 616: Security Roles Endpoints

Endpoint	Method	Description	Link
/ {id}	GET	Returns details for the security role with the specified ID, including permissions granted to the role and claims assigned the role.	GET Security Roles ID on the next page
/ {id}	DELETE	Deletes the security role with the specified ID.	DELETE Security Roles ID on the next page
/	GET	Returns all security roles with filtering and output options.	GET Security Roles on page 2088
/	POST	Adds a new security role.	POST Security Roles on page 2093
/	PUT	Updates the security role with the specified ID.	PUT Security Roles on page 2105
/ {id}/Identities	GET	Returns the security identities assigned to the security role with the specified ID.	GET Security Roles ID Identities on page 2121
/ {id}/Identities	PUT	Updates the security identities assigned to the security role with the specified ID.	PUT Security Roles ID Identities on page 2120
/ {id}/Copy	POST	Adds a new security role by copying the existing security role with the specified ID.	POST Security Roles ID Copy on page 2117

3.6.33.1 DELETE Security Roles ID

The DELETE /Security/Roles/{id} method is used to delete the security role with the specified ID. Use the GET /Security/Roles method (see [GET Security Roles on page 2088](#)) to determine the ID of the security role you wish to delete. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

Table 617: DELETE Security Roles {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the security role that should be deleted from Keyfactor Command.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.33.2 GET Security Roles ID

The GET /Security/Roles/{id} method is used to return a security role by ID. This method returns HTTP 200 OK on a success with details for the specified security roles.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

This method has two available versions. Keyfactor strongly recommends using the newer method when possible; the v1 method has been deprecated since it supports Active Directory identities only. The v2 method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. This version of the method supports both Active Directory and other identity providers. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the GET /Security/Roles/{id} method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. All new development should use this version.

Table 618: GET Security Roles {id} v2 Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role to retrieve. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.

Table 619: GET Security Roles {id} v2 Response Data

Name	Description															
Id	An integer containing the Keyfactor Command identifier for the security role.															
Name	A string containing the short reference name for the security role.															
Description	A string containing the description for the security role.															
Immutable	A Boolean indicating if the role is immutable or not. Only the built-in <i>Administrators</i> role is considered immutable. The value of this parameter cannot be changed.															
PermissionSetId	A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see Permission Sets on page 1959).															
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version Two Permission Model on page 632 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["/portal/read/", "/dashboard/read/", "/certificates/collections/metadata/modify/6/", "/certificates/collections/private_key/read/6/"],</pre>															
Claims	<p>An array of objects containing the claims associated with the role.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>In</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Description</td> <td>Body</td> <td>A string indicating a description for the security claim.</td> </tr> <tr> <td>ClaimType</td> <td>Body</td> <td> <p>A string indicating the type of claim.</p> <p>Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	In	Description	Description	Body	A string indicating a description for the security claim.	ClaimType	Body	<p>A string indicating the type of claim.</p> <p>Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active
Name	In	Description														
Description	Body	A string indicating a description for the security claim.														
ClaimType	Body	<p>A string indicating the type of claim.</p> <p>Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active								
Claim Type Integer	Claim Type String	Description														
0	User	Active														

Name	Description											
	<table border="1"> <thead> <tr> <th>Name</th> <th>In</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ClaimValue</td> <td>Body</td> <td>A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).</td> </tr> <tr> <td>Provider-AuthenticationScheme</td> <td>Body</td> <td>A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td> </tr> </tbody> </table>	Name	In	Description	ClaimValue	Body	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).	Provider-AuthenticationScheme	Body	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).		
Name	In	Description										
ClaimValue	Body	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).										
Provider-AuthenticationScheme	Body	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).										

Version 1

Version 1 of the GET /Security/Roles/{id} method includes the same capabilities as version 2, but offers support for managing legacy formatted Active Directory identities.

Important: This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other identity providers. See version 2 of this method.

Table 620: GET Security Roles {id} v1 Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role to retrieve. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.

Table 621: GET Security Roles {id} v1 Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.								
PermissionSetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see Permission Sets on page 1959).								
Identities	An array of objects containing information about the security identities assigned to the security role. Identity details include: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>AccountName</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div></td> </tr> <tr> <td>IdentityType</td> <td>A string indicating the type of identity—User or Group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>	IdentityType	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>								
IdentityType	A string indicating the type of identity—User or Group.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version One Permission Model on page 670 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.33.3 GET Security Roles

The GET /Security/Roles method is used to return the list of security roles configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security roles.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/read/

This method has two available versions. Keyfactor strongly recommends using the newer method when possible; the v1 method has been deprecated since it supports Active Directory identities only. The v2 method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. This version of the method supports both Active Directory and other identity providers. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the GET /Security/Roles method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. All new development should use this version.

Table 622: GET Security Roles v2 Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Security Role Search Feature on page 690 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> Name
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 623: GET Security Roles v2 Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security role.
Name	A string containing the short reference name for the security role.
Immutable	A Boolean indicating if the role is immutable or not. Only the built-in <i>Administrators</i> role is considered immutable. The value of this parameter cannot be changed.
PermissionSetId	<p>A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see Permission Sets on page 1959).</p> <p> Tip: For details of the permissions associated with the role, use the <i>GET /SecurityRoles/{id}</i> method (see GET Security Roles ID on page 2082) for the desired role. For details of the permissions associated with the permission set to which the role belongs, use <i>GET /PermissionSets/{id}</i> method (see GET Permission Sets ID on page 1961) using this permission set GUID. A role may be only granted a subset of the permissions available in a permission set.</p>
ClaimsCount	<p>An integer indicating the number of claims mapped to the role.</p> <p> Tip: For details of the claims associated with the role, use the <i>GET /SecurityRoles/{id}</i> method (see GET Security Roles ID on page 2082) for the desired role.</p>

Version 1

Version 1 of the GET /Security/Roles method includes the same capabilities as version 2, but offers support for managing legacy formatted Active Directory identities only.

Important: This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other identity providers. See version 2 of this method.

Table 624: GET Security Roles v1 Input Parameters

Name	In	Description
Validate	Query	A Boolean that specifies whether the optional parameter of <i>validate</i> is false , which allows the AuditXML validation to be skipped when loading records, or true (or not specified) in which case validation will occur. The default is true .
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Security Role Search Feature on page 690 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> Name
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 625: GET Security Roles v1 Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.								
PermissionSetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see Permission Sets on page 1959).								
Identities	An array of objects containing information about the security identities assigned to the security role. Identity details include: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>AccountName</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div></td> </tr> <tr> <td>IdentityType</td> <td>A string indicating the type of identity—User or Group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div>	IdentityType	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div>								
IdentityType	A string indicating the type of identity—User or Group.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version One Permission Model on page 670 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.33.4 POST Security Roles

The POST /Security/Roles method is used to create a new security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security role.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

This method has two available versions. Keyfactor strongly recommends using the newer method when possible; the v1 method has been deprecated since it supports Active Directory identities only. The v2 method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. This version of the method supports both Active Directory and other identity providers. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the POST /Security/Roles method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. All new development should use this version.

Table 626: POST Security Roles v2 Input Parameters

Name	Description																		
Name	Required. A string containing the short reference name for the security role.																		
Description	Required. A string containing the description for the security role.																		
PermissionSetId	A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see Permission Sets on page 1959).																		
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version Two Permission Model on page 632 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["/portal/read/", "/dashboard/read/", "/certificates/collections/metadata/modify/6/", "/certificates/collections/private_key/read/6/"],</pre>																		
Claims	<p>An array of objects containing the claims associated with the role.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>In</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Description</td> <td>Body</td> <td>A string indicating a description for the security claim.</td> </tr> <tr> <td>ClaimType</td> <td>Body</td> <td> <p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	In	Description	Description	Body	A string indicating a description for the security claim.	ClaimType	Body	<p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active
Name	In	Description																	
Description	Body	A string indicating a description for the security claim.																	
ClaimType	Body	<p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active								
Claim Type Integer	Claim Type String	Description																	
0	User	Active Directory user account																	
1	Group	Active																	

Name	Description		
	Name	In	Description
			KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).
	Provider-AuthenticationScheme	Body	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).

Table 627: POST Security Roles v2 Response Data

Name	In	Description												
Id	Body	An integer containing the Keyfactor Command identifier for the security role.												
Name	Body	A string containing the short reference name for the security role.												
Description	Body	A string containing the description for the security role.												
Immutable	Body	A Boolean indicating if the role is immutable (true) or not (false). Only the built-in <i>Administrators</i> role is considered immutable. The value of this parameter cannot be changed.												
PermissionSetId	Body	A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see Permission Sets on page 1959).												
Permissions	Body	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version Two Permission Model on page 632 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["/portal/read/", "/dashboard/read/", "/certificates/collections/metadata/modify/6/", "/certificates/collections/private_key/read/6/"],</pre>

DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).									
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the provider.																		
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																		
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																		

Version 1

Version 1 of the POST /Security/Roles method includes the same capabilities as version 2, but offers support for managing legacy formatted Active Directory identities only.

Important: This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other identity providers. See version 2 of this method.

Table 628: POST Security Roles v1 Input Parameters

Name	In	Description				
Name	Body	Required. A string containing the short reference name for the security role.				
Description	Body	Required. A string containing the description for the security role.				
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.				
Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.				
PermissionSetId	Body	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see Permission Sets on page 1959).				
Permissions	Body	An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version One Permission Model on page 670 for an overview of the possible permissions. For example: <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>				
Identities	Body	An array of objects containing one or more identifiers for each security identity to associate with the role. Supported identifiers include: <table border="1" data-bbox="592 1323 1404 1711"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AccountName</td> <td>Required* A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code> * One of <i>AccountName</i> or <i>SID</i> is required in</td> </tr> </tbody> </table>	Name	Description	AccountName	Required* A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code> * One of <i>AccountName</i> or <i>SID</i> is required in
Name	Description					
AccountName	Required* A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code> * One of <i>AccountName</i> or <i>SID</i> is required in					

Name	In	Description						
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>order to specify an identity, but not both.</td> </tr> <tr> <td>SID</td> <td> <p>Required*. SID	<p>Required*. A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</p> <p>* One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.</p>
Name	Description							
	order to specify an identity, but not both.							
SID	<p>Required*. A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</p> <p>* One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.</p>							

Table 629: POST Security Roles v1 Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.								
PermissionSetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see Permission Sets on page 1959).								
Identities	An array of objects containing information about the security identities assigned to the security role. Identity details include: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>AccountName</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div></td> </tr> <tr> <td>IdentityType</td> <td>A string indicating the type of identity—User or Group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>	IdentityType	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>								
IdentityType	A string indicating the type of identity—User or Group.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version One Permission Model on page 670 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.33.5 PUT Security Roles

The PUT /Security/Roles method is used to update a security role in Keyfactor Command including the permissions set for the role and the security identities mapped to the role. This method returns HTTP 200 OK on a success with the details of the security role.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

This method has two available versions. Keyfactor strongly recommends using the newer method when possible; the v1 method has been deprecated since it supports Active Directory identities only. The v2 method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. This version of the method supports both Active Directory and other identity providers. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the PUT /Security/Roles method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. All new development should use this version.

Table 630: PUT Security Roles v2 Input Parameters

Name	In	Description									
Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.									
Name	Body	Required. A string containing the short reference name for the security role.									
Description	Body	Required. A string containing the description for the security role.									
PermissionSetId	Body	A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see Permission Sets on page 1959).									
Permissions	Body	An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version Two Permission Model on page 632 for an overview of the possible permissions. For example: <pre>"Permissions": ["/portal/read/", "/dashboard/read/", "/certificates/collections/metadata/modify/6/", "/certificates/collections/private_key/read/6/"],</pre>									
Claims	Body	An array of objects containing the claims associated with the role. <table border="1" data-bbox="493 1251 1403 1503"> <thead> <tr> <th>Name</th> <th>In</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Description</td> <td>Body</td> <td>A string indicating a description for the security claim.</td> </tr> <tr> <td>ClaimType</td> <td>Body</td> <td>A string indicating the type of claim. AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).									
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the provider.																		
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																		
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																		

Version 1

Version 1 of the PUT /Security/Roles method includes the same capabilities as version 2, but offers support for managing legacy formatted Active Directory identities only.

Important: This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other identity providers. See version 2 of this method.

Table 632: PUT Security Roles v1 Input Parameters

Name	In	Description				
Id	Body	<p>Required. An integer containing the Keyfactor Command identifier for the security role.</p> <p>Use the GET /Security/Roles method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.</p>				
Name	Body	<p>Required. A string containing the short reference name for the security role.</p>				
Description	Body	<p>Required. A string containing the description for the security role.</p>				
Enabled	Body	<p>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>				
Private	Body	<p>A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>				
PermissionSetId	Body	<p>A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see Permission Sets on page 1959).</p>				
Permissions	Body	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version One Permission Model on page 670 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>				
Identities	Body	<p>An array of objects containing one or more identifiers for each security identity to associate with the role. Supported identifiers include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AccountName</td> <td>Required* A string containing the account name for the security identity. For Active Directory user and groups, this will be in the</td> </tr> </tbody> </table>	Name	Description	AccountName	Required* A string containing the account name for the security identity. 	form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div> * One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.							
SID	Required* . A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity. * One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.							

Table 633: PUT Security Roles v1 Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.								
PermissionSetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see Permission Sets on page 1959).								
Identities	An array of objects containing information about the security identities assigned to the security role. Identity details include: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>AccountName</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div></td> </tr> <tr> <td>IdentityType</td> <td>A string indicating the type of identity—User or Group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div>	IdentityType	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div>								
IdentityType	A string indicating the type of identity—User or Group.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version One Permission Model on page 670 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.33.6 POST Security Roles ID Copy

The POST `/Security/Roles{id}/Copy` method is used to copy an existing security role in Keyfactor Command to create a new security role. This method returns HTTP 200 OK on a success with the details of the new security role.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/security/modify/`

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

 **Important:** This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other identity providers. There is not an equivalent function to this among the newer methods.

Instead, use the v2 versions of [GET /Security/Roles/{id}](#) and [POST /Security/Roles](#) (see [GET Security Roles ID on page 2082](#) and [POST Security Roles on page 2093](#)).

Table 634: POST Security Roles {id} Copy Input Parameters

Name	In	Description						
id	Path	Required. The Keyfactor Command reference ID of the security role from which to copy role information. Use the GET /Security/Roles method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.						
role	Body	An array containing information about the new security role to create. Role details include: <table border="1" data-bbox="516 703 1404 961"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>Required. A string containing the short reference name for the security role.</td> </tr> <tr> <td>Description</td> <td>Required. A string containing the description for the security role.</td> </tr> </tbody> </table>	Name	Description	Name	Required. A string containing the short reference name for the security role.	Description	Required. A string containing the description for the security role.
Name	Description							
Name	Required. A string containing the short reference name for the security role.							
Description	Required. A string containing the description for the security role.							

Table 635: POST Security Roles {id} Copy Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.								
PermissionSetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see Permission Sets on page 1959).								
Identities	An array of objects containing information about the security identities assigned to the security role. Identity details include: <div data-bbox="483 1251 1406 1696" style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>AccountName</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div></td> </tr> <tr> <td>IdentityType</td> <td>A string indicating the type of identity—User or Group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div>	IdentityType	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div>								
IdentityType	A string indicating the type of identity—User or Group.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Version One Permission Model on page 670 for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.33.7 PUT Security Roles ID Identities

The PUT /Security/Roles{id}/Identities method is used to update security identities assigned to a security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities actively assigned to the security role.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1959](#)).

 **Important:** This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other

identity providers. See the v2 version of PUT /Security/Roles to update claims on a security role (see [PUT Security Roles on page 2105](#)).

Table 636: PUT Security Roles {id} Identities Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role for which to update identities. Use the GET /Security/Roles method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.
identities	Body	An array in which you provide a complete list of the identities that are associated with an Security Role Id. Use the GET /Security/Identities method (see GET Security Identities on page 2034) to retrieve a list of all the security identities to determine the identity ID(s).

Table 637: PUT Security Roles {id} Identities Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security identity.
Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.33.8 GET Security Roles ID Identities

The GET /Security/Roles/{id}/Identities method is used to return the security identities assigned to a security role by security role ID. This method returns HTTP 200 OK on a success with details of the security identities assigned to the specified security role.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/security/read/`

Important: This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other identity providers. See the v2 version of [GET /Security/Roles/{id}](#) to review claims on a security role (see [GET Security Roles ID on page 2082](#)).

Table 638: GET Security Roles {id} Identities Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role for which to retrieve security identities. Use the GET /Security/Roles method (see GET Security Roles on page 2088) to retrieve a list of all the security roles to determine the role's ID.

Table 639: GET Security Roles {id} Identities Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security identity.
Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.34 SSH

The SSH component of the Keyfactor API includes methods necessary to create, update, and delete SSH keys, logons, servers, server groups, and service accounts within Keyfactor Command.

Table 640: SSH Endpoints

Endpoint	Method	Description	Link
/Keys/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	DELETE SSH Keys Unman-

Endpoint	Method	Description	Link
			aged ID on page 2128
/Keys/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	GET SSH Keys Unmanaged ID on page 2129
/Keys/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	GET SSH Keys My Key on page 2130
/Keys/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	POST SSH Keys My Key on page 2133
/Keys/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	PUT SSH Keys My Key on page 2137
/Keys/Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	DELETE SSH Keys Unmanaged on page 2140
/Keys/Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	GET SSH Keys Unmanaged on page 2141
/Logons/{id}	DELETE	Deletes a Linux logon from Keyfactor Command.	DELETE SSH Logons ID on page 2144
/Logons/{id}	GET	Returns information about a Linux logons.	GET SSH Logons ID on page 2145
/Logons/	GET	Returns information about one or more Linux logons.	GET SSH Logons on page 2147
/Logons/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory and publish policy</i> mode, publishes it out to a Linux server.	POST SSH Logons on page 2149

Endpoint	Method	Description	Link
/Logons/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	POST SSH Logons Access on page 2152
/Servers/{id}	DELETE	Deletes the SSH server with the specified ID.	DELETE SSH Servers ID on page 2154
/Servers/{id}	GET	Returns the SSH server with the specified ID.	GET SSH Servers ID on page 2155
/Servers/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.	GET SSH Servers Access ID on page 2159
/Servers/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	GET SSH Servers on page 2162
/Servers/	POST	Creates a new SSH server.	POST SSH Servers on page 2167
/Servers/	PUT	Updates an existing SSH server.	PUT SSH Servers on page 2172
/Servers/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	DELETE SSH Servers Access on page 2177
/Servers/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	POST SSH Servers Access on page 2181
/ServerGroups/{id}	DELETE	Deletes the SSH server group with the specified ID.	DELETE SSH Server Groups ID on page 2185

Endpoint	Method	Description	Link
/ServerGroups/{id}	GET	Returns the SSH server group with the specified ID.	GET SSH Server Groups ID on page 2185
/ServerGroups/{name}	GET	Returns the SSH server group with the specified name.	GET SSH Server Groups Name on page 2190
/ServerGroups/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	GET SSH Server Groups Access ID on page 2194
/ServerGroups/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	GET SSH Server Groups on page 2197
/ServerGroups/	POST	Creates a new SSH server group.	POST SSH Server Groups on page 2202
/ServerGroups/	PUT	Updates an existing SSH server group.	PUT SSH Server Groups on page 2210
/ServerGroups/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	DELETE SSH Server Groups Access on page 2218
/ServerGroups/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	POST SSH Server Groups Access on page 2221
/ServiceAccounts/{id}	DELETE	Deletes the SSH service account with the specified ID.	DELETE SSH Service Accounts ID on page 2224
/ServiceAccounts/{id}	GET	Returns the SSH service account with the specified ID.	GET SSH Service Accounts ID on

Endpoint	Method	Description	Link
			page 2227
/ServiceAccounts/Key/{id}	GET	Returns the public key and optional private key of an SSH service account with the specified ID.	GET SSH Service Accounts Key ID on page 2234
/ServiceAccounts/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	DELETE SSH Service Accounts on page 2238
/ServiceAccounts/	GET	Returns a list of SSH service accounts based on the specified filters.	GET SSH Service Accounts on page 2240
/ServiceAccounts/	POST	Creates a new SSH service account.	POST SSH Service Accounts on page 2248
/ServiceAccounts/	PUT	Updates an existing SSH service account.	PUT SSH Service Accounts on page 2258
/ServiceAccounts/Rotate/{id}	POST	Generates a new key pair for an existing service account.	POST SSH Service Accounts Rotate ID on page 2266
/Users/{id}	DELETE	Deletes the SSH user with the specified ID.	DELETE SSH Users ID on page 2270
/Users/{id}	GET	Returns the SSH user with the specified ID.	GET SSH Users ID on page 2271
/Users/	GET	Returns a list of SSH users based on the specified filters.	GET SSH Users on page 2276

Endpoint	Method	Description	Link
/Users/	POST	Creates a new SSH user.	POST SSH Users on page 2287
/Users/	PUT	Updates an existing SSH user.	PUT SSH Users on page 2289
/Users/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	POST SSH Users Access on page 2290

3.6.34.1 SSH Keys

The SSH Keys component of the Keyfactor API includes methods necessary to allow a user with the *SSH User Keyfactor Command* role permission (see [SSH Permissions on page 597](#) in the *Keyfactor Command Reference Guide*) to generate an SSH key pair for himself or herself, retrieve that key, update it, or delete it. Methods are also included to list and delete unmanaged keys—keys discovered on servers configured in inventory only mode.

Table 641: SSH Keys Endpoints

Endpoint	Method	Description	Link
/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	DELETE SSH Keys Unmanaged ID on the next page
/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	GET SSH Keys Unmanaged ID on page 2129
/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	GET SSH Keys My Key on page 2130
/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	POST SSH Keys My Key on page 2133
/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	PUT SSH Keys My Key on page 2137
Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	DELETE SSH Keys Unmanaged on page 2140
Unmanaged	GET	Retrieve details for one or more	GET SSH Keys Unman-

Endpoint	Method	Description	Link
		discovered unmanaged SSH keys based on a selection query.	aged on page 2141

DELETE SSH Keys Unmanaged ID

The DELETE /SSH/Keys/Unmanaged/{id} method is used to delete an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Note: Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See [Unmanaged SSH Keys on page 556](#) in the *Keyfactor Command Reference Guide* for more information.

Table 642: DELETE SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the unmanaged SSH key to be deleted. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see GET SSH Keys Unmanaged on page 2141) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Keys Unmanaged ID

The GET /SSH/Keys/Unmanaged/{id} method is used to retrieve an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This method returns HTTP 200 OK on a success with details for the requested SSH key.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 643: GET SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the unmanaged SSH key to be retrieved. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see GET SSH Keys Unmanaged on page 2141) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

Table 644: GET SSH Keys Unmanaged {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	A string indicating the date, in UTC, on which the SSH key was discovered.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Keys My Key

The GET /SSH/Keys/MyKey method is used to retrieve the current user's SSH key generated in Keyfactor Command (see [POST SSH Keys My Key on page 2133](#)). This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/user/

OR

/ssh/server_admin/

OR

/ssh/enterprise_admin/

Table 645: GET SSH Keys My Key Input Parameters

Name	In	Description
includePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (true) or not (false). If set to <i>true</i> , the <i>x-keyfactor-key-passphrase</i> header must be supplied. The default is <i>false</i> .
x-keyfactor-key-passphrase	Header	Required* . A string that sets a password used to secure the private key of the SSH key pair for download. This field is required if <i>IncludePrivateKey</i> is set to <i>true</i> .  Tip: This password does not need to match the password entered to secure the private key when the SSH key pair was initially generated. The private key is encrypted at download time and a different password may be used for each download.

Table 646: GET SSH Keys My Key Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	A string indicating the date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Keys My Key

The POST /SSH/Keys/MyKey method is used to generate a new SSH key pair for the current user in Keyfactor Command. The user needs to download the private key as an encrypted file and store it locally and an administrator needs to use Keyfactor Command to associate the user's Keyfactor user account with his or her Linux logon account(s) on the target server(s) that the user wishes to access via SSH (see [POST SSH Logons Access on page 2152](#), [POST SSH Server Groups Access on page 2221](#), and [POST SSH Servers Access on page 2181](#)). This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/user/

OR

/ssh/server_admin/

OR

/ssh/enterprise_admin/

Table 647: POST SSH Keys My Key Input Parameters

Name	In	Description								
KeyType	Body	<p>Required. A string indicating the cryptographic algorithm to use to generate the SSH key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Numeric Value</th> <th>Text Value</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>ECDSA</td> </tr> <tr> <td>2</td> <td>Ed25519</td> </tr> <tr> <td>3</td> <td>RSA</td> </tr> </tbody> </table> <p>The <i>KeyType</i> may be specified using either the numeric value or text value.</p>	Numeric Value	Text Value	1	ECDSA	2	Ed25519	3	RSA
Numeric Value	Text Value									
1	ECDSA									
2	Ed25519									
3	RSA									
PrivateKeyFormat	Body	<p>Required. A string indicating the format to use for the downloadable private key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Numeric Value</th> <th>Text Value</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>OpenSSH</td> </tr> <tr> <td>2</td> <td>PKCS8</td> </tr> </tbody> </table> <p>The <i>PrivateKeyFormat</i> may be specified using either the numeric value or text value.</p>	Numeric Value	Text Value	1	OpenSSH	2	PKCS8		
Numeric Value	Text Value									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<p>Required*. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and required if the <i>KeyType</i> is set to RSA.</p>								
Email	Body	<p>Required. A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.</p>								
Password	Body	<p>Required. A string that sets a password used to secure the private key of the SSH key pair for download.</p> <div style="border: 1px solid green; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: This password is used to secure the private key in the downloaded copy of the SSH key pair. You may later download the SSH key pair with private key (see GET SSH Keys My Key on page 2130) and encrypt it with a different pass-</p> </div>								

Name	In	Description
		 word, if desired.
Comment	Body	<p>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</p> <p> Note: Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery.</p>

Table 648: POST SSH Keys My Key Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	A string indicating the date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT SSH Keys My Key

The PUT /SSH/Keys/MyKey method is used to update the existing SSH key pair for the current user in Keyfactor Command. Most features of a key pair are fixed and cannot be changed. Only the email address and comment associated with the key may be changed with this option. This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/user/

OR

/ssh/server_admin/

OR

/ssh/enterprise_admin/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 649: PUT SSH Keys My Key Input Parameters

Name	In	Description
ID	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH key.
Email	Body	Required. A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comment	Body	<p>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</p> <div style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> Note: Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery.</p> </div>

Table 650: PUT SSH Keys My Key Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	A string indicating the date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

DELETE SSH Keys Unmanaged

The DELETE /SSH/Keys/Unmanaged method is used to delete one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Note: Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See [Unmanaged SSH Keys on page 556](#) in the *Keyfactor Command Reference Guide* for more information.

Table 651: DELETE SSH Keys Unmanaged Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers indicating the Keyfactor Command reference IDs for the unmanaged SSH keys to be deleted provided in the request body in the following format (without parameter name):</p> <pre>[4, 27, 89]</pre> <p>Use the GET /SSH/Keys/Unmanaged method (see GET SSH Keys Unmanaged on the next page) to retrieve a list of all the unmanaged keys to determine the unmanaged key IDs.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Keys Unmanaged

The GET /SSH/Keys/Unmanaged method is used to retrieve one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH keys.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 652: GET SSH Keys Unmanaged Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Unmanaged Keys Search on page 558 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • DiscoveredDate • KeyComments • KeyLength • KeyType • ServerId
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal.
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 653: GET SSH Keys Unmanaged Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	A string indicating the date, in UTC, on which the SSH key was discovered.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.34.2 SSH Logons

The SSH Logons component of the Keyfactor API includes methods necessary to view and manage the Linux user accounts associated with authorized_keys files containing valid SSH public keys. The logons include both those discovered on SSH servers during the initial discovery phase using the orchestrator and those created in Keyfactor Command and published to the SSH servers using the orchestrator.

Table 654: SSH Logon Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a Linux logon from Keyfactor Command.	DELETE SSH Logons ID below
/id}	GET	Returns information about a Linux logons.	GET SSH Logons ID on the next page
/	GET	Returns information about one or more Linux logons.	GET SSH Logons on page 2147
/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory and publish policy</i> mode, publishes it out to a Linux server.	POST SSH Logons on page 2149
/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	POST SSH Logons Access on page 2152

DELETE SSH Logons ID

The DELETE /SSH/Logons/{id} method is used to delete a Linux logon in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Note: Deleting a logon in Keyfactor Command does not delete it on the Linux server. It must be manually removed from the Linux server at the same time. If this is not done, when the next inventory of the Linux server is performed, the logon will be recreated in Keyfactor Command. This method is intended primarily to be used to clean up logons in Keyfactor Command from SSH servers that have been retired.

Table 655: DELETE SSH Logons {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH logon to be deleted. Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 2147) to retrieve a list of all the SSH logons to determine the logon's ID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

GET SSH Logons ID

The *GET /SSH/Logons/{id}* method is used to retrieve a Linux logon by ID. This method returns HTTP 200 OK on a success with details for the requested SSH logon.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssh/server_admin/
OR
/ssh/enterprise_admin/
SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin (/ssh/server_admin/)* role. For more information, see [SSH Permissions on page 597](#).

Table 656: GET SSH Logons {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH logon to retrieve. Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 2147) to retrieve a list of all the SSH logons to determine the logon's ID.

Table 657: GET SSH Keys Unmanaged {id} Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>An object containing details about the server on which the SSH logon resides. Server information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td> </tr> <tr> <td>Hostname</td> <td>A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 577 for more information.</td> </tr> <tr> <td>UnderManagement</td> <td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td> </tr> <tr> <td>GroupName</td> <td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 560 for more information.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 577 for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 560 for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 577 for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 560 for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of objects providing information about the users mapped to the logon. Access information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Logons

The GET /SSH/Logons method is used to retrieve one or more Linux logons. Results can be limited to selected logons using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH logons.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 658: GET SSH Logons Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Logons Search on page 590 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • Id (Login ID) • LastLogon • Hostname (Logon Server Name) • LogonUserUsername • ServerId • UnmanagedKeyId • Username
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 659: GET SSH Logons Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.
Username	A string indicating the user's logon name on the Linux server.
ServerId	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.
ServerName	A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 577 for more information.
GroupName	A string indicating the server group to which the server referenced by <i>ServerName</i> belongs. See SSH Server Groups on page 560 for more information.
ServerUnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Logons

The POST /SSH/Logons method is used to create a new Linux logon in Keyfactor Command and, for servers in *inventory and publish policy* mode, publish it out to a Linux server. The logon can optionally be associated with one or more SSH keys by mapping the logon to one or more *users* or *service accounts* during creation. This method returns HTTP 200 OK on a success with details for the new SSH logon.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /ssh/server_admin/
 OR
 /ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin (/ssh/server_admin/)* role. For more information, see [SSH Permissions on page 597](#).

Table 660: POST SSH Logons Input Parameters

Name	In	Description
Username	Body	Required. A string indicating the user's logon name on the Linux server.
ServerId	Body	Required. An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon should be created. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 2162) to retrieve a list of all the SSH servers to determine the server's ID.
UserIds	Body	An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format: <pre>[4,7,19]</pre> See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 2276) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID.

Table 661: POST SSH Logons Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>An object containing details about the server on which the SSH logon resides. Server information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td> </tr> <tr> <td>Hostname</td> <td>A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 577 for more information.</td> </tr> <tr> <td>UnderManagement</td> <td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td> </tr> <tr> <td>GroupName</td> <td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 560 for more information.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 577 for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 560 for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 577 for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 560 for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of objects providing information about the users mapped to the logon. Access information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Logons Access

The POST /SSH/Logons/Access method is used to associate one or more SSH keys with a Linux logon by mapping the logon to one or more *users* or *service accounts*. This method returns HTTP 200 OK on a success with a list of the users associated with the logon.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 662: POST SSH Logons Access Input Parameters

Name	In	Description
LogonId	Body	<p>Required. An integer indicating the Keyfactor Command reference ID for the SSH logon.</p> <p>Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 2147) to retrieve a list of all the SSH logons to determine the logon's ID.</p>
UserIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format:</p> <p>[4,7,19]</p> <p>Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 2276) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID.</p> <p>See SSH on page 525 for more information about users and service accounts.</p>

Table 663: POST SSH Logons Access Response Data

Name	Description						
LogonId	An integer indicating the Keyfactor Command reference ID for the SSH logon.						
LogonName	A string indicating the user's logon name on the Linux server.						
Users	An array of objects providing information about the users mapped to the logon. User information includes: <table border="1" data-bbox="435 533 1404 863"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 for more information.						
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.34.3 SSH Servers

The SSH Servers component of the Keyfactor API includes methods necessary to create, update, and delete SSH servers within Keyfactor Command.

Table 664: SSH Servers Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH server with the specified ID.	DELETE SSH Servers ID on the next page
/id}	GET	Returns the SSH server with the specified ID.	GET SSH Servers ID on page 2155
/Access/id}	GET	Retrieves Linux logons along with users and	GET SSH

Endpoint	Method	Description	Link
		service accounts granted access to those logons for the specified SSH server.	Servers Access ID on page 2159
/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	GET SSH Servers on page 2162
/	POST	Creates a new SSH server.	POST SSH Servers on page 2167
/	PUT	Updates an existing SSH server.	PUT SSH Servers on page 2172
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	DELETE SSH Servers Access on page 2177
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	POST SSH Servers Access on page 2181

DELETE SSH Servers ID

The DELETE `/SSH/Servers/{id}` method is used to delete an SSH server in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

`/ssh/server_admin/`

OR

`/ssh/enterprise_admin/`

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see [SSH Permissions on page 597](#).

Table 665: DELETE SSH Servers {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH server to be deleted. Use the <code>GET /SSH/Servers</code> method (see GET SSH Servers on page 2162) to retrieve a list of all the SSH servers to determine the server's ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Servers ID

The GET `/SSH/Servers/{id}` method is used to retrieve an SSH server with the specified ID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

`/ssh/server_admin/`

OR

`/ssh/enterprise_admin/`

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see [SSH Permissions on page 597](#).

Table 666: GET SSH Servers {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH server to be retrieved. Use the <code>GET /SSH/Servers</code> method (see GET SSH Servers on page 2162) to retrieve a list of all the SSH servers to determine the server's ID.

Table 667: GET SSH Servers {id} Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.	For example, on the first of every month at 5:30 pm:		<pre data-bbox="618 863 1382 1045"> "Monthly": { "Day": 1 "Time": "2023-11-27T17:30:00Z" } </pre>	
Name	Description																
Monthly	A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:																
<table border="1" data-bbox="618 443 1382 772"> <thead> <tr> <th data-bbox="618 443 781 506">Name</th> <th data-bbox="781 443 1382 506">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="618 506 781 674">Time</td> <td data-bbox="781 506 1382 674">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="618 674 781 772">Day</td> <td data-bbox="781 674 1382 772">The number of the day, in the month, to run the job.</td> </tr> </tbody> </table>		Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.										
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																
Day	The number of the day, in the month, to run the job.																
For example, on the first of every month at 5:30 pm:																	
<pre data-bbox="618 863 1382 1045"> "Monthly": { "Day": 1 "Time": "2023-11-27T17:30:00Z" } </pre>																	
Under-Management	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).																

Name	Description						
	 Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see Bash Orchestrator on page 2991 in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Servers Access ID

The GET `/SSH/Servers/Access/{id}` method is used to retrieve Linux logons for an SSH server, along with any users or service accounts mapped to those logons, from Keyfactor Command for the

specified server ID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 668: GET SSH Servers Access {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH server for which to retrieve logon and user mappings. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 2162) to retrieve a list of all the SSH servers to determine the server's ID.

Table 669: GET SSH Servers Access {id} Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonId</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

GET SSH Servers

The GET /SSH/Servers method is used to retrieve one or more SSH servers defined in Keyfactor Command. Results can be limited to selected servers using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH servers.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 670: GET SSH Servers Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the SSH Server Search on page 583. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Agent (Agent ID) • Hostname • Orchestrator (ClientMachine) • ServerGroup (Server Group Id) • ServerGroupName • ServerGroupOwner (Username) • EnforcePublishPolicy (UnderManagement) (true, false)
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Hostname</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 671: GET SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="454 275 597 336">Name</th> <th data-bbox="597 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="454 336 597 590"></td> <td data-bbox="597 336 1398 590"> <table border="1"> <thead> <tr> <th data-bbox="620 357 779 420">Name</th> <th data-bbox="779 357 1375 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="620 420 779 590">Time</td> <td data-bbox="779 420 1375 590">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.	For example, on the first of every month at 5:30 pm:		<pre data-bbox="618 863 1382 1045"> "Monthly": { "Day": 1 "Time": "2023-11-27T17:30:00Z" } </pre>	
Name	Description																
Monthly	A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:																
<table border="1" data-bbox="618 443 1382 772"> <thead> <tr> <th data-bbox="618 443 781 506">Name</th> <th data-bbox="781 443 1382 506">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="618 506 781 674">Time</td> <td data-bbox="781 506 1382 674">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="618 674 781 772">Day</td> <td data-bbox="781 674 1382 772">The number of the day, in the month, to run the job.</td> </tr> </tbody> </table>		Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.										
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																
Day	The number of the day, in the month, to run the job.																
For example, on the first of every month at 5:30 pm:																	
<pre data-bbox="618 863 1382 1045"> "Monthly": { "Day": 1 "Time": "2023-11-27T17:30:00Z" } </pre>																	
Under-Management	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).																

Name	Description						
	 Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see Bash Orchestrator on page 2991 in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Servers

The POST /SSH/Servers method is used to create a new SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server.

Before adding a new SSH server, be sure that you have added at least one server group (see [POST SSH Server Groups on page 2202](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 858](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 672: POST SSH Servers Input Parameters

Name	In	Description
AgentId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.
Hostname	Body	Required. A string indicating the hostname of the SSH server.
ServerGroupId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.
UnderManagement	Body	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True). <div data-bbox="656 1129 709 1180" data-label="Image"> </div> Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.
Port	Body	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

Table 673: POST SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="454 275 597 336">Name</th> <th data-bbox="597 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="454 336 597 590"></td> <td data-bbox="597 336 1398 590"> <table border="1"> <thead> <tr> <th data-bbox="620 357 779 420">Name</th> <th data-bbox="779 357 1375 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="620 420 779 590">Time</td> <td data-bbox="779 420 1375 590">The date and time to next run the job. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see Bash Orchestrator on page 2991 in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

PUT SSH Servers

The PUT /SSH/Servers method is used to update an existing SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH server.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 674: PUT SSH Servers Input Parameters

Name	In	Description
ID	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.
UnderManagement	Body	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True). <div data-bbox="654 1108 708 1159" data-label="Image"></div> Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.
Port	Body	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

Table 675: PUT SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="454 275 597 336">Name</th> <th data-bbox="597 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="454 336 597 590"></td> <td data-bbox="597 336 1398 590"> <table border="1"> <thead> <tr> <th data-bbox="620 357 779 420">Name</th> <th data-bbox="779 357 1375 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="620 420 779 590">Time</td> <td data-bbox="779 420 1375 590">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1" data-bbox="618 443 1382 772"> <thead> <tr> <th data-bbox="618 443 784 506">Name</th> <th data-bbox="784 443 1382 506">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="618 506 784 674">Time</td> <td data-bbox="784 506 1382 674">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="618 674 784 772">Day</td> <td data-bbox="784 674 1382 772">The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre data-bbox="618 863 1382 1024"> { "Monthly": { "Day": 1 "Time": "2023-11-27T17:30:00Z" } } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).										

Name	Description						
	 Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see Bash Orchestrator on page 2991 in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

DELETE SSH Servers Access

The DELETE /SSH/Servers/Access method is used to remove a mapping of Keyfactor Command users or service accounts to one or more Linux logons on one or more SSH servers. This method

returns HTTP 200 OK on a success with details of the logons and remaining associated users, if applicable, for the specified SSH server(s).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Tip: Before deleting a logon to user mapping, be sure that you have switched the server from which you will removing your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be removed from the server. If the server is in *inventory only* mode and you remove a mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the server.

Table 676: DELETE SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	<p>Required. An array of objects containing information for the Linux logon(s) to update. The following information should be included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.</td> </tr> </tbody> </table> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.							

Table 677: DELETE SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonId</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Servers Access

The POST /SSH/Servers/Access method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH servers. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server(s).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Tip: Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 678: POST SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	<p>Required. An array of objects containing information for the Linux logon(s) to update. The following information should be included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.</td> </tr> </tbody> </table> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.							

Table 679: POST SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonId</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.34.4 SSH Server Groups

The SSH Server Groups component of the Keyfactor API includes methods necessary to create, update and delete SSH server groups within Keyfactor Command.

Table 680: SSH Server Groups Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH server group with the specified ID.	DELETE SSH Server Groups ID on the next page
/id}	GET	Returns the SSH server group with the specified ID.	GET SSH Server Groups ID on the next page
/name}	GET	Returns the SSH server group with the specified name.	GET SSH Server Groups Name on page 2190
/Access/id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	GET SSH Server Groups Access ID on page 2194
/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	GET SSH Server Groups on page 2197
/	POST	Creates a new SSH server group.	POST SSH Server Groups on page 2202
/	PUT	Updates an existing SSH server group.	PUT SSH Server Groups on page 2210
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	DELETE SSH Server Groups Access on page 2218
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	POST SSH Server Groups Access on page 2221

DELETE SSH Server Groups ID

The DELETE /SSH/ServerGroups/{id} method is used to delete an SSH server group in Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssh/enterprise_admin/

Table 681: DELETE SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to be deleted. Use the GET /SSH/ServerGroups method (see GET SSH Server Groups on page 2197) to retrieve a list of all the SSH server groups to determine the server group's GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Server Groups ID

The GET /SSH/ServerGroups/{id} method is used to retrieve an SSH server group with the specified GUID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssh/server_admin/
OR
/ssh/enterprise_admin/
SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 682: GET SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to be retrieved. Use the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 2197) to retrieve a list of all the SSH server groups to determine the server group's GUID.

Table 683: GET SSH Server Groups {id} Response Data

Name	Description										
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.										
GroupName	A string indicating the name of the SSH server group.										
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Off	Turn off a previously configured schedule.										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.

Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Day	The number of the day, in the month, to run the job.												

Name	Description
	<pre> } } </pre>
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	An integer indicating the number of SSH servers that belong to the server group.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Server Groups Name

The GET /SSH/ServerGroups/{name} method is used to retrieve an SSH server group with the specified name from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /ssh/server_admin/
 OR
 /ssh/enterprise_admin/
 SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 684: GET SSH Server Groups {name} Input Parameters

Name	In	Description
name	Path	Required. A string indicating the full name of the SSH server group to be retrieved.

Table 685: GET SSH Server Groups {name} Response Data

Name	In	Description										
ID	Body	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	Body	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.				
Name	Description											
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.											
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.											
GroupName	Body	A string indicating the name of the SSH server group.										
SyncSchedule	Body	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Off	Turn off a previously configured schedule.	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description											
Off	Turn off a previously configured schedule.											
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.											
Name	Description											
Minutes	An integer indicating the number of minutes between each interval.											

Name	In	Description

Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).													
Day	The number of the day, in the month, to run the job.													

Name	In	Description
		<pre>"SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } }</pre>
Under-Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Server Groups Access ID

The GET /SSH/ServerGroups/Access/{id} method is used to retrieve Linux logons for an SSH server group, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server group GUID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /ssh/server_admin/
 OR
 /ssh/enterprise_admin/
 SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 686: GET SSH Server Groups Access {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group for which to retrieve logon and user mappings. Use the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 2197) to retrieve a list of all the SSH server groups to determine the server group's ID.

Table 687: GET SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td> </tr> </tbody> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Server Groups

The GET /SSH/ServerGroups method is used to retrieve one or more SSH server groups defined in Keyfactor Command. Results can be limited to selected server groups using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH server groups.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 688: GET SSH Server Groups Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Server Group Search on page 575 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • GroupId • GroupName • Owner (Owner ID) • OwnerName (Username) • EnforcePublishPolicy (Under Management) (true, false)
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>GroupName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 689: GET SSH Server Groups Response Data

Name	Description										
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.										
GroupName	A string indicating the name of the SSH server group.										
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Day	The number of the day, in the month, to run the job.												

Name	Description
	<pre> } } </pre>
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	An integer indicating the number of SSH servers that belong to the server group.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

POST SSH Server Groups

The POST /SSH/ServerGroups method is used to create an SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server group.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssh/enterprise_admin/

Table 690: POST SSH Server Groups Input Parameters

Name	In	Description												
OwnerName	Body	<p>Required. A string indicating the Active Directory user who owns the server group (in DOMAIN\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</p> </div>												
GroupName	Body	<p>Required. A string indicating the name of the SSH server group.</p>												
SyncSchedule	Body	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1" style="margin: 10px auto; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" style="margin: 10px auto; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="background-color: #f5f5f5; border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px auto;"> "Interval": { "Minutes": 60 } </pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule. Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Day	The number of the day, in the month, to run the job.												

Name	Description
	<pre> } } </pre>
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	An integer indicating the number of SSH servers that belong to the server group.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

PUT SSH Server Groups

The PUT /SSH/ServerGroups method is used to update an existing SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the updated SSH server group.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /ssh/server_admin/
 OR
 /ssh/enterprise_admin/
 SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 692: PUT SSH Server Groups Input Parameters

Name	In	Description												
ID	Body	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.												
OwnerName	Body	<p>Required. A string indicating the Active Directory user who owns the server group (in DOMAIN\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</p> </div>												
GroupName	Body	Required. A string indicating the name of the SSH server group.												
SyncSchedule	Body	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).													
Day	The number of the day, in the month, to run the job.													

Name	In	Description
		<pre>"SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } }</pre>
Under-Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

DELETE SSH Server Groups Access

The DELETE /SSH/ServerGroups/Access method is used to remove a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /ssh/server_admin/
 OR
 /ssh/enterprise_admin/
 SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

 **Tip:** Before deleting a logon to user mapping, be sure that you have switched the server group from which you will removing your mapping to *inventory and publish policy* mode so that the key for the user will be removed from the servers in the server group. If the server group

is in *inventory only* mode and you remove a mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the servers.

Table 694: DELETE SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH server group.						
LogonUsers	Body	<p>An array of objects containing information for the Linux logon(s) to update. The following information should be included:</p> <table border="1"><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.</td></tr></tbody></table> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.							

Table 695: DELETE SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td> </tr> </tbody> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Server Groups Access

The POST /SSH/ServerGroups/Access method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Tip: Before creating a logon to user mapping, be sure that you have switched the server group to which you will add your mapping to *inventory and publish policy* mode so that the key for the user will be published to the servers in the group. If the server group is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the servers.

Table 696: POST SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group.						
LogonUsers	Body	<p>Required. An array of objects containing information for the Linux logon (s) to update. The following information should be included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\jsmith"] }] </pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.							

Table 697: POST SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.34.5 SSH Service Accounts

The SSH Service Accounts component of the Keyfactor API includes methods necessary to retrieve, create, update, rotate and delete service accounts and associated keys in Keyfactor Command.

Table 698: SSH Service Accounts Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH service account with the specified ID.	DELETE SSH Service Accounts ID below
/id}	GET	Returns the SSH service account with the specified ID.	GET SSH Service Accounts ID on page 2227
/Key/{id}	GET	Returns the public key and optional private key of an SSH service account with the specified ID.	GET SSH Service Accounts Key ID on page 2234
/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	DELETE SSH Service Accounts on page 2238
/	GET	Returns a list of SSH service accounts based on the specified filters.	GET SSH Service Accounts on page 2240
/	POST	Creates a new SSH service account.	POST SSH Service Accounts on page 2248
/	PUT	Updates an existing SSH service account.	PUT SSH Service Accounts on page 2258
/Rotate/{id}	POST	Generates a new key pair for an existing service account.	POST SSH Service Accounts Rotate ID on page 2266

DELETE SSH Service Accounts ID

The DELETE /SSH/ServiceAccounts/{id} method is used to delete an SSH service account in Keyfactor Command, including its SSH key pair. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 699: DELETE SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID for the SSH service account to be deleted.</p> <p>Use the GET /SSH/ServiceAccounts method (see GET SSH Service Accounts on page 2240) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a GET /SSH/ServiceAccounts:</p> <pre data-bbox="586 680 1398 1514" style="background-color: #f5f5f5; padding: 10px; border-radius: 10px;"> { "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rx-t2qXwGp7qcVzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2023-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsrvr80.keyexample.com" } } </pre> </div> <p>It contains three IDs:</p> <ul style="list-style-type: none"> ID 2: The service account's ID. Use this one for delete requests. ID 7: The service account user's ID. ID 36: The ID of the service account user's key.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Service Accounts ID

The GET /SSH/ServiceAccounts/{id} method is used to retrieve an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account and its public key. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 2234](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/
OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 700: GET SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH service account to be retrieved. Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 2240) to retrieve a list of all the SSH service accounts to determine the service account's ID.

Table 701: GET SSH Service Accounts {id} Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).														
Server-Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See SSH Permissions on page 597 in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>GroupName</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>SyncSchedule</td> <td>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:
Name	Description														
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.														
Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
GroupName	A string indicating the name of the SSH server group.														
SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:

Name	Description										
	the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Service Accounts Key ID

The GET /SSH/ServiceAccounts/Key/{id} method is used to retrieve the key information for an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account key, including optional private key.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 702: GET SSH Service Accounts Key {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID for the SSH service account key for which to retrieve key information.</p> <p>Use the <code>GET /SSH/ServiceAccounts</code> method (see GET SSH Service Accounts on page 2240) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: Be sure to use the ID of the service account's key and not the ID of the service account itself or the service account user. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre data-bbox="747 714 1396 1596"> { "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rx-t2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2023-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsrvr80.keyexample.com" } } </pre> </div> <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. • ID 7: The service account user's ID.

Name	In	Description
		 <ul style="list-style-type: none"> ID 36: The ID of the service account user's key. Use this one to request the key.
IncludePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (True) or not (False). The default is <i>False</i> . If set to True, the X-Keyfactor-Key-Passphrase header must be supplied.
X-Keyfactor-Key-Passphrase	Header	Required *. A string that sets a password used to secure the private key of the SSH key pair for download. This field is required if <i>IncludePrivateKey</i> is set to <i>True</i> .

Table 703: GET SSH Service Accounts Key {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	A string indicating the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

DELETE SSH Service Accounts

The DELETE /SSH/ServiceAccounts method is used to delete one or more SSH service accounts in Keyfactor Command, including their SSH key pairs. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 704: DELETE SSH Service Accounts Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers indicating the Keyfactor Command reference IDs for the SSH service accounts to be deleted provided in the request body in the following format:</p> <pre data-bbox="565 428 1406 474">[4,12,17]</pre> <p>Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on the next page) to retrieve a list of all the SSH service accounts to determine the service accounts IDs.</p> <div data-bbox="516 625 1406 1740" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a GET /SSH/ServiceAccounts:</p> <pre data-bbox="656 785 1370 1724"> { "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsrvr80.keyexample.com" } } </pre> </div>

Name	In	Description
		 } <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. Use this one for delete requests. • ID 7: The service account user's ID. • ID 36: The ID of the service account user's key.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Service Accounts

The GET /SSH/ServiceAccounts method is used to retrieve one or more SSH service accounts defined in Keyfactor Command. Results can be limited to selected service accounts using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH service accounts and their public keys. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 2234](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /ssh/server_admin/
 OR
 /ssh/enterprise_admin/
 SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 705: GET SSH Service Accounts Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Service Account Key Search on page 553. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Comments (Key comments) • CreationDate • Id • KeyLength • KeyType • ServerGroup (Server Group ID) • ServerGroupName • Username
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 706: GET SSH Service Accounts Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).														
Server-Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See SSH Permissions on page 597 in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>GroupName</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>SyncSchedule</td> <td>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:
Name	Description														
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.														
Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
GroupName	A string indicating the name of the SSH server group.														
SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:

Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description										
	the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Service Accounts

The POST /SSH/ServiceAccounts method is used to create a new SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH service account.

Before adding a new SSH service account, be sure that you have added at least one server group (see [POST SSH Server Groups on page 2202](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 858](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>myapp@appsrvr75).</td> </tr> <tr> <td>LogonIds</td> <td>An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.</td> </tr> </tbody> </table>	Name	Description		myapp@appsrvr75).	LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.
Name	Description							
	myapp@appsrvr75).							
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.							
ClientHostname	Body	Required. A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. user-name@client_hostname). The naming convention is to use the hostname of the server on which the application that will use the private key resides (e.g. appsrvr12), but you can put anything you like in this field (e.g. cheesetoast).						
ServerGroupId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See SSH Permissions on page 597 in the <i>Keyfactor Command Reference Guide</i> for more information.						

Table 708: POST SSH Service Accounts Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).														
Server-Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See SSH Permissions on page 597 in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. Name	Description										
	the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST <code>/SSH/ServiceAccounts</code> method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT SSH Service Accounts

The PUT /SSH/ServiceAccounts method is used to update an existing SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH service account.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 709: PUT SSH Service Accounts Input Parameters

Name	In	Description								
KeyUpdateRequest	Body	<p>Required. An object that sets the information to include in the SSH service account key update request. Key update request information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>Required. An integer indicating the Keyfactor Command reference ID for the service account's key.</td> </tr> <tr> <td>Email</td> <td>Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its life-time.</td> </tr> <tr> <td>Comment</td> <td>A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</td> </tr> </tbody> </table>	Name	Description	Id	Required. An integer indicating the Keyfactor Command reference ID for the service account's key.	Email	Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its life-time.	Comment	A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.
Name	Description									
Id	Required. An integer indicating the Keyfactor Command reference ID for the service account's key.									
Email	Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its life-time.									
Comment	A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.									
Id	Body	<p>Required. An integer indicating the Keyfactor Command reference ID for the service account. Use the GET /SSH/ServiceAccounts method (see GET SSH Service Accounts on page 2240) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p>								

Table 710: PUT SSH Service Accounts Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).														
Server-Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See SSH Permissions on page 597 in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>GroupName</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>SyncSchedule</td> <td>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:
Name	Description														
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.														
Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 560 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
GroupName	A string indicating the name of the SSH server group.														
SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:

Name	Description										
	the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Service Accounts Rotate ID

The POST /SSH/ServiceAccounts/Rotate/{id} method is used to generate a new key pair in Keyfactor Command for an existing SSH service account. This method returns HTTP 200 OK on a success with details for the new key pair of the SSH service account, including the private key.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 711: GET SSH Service Accounts Rotate {id} Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID for the SSH service account key for which to retrieve key information. Use the <code>GET /SSH/ServiceAccounts</code> method (see GET SSH Service Accounts on page 2240) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre data-bbox="714 714 1396 1596"> { "Id": 2, "ClientHostname": "appsvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rx-t2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsvr- vr80.keyexample.com" } } </pre> </div> <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. Use this one to rotate the key.

Name	In	Description								
		<ul style="list-style-type: none"> • ID 7: The service account user's ID. • ID 36: The ID of the service account user's key. 								
KeyType	Body	<p>Required. A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>ECDSA</td> </tr> <tr> <td>2</td> <td>Ed25519</td> </tr> <tr> <td>3</td> <td>RSA</td> </tr> </tbody> </table>	Value	Description	1	ECDSA	2	Ed25519	3	RSA
Value	Description									
1	ECDSA									
2	Ed25519									
3	RSA									
PrivateKeyFormat	Body	<p>Required. A string indicating the format to use for the downloadable private key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>OpenSSH</td> </tr> <tr> <td>2</td> <td>PKCS8</td> </tr> </tbody> </table>	Value	Description	1	OpenSSH	2	PKCS8		
Value	Description									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<p>Required*. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and required if the <i>KeyType</i> is set to RSA.</p>								
Email	Body	<p>Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.</p>								
Password	Body	<p>Required. A string that sets a password used to secure the private key of the SSH key pair for download.</p>								
Comment	Body	<p>An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.</p>								

Table 712: GET SSH Service Accounts Rotate {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account key. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.34.6 SSH Users

The SSH Users component of the Keyfactor API includes methods necessary to retrieve, create, update, rotate, and delete users and associated keys in Keyfactor Command.

Table 713: SSH Users Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH user with the specified ID.	DELETE SSH Users ID below
/id}	GET	Returns the SSH user with the specified ID.	GET SSH Users ID on the next page
/	GET	Returns a list of SSH users based on the specified filters.	GET SSH Users on page 2276
/	POST	Creates a new SSH user.	POST SSH Users on page 2287
/	PUT	Updates an existing SSH user.	PUT SSH Users on page 2289
/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	POST SSH Users Access on page 2290

DELETE SSH Users ID

The DELETE /SSH/Users/{id} method is used to delete an SSH user in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssh/server_admin/

Table 714: DELETE SSH Users {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH user (user or service account) to be deleted. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 2276) to retrieve a list of all the SSH users to determine the user's ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Users ID

The GET /SSH/Users/{id} method is used to retrieve an SSH user defined in Keyfactor Command. The method can return either a *user* or a *service account*. See [SSH on page 525](#) in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. This method returns HTTP 200 OK on a success with details for the requested SSH user and its public key. To return an SSH private key, use the GET /SSH/Keys/MyKey method (see [GET SSH Keys My Key on page 2130](#)) for a user account or the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 2234](#)) for a service account.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/
OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the GET /SSH/Users/{id} method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 715: GET SSH Users {id} v2 Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH user (user or service account) to be retrieved. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 2276) to retrieve a list of all the SSH users to determine the user's ID.

Table 716: GET SSH Users {id} v2 Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																		
Key	An object containing information about the key for the user. Key details include: <table border="1" data-bbox="412 436 1403 1692"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td> </tr> <tr> <td>Fingerprint</td> <td>A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.</td> </tr> <tr> <td>PublicKey</td> <td>A string indicating the public key of the key pair for the SSH user.</td> </tr> <tr> <td>KeyType</td> <td>A string indicating the cryptographic algorithm used to generate the SSH key. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.		
Name	Description								
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.								
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.								
Username	A string indicating the full username of the user or service account. For a user account, the username appears in <code>DOMAIN\username</code> format (e.g. <code>KEYEXAMPLE\jsmith</code>). For a service account, the username is made up of the user name and <code>ClientHostname</code> entered when the service account is created (e.g. <code>myapp@appsrvr75</code>).								
Access	<p>An object containing information about the Linux logons mapped to the user. Linux logon mapping details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>KeyCount</td> <td>An integer indicating the number of SSH keys associated with the Linux logon.</td> </tr> <tr> <td>Access</td> <td>An object containing information about the users mapped to the Linux logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.	KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.	Access	An object containing information about the users mapped to the Linux logon.
Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.								
KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.								
Access	An object containing information about the users mapped to the Linux logon.								
IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).								

Version 1

Version 1 of the `GET /SSH/Users/{id}` method includes the same capabilities as version 2, but offers more limited information on returned logons for the user.

Table 717: GET SSH Users {id} v1 Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH user (user or service account) to be retrieved. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 2276) to retrieve a list of all the SSH users to determine the user's ID.

Table 718: GET SSH Users {id} v1 Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																		
Key	An object containing information about the key for the user. Key details include: <table border="1" data-bbox="414 441 1404 1690"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td> </tr> <tr> <td>Fingerprint</td> <td>A string indicating the fingerprint of the public key. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description						
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.						
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.						
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).						
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Users

The GET /SSH/Users method is used to retrieve one or more SSH users defined in Keyfactor Command. The method returns both *users* and *service accounts*. See [SSH on page 525](#) in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. Results can be limited to selected users using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH users and their public keys. To return the SSH private key, use the GET /SSH/Keys/MyKey method (see [GET SSH Keys My Key on page 2130](#)) for user accounts and the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 2234](#)) for service accounts.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the GET /SSH/Users method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 719: GET SSH Users v2 Input Parameters

Name	In	Description
showOwnedAccess	Query	<p>A Boolean that specifies whether to return only users that have logons on servers that the requesting user owns (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p>This option applies only to requesting users with <i>SSH User</i> or <i>SSH Server Admin</i> permissions; users with <i>SSH Enterprise Admin</i> permissions will see all users regardless of the configuration of this setting.</p> <p>Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 2162) or the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 2197) to determine ownership of a server or server group.</p> <div data-bbox="669 722 1406 1503" style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p> Example: Example Scenario One</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B but not on server A. <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave’s user record. She sees Dave’s user record, but sees no specific logon information for Dave (other than the LogonCount), because all Dave’s logons are on servers that Gina does not own.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave’s user record. Dave’s user record does not appear.</p> <p>The presence or absence of Dave’s user record is controlled by <i>showOwnedAccess</i>. The presence or absence of logon information associated with Dave’s user record is controlled by Gina’s level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p> </div> <div data-bbox="669 1524 1406 1755" style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p> Example: Example Scenario Two</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B and a logon on server A. </div>

Name	In	Description
		<p> Gina does a GET /SSH/Users with <i>showOwnedAccess=false</i> and looks at the results for Dave’s user record. She sees Dave’s user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Gina does a GET /SSH/Users with <i>showOwnedAccess=true</i> and looks at the results for Dave’s user record. She sees Dave’s user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Notice there is no difference here in the results whether you choose <i>true</i> or <i>false</i> because at least one logon for Dave is present on a server owned by Gina. The <i>showOwnedAccess</i> option only comes into play when a user has no logons on a server owned by the requesting user.</p> <p>The presence or absence of logon information associated with Dave’s user record is controlled by Gina’s level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p>
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: Using the SSH Server Search on page 583. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Email • Fingerprint • IsServiceAccount • KeyLength • KeyType • LogonCount • LogonServerGroupId • LogonServerId • ServiceAccountId • StaleDate

Name	In	Description
		<ul style="list-style-type: none"> Username
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 720: GET SSH Users v2 Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																		
Key	An object containing information about the key for the user. Key details include: <table border="1" data-bbox="414 441 1404 1690"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td> </tr> <tr> <td>Fingerprint</td> <td>A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.</td> </tr> <tr> <td>PublicKey</td> <td>A string indicating the public key of the key pair for the SSH user.</td> </tr> <tr> <td>KeyType</td> <td>A string indicating the cryptographic algorithm used to generate the SSH key. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.	Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.	PublicKey	A string indicating the public key of the key pair for the SSH user.	KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 	KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.	CreationDate	A string containing the date, in UTC, on which the SSH key pair was created.	StaleDate	A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.	Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																		
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																		
PublicKey	A string indicating the public key of the key pair for the SSH user.																		
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 																		
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																		
CreationDate	A string containing the date, in UTC, on which the SSH key pair was created.																		
StaleDate	A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.																		
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																		

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Comments</td> <td>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.</td> </tr> <tr> <td>LogonCount</td> <td>An integer indicating the number of Linux logons associated with the SSH key pair.</td> </tr> </tbody> </table>	Name	Description	Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.		
Name	Description								
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.								
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.								
Username	A string indicating the full username of the user or service account. For a user account, the username appears in <code>DOMAIN\username</code> format (e.g. <code>KEYEXAMPLE\jsmith</code>). For a service account, the username is made up of the user name and <code>ClientHostname</code> entered when the service account is created (e.g. <code>myapp@appsrvr75</code>).								
Access	<p>An object containing information about the Linux logons mapped to the user. Linux logon mapping details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>KeyCount</td> <td>An integer indicating the number of SSH keys associated with the Linux logon.</td> </tr> <tr> <td>Access</td> <td>An object containing information about the users mapped to the Linux logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.	KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.	Access	An object containing information about the users mapped to the Linux logon.
Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.								
KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.								
Access	An object containing information about the users mapped to the Linux logon.								
IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).								

Version 1

Version 1 of the `GET /SSH/Users` method includes the same capabilities as version 2, but offers more limited information on returned logons for the user.

Table 721: GET SSH Users v1 Input Parameters

Name	In	Description
showOwnedAccess	Query	<p>A Boolean that specifies whether to return only users that have logons on servers that the requesting user owns (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p>This option applies only to requesting users with <i>SSH User</i> or <i>SSH Server Admin</i> permissions; users with <i>SSH Enterprise Admin</i> permissions will see all users regardless of the configuration of this setting.</p> <p>Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 2162) or the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 2197) to determine ownership of a server or server group.</p> <div data-bbox="669 724 1404 1501" style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p> Example: Example Scenario One</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B but not on server A. <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave’s user record. She sees Dave’s user record, but sees no specific logon information for Dave (other than the LogonCount), because all Dave’s logons are on servers that Gina does not own.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave’s user record. Dave’s user record does not appear.</p> <p>The presence or absence of Dave’s user record is controlled by <i>showOwnedAccess</i>. The presence or absence of logon information associated with Dave’s user record is controlled by Gina’s level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p> </div> <div data-bbox="669 1522 1404 1753" style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p> Example: Example Scenario Two</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B and a logon on server A. </div>

Name	In	Description
		<p> Gina does a GET /SSH/Users with <i>showOwnedAccess=false</i> and looks at the results for Dave’s user record. She sees Dave’s user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Gina does a GET /SSH/Users with <i>showOwnedAccess=true</i> and looks at the results for Dave’s user record. She sees Dave’s user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Notice there is no difference here in the results whether you choose <i>true</i> or <i>false</i> because at least one logon for Dave is present on a server owned by Gina. The <i>showOwnedAccess</i> option only comes into play when a user has no logons on a server owned by the requesting user.</p> <p>The presence or absence of logon information associated with Dave’s user record is controlled by Gina’s level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p>
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 =eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: Using the SSH Server Search on page 583. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Email • Fingerprint • IsServiceAccount • KeyLength • KeyType • LogonCount • LogonServerGroupId • LogonServerId • ServiceAccountId • StaleDate

Name	In	Description
		<ul style="list-style-type: none"> Username
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 722: GET SSH Users v1 Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																		
Key	An object containing information about the key for the user. Key details include: <table border="1" data-bbox="414 441 1404 1690"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td> </tr> <tr> <td>Fingerprint</td> <td>A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.</td> </tr> <tr> <td>PublicKey</td> <td>A string indicating the public key of the key pair for the SSH user.</td> </tr> <tr> <td>KeyType</td> <td>A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 </td> </tr> <tr> <td>KeyLength</td> <td>An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Email</td> <td>A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.	Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.	PublicKey	A string indicating the public key of the key pair for the SSH user.	KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 	KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.	CreationDate	A string containing the date, in UTC, on which the SSH key pair was created.	StaleDate	A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.	Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																		
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																		
PublicKey	A string indicating the public key of the key pair for the SSH user.																		
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 																		
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																		
CreationDate	A string containing the date, in UTC, on which the SSH key pair was created.																		
StaleDate	A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 620 in the <i>Keyfactor Command Reference Guide</i> for more information.																		
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																		

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Comments</td> <td>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.</td> </tr> <tr> <td>LogonCount</td> <td>An integer indicating the number of Linux logons associated with the SSH key pair.</td> </tr> </tbody> </table>	Name	Description	Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description						
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.						
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.						
Username	A string indicating the full username of the user or service account. For a user account, the username appears in <code>DOMAIN\username</code> format (e.g. <code>KEYEXAMPLE\jsmith</code>). For a service account, the username is made up of the user name and <code>ClientHostname</code> entered when the service account is created (e.g. <code>myapp@appsrvr75</code>).						
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Users

The `POST /SSH/Users` method is used to create a new SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons during creation to allow the public key for the user to be published out to a Linux server—for servers in *inventory and publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/ssh/server_admin/`
 OR
`/ssh/enterprise_admin/`

SSH actions are affected by ownership on the server group with which user to login mappings are associated and limited for users with only the *Server Admin (/ssh/server_admin/)* role. For more information, see [SSH Permissions on page 597](#).

Table 723: POST SSH Users Input Parameters

Name	In	Description
Username	Body	<p>Required. A string indicating the full username of the <i>user</i> or <i>service account</i>.</p> <p>For a <i>user</i> account, the username is given in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a <i>service account</i>, the username is made up of a user name (e.g. svc_myapp) and client hostname reference for the service account. The client hostname is used for reference only and does not need to match an actual client hostname. The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast). The full service account name is given in the form username@clienthostname (e.g. svc_myapp@appsvr75).</p>
LogonIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">[12, 27, 39]</div> <p>Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 2147) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p>

Table 724: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT SSH Users

The PUT /SSH/Users method is used to update an existing SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons to allow the public key for the user to be published out to a Linux server—for servers in *inventory and publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

Table 725: PUT SSH Users Input Parameters

Name	In	Description
ID	Body	<p>Required. An integer indicating the Keyfactor Command reference ID of the SSH user.</p> <p>Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 2276) to retrieve a list of all the SSH users to determine the user's ID.</p>
LogonIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <pre>[12, 27, 39]</pre> <p>Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 2147) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p> <div style="border: 1px solid orange; padding: 5px; margin-top: 10px;"> <p>Important: Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see GET SSH Users on page 2276) before updating and provide both existing and new logon IDs.</p> </div>

Table 726: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

POST SSH Users Access

The POST /SSH/Users/Access method is used to create a mapping of one or more Linux logons to a Keyfactor Command user or service account. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /ssh/server_admin/
 OR
 /ssh/enterprise_admin/
 SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see [SSH Permissions on page 597](#).

 **Tip:** Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 727: POST SSH Users Access Input Parameters

Name	In	Description
ID	Body	<p>Required. An integer indicating the Keyfactor Command reference ID of the SSH user.</p> <p>Use the GET /SSH/Users method (see GET SSH Users on page 2276) to retrieve a list of all the SSH users to determine the user's ID.</p>
LogonIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <pre>[12, 27, 39]</pre> <p>Use the GET /SSH/Logons method (see GET SSH Logons on page 2147) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p> <div style="border: 1px solid orange; padding: 5px; background-color: #fff9e6;"> <p> Important: Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see GET SSH Users on page 2276) before updating and provide both existing and new logon IDs.</p> </div>

Table 728: POST SSH Users Access Response Data

LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the user or service account. For a user account, the username appears in <code>DOMAIN\username</code> format (e.g. <code>KEYEXAMPLE\jsmith</code>). For a service account, the username is made up of the user name and <code>ClientHostname</code> entered when the service account is created (e.g. <code>myapp@appsrvr75</code>).										
Access	<p>An object containing information about the Linux logons mapped to the user. Linux logon mapping details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>Username</td> <td>A string indicating the user's logon name on the Linux server.</td> </tr> <tr> <td>KeyCount</td> <td>An integer indicating the number of SSH keys associated with the Linux logon.</td> </tr> <tr> <td>Access</td> <td>An object containing information about the users mapped to the Linux logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.	Username	A string indicating the user's logon name on the Linux server.	KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.	Access	An object containing information about the users mapped to the Linux logon.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.										
Username	A string indicating the user's logon name on the Linux server.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.										
Access	An object containing information about the users mapped to the Linux logon.										
IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.35 SMTP

The SMTP component of the Keyfactor API includes methods necessary to programmatically edit and retrieve the SMTP configuration profile and send a test email message. Editing the SMTP configuration profile in Keyfactor Command will only apply within the software. Only one SMTP profile may be configured.

Table 729: SMTP Endpoints

Endpoint	Method	Description	Link
/	GET	Returns information about the SMTP configuration profile.	GET SMTP below
/	PUT	Updates settings for the SMTP configuration profile.	PUT SMTP on page 2296
/Test	POST	Sends a test email message to confirm SMTP configuration.	POST SMTP Test on page 2299

3.6.35.1 GET SMTP

The GET /SMTP method is used to retrieve the SMTP configuration profile from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SMTP profile. Only one profile may be configured. There are no input parameters for this method.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/system_settings/read/

Table 730: GET SMTP Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). This is considered deprecated and may be removed in a future release.						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.35.2 PUT SMTP

The PUT /SMTP method is used to update the SMTP configuration profile information. This method returns HTTP 200 OK on a success with details about the SMTP configuration profile.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/system_setting/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 731: PUT SMTP Input Parameters

Name	In	Description						
Host	Body	Required. A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	Required. An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	An integer indicating the type of authentication used to connect to the mail server. Possible values are: <table border="1" data-bbox="716 695 1403 890"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	Required* A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is required if <i>RelayAuthenticationType</i> is set to 2. No data is output in this field on a GET.						
RelayUsername	Body	Required* A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format. This field is required if <i>RelayAuthenticationType</i> is set to 2. For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.						
SenderAccount	Body	Required. A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	Body	Required. A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthentic-</i>						

Name	In	Description
		<i>ationType</i> .
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.

Table 732: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	An integer indicating the type of authentication used to connect to the mail server. Possible values are: <table border="1" data-bbox="581 919 1404 1115"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format. For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.35.3 POST SMTP Test

The POST /SMTP/Test method is used to test the SMTP settings by sending a test email message. This method returns HTTP 200 OK on a success with details about the SMTP profile.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/system_setting/modify/

Table 733: POST SMTP Test Input Parameters

Name	In	Description						
Host	Body	Required. A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	Required. An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	An integer indicating the type of authentication used to connect to the mail server. Possible values are: <table border="1" data-bbox="721 661 1404 856"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	Required* . A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is required if <i>RelayAuthenticationType</i> is set to 2. No data is output in this field on a GET.						
RelayUsername	Body	Required* . A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format. This field is required if <i>RelayAuthenticationType</i> is set to 2. For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.						
SenderAccount	Body	Required. A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	Body	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). This is considered deprecated and may be removed in a future						

Name	In	Description
		release.
SenderName	Body	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .
TestRecipient	Body	Required. A string indicating the recipient name, in email format (e.g. mjones@keyexample.com), for a test message to be sent using the SMTP configuration to confirm functionality.
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.

Table 734: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
TestRecipient	A string indicating the recipient name, in email format (e.g. mjones@keyexample.com), for a test message to be sent using the SMTP configuration to confirm functionality.						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.36 SSL

The SSL component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list SSL networks, network ranges, and endpoints found in an SSL scan.

Table 735: SSL Endpoints

Endpoint	Method	Description	Link
/Parts/{id}	GET	Returns detailed information about a scan job for SSL discovery or monitoring.	GET SSL Parts ID on page 2305
/Endpoints/{id}	GET	Returns the details about a single endpoint discovered during SSL scanning.	GET SSL Endpoints ID on page 2307
/NetworkRanges/{id}	DELETE	Removes all network ranges from the specified SSL network.	DELETE SSL NetworkRanges ID on page 2308
/NetworkRanges/{id}	GET	Returns network range information about the specified SSL network.	GET SSL NetworkRanges ID on page 2309
/Networks/{identifier}	GET	Returns information about the specified SSL network.	GET SSL Networks Identifier on page 2310
/	GET	Returns the results of an SSL scan based on query information.	GET SSL on page 2320
/Networks	GET	Returns information about all SSL networks in Keyfactor Command.	GET SSL Networks on page 2322
/Networks	POST	Creates a new SSL network.	POST SSL Networks on page 2333
/Networks	PUT	Updates an existing SSL network.	PUT SSL Networks on page 2347

Endpoint	Method	Description	Link
/Endpoints/{id}/History	GET	Returns a list of all the SSL scanning endpoint histories for an endpoint with the given ID.	GET SSL Endpoints ID History on page 2361
/Networks/{id}/Parts	GET	Returns the scan job information for SSL discovery or monitoring.	GET SSL Networks ID Parts on page 2366
/NetworkRanges	POST	Adds network ranges to the specified SSL network.	POST SSL NetworkRanges on page 2368
/NetworkRanges	PUT	Updates network range information on the specified SSL network.	PUT SSL NetworkRanges on page 2369
/Endpoints/ReviewStatus	PUT	Used to change the <i>reviewed</i> status for a given SSL endpoint.	PUT SSL Endpoints Review Status on page 2370
/Endpoints/MonitorStatus	PUT	Used to change the <i>monitoring</i> status for a given SSL endpoint.	PUT SSL Endpoints Monitor Status on page 2371
/Endpoints/ReviewAll	PUT	Used to change the <i>reviewed</i> status for all given SSL endpoints to true.	PUT SSL Endpoints Review All on page 2371
/Endpoints/MonitorAll	PUT	Used to change the <i>monitoring</i> status for all given SSL endpoints to true.	PUT SSL Endpoints Monitor All on page 2372
/Networks/{id}/Scan	POST	Starts an SSL discovery or monitoring scan job manually.	POST SSL Networks ID Scan on page 2373
/NetworkRanges/Validate	POST	Validates all SSL networks given.	POST SSL NetworkRanges Validate on page 2374
/Networks/{id}	DELETE	Removes an SSL network from Keyfactor Command.	DELETE SSL Networks ID on page 2375

3.6.36.1 GET SSL Parts ID

The GET /SSL/Parts/{id} method retrieves information for a specific job scan segment (see [GET SSL Networks ID Parts on page 2366](#)). This method returns HTTP 200 OK on a success with details about the specified scan job segment.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/read/

Table 736: GET SSL Parts {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL scan job segment to be retrieved. Use the <i>GET /SSL/Networks/{id}/Parts</i> method (see GET SSL Networks ID Parts on page 2366) to retrieve a list of all the scan job segments in an SSL network to determine the SSL scan job segment's GUID.

Table 737: GET SSL Parts {id} Response Data

Parameter Name	Description								
ScanJobPartId	A string indicating the Keyfactor Command reference GUID for the scan job segment.								
LogicalScanJobId	A string indicating the Keyfactor Command reference GUID for the scan job as a whole.								
AgentJobId	A string indicating the Keyfactor Command reference GUID for the orchestrator that ran the job segment, if applicable. If the segment has not yet started scanning, this will show all zeros.								
EstimatedEndpointCount	An integer indicating the number of endpoints that will be scanned for the segment estimated in preparation for scanning. The number of endpoints per segment is configurable (see the <i>SSL Maximum Scan Job Size</i> setting on the agents tab in Application Settings: Agents Tab on page 614 in the <i>Keyfactor Command Reference Guide</i>).								
Status	An integer indicating the status of the scan job segment. Possible values are: <table border="1" data-bbox="669 961 1404 1220"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Not Started</td> </tr> <tr> <td>2</td> <td>In Progress</td> </tr> <tr> <td>3</td> <td>Complete</td> </tr> </tbody> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StatTotalEndpointCount	An integer indicating the number of endpoints that were scanned for the segment. This value will be null if the scan is not yet complete.								
StatTimedOutConnectingCount	An integer indicating the number of endpoints that timed out while attempting connections. This value will be null if the scan is not yet complete.								
StatConnectionRefusedCount	An integer indicating the number of endpoints that received a connection refused while attempting connections. This value will be null if the scan is not yet complete.								
StatTimedOutDownloadingCount	An integer indicating the number of endpoints that timed out while downloading while attempting connections. This value will be null if the scan is not yet complete.								

Parameter Name	Description
StatExceptionDownloadingCount	An integer indicating the number of endpoints that encountered an exception while attempting connections. This value will be null if the scan is not yet complete.
StatNotSslCount	An integer indicating the number of endpoints that made a connection and were considered not SSL (connection on a non-SSL port such as 22 or 636). This value will be null if the scan is not yet complete.
StatBadSslHandshakeCount	An integer indicating the number of endpoints that had a bad handshake while attempting connections. This value will be null if the scan is not yet complete.
StatCertificateFoundCount	An integer indicating the number of endpoints where a certificate was found. This value will be null if the scan is not yet complete.
StatNoCertificateCount	An integer indicating the number of endpoints where the handshake got to the part of the TLS where a certificate should be returned, but did not find a certificate. This is an uncommon occurrence, so will usually be zero.
ScanJobPartsDefinitions	This is no longer in use and will always return "null".
StartTime	A string indicating the date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.
EndTime	A string indicating the date and time at which the scan job segment finished in UTC. For jobs that have not yet started, this value will be null.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.2 GET SSL Endpoints ID

The GET /SSL/Endpoints/{id} method is used to retrieve information about an endpoint found in an SSL discover or monitor scan using the EndpointId. This method returns HTTP 200 OK on a success with details of the SSL endpoints.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/read/

Table 738: GET SSL Endpoints {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL endpoint to be retrieved. Use the <i>GET /SSL</i> method (see GET SSL on page 2320) to retrieve a list of all the SSL endpoints to determine the SSL endpoint's GUID.

Table 739: GET SSL Endpoints {id} Response Data

Name	Description
EndpointId	A string indicating the Keyfactor Command reference GUID for the endpoint.
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network that scanned the endpoint.
LastHistoryId	A string indicating the Keyfactor Command reference GUID for the last history entry on the endpoint.
IpAddressBytes	A string indicating the IP address for the endpoint as bytes.
Port	An integer indicating the port on which this endpoint was found.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
EnableMonitor	A Boolean indicating whether monitoring is enabled on this endpoint (true) or not (false).
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.3 DELETE SSL NetworkRanges ID

The DELETE /SSL/NetworkRanges/{id} method is used to delete all the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no

content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/ssl/modify/`

 **Tip:** To delete some but not all of the network ranges for a network, use the `PUT /SSL/Networks` method to update the network and submit the request with only those network ranges you wish to retain (see [PUT SSL Networks on page 2347](#)).

Table 740: DELETE SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to delete network ranges. Use the <code>GET /SSL/Networks</code> method (see GET SSL Networks on page 2322) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.36.4 GET SSL NetworkRanges ID

The `GET /SSL/NetworkRanges/{id}` method is used to retrieve the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/ssl/read/`

Table 741: GET SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to retrieve network ranges. Use the <code>GET /SSL/Networks</code> method (see GET SSL Networks on page 2322) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 742: GET SSL Network Ranges {id} Response Data

Name	Description										
ItemType	An integer indicating the type of network range. Possible values are: <table border="1" data-bbox="402 373 1404 688"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>IP Address</td> </tr> <tr> <td>2</td> <td>Host Name</td> </tr> <tr> <td>3</td> <td>Network Notation</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	IP Address	2	Host Name	3	Network Notation
Value	Description										
0	Unknown										
1	IP Address										
2	Host Name										
3	Network Notation										
Value	A string indicating the value for the network range, including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).										

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.36.5 GET SSL Networks Identifier

The GET /SSL/Networks/{identifier} method is used to retrieve a defined SSL network according to the provided name from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SSL network.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/read/

Table 743: GET SSL Networks {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network to be retrieved. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 2322) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 744: GET SSL Networks {id} Response Data

Name	Description										
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See Orchestrator Pools Definition on page 470 for more information.										
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	<p>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #8bc34a; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #8bc34a; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
