The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.										
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.										

Name	Description																
DiscoverStatus	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.																

Name	Description
	<div style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; background-color: #e6f2ff;">  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array of objects providing the list of scheduled quiet hour periods.
BlackoutStart	<p>An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>
BlackoutEnd	<p>An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.6 GET SSL

The GET /SSL method is used to return a list of all discovered SSL endpoints, limited by the provided parameters. This method returns HTTP 200 OK on a success with details about the requested endpoints.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/read/

Table 745: GET SSL Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to: Using the Discovery Results Search Feature on page 474. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AgentPoolName</i> • <i>CertificateCN</i> • <i>CertificateFound</i> (True, False) • <i>Status</i> (6-Certificate Found, 1-Timed Out Connecting, 2-Exception Connecting, 3-Timed Out Downloading, 4-Exception Downloading, 5-Not SSL, 7-Exception in Sql, 8-Invalid or Unreachable Host, 9-Connection Refused, 10-Bad SSL Handshake, 11-Client Authentication Failed, 12-No Certificate, 13-SSL Refused, 14-Not Probed, 0-Unknown) • <i>IpAddress</i> • <i>IsMonitored</i> (True, False) • <i>IssuerDN</i> • <i>NetworkName</i> • <i>Port</i> • <i>ReverseDNS</i> • <i>Reviewed</i> (True, False) • <i>SelfSigned</i> (True, False) • <i>SNIName</i>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ReverseDNS</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 746: GET SSL Response Data

Name	Description
EndpointId	A string indicating the Keyfactor Command reference GUID for the endpoint.
ReverseDNS	A string indicating the DNS name resolved for the endpoint based on the discovered IP address. If a host name could not be resolved, this will be the IP address.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
IpAddress	A string indicating the IP address of the endpoint.
Port	An integer indicating the port at which the endpoint was found.
CertificateFound	A Boolean indicating whether a certificate was found at the endpoint (true) or not (false).
AgentPoolName	A string indicating the name of the orchestrator pool that performed a scan (discovery or monitoring) on the endpoint.
NetworkName	A string indicating the name of the SSL network that performed a scan (discovery or monitoring) on the endpoint.
MonitorStatus	A Boolean indicating whether the endpoint should be monitored (true) or not (false).
CertificateCN	A string indicating the common name of the certificate that was found at the endpoint.
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.7 GET SSL Networks

The GET /SSL/Networks method is used to retrieve one or more SSL networks from Keyfactor Command. Results can be limited to selected SSL networks using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified SSL networks.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/ssl/read/`

Table 747: GET SSL Networks Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Network Scan Details Search on page 467 . The query fields supported for this endpoint are: <ul style="list-style-type: none">• Name• Pool
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending. This field is optional.

Table 748: GET SSL Networks Response Data

Name	Description										
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See Orchestrator Pools Definition on page 470 for more information.										
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	<p>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #8bc34a; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #8bc34a; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #8bc34a; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.										
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.										

Name	Description																
DiscoverStatus	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.																

Name	Description
	 Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.
GetRobots	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array of objects providing the list of scheduled quiet hour periods.
BlackoutStart	<p>An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>
BlackoutEnd	<p>An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.8 POST SSL Networks

The POST /SSL/Networks method is used to create an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSL network.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/ssl/modify/

Table 749: POST SSL Networks Input Parameters

Name	In	Description										
NetworkId	Body	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	Required. A string indicating the name for the SSL network.										
AgentPoolName	Body	Required. A string indicating the name of the orchestrator pool assigned to the SSL network. See for more information.										
AgentPoolId	Body	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	Required. A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	Body	<p>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description																	
Day	The number of the day, in the month, to run the job.																	
ExactlyOnce	A dictionary that indicates a job scheduled to run at the time specified with the parameter:																	
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2023-11-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).													
Name	Description																	
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																	
DiscoverPercentComplete	Body	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.																

Name	In	Description																
		This field is for reference and is not configurable.																
Monit- orPer- centComplete	Bod- y	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
DiscoverStatus	Bod- y	An integer indicating the status of the discovery job. Possible values are: <table border="1" data-bbox="570 621 1403 1121"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
MonitorStatus	Bod- y	An integer indicating the status of the monitoring job. Possible values are: <table border="1" data-bbox="570 1209 1403 1709"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
Discov-	Bod-	A string indicating the date and time, in UTC, of the most recent discovery																

Name	In	Description
erLastScanned	y	job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.
Monit- orLastScanned	Bod- y	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.
SslAlertRecipients	Bod- y	An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs. <div style="border: 1px solid #007bff; border-radius: 10px; padding: 10px; background-color: #e6f2ff;">  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
GetRobots	Bod- y	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
Discov- erTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
Expir- ationAlertDays	Bod- y	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
MonitorJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
QuietHours	Bod- y	An array of objects providing the list of scheduled quiet hour periods. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; background-color: #f9f9f9;"> <pre>"QuietHours": [{ "StartDay": "Monday",</pre> </div>

Name	In	Description
		<pre> "StartTime": "2022-11-21T14:00:08Z", "EndDay": "Tuesday", "EndTime": "2022-11-22T14:00:08Z" }, { "StartDay": "Saturday", "StartTime": "2022-11-26T04:00:08Z", "EndDay": "Sunday", "EndTime": "2022-11-27T16:00:08Z" }] </pre>
BlackoutStart	Body	<p>An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>
BlackoutEnd	Body	<p>An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>

Table 750: POST SSL Networks Response Data

Name	Description
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.
Name	A string indicating the name for the SSL network.
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See Orchestrator Pools Definition on page 470 for more information.
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.
Description	A string indicating the description of the SSL network.
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.
DiscoverSchedule	An object providing the discovery schedule for the SSL network group.
MonitorSchedule	An object providing the monitoring schedule for the SSL network group.
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
DiscoverStatus	An integer indicating the status of the discovery job. Possible values are:

Name	Description																
	<table border="1"> <thead> <tr> <th data-bbox="597 275 906 338">Value</th> <th data-bbox="906 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="597 338 906 401">0</td> <td data-bbox="906 338 1398 401">Unknown</td> </tr> <tr> <td data-bbox="597 401 906 464">1</td> <td data-bbox="906 401 1398 464">Not Scheduled</td> </tr> <tr> <td data-bbox="597 464 906 527">2</td> <td data-bbox="906 464 1398 527">Running</td> </tr> <tr> <td data-bbox="597 527 906 590">3</td> <td data-bbox="906 527 1398 590">Previously Scanned</td> </tr> <tr> <td data-bbox="597 590 906 653">4</td> <td data-bbox="906 590 1398 653">Scheduled</td> </tr> <tr> <td data-bbox="597 653 906 716">5</td> <td data-bbox="906 653 1398 716">Disabled</td> </tr> <tr> <td data-bbox="597 716 906 779">6</td> <td data-bbox="906 716 1398 779">In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description

3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.																

Name	Description
	<div style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; background-color: #e6f2ff;">  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array of objects providing the list of scheduled quiet hour periods.
BlackoutStart	<p>An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>
BlackoutEnd	<p>An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.9 PUT SSL Networks

The PUT /SSL/Networks method is used to update an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSL network.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 751: PUT SSL Networks Input Parameters

Name	In	Description										
NetworkId	Body	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	Required. A string indicating the name for the SSL network.										
AgentPoolName	Body	Required. A string indicating the name of the orchestrator pool assigned to the SSL network. See for more information.										
AgentPoolId	Body	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	Required. A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	Body	<p>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.

Name	Description															
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).															
DiscoverPercentComplete	Body	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.														

Name	In	Description																
		This field is for reference and is not configurable.																
Monit- orPer- centComplete	Bod- y	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
DiscoverStatus	Bod- y	An integer indicating the status of the discovery job. Possible values are: <table border="1" data-bbox="570 621 1403 1121"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
MonitorStatus	Bod- y	An integer indicating the status of the monitoring job. Possible values are: <table border="1" data-bbox="570 1209 1403 1709"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
Discov-	Bod-	A string indicating the date and time, in UTC, of the most recent discovery																

Name	In	Description
erLastScanned	y	job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.
Monit- orLastScanned	Bod- y	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.
SslAlertRecipients	Bod- y	An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs. <div style="border: 1px solid #007bff; border-radius: 10px; padding: 10px; background-color: #e6f2ff;">  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
GetRobots	Bod- y	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
Discov- erTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
Expir- ationAlertDays	Bod- y	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
MonitorJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
QuietHours	Bod- y	An array of objects providing the list of scheduled quiet hour periods. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; background-color: #f0f0f0;"> <pre>"QuietHours": [{ "StartDay": "Monday",</pre> </div>

Name	In	Description
		<pre> "StartTime": "2022-11-21T14:00:08Z", "EndDay": "Tuesday", "EndTime": "2022-11-22T14:00:08Z" }, { "StartDay": "Saturday", "StartTime": "2022-11-26T04:00:08Z", "EndDay": "Sunday", "EndTime": "2022-11-27T16:00:08Z" }] </pre>
BlackoutStart	Body	<p>An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>
BlackoutEnd	Body	<p>An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>

Table 752: PUT SSL Networks Response Data

Name	Description
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.
Name	A string indicating the name for the SSL network.
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See Orchestrator Pools Definition on page 470 for more information.
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.
Description	A string indicating the description of the SSL network.
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.
DiscoverSchedule	An object providing the discovery schedule for the SSL network group.
MonitorSchedule	An object providing the monitoring schedule for the SSL network group.
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
DiscoverStatus	An integer indicating the status of the discovery job. Possible values are:

Name	Description																
	<table border="1"> <thead> <tr> <th data-bbox="597 275 906 338">Value</th> <th data-bbox="906 275 1403 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="597 338 906 401">0</td> <td data-bbox="906 338 1403 401">Unknown</td> </tr> <tr> <td data-bbox="597 401 906 464">1</td> <td data-bbox="906 401 1403 464">Not Scheduled</td> </tr> <tr> <td data-bbox="597 464 906 527">2</td> <td data-bbox="906 464 1403 527">Running</td> </tr> <tr> <td data-bbox="597 527 906 590">3</td> <td data-bbox="906 527 1403 590">Previously Scanned</td> </tr> <tr> <td data-bbox="597 590 906 653">4</td> <td data-bbox="906 590 1403 653">Scheduled</td> </tr> <tr> <td data-bbox="597 653 906 716">5</td> <td data-bbox="906 653 1403 716">Disabled</td> </tr> <tr> <td data-bbox="597 716 906 779">6</td> <td data-bbox="906 716 1403 779">In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown

MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th data-bbox="597 894 906 957">Value</th> <th data-bbox="906 894 1403 957">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="597 957 906 1020">0</td> <td data-bbox="906 957 1403 1020">Unknown</td> </tr> <tr> <td data-bbox="597 1020 906 1083">1</td> <td data-bbox="906 1020 1403 1083">Not Scheduled</td> </tr> <tr> <td data-bbox="597 1083 906 1146">2</td> <td data-bbox="906 1083 1403 1146">Running</td> </tr> <tr> <td data-bbox="597 1146 906 1209">3</td> <td data-bbox="906 1146 1403 1209">Previously Scanned</td> </tr> <tr> <td data-bbox="597 1209 906 1272">4</td> <td data-bbox="906 1209 1403 1272">Scheduled</td> </tr> <tr> <td data-bbox="597 1272 906 1335">5</td> <td data-bbox="906 1272 1403 1335">Disabled</td> </tr> <tr> <td data-bbox="597 1335 906 1398">6</td> <td data-bbox="906 1335 1403 1398">In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.																

Name	Description
	<div style="border: 1px solid #ccc; border-radius: 10px; background-color: #e6f2ff; padding: 10px;">  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array of objects providing the list of scheduled quiet hour periods.
BlackoutStart	<p>An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>
BlackoutEnd	<p>An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.10 GET SSL Endpoints ID History

The GET /SSL/Endpoints/{id}/History method is used to return a list of history found for a given SSL endpoint. URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the specified endpoint.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/read/

Table 753: GET SSL Endpoints {id} History Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL endpoint for which to return history information. Use the <i>GET /SSL</i> method (see GET SSL on page 2320) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 754: GET SSL Endpoints {id} History Response Data

Name	Description																																
HistoryId	A string indicating the Keyfactor Command reference GUID for the history entry.																																
EndpointId	A string indicating the Keyfactor Command reference GUID for the endpoint with which the history is associated.																																
AuditId	An integer indicating the Keyfactor Command ID used to track progress during scan jobs.																																
Timestamp	A string indicating the date and time the history entry was created.																																
Status	<p>An integer containing the status of the scan for which the history item was created. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>TimeOutConnecting</td> </tr> <tr> <td>2</td> <td>ExceptionConnecting</td> </tr> <tr> <td>3</td> <td>TimeoutDownloading</td> </tr> <tr> <td>4</td> <td>ExceptionDownloading</td> </tr> <tr> <td>5</td> <td>NotSsl</td> </tr> <tr> <td>6</td> <td>CertificateFound</td> </tr> <tr> <td>7</td> <td>ExceptionInSql</td> </tr> <tr> <td>8</td> <td>InvalidOrUnreachableHost</td> </tr> <tr> <td>9</td> <td>ConnectionRefused</td> </tr> <tr> <td>10</td> <td>BadSslHandshake</td> </tr> <tr> <td>11</td> <td>ClientAuthenticationFailed</td> </tr> <tr> <td>12</td> <td>NoCertificate</td> </tr> <tr> <td>13</td> <td>SslRefused</td> </tr> <tr> <td>14</td> <td>NotProbed</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	TimeOutConnecting	2	ExceptionConnecting	3	TimeoutDownloading	4	ExceptionDownloading	5	NotSsl	6	CertificateFound	7	ExceptionInSql	8	InvalidOrUnreachableHost	9	ConnectionRefused	10	BadSslHandshake	11	ClientAuthenticationFailed	12	NoCertificate	13	SslRefused	14	NotProbed
Value	Description																																
0	Unknown																																
1	TimeOutConnecting																																
2	ExceptionConnecting																																
3	TimeoutDownloading																																
4	ExceptionDownloading																																
5	NotSsl																																
6	CertificateFound																																
7	ExceptionInSql																																
8	InvalidOrUnreachableHost																																
9	ConnectionRefused																																
10	BadSslHandshake																																
11	ClientAuthenticationFailed																																
12	NoCertificate																																
13	SslRefused																																
14	NotProbed																																
JobType	An integer containing the type of scan job from which the history entry was created.																																

Name	Description												
	<p>The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Discovery</td> </tr> <tr> <td>2</td> <td>Monitoring</td> </tr> <tr> <td>3</td> <td>Compliance</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Discovery	2	Monitoring	3	Compliance		
Value	Description												
0	Unknown												
1	Discovery												
2	Monitoring												
3	Compliance												
ProbeType	<p>An integer containing the type of connection made to the endpoint for the scan from which the history entry was created. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>SSLv2</td> </tr> <tr> <td>3</td> <td>TLS</td> </tr> </tbody> </table>	Value	Description	2	SSLv2	3	TLS						
Value	Description												
2	SSLv2												
3	TLS												
ReverseDNS	<p>A string indicating the DNS name of the endpoint resolved based on the discovered IP address at the time the history entry was created. If a host name could not be resolved, this will be the IP address.</p>												
HistoryCertificates	<p>An array of objects indicating the certificates found at the endpoint during the scan from which the history entry was created. Information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the certificate.</td> </tr> <tr> <td>IssuedDN</td> <td>A string indicating the distinguished name of the certificate.</td> </tr> <tr> <td>SerialNumber</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>NotBefore</td> <td>A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.</td> </tr> <tr> <td>NotAfter</td> <td>A string indicating the date, in UTC, on which the certificate expires.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	IssuedDN	A string indicating the distinguished name of the certificate.	SerialNumber	A string indicating the serial number of the certificate.	NotBefore	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.	NotAfter	A string indicating the date, in UTC, on which the certificate expires.
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the certificate.												
IssuedDN	A string indicating the distinguished name of the certificate.												
SerialNumber	A string indicating the serial number of the certificate.												
NotBefore	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.												
NotAfter	A string indicating the date, in UTC, on which the certificate expires.												

Name	Description

ValueHash	A string indicating a hash of the SAN value.																																								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.11 GET SSL Networks ID Parts

The GET /SSL/Networks/{id}/Parts method returns a list of scan job segments for an SSL network defined in Keyfactor Command. This method returns HTTP 200 OK on a success with the scan job segments for the specified SSL network. The results will only include more than one segment if the SSL management job was broken up into segments due to the number of endpoints it contained. The number of endpoints per segment is configurable (see the *SSL Maximum Discovery Scan Job Size* and *SSL Maximum Monitoring Scan Job Size* settings in [Application Settings: Agents Tab on page 614](#)). The results from this method are of the currently in progress job or the latest completed job.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/read/

Table 755: GET SSL Networks {id} Parts Input Parameters

Name	In	Description
ID	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to retrieve scan job segments. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 2322) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Network Scan Details Search on page 467 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • Agent • EndTime • EndpointCount • Status • StartTime
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Status</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 756: GET SSL Networks {id} Parts Response Data

Name	Description								
ScanJobPartId	A string indicating the Keyfactor Command reference GUID for the scan job segment.								
Agent	A string indicating the client machine name of the orchestrator that ran the scan job segment.								
Status	An integer indicating the status of the scan job segment. Possible values are: <table border="1" data-bbox="467 562 1404 821"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Not Started</td> </tr> <tr> <td>2</td> <td>In Progress</td> </tr> <tr> <td>3</td> <td>Complete</td> </tr> </tbody> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StartTime	A string indicating the date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.								
EndTime	A string indicating the date and time at which the scan job segment finished in UTC. For jobs that are in progress, this value will be null.								
EndpointCount	An integer indicating the number of endpoints scanned for the segment.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.12 POST SSL NetworkRanges

The POST /SSL/NetworkRanges method is used to add network ranges to a specified SSL network. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/modify/

Table 757: POST SSL Network Ranges Input Parameters

Name	In	Description
NetworkId	Body	<p>Required. A string indicating the Keyfactor Command reference GUID for the SSL network.</p> <p>Use the GET /SSL/Networks method (see GET SSL Networks on page 2322) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.</p>
Ranges	Body	<p>Required. An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).</p> <p>For example:</p> <pre>"Ranges": ["192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443"]</pre>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.36.13 PUT SSL NetworkRanges

The PUT /SSL/NetworkRanges method is used to update network ranges for a specified SSL network. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 758: PUT SSL Network Ranges {id} Input Parameters

Name	In	Description
NetworkId	Body	<p>Required. A string indicating the Keyfactor Command reference GUID for the SSL network.</p> <p>Use the GET /SSL/Networks method (see GET SSL Networks on page 2322) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.</p>
Ranges	Body	<p>Required. An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).</p> <p>For example:</p> <pre>"Ranges": ["192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443"]</pre>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.36.14 PUT SSL Endpoints Review Status

The PUT /SSL/Endpoints/ReviewStatus method is used to update the reviewed status of the specified endpoint. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/modify/

Table 759: PUT SSL Endpoints Review Status Input Parameters

Name	In	Description
Id	Body	<p>Required. A string indicating the Keyfactor Command reference GUID for the endpoint to be updated.</p> <p>Use the GET /SSL method (see GET SSL on page 2320) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.</p>
Status	Body	<p>Required. A Boolean indicating whether the endpoint should be marked as reviewed (true) or not (false).</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.15 PUT SSL Endpoints Monitor Status

The PUT /SSL/Endpoints/MonitorStatus method is used to update the monitoring status of the specified endpoint. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/modify/

Table 760: PUT SSL Endpoints Monitor Status Input Parameters

Name	In	Description
Id	Body	Required. A string indicating the Keyfactor Command reference GUID for the endpoint to be updated. Use the <i>GET /SSL</i> method (see GET SSL on page 2320) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
Status	Body	Required. A Boolean indicating whether monitoring should be enabled on this endpoint (true) or not (false).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.16 PUT SSL Endpoints Review All

The PUT /SSL/Endpoints/ReviewAll method is used to update all endpoints in the given query to set the reviewed status to true. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/modify/

Table 761: PUT SSL Endpoints Review All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as reviewed (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as reviewed. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to: Using the Discovery Results Search Feature on page 474 .

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.36.17 PUT SSL Endpoints Monitor All

The PUT /SSL/Endpoint/MonitorAll method is used to update all endpoints in the given query to set the monitoring status to true. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/modify/

Table 762: PUT SSL Endpoints Monitor All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as monitored (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as monitored. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to: Using the Discovery Results Search Feature on page 474 .

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.36.18 POST SSL Networks ID Scan

The POST `/SSL/Networks/{id}/Scan` method is used to initiate a scan job for an SSL network defined in Keyfactor Command. A scan may be manually initiated for a configured network at any time that a scan is not already running for the network or the network is not in quiet hours. When you initiate a scan, you can choose whether to run a discovery scan, a monitoring scan, or both. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/ssl/modify/`

Table 763: POST SSL Networks {id} Scan Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network for which to initiate a manual scan. Use the <code>GET /SSL/Networks</code> method (see GET SSL Networks on page 2322) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
Discovery	Body	A Boolean indicating whether to initiate a manual discovery scan (true) or not (false).
Monitoring	Body	A Boolean indicating whether to initiate a manual monitoring scan (true) or not (false).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.36.19 POST SSL Networks ID Reset

The POST `/SSL/Networks/{id}/Reset` method is used to reset an SSL scan. Reset deletes all scan jobs, scan job parts, logical scan jobs, and current schedules associated with the selected network. The agent job status relating to the SSL scans is set to failed and completed, and the agent is forced to register for a new session. Afterward, *Scan Now* is enabled to allow you to initiate a manual scan. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

 /ssl/modify/

Table 764: POST SSL Networks {id} Reset Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network for which to reset. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 2322) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.36.20 POST SSL NetworkRanges Validate

The POST */SSL/NetworkRanges/Validate* method ensures that network ranges supplied in the request are of valid structure. This endpoint returns 204 with no content upon success. Use this method to test a proposed network range before using POST */SSL/NetworkRanges* or PUT */SSL/NetworkRanges* to configure it for an SSL network.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/read/

Table 765: POST SSL Network Ranges Validate Input Parameters

Name	In	Description
networkRangesToVerify	Body	Required. An array of strings indicating the network ranges to validate. For example: <pre>["10.5.4.0/24:443", "192.168.12.0/16:443,22", "keyexample.com:443"]</pre>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.36.21 DELETE SSL Networks ID

The DELETE /SSL/Networks/{id} method is used to delete an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/ssl/modify/

Table 766: DELETE SSL Networks {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network to be deleted. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 2322) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.37 Status

The Status component of the Keyfactor API includes methods necessary to retrieve the current list of Keyfactor API endpoints.

Table 767: Status Endpoints

Endpoint	Method	Description	Link
/Endpoints	GET	Returns a list of the Keyfactor API endpoints.	GET Status Endpoints below

3.6.37.1 GET Status Endpoints

The GET /Status/Endpoints method returns a list of all the endpoints currently available for use in the Keyfactor API. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)). This method returns HTTP 200 OK on a success with a list of all the API endpoints available in the Keyfactor API.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
None

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.38 Templates

The Templates component of the Keyfactor API includes methods necessary to programmatically edit, import and retrieve templates. Editing a template in Keyfactor Command will only apply within the software.

Table 768: Templates Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns information about the specified template.	GET Templates ID on the next page
/Settings	GET	Returns the global template policy settings.	GET Templates Settings on page 2395
/Settings	PUT	Sets global values for template policy.	PUT Templates Settings on page 2402
/SubjectParts	GET	Returns a list of supported subject parts for template regular expressions and default subjects.	GET Templates Subject Parts on page 2421
/	GET	Returns a list of templates.	GET Templates on page 2422
/	PUT	Updates selected settings for the specified template.	PUT Templates on page 2435
/Import	POST	Import templates from a specified configuration tenant into Keyfactor Command	POST Templates Import on page 2470

3.6.38.1 GET Templates ID

The GET /Templates/{id} method is used to retrieve a specified template from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the requested template.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_templates/read/

Table 769: GET Templates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer specifying the ID of the template in Keyfactor Command. Use the <i>GET /Templates</i> method (see GET Templates on page 2422) to retrieve a list of all the templates to determine the template ID.

Table 770: GET Templates {id} Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name>_<certificate profile name></i> . This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name> (<certificate profile name>)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as returned by the CA. This value is calculated based on the algorithms provided in the template from the CA (see <i>KeyAlgorithms</i>). The algorithm key types and sizes are evaluated in order (RSA, ECC, Ed448, and Ed25519) and from these, the minimum type and size is determined. For example, if the template supports RSA, Ed448, and Ed25519, the minimum key type will be evaluated to RSA. Then for that algorithm, the minimum key size returned by the CA will be selected (e.g. 2048 if 2048 and 4096 are returned for RSA). See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
KeyType	A string indicating the key type of the template as returned by the CA. See details under <i>KeySize</i> . See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
ForestRoot	A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable. <div style="border: 1px solid #007bff; border-radius: 10px; padding: 5px; background-color: #e6f2ff;">  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.

Name	Description										
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>AfterExpiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>FromIssuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued</p>										

Name	Description																
	<p>Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div data-bbox="479 359 1404 527" style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div> <p>The enrollment fields object contains the following parameters:</p> <table border="1" data-bbox="479 604 1404 1304" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th data-bbox="479 604 670 667">Name</th> <th data-bbox="670 604 1404 667">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="479 667 670 730">Id</td> <td data-bbox="670 667 1404 730">An integer indicating the ID of the custom enrollment field.</td> </tr> <tr> <td data-bbox="479 730 670 825">Name</td> <td data-bbox="670 730 1404 825">A string indicating the name of the custom enrollment field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table border="1" data-bbox="695 993 1380 1283" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th data-bbox="695 993 857 1056">Value</th> <th data-bbox="857 993 1380 1056">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="695 1056 857 1119">1</td> <td data-bbox="857 1056 1380 1119">String: A free-form data entry field.</td> </tr> <tr> <td data-bbox="695 1119 857 1283">2</td> <td data-bbox="857 1119 1380 1283">Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
MetadataFields	<p>An array of objects containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> • Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>. • The <i>default value</i> for the metadata field. • A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message. • For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p>																

Name	Description																
	<p>The metadata fields object contains the following parameters:</p> <table border="1" data-bbox="479 325 1391 1640"> <thead> <tr> <th data-bbox="485 333 709 396">Name</th> <th data-bbox="712 333 1385 396">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="485 401 709 489">Id</td> <td data-bbox="712 401 1385 489">An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.</td> </tr> <tr> <td data-bbox="485 493 709 581">DefaultValue</td> <td data-bbox="712 493 1385 581">A string containing the default value defined for the metadata field for the specific template.</td> </tr> <tr> <td data-bbox="485 585 709 674">MetadataId</td> <td data-bbox="712 585 1385 674">An integer indicating the global metadata field associated with the template-specific settings.</td> </tr> <tr> <td data-bbox="485 678 709 1295">Validation</td> <td data-bbox="712 678 1385 1295"> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. TemplateRegexes	<p>An array of objects containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see GET Templates Settings on page 2395. The template regular expression object contains the following parameters:</p> <table border="1"> <thead> <tr> <th data-bbox="480 825 643 888">Name</th> <th data-bbox="646 825 1401 888">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="480 892 643 982">TemplateId</td> <td data-bbox="646 892 1401 982">An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> <tr> <td data-bbox="480 987 643 1077">SubjectPart</td> <td data-bbox="646 987 1401 1077">A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td data-bbox="480 1081 643 1680">RegEx</td> <td data-bbox="646 1081 1401 1680"> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th data-bbox="670 1402 873 1493">Subject Part</th> <th data-bbox="876 1402 1377 1493">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="670 1497 873 1608">CN (Common Name)</td> <td data-bbox="876 1497 1377 1608">This regular expression specifies that the data entered in the field must consist of some number of characters in the first</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	TemplateId	An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th data-bbox="670 1402 873 1493">Subject Part</th> <th data-bbox="876 1402 1377 1493">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="670 1497 873 1608">CN (Common Name)</td> <td data-bbox="876 1497 1377 1608">This regular expression specifies that the data entered in the field must consist of some number of characters in the first</td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first
Name	Description												
TemplateId	An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.												
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th data-bbox="670 1402 873 1493">Subject Part</th> <th data-bbox="876 1402 1377 1493">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="670 1497 873 1608">CN (Common Name)</td> <td data-bbox="876 1497 1377 1608">This regular expression specifies that the data entered in the field must consist of some number of characters in the first</td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first

UseAllowedRequesters	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level</p>																

Name	Description
	<p>on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See Adding or Modifying a CA Record on page 354 for more information.</p>
AllowedRequesters	<p>An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.</p>
DisplayName	<p>A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.</p>
RFCEnforcement	<p>A Boolean indicating whether RFC 2818 compliance enforcement is enabled (<i>true</i>) or not (<i>false</i>). When this option is set to <i>true</i>, certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.</p>
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="479 1081 1404 1669" style="background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p>Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 437: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that</p>

Name	Description																																	
	<p>make up the key usage value include:</p> <table border="1" data-bbox="480 327 1403 1318"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> <tr> <td>4</td> <td>Key Certificate Signing</td> <td>The key can be used to sign certificates.</td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
ExtendedKeyUsages	<p>An array of objects containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table border="1" data-bbox="480 1570 1403 1734"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the extended key usage in Active Directory.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.																													
Name	Description																																	
Id	An integer indicating the ID of the extended key usage in Active Directory.																																	

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Oid</td> <td>A string containing the object ID of the extended key usage.</td> </tr> <tr> <td>DisplayName</td> <td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td> </tr> </tbody> </table>	Name	Description	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).
Name	Description						
Oid	A string containing the object ID of the extended key usage.						
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).						
Curve	<p>A string indicating the friendly name of the elliptic curve algorithm configured for the template returned from the CA, for ECC templates. Possible values include:</p> <ul style="list-style-type: none"> • P-256 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • P-384 1.3.132.0.34 = P-384/secp384r1 • P-521 1.3.132.0.35 = P-521/secp521r1 <p>If the template supports more than one curve, this field contains the minimum curve value.</p>						
AllowOneClick-Renewals	<p>A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false).</p> <p>If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see Certificate Template Operations on page 381 and Adding or Modifying a CA Record on page 354). For more information about one-click renewals, see Renew on page 69.</p>						
KeyTypes	<p>A string containing a comma-delimited list of the key sizes and types supported for the template returned from the CA as they are displayed in the Management Portal templates grid. Possible values include RSA 2048, ECC P-384, Ed25519, and Ed448.</p>						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.38.2 GET Templates Settings

The GET /Templates/Settings method is used to retrieve the global template policy settings Keyfactor Command. This method returns HTTP 200 OK on a success with details about the global template policy settings. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

 **Tip:** Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 2435](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_templates/read/

Table 771: GET Templates Settings Response Data

Name	Description										
TemplateRege- xes	<p>An array of objects containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Regular expression details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SubjectPa- rt</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td>RegEx</td> <td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lower-case letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one char-</p> </td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	SubjectPa- rt	A string indicating the portion of the subject the regular expression applies to (e.g. CN).  **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.38.3 PUT Templates Settings

The PUT /Templates/Settings method is used to create or update the global template policy settings in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the template policy settings.

 **Tip:** Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 2435](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

Note: Global template settings replaced and expanded upon select enrollment-related applications settings in release 10.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/certificate_templates/modify/`

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 772: PUT Templates Settings Input Parameters

Name	Description										
TemplateRege- xes	<p>An array of objects containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.38.4 GET Templates Subject Parts

The GET /Templates/SubjectParts method is used to retrieve a list of the certificate subject parts that are supported for regular expressions (TemplateRegexes) and defaults (TemplateDefaults). This method returns HTTP 200 OK on a success with the list of supported certificate subject part fields. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_templates/read/

Table 774: GET Templates Subject Parts Response Data

Name	Description
SubjectPart	A string indicating the supported subject part code (e.g. L for City/Locality).
SubjectPartName	A string containing a friendly name for the subject part (e.g. City/Locality).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.38.5 GET Templates

The GET /Templates method is used to retrieve one or more templates from Keyfactor Command. Results can be limited to selected templates using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified templates.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_templates/read/

Table 775: GET Templates Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Template Search Feature on page 406. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • AllowedEnrollmentType (1-PFX Enrollment, 2-CSR Enrollment, 3-CSR Generation, 0-None) • ConfigurationTenant • DisplayName • ForestRoot (deprecated) • FriendlyName • HasPrivateKeyRetention (True, False) • IsDefaultTemplate (True, False) • ShortName <div style="border: 1px solid #c8e6c9; padding: 10px; margin-top: 10px;"> <p> Tip: To filter out all the built-in Active Directory templates and display only your custom templates, use the following query:</p> <pre style="text-align: center;">IsDefaultTemplate -eq "false"</pre> <p>To filter out all templates that are not configured for either PFX Enrollment or CSR Enrollment, use the following query:</p> <pre style="text-align: center;">AllowedEnrollmentType -eq "3"</pre> <p>A value of 1 will filter out all templates except those configured for PFX Enrollment. A value of 2 will filter out all templates except those configured for CSR Enrollment.</p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .

Name	In	Description
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 776: GET Templates Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name>_<certificate profile name></i> . This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name> (<certificate profile name>)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as returned by the CA. This value is calculated based on the algorithms provided in the template from the CA (see <i>KeyAlgorithms</i>). The algorithm key types and sizes are evaluated in order (RSA, ECC, Ed448, and Ed25519) and from these, the minimum type and size is determined. For example, if the template supports RSA, Ed448, and Ed25519, the minimum key type will be evaluated to RSA. Then for that algorithm, the minimum key size returned by the CA will be selected (e.g. 2048 if 2048 and 4096 are returned for RSA). See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
KeyType	A string indicating the key type of the template as returned by the CA. See details under <i>KeySize</i> . See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
ForestRoot	A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable. <div style="border: 1px solid #007bff; border-radius: 10px; padding: 5px; background-color: #e6f2ff;">  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.

Name	Description										
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>AfterExpiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>FromIssuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued</p>										

Name	Description																
	<p>Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div data-bbox="477 359 1406 527" style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div> <p>The enrollment fields object contains the following parameters:</p> <table border="1" data-bbox="477 604 1406 1304" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th data-bbox="483 613 669 676">Name</th> <th data-bbox="669 613 1399 676">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="483 676 669 739">Id</td> <td data-bbox="669 676 1399 739">An integer indicating the ID of the custom enrollment field.</td> </tr> <tr> <td data-bbox="483 739 669 831">Name</td> <td data-bbox="669 739 1399 831">A string indicating the name of the custom enrollment field. Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table border="1" data-bbox="695 995 1380 1287" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th data-bbox="701 1003 857 1066">Value</th> <th data-bbox="857 1003 1373 1066">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="701 1066 857 1129">1</td> <td data-bbox="857 1066 1373 1129">String: A free-form data entry field.</td> </tr> <tr> <td data-bbox="701 1129 857 1278">2</td> <td data-bbox="857 1129 1373 1278">Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See Adding or Modifying a CA Record on page 354 for more information. Possible values are:</p>

TemplateRegexes	<p>An array of objects containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see GET Templates Settings on page 2395. The template regular expression object contains the following parameters:</p> <table border="1"> <thead> <tr> <th data-bbox="479 1129 643 1192">Name</th> <th data-bbox="647 1129 1398 1192">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="479 1199 643 1289">TemplateId</td> <td data-bbox="647 1199 1398 1289">An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> <tr> <td data-bbox="479 1295 643 1386">SubjectPart</td> <td data-bbox="647 1295 1398 1386">A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td data-bbox="479 1392 643 1692">RegEx</td> <td data-bbox="647 1392 1398 1692"> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> </td> </tr> </tbody> </table>	Name	Description	TemplateId	An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p>										
Name	Description																		
TemplateId	An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.																		
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).																		
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p>

Error	<p>A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression.</p> <p> Note: The error message already includes a leading string with the subject part (e.g. “Common Name:” or “Invalid CN provided:” depending on the interface used). Your custom message follows this.</p>												

Name	Description
UseAllowedRequesters	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See Adding or Modifying a CA Record on page 354 for more information.</p>
AllowedRequesters	<p>An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.</p>
DisplayName	<p>A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.</p>
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="479 1087 1404 1333" style="background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p>Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p> </div> <div data-bbox="548 1335 1058 1617" style="border: 1px solid #ccc; padding: 5px; margin: 10px auto; width: fit-content;"> </div> <p><i>Figure 438: Microsoft Issuance Requirements on a Template for Manager Approval</i></p>
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that</p>

Name	Description																																	
	<p>make up the key usage value include:</p> <table border="1" data-bbox="480 327 1401 1318"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> <tr> <td>4</td> <td>Key Certificate Signing</td> <td>The key can be used to sign certificates.</td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
ExtendedKeyUsages	<p>An array of objects containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table border="1" data-bbox="480 1566 1401 1734"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the extended key usage in Active Directory.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.																													
Name	Description																																	
Id	An integer indicating the ID of the extended key usage in Active Directory.																																	

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Oid</td> <td>A string containing the object ID of the extended key usage.</td> </tr> <tr> <td>DisplayName</td> <td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td> </tr> </tbody> </table>	Name	Description	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).
Name	Description						
Oid	A string containing the object ID of the extended key usage.						
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).						
AllowOneClick-Renewals	A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see Certificate Template Operations on page 381 and Adding or Modifying a CA Record on page 354). For more information about one-click renewals, see Renew on page 69 .						
KeyTypes	A string containing a comma-delimited list of the key sizes and types supported for the template returned from the CA as they are displayed in the Management Portal templates grid. Possible values include RSA 2048, ECC P-384, Ed25519, and Ed448.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.38.6 PUT Templates

The PUT /Templates method is used to update selected information about a certificate template. This method returns HTTP 200 OK on a success with details about the specified template.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_templates/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 777: PUT Templates Input Parameters

Name	In	Description										
Id	Body	Required. An integer indicating the ID of the template in Keyfactor Command.										
FriendlyName	Body	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	Body	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters: <div data-bbox="548 730 1404 1291" style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>AfterExpiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>Fromissuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table> </div>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	Fromissuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description											
None	The private key will not be retained.											
Indefinite	The private key will be retained until it is explicitly deleted.											
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.											
Fromissuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.											
KeyRetentionDays	Body	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	Body	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	Body	An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as: <ul style="list-style-type: none"> Preventing users from requesting invalid certificates, based on your 										

Name	In	Description																
		<p>specific certificate requirements per template.</p> <ul style="list-style-type: none"> • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div style="border: 1px solid #add8e6; padding: 5px; margin: 10px 0;"> <p> Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div> <p>The enrollment fields object contains the following parameters:</p> <table border="1" style="margin: 10px 0;"> <thead> <tr> <th data-bbox="553 800 743 863">Name</th> <th data-bbox="743 800 1398 863">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 863 743 957">Id</td> <td data-bbox="743 863 1398 957">An integer indicating the ID of the custom enrollment field.</td> </tr> <tr> <td data-bbox="553 957 743 1052">Name</td> <td data-bbox="743 957 1398 1052">A string indicating the name of the custom enrollment field. 		<pre> "Id": 3, "Name": "MyCustomField", "Options": ["Green", "Red", "Yellow", "Blue"], "DataType": 2 }] </pre>										
MetadataFields	Body	<p>An array of objects containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> • Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>. • The <i>default value</i> for the metadata field. • A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message. • For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.</td> </tr> <tr> <td>DefaultValue</td> <td>A string containing the default value defined for the metadata field for the specific template.</td> </tr> <tr> <td>MetadataId</td> <td>An integer indicating the global metadata field associated with the template-specific settings.</td> </tr> <tr> <td>Validation</td> <td>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <pre>^[a-zA-Z0-9'_.\.-]*@</pre> </td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.	Validation	A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <pre>^[a-zA-Z0-9'_.\.-]*@</pre>
Name	Description											
Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.											
DefaultValue	A string containing the default value defined for the metadata field for the specific template.											
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.											
Validation	A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <pre>^[a-zA-Z0-9'_.\.-]*@</pre>

TemplateRegexes	Body	<p>An array of objects containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see GET Templates Settings on page 2395. The template regular expression object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Template-Id</td> <td>In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> <tr> <td>SubjectPart</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td>RegEx</td> <td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> </td> </tr> </tbody> </table>	Name	Description	Template-Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p>						
Name	Description															
Template-Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.															
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).															
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p>

Name	In	Description
		<pre> "AllowKeyReuse": false, "AllowWildcards": true, "RFCEnforcement": true, "KeyInfo": { "ECDSA": { "bit_lengths": [256, 384, 521], "curves": ["1.2.840.10045.3.1.7", "1.3.132.0.34", "1.3.132.0.35"] }, "RSA": null, "Ed448": null, "Ed25519": null } </pre>
UseAllowedRequesters	Body	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See Adding or Modifying a CA Record on page 354 for more information.</p>
AllowedRequesters	Body	<p>An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template. For example:</p> <pre> "AllowedRequesters": ["Administrator", "Power Users", "Revokers"] </pre>

Name	In	Description																		
RequiresApproval	Body	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="553 394 1406 1020" style="background-color: #f4a460; padding: 10px; border-radius: 10px;"> <p> Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 439: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>																		
KeyUsage	Body	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1" data-bbox="553 1171 1406 1724"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> <tr> <td>4</td> <td>Key Certificate Signing</td> <td>The key can be used to sign certificates.</td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman</td> </tr> </tbody> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman
Value	Function	Description																		
0	None	No key usage parameters.																		
1	Encipherment Only	The key can be used for encryption only.																		
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																		
4	Key Certificate Signing	The key can be used to sign certificates.																		
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman																		

Name	In	Description																					
		<table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td></td> <td>key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description			key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																					
		key agreement algorithm.																					
16	Data Encipherment	The key can be used for data encryption.																					
32	Key Encipherment	The key can be used for key encryption.																					
64	Nonrepudiation	The key can be used for authentication.																					
128	Digital Signature	The key can be used as a digital signature.																					
32768	Decipherment Only	The key can be used for decryption only.																					
AllowOneClick-Renewals	Body	<p>A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see Certificate Template Operations on page 381 and Adding or Modifying a CA Record on page 354). For more information about one-click renewals, see Renew on page 69.</p>																					

Table 778: PUT Templates Response Body

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name>_<certificate profile name></i> . This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name> (<certificate profile name>)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as returned by the CA. This value is calculated based on the algorithms provided in the template from the CA (see <i>KeyAlgorithms</i>). The algorithm key types and sizes are evaluated in order (RSA, ECC, Ed448, and Ed25519) and from these, the minimum type and size is determined. For example, if the template supports RSA, Ed448, and Ed25519, the minimum key type will be evaluated to RSA. Then for that algorithm, the minimum key size returned by the CA will be selected (e.g. 2048 if 2048 and 4096 are returned for RSA). See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
KeyType	A string indicating the key type of the template as returned by the CA. See details under <i>KeySize</i> . See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
ForestRoot	A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable. <div style="border: 1px solid #007bff; border-radius: 10px; padding: 5px; background-color: #e6f2ff;">  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.

Name	Description										
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>AfterExpiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>FromIssuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued</p>										

Name	Description																
	<p>Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div data-bbox="479 359 1404 527" style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div> <p>The enrollment fields object contains the following parameters:</p> <table border="1" data-bbox="479 604 1404 1304" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th data-bbox="479 604 670 667">Name</th> <th data-bbox="670 604 1404 667">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="479 667 670 730">Id</td> <td data-bbox="670 667 1404 730">An integer indicating the ID of the custom enrollment field.</td> </tr> <tr> <td data-bbox="479 730 670 825">Name</td> <td data-bbox="670 730 1404 825">A string indicating the name of the custom enrollment field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
MetadataFields	<p>An array of objects containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> • Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>. • The <i>default value</i> for the metadata field. • A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message. • For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p>																

Name	Description																
	<p>The metadata fields object contains the following parameters:</p> <table border="1" data-bbox="480 327 1391 1638"> <thead> <tr> <th data-bbox="480 327 708 390">Name</th> <th data-bbox="714 327 1391 390">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="480 399 708 491">Id</td> <td data-bbox="714 399 1391 491">An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.</td> </tr> <tr> <td data-bbox="480 499 708 583">DefaultValue</td> <td data-bbox="714 499 1391 583">A string containing the default value defined for the metadata field for the specific template.</td> </tr> <tr> <td data-bbox="480 592 708 676">MetadataId</td> <td data-bbox="714 592 1391 676">An integer indicating the global metadata field associated with the template-specific settings.</td> </tr> <tr> <td data-bbox="480 684 708 1297">Validation</td> <td data-bbox="714 684 1391 1297"> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre data-bbox="792 905 1377 982">^[a-zA-Z0-9' _\. \-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> </td> </tr> <tr> <td data-bbox="480 1306 708 1638">Enrollment</td> <td data-bbox="714 1306 1391 1638"> <p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Name	Description																
Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.																
DefaultValue	A string containing the default value defined for the metadata field for the specific template.																
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.																
Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre data-bbox="792 905 1377 982">^[a-zA-Z0-9' _\. \-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>																
Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="737 1440 1369 1629"> <thead> <tr> <th data-bbox="737 1440 894 1503">Value</th> <th data-bbox="901 1440 1369 1503">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="737 1512 894 1629">0</td> <td data-bbox="901 1512 1369 1629">Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> </tbody> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.												
Value	Description																
0	Optional Users have the option to either enter a value or not enter a value in the field.																

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Message</td> <td>A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).</td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table>	Value	Description	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.	Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).
Name	Description												
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table>	Value	Description	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.						
Value	Description												
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.												
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.												
Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).												
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See Adding or Modifying a CA Record on page 354 for more information. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>CSR Enrollment & PFX Enrollment</td> </tr> <tr> <td>4</td> <td>CSR Generation</td> </tr> </tbody> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation
Value	Description												
0	None												
1	PFX Enrollment												
2	CSR Enrollment												
3	CSR Enrollment & PFX Enrollment												
4	CSR Generation												

Name	Description												
	<table border="1"> <thead> <tr> <th data-bbox="479 275 675 338">Value</th> <th data-bbox="678 275 1395 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="479 342 675 405">5</td> <td data-bbox="678 342 1395 405">CSR Generation & PFX Enrollment</td> </tr> <tr> <td data-bbox="479 409 675 472">6</td> <td data-bbox="678 409 1395 472">CSR Generation & CSR Enrollment</td> </tr> <tr> <td data-bbox="479 476 675 539">7</td> <td data-bbox="678 476 1395 539">CSR Enrollment, PFX Enrollment & CSR Generation</td> </tr> </tbody> </table>	Value	Description	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation				
Value	Description												
5	CSR Generation & PFX Enrollment												
6	CSR Generation & CSR Enrollment												
7	CSR Enrollment, PFX Enrollment & CSR Generation												
TemplateRegexes	<p>An array of objects containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see GET Templates Settings on page 2395. The template regular expression object contains the following parameters:</p> <table border="1"> <thead> <tr> <th data-bbox="479 821 643 884">Name</th> <th data-bbox="646 821 1395 884">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="479 888 643 982">TemplateId</td> <td data-bbox="646 888 1395 982">An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> <tr> <td data-bbox="479 987 643 1081">SubjectPart</td> <td data-bbox="646 987 1395 1081">A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td data-bbox="479 1085 643 1654">RegEx</td> <td data-bbox="646 1085 1395 1654"> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th data-bbox="667 1398 870 1493">Subject Part</th> <th data-bbox="873 1398 1373 1493">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="667 1497 870 1650">CN (Common Name)</td> <td data-bbox="873 1497 1373 1650">This regular expression specifies that the data entered in the field must consist of some number of characters in the first</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	TemplateId	An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th data-bbox="667 1398 870 1493">Subject Part</th> <th data-bbox="873 1398 1373 1493">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="667 1497 870 1650">CN (Common Name)</td> <td data-bbox="873 1497 1373 1650">This regular expression specifies that the data entered in the field must consist of some number of characters in the first</td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first
Name	Description												
TemplateId	An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.												
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th data-bbox="667 1398 870 1493">Subject Part</th> <th data-bbox="873 1398 1373 1493">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="667 1497 870 1650">CN (Common Name)</td> <td data-bbox="873 1497 1373 1650">This regular expression specifies that the data entered in the field must consist of some number of characters in the first</td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first								
Subject Part	Example												
CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first												

Name	Description												
	<table border="1"> <thead> <tr> <th data-bbox="464 273 639 336">Name</th> <th data-bbox="646 273 1414 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="464 344 639 1033"></td> <td data-bbox="646 344 1414 1033"> <table border="1"> <thead> <tr> <th data-bbox="652 352 873 457">Subject Part</th> <th data-bbox="880 352 1408 457">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="652 466 873 1033"></td> <td data-bbox="880 466 1408 1033"> <p>portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre data-bbox="941 651 1347 735">^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre data-bbox="941 840 1347 892">.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> <tr> <td data-bbox="652 1041 873 1453">O (Organization)</td> <td data-bbox="880 1041 1408 1453"> <p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre data-bbox="941 1197 1347 1270">^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash (“\”) but the comma does not.</p> </td> </tr> <tr> <td data-bbox="652 1461 873 1696">OU (Organization Unit)</td> <td data-bbox="880 1461 1408 1696"> <p>This regular expression requires that the organizational unit entered in the field be one of these four departments:</p> <pre data-bbox="941 1585 1347 1659">^(?:IT HR Accounting E-Commerce)\$</pre> </td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th data-bbox="652 352 873 457">Subject Part</th> <th data-bbox="880 352 1408 457">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="652 466 873 1033"></td> <td data-bbox="880 466 1408 1033"> <p>portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre data-bbox="941 651 1347 735">^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre data-bbox="941 840 1347 892">.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> <tr> <td data-bbox="652 1041 873 1453">O (Organization)</td> <td data-bbox="880 1041 1408 1453"> <p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre data-bbox="941 1197 1347 1270">^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash (“\”) but the comma does not.</p> </td> </tr> <tr> <td data-bbox="652 1461 873 1696">OU (Organization Unit)</td> <td data-bbox="880 1461 1408 1696"> <p>This regular expression requires that the organizational unit entered in the field be one of these four departments:</p> <pre data-bbox="941 1585 1347 1659">^(?:IT HR Accounting E-Commerce)\$</pre> </td> </tr> </tbody> </table>	Subject Part	Example		<p>portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre data-bbox="941 651 1347 735">^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre data-bbox="941 840 1347 892">.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>	O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre data-bbox="941 1197 1347 1270">^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash (“\”) but the comma does not.</p>	OU (Organization Unit)	<p>This regular expression requires that the organizational unit entered in the field be one of these four departments:</p> <pre data-bbox="941 1585 1347 1659">^(?:IT HR Accounting E-Commerce)\$</pre>

Use the <code>GET /Templates/SubjectParts</code> method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.	Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).				
Value	Description										
SubjectPart	A string indicating the portion of the subject the default applies to (e.g. L for City/Locality). Use the <code>GET /Templates/SubjectParts</code> method (see GET Templates Subject Parts on page 2421) to retrieve a list of all the supported subject parts.										
Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).										
TemplatePolicy	<p>An object containing the individual template-level template policy settings. Template policies defined on a template apply to enrollments made with that template only. Template-level policies, if defined, take precedence over system-wide template policies. For more information about system-wide template policies, see GET Templates Settings on page 2395. The template policy object contains the following parameters:</p> <table border="1" data-bbox="477 982 1404 1713"> <thead> <tr> <th data-bbox="483 991 755 1054">Value</th> <th data-bbox="755 991 1398 1054">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="483 1054 755 1150">TemplateId</td> <td data-bbox="755 1054 1398 1150"> The Keyfactor Command reference ID of the certificate template the policy is associated with. </td> </tr> <tr> <td data-bbox="483 1150 755 1310">AllowKeyReuse</td> <td data-bbox="755 1150 1398 1310"> A Boolean that indicates whether private key reuse is allowed (true) or not (false). UseAllowedRequesters	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level</p>														

Name	Description
	<p>on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See Adding or Modifying a CA Record on page 354 for more information.</p>
AllowedRequesters	<p>An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.</p>
DisplayName	<p>A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.</p>
RFCEnforcement	<p>A Boolean indicating whether RFC 2818 compliance enforcement is enabled (<i>true</i>) or not (<i>false</i>). When this option is set to <i>true</i>, certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.</p>
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="479 1081 1404 1675" style="border: 1px solid orange; padding: 10px; margin: 10px 0;"> <p>Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 440: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that</p>

16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
ExtendedKeyUsages	<p>An array of objects containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table border="1" data-bbox="480 1570 1403 1734"> <thead> <tr> <th data-bbox="480 1570 708 1629">Name</th> <th data-bbox="712 1570 1403 1629">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="480 1635 708 1734">Id</td> <td data-bbox="712 1635 1403 1734">An integer indicating the ID of the extended key usage in Active Directory.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.																													
Name	Description																																	
Id	An integer indicating the ID of the extended key usage in Active Directory.																																	

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Oid</td> <td>A string containing the object ID of the extended key usage.</td> </tr> <tr> <td>DisplayName</td> <td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td> </tr> </tbody> </table>	Name	Description	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).
Name	Description						
Oid	A string containing the object ID of the extended key usage.						
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).						
Curve	<p>A string indicating the friendly name of the elliptic curve algorithm configured for the template returned from the CA, for ECC templates. Possible values include:</p> <ul style="list-style-type: none"> • P-256 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • P-384 1.3.132.0.34 = P-384/secp384r1 • P-521 1.3.132.0.35 = P-521/secp521r1 <p>If the template supports more than one curve, this field contains the minimum curve value.</p>						
AllowOneClick-Renewals	<p>A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false).</p> <p>If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see Certificate Template Operations on page 381 and Adding or Modifying a CA Record on page 354). For more information about one-click renewals, see Renew on page 69.</p>						
KeyTypes	<p>A string containing a comma-delimited list of the key sizes and types supported for the template returned from the CA as they are displayed in the Management Portal templates grid. Possible values include RSA 2048, ECC P-384, Ed25519, and Ed448.</p>						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.38.7 POST Templates Import

The POST /Templates/Import method is used to import templates from a specified configuration tenant into Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_templates/modify/

Table 779: POST Templates Import Input Parameters

Name	Description
ConfigurationTenant	A string indicating the name of the configuration tenant from which to import.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.39 Workflow Certificates

The endpoints in Keyfactor Command that are found under /Workflow/Certificates refer to the process through which certificate requests that are require manager approval at the CA level before issuance are approved or denied. These endpoints provide the ability to obtain a list of pending certificate enrollment requests, and approve or deny current requests. Endpoints are also included to view denied and external validation requests.

 **Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 230](#)) are not managed with these endpoints. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 2487](#) and [Workflow Instances on page 2628](#)).

Table 780: Workflow Certificates Endpoints

Endpoint	Method	Description	Link
/Certificates/{id}	GET	Retrieve certificate request information for a single request.	GET Workflow Certificates ID on the next page
/Certificates/Denied	GET	Retrieve a list of denied certificate request(s).	GET Workflow Certi-

Endpoint	Method	Description	Link
			ificates Denied on page 2475
/Certificates/Pending	GET	Retrieve a list of outstanding pending certificate request(s).	GET Workflow Certificates Pending on page 2478
/Certificates/ExternalValidation	GET	Retrieve a list of certificate request(s) requiring external validation.	GET Workflow Certificates External Validation on page 2481
/Certificates/Approve	POST	Approve a list of pending certificate request(s).	POST Workflow Certificates Approve on page 2486
/Certificates/Deny	POST	Deny a list of pending certificate request(s).	POST Workflow Certificates Deny on page 2484

3.6.39.1 GET Workflow Certificates ID

The Workflow GET /Certificates/{id} method is used to return details for a certificate enrollment request stored within Keyfactor Command that requires manager approval at the CA level. This method returns HTTP 200 OK on a success with the specified certificate request. This method will return certificate requests with any state (e.g. Pending, Denied, External Validation).

 **Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 2487](#) and [Workflow Instances on page 2628](#)).

 **Note:** Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 781: GET Workflow Certificates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the ID of the certificate request to retrieve. Use the <i>GET /Workflow/Certificates/Pending</i> method (see GET Workflow Certificates Pending on page 2478) to retrieve a list of all the certificate requests to determine the certificate request ID.

Table 782: GET Workflow Certificates {id} Input Parameters

Name	Description
Id	<p>An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.</p> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 10px; background-color: #e6f2ff; margin-top: 10px;">  Note: The reference ID for the certificate request in Keyfactor Command does not necessarily match the reference ID for the issued certificate in Keyfactor Command. </div>
CARequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	<p>A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example:</p> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 5px; background-color: #e6f2ff; margin-top: 5px; text-align: center;"> corpca01.keyexample.com\CorpIssuingCA1 </div>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	<p>An integer indicating the request state of the certificate. The possible values are:</p> <ul style="list-style-type: none"> • Unknown (0) • Active (1) • Revoked (2) • Denied (3) • Failed (4) • Pending (5) • Certificate Authority (6) • Parent Certificate Authority (7) • External Validation (8)
StateString	A string indicating the request state of the certificate (e.g. Pending).

Name	Description								
Metadata	An object containing the metadata fields populated for the certificate request.								
DenialComment	A string containing the user-provided comment entered when the certificate request was denied.								
KeyLength	An integer indicating the key length of the certificate request.								
SANs	An array of strings listing the subject alternative name (SAN) elements of the certificate request.								
CertStores	<p>An array of objects containing the certificate store locations to which the certificate resulting from the request will be distributed once approved. Certificate store location data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EntryName</td> <td>A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.</td> </tr> <tr> <td>ClientMachine</td> <td>A string indicating the machine on which the certificate store is located.</td> </tr> <tr> <td>StorePath</td> <td>A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.</td> </tr> </tbody> </table>	Name	Description	EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.	ClientMachine	A string indicating the machine on which the certificate store is located.	StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.
Name	Description								
EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.								
ClientMachine	A string indicating the machine on which the certificate store is located.								
StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured used for the certificate request, for ECC certificate requests. Well-known OIDs include:</p> <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 								
SubjectAltNames	<p>An array of objects indicating the subject alternative name (SAN) elements for the certificate request. SAN data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td>A string indicating the value set for the SAN element.</td> </tr> <tr> <td>Type</td> <td>A string indicating the type of SAN element (e.g. DNS Name).</td> </tr> </tbody> </table>	Name	Description	Value	A string indicating the value set for the SAN element.	Type	A string indicating the type of SAN element (e.g. DNS Name).		
Name	Description								
Value	A string indicating the value set for the SAN element.								
Type	A string indicating the type of SAN element (e.g. DNS Name).								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.39.2 GET Workflow Certificates Denied

The GET /Workflow/Certificates/Denied method is used to return a list of denied certificate enrollment requests stored within Keyfactor Command for requests that required manager approval at the CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified denied certificate requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 2487](#) and [Workflow Instances on page 2628](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 783: GET Workflow Certificates Denied Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • CAHostname • CALogical • CommonName • Requester • RequestType (3-Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 3. • SubmissionDate • Template <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> Tip: For example, for recent denied requests from requester key_service:</p> <pre style="margin-left: 40px;">SubmissionDate -ge "2023-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 784: GET Workflow Certificates Denied Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin-top: 5px; background-color: #f9f9f9;"> corpca01.keyexample.com\CorpIssuingCA1 </div>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate. <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px; border-radius: 10px;">  Note: This method returns only requests with state 3 (denied). </div>
StateString	A string indicating the request state of the certificate (e.g. Pending). <div style="background-color: #e1f5fe; padding: 10px; margin-top: 10px; border-radius: 10px;">  Note: This method returns only requests with a Denied state. </div>
Metadata	An object containing the metadata fields populated for the certificate request.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.39.3 GET Workflow Certificates Pending

The GET /Workflow/Certificates/Pending method is used to return a list of pending certificate enrollment requests stored within Keyfactor Command for requests that require manager approval at the CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified pending certificate requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 2487](#) and [Workflow Instances on page 2628](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 785: GET Workflow Certificates Pending Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • CAHostname • CALogical • CommonName • Requester • RequestType (3-Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 5. • SubmissionDate • Template <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> Tip: For example, for recent pending requests from requester key_service:</p> <pre style="margin-left: 40px;">SubmissionDate -ge "2023-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .

Table 786: GET Workflow Certificates Pending Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin-top: 5px; background-color: #f9f9f9;">corpca01.keyexample.com\CorpIssuingCA1</div>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate. <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin-top: 5px; background-color: #e1f5fe;">  Note: This method returns only requests with state 5 (pending). </div>
StateString	A string indicating the request state of the certificate (e.g. Pending). <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin-top: 5px; background-color: #e1f5fe;">  Note: This method returns only requests with a Pending state. </div>
Metadata	An object containing the metadata fields populated for the certificate request.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.39.4 GET Workflow Certificates External Validation

The GET /Workflow/Certificates/ExternalValidation method is used to return a list of certificate enrollment requests requiring external validation (at the public CA level) stored within Keyfactor Command. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified certificate requests requiring external validation.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 2487](#) and [Workflow Instances on page 2628](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 787: GET Workflow Certificates External Validation Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • CAHostname • CALogical • CommonName • Requester • RequestType (3-Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 8. • SubmissionDate • Template <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> Tip: For example, for recent external validation requests from requester key_service:</p> <pre style="margin-left: 40px;">SubmissionDate -ge "2023-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 788: GET Workflow Certificates External Validation Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin-top: 5px; background-color: #f9f9f9;">corpca01.keyexample.com\\CorpIssuingCA1</div>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate. <div style="border: 1px solid #add8e6; border-radius: 15px; padding: 10px; margin-top: 10px; background-color: #e6f2ff;">  Note: This method returns only requests with state 8 (external validation). </div>
StateString	A string indicating the request state of the certificate (e.g. Pending). <div style="border: 1px solid #add8e6; border-radius: 15px; padding: 10px; margin-top: 10px; background-color: #e6f2ff;">  Note: This method returns only requests with an External Validation state. </div>
Metadata	An object containing the metadata fields populated for the certificate request.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.39.5 POST Workflow Certificates Deny

The POST /Workflow/Certificates/Deny method will attempt to deny the provided pending certificate enrollment request(s) that require manager approval at the CA level. This method returns HTTP 200 OK on a success with details about successful, failed and denied denial requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 2487](#) and [Workflow Instances on page 2628](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/requests/manage/

Table 789: POST Workflow Certificates Deny Input Parameters

Name	In	Description
CertificateRequestIds	Body	Required. An array of integers indicating the Keyfactor Command certificate request IDs for certificate requests that should be denied in the form: <pre>[23,45,12]</pre> Use the GET /Workflow/Certificates/Pending method (see GET Workflow Certificates Pending on page 2478) to retrieve a list of all the pending certificate requests to determine the certificate request's IDs.
Comment	Body	A string providing a comment regarding the denial. This comment can be delivered to the requester or other interested party using a denied request alert.

Table 790: POST Workflow Certificates Deny Response Data

Name	Description												
Successes	<p>An array of strings indicating the successful denial response details. Response details contain the following information:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CAHost</td> <td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CALogicalName</td> <td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CARequestId</td> <td>The row index of the certificate request in the certificate authority.</td> </tr> <tr> <td>KeyfactorRequestId</td> <td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td> </tr> <tr> <td>Comment</td> <td>A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denials will have alternate comments (see below).</td> </tr> </tbody> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARequestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denials will have alternate comments (see below).
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARequestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denials will have alternate comments (see below).												
Failures	An array of strings indicating the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of strings indicating the denial requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the deny.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.39.6 POST Workflow Certificates Approve

The POST /Workflow/Certificates/Approve method will attempt to approve the provided pending certificate enrollment request(s) that require manager approval at the CA level. This method returns HTTP 200 OK on a success with details about successful, failed and denied approval requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on the next page](#) and [Workflow Instances on page 2628](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/requests/manage/

Table 791: POST Workflow Certificates Approve Input Parameters

Name	In	Description
requestIds	Body	<p>Required. An array of integers indicating the Keyfactor Command certificate request IDs for certificate requests that should be approved in the form (without parameter name):</p> <pre>[23,45,12]</pre> <p>Use the GET /Workflow/Certificates/Pending method (see GET Workflow Certificates Pending on page 2478) to retrieve a list of all the certificate requests to determine the certificate request's IDs.</p>

Table 792: POST Workflow Certificates Approve Response Data

Name	Description												
Successes	<p>An array of strings indicating the successful approval response details. Response details contain the following information:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CAHost</td> <td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CALogicalName</td> <td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CARquestId</td> <td>The row index of the certificate request in the certificate authority.</td> </tr> <tr> <td>KeyfactorRequestId</td> <td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td> </tr> <tr> <td>Comment</td> <td>A reason or description about why the request denials succeeded, failed or were denied.</td> </tr> </tbody> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARquestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A reason or description about why the request denials succeeded, failed or were denied.
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARquestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A reason or description about why the request denials succeeded, failed or were denied.												
Failures	An array of strings indicating the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of strings indicating the approval requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the approval.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.40 Workflow Definitions

The Workflow Definitions component of the Keyfactor API includes methods necessary to programmatically create, edit, retrieve, and test workflow definitions. There are two types of workflow definition:

- Global

The global workflow definitions are built into the product and cannot be deleted, though they can be modified to add workflow steps, if desired. Global workflow definitions do not have a specific associated *key*—in the case of the currently available workflows, this is a *certificate template*—and apply to all requests of the workflow’s type (e.g. enrollment) that are not otherwise handled by a custom workflow specifying a key.

- Custom

Custom workflow definitions are any additional workflow definitions you define beyond the built-in ones. Custom workflows are associated with a specific *key* (certificate template or certificate collection) and each workflow only applies to requests made using that key.

All enrollment, certificate renewal, and revocation requests go through workflow even if you haven’t created any workflow steps or added any custom workflow definitions. In the absence of customization, the global workflow definitions are used. Monitoring certificate collections on a periodic basis for certificates that change membership status based on the query criteria of a specified certificate collection can be configured to flow through workflow as well, but there are no global workflows for these.

For more information about workflows, see [Workflow Definitions on page 230](#) in the *Keyfactor Command Reference Guide*.

Table 793: Workflow Definitions Endpoints

Endpoint	Method	Description	Link
/Steps/{extensionName}	GET	Returns information about the structure of the workflow definition step with the specified name.	GET Workflow Definitions Steps Extension Name on the next page
/{definitionId}	DELETE	Deletes the workflow definition with the specified GUID.	DELETE Workflow Definitions Definition ID on page 2494
/{definitionId}	GET	Returns details of the workflow definition, including steps, for the workflow with the specified GUID.	GET Workflow Definitions Definition ID on page 2494
/{definitionId}	PUT	Updates the name and description of the workflow definition with the specified GUID.	PUT Workflow Definitions Definition ID on page 2518
/	GET	Returns a list of workflow definitions, without steps.	GET Workflow Definitions on page 2542
/	POST	Creates a new workflow definition, without steps.	POST Workflow Definitions on page 2545
/Steps	GET	Returns information about the	GET Workflow Defin-

Endpoint	Method	Description	Link
		structure of the workflow definitions.	itions Steps on page 2570
/Types	GET	Returns a list of the defined workflow definition types.	GET Workflow Definitions Types on page 2576
//{definitionId}/Steps	PUT	Updates the workflow definition with the specified GUID to add new steps or modify existing steps.	PUT Workflow Definitions Definition ID Steps on page 2579
//{definitionId}/Publish	POST	Publishes the workflow definition with the specified GUID to activate it for use.	POST Workflow Definitions Definition ID Publish on page 2604

3.6.40.1 GET Workflow Definitions Steps Extension Name

The GET `/Workflow/Definitions/Steps/{extensionName}` method is used to retrieve the workflow definition step structure for the step with the specified `extensionName`. Its primary use case is to populate the UI dialog in which step information is configured. When you are developing a custom workflow step, it can be used to confirm that the workflow step will display correctly in the UI. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition step.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/workflows/definitions/read/

Table 794: GET Workflow Definitions Steps {extensionName} Input Parameters

Name	In	Description
extensionName	Path	Required. A string indicating the <code>extensionName</code> of the workflow definition step to retrieve. Use the <code>GET /Workflow/Definitions/Steps</code> method (see GET Workflow Definitions Steps on page 2570) to retrieve a list of all the workflow definition steps to determine the <code>extensionName</code> .

Table 795: GET Workflow Definitions Steps {extensionName} Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> • Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> • PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> • ConvertFrom-Csv • ConvertFrom-Json • ConvertFrom-Markdown • ConvertFrom-SddlString • ConvertFrom-StringData • ConvertTo-Csv • ConvertTo-Html • ConvertTo-Json • ConvertTo-Xml • ForEach-Object • Get-Command • Where-Object • CustomPowerShell <p>Run a PowerShell script that has been imported into the Keyfactor Command database. All scripts in the database that have been configured with the workflow category will be available for use. See Extensions Scripts on page 1704 for</p>

Name	Description
	<p>adding scripts to the database.</p> <ul style="list-style-type: none"> RequireApproval Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this. <div data-bbox="730 745 1404 913" style="background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p> Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration Authorization Methods Tab on page 367.</p> </div> <div data-bbox="730 934 1404 1123" style="background-color: #a8c9e8; padding: 10px; border-radius: 10px;"> <p> Note: The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request.</p> </div> <div data-bbox="730 1144 1404 1386" style="background-color: #a8d8b8; padding: 10px; border-radius: 10px;"> <p> Tip: The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see Issued Request Alert Operations on page 189).</p> </div> <ul style="list-style-type: none"> RESTRequest Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file. OAuthRESTRequest Run a REST (API) request using an identity provider other than Active Directory and Token authentication. The REST request contents are embedded within the step. It does not call out to an external file.

Name	Description
	<ul style="list-style-type: none"> EnrollmentAgent (Enrollment Only) <p>On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.</p> <p>For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the <i>Enrollment Agent</i> template or the <i>Enrollment Agent (Computer)</i> template) and must have a Certificate Request Agent EKU. Note that the built-in <i>Enrollment Agent</i> and <i>Enrollment Agent (Computer)</i> templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.</p> <div data-bbox="727 1192 1404 1381" style="border: 1px solid orange; border-radius: 10px; padding: 10px; background-color: #ffe4c4;"> <p> Important: This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.</p> </div> SubjectFormatter (Enrollment Only) <p>On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the <i>Build from this Active Directory information</i> option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template, which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template</p>

Name	Description
	<p>configured with the subject as <i>Build from this Active Directory information</i> must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.</p> <div data-bbox="727 495 1406 793" style="background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p> Important: The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the <i>Keyfactor Windows Enrollment Gateway Installation and Configuration Guide</i>.</p> </div> <ul style="list-style-type: none"> • EnrollStep Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step. • NOOPStep An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow. • RevokeStep Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.
Outputs	An array of strings containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow.
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.40.2 DELETE Workflow Definitions Definition ID

The DELETE /Workflow/Definitions/{definitionid} method is used to delete the workflow definition with the specified GUID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/workflows/definitions/modify/

 **Note:** The built-in global workflow definitions (*Global Revocation Workflow* and *Global Enrollment Workflow*) cannot be deleted. A workflow definition cannot be deleted if there is an active or suspended workflow instance for the workflow definition.

Table 796: DELETE Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to delete. Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 2542) to retrieve a list of all the workflow definitions to determine the GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.40.3 GET Workflow Definitions Definition ID

The GET /Workflow/Definitions/{definitionid} method is used to retrieve the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the specified workflow definition.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/workflows/definitions/read/

Table 797: GET Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to retrieve. Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 2542) to retrieve a list of all the workflow definitions to determine the GUID.
definitionVersion	Query	An integer indicating which version of the workflow definition to return. The default is to return the most recent version (which may not necessarily be the published version).
exportable	Query	A Boolean indicating whether any security RoleIds (see Security Roles on page 2081) in the workflow definition should be removed from the response (true) or not (false). A value of <i>true</i> allows for the workflow definition to be exported without role-specific data. The default is <i>false</i> .

Table 798: GET Workflow Definitions {definitionsid} Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

Name	Description										
	<ul style="list-style-type: none"> • Revocation <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table border="1" data-bbox="363 600 1398 1696"> <thead> <tr> <th data-bbox="370 609 557 663">Name</th> <th data-bbox="557 609 1391 663">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="370 663 557 758">Id</td> <td data-bbox="557 663 1391 758">A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td> </tr> <tr> <td data-bbox="370 758 557 821">DisplayName</td> <td data-bbox="557 758 1391 821">A string indicating the display name for the step.</td> </tr> <tr> <td data-bbox="370 821 557 951">UniqueName</td> <td data-bbox="557 821 1391 951">A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td> </tr> <tr> <td data-bbox="370 951 557 1688">ExtensionName</td> <td data-bbox="557 951 1391 1688"> <p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none"> • Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> • PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> • ConvertFrom-Csv • ConvertFrom-Json • ConvertFrom-Markdown </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step. Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).										
Value	Description																
Id	A string indicating the Keyfactor Command reference GUID of the condition.																
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).																
Outputs	An object indicating the next step in the workflow. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>continue</td> <td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td> </tr> </tbody> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.												
Value	Description																
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.																
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.																
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.																

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.40.4 PUT Workflow Definitions Definition ID

The PUT `/Workflow/Definitions/{definitionid}` method is used to update the name and description for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/workflows/definitions/modify/

Tip: A given workflow can only apply to one key. If you need to run the same workflow steps for more than one key (e.g. the same enrollment steps for more than one template), you can either add these steps to the global workflow or, if you want to run the steps for more than one type of enrollment, for example, but not all, you can configure one custom workflow and then export and re-import that workflow to duplicate it (see [PUT Workflow Definitions Definition ID on the previous page](#)) and edit the copy to change the key.

Note: If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 799: PUT Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	Body	Required. A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.

Table 800: PUT Workflow Definitions {definitionid} Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

Name	Description										
	<ul style="list-style-type: none"> • Revocation <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table border="1" data-bbox="365 598 1398 1696"> <thead> <tr> <th data-bbox="365 598 557 661">Name</th> <th data-bbox="557 598 1398 661">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="365 661 557 758">Id</td> <td data-bbox="557 661 1398 758">A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td> </tr> <tr> <td data-bbox="365 758 557 821">DisplayName</td> <td data-bbox="557 758 1398 821">A string indicating the display name for the step.</td> </tr> <tr> <td data-bbox="365 821 557 951">UniqueName</td> <td data-bbox="557 821 1398 951">A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td> </tr> <tr> <td data-bbox="365 951 557 1696">ExtensionName</td> <td data-bbox="557 951 1398 1696"> <p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none"> • Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> • PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> • ConvertFrom-Csv • ConvertFrom-Json • ConvertFrom-Markdown </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.	ExtensionName	<p>A string indicating the type of step. Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.										
DisplayName	A string indicating the display name for the step.										
UniqueName	A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.										
ExtensionName	<p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none"> • Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> • PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> • ConvertFrom-Csv • ConvertFrom-Json • ConvertFrom-Markdown

	<div style="border: 1px solid #add8e6; padding: 5px; margin-bottom: 10px;">  Note: The \$(requester:mail) substitutable special text token is only supported in environments using Active Directory as an identity provider. </div> <ul style="list-style-type: none"> Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress). 														
ApprovalEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is approved.														
ApprovalEmailMessage	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. See Table 11: Tokens for Workflow Definitions for a complete list of available tokens.														
ApprovalEmailRecipients	An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"> \$(requester:mail) The certificate requester, based on

This value will be null for the final step in the chain.												
Value	Description																
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.																
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.																
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.																

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.40.5 GET Workflow Definitions

The GET /Workflow/Definitions method is used to retrieve the list of workflow definitions. This method returns HTTP 200 OK on a success with high level information about the workflow definitions. Use the GET /Workflow/Definitions/{definitionid} method (see [GET Workflow Definitions Definition ID on page 2494](#)) to return details including the workflow steps.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/workflows/definitions/read/`

Table 801: GET Workflow Definitions Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Workflow Definitions Search Feature on page 303 . The query fields supported for this endpoint are: <ul style="list-style-type: none">• DisplayName• Id• IsPublished (true or false)• WorkflowType (CertificateEnteredCollection, CertificateLeftCollection, Enrollment, or Revocation)
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 802: GET Workflow Definitions Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> <p>• CertificateEnteredCollection</p> <p>The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.</p> <p>For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.</p> <p>• CertificateLeftCollection</p> <p>The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.</p> <p>For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.</p> <p>• Enrollment (Including Renewals)</p> <p>The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.</p> <p>• Revocation</p> <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>

Name	Description
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
PublishedVersion	An integer indicating the currently published version number of the workflow definition.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.40.6 POST Workflow Definitions

The POST /Workflow/Definitions method is used to create a new workflow definition without any steps. To add steps to the workflow, use the PUT /Workflow/Definitions/{definitionId}/Steps method (see [PUT Workflow Definitions Definition ID Steps on page 2579](#)). This method returns HTTP 200 OK on a success with details about the workflow definition.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/workflows/definitions/modify/

 **Tip:** A given workflow can only apply to one key. If you need to run the same workflow steps for more than one key (e.g. the same enrollment steps for more than one template), you can either add these steps to the global workflow or, if you want to run the steps for more than one type of enrollment, for example, but not all, you can configure one custom workflow and then export and re-import that workflow to duplicate it (see [POST Workflow Definitions above](#)) and edit the copy to change the key.

Table 803: POST Workflow Definitions Input Parameters

Name	In	Description
DisplayName	Body	Required. A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.
Key	Body	<p>Required. A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i>. If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i>, this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i>, this field will contain the Keyfactor Command reference ID for the certificate collection.</p> <p>Use the GET /Templates method (see GET Templates on page 2422) to retrieve a list of your certificate templates to determine the template ID.</p> <p>Use the GET /CertificateCollections method (see GET Certificate Collections on page 1296) to retrieve a list of your certificate collections to determine the collection ID.</p> <p>This field cannot be modified on an edit.</p>
KeyDisplayName	Body	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
WorkflowType	Body	<p>Required. A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a

Name	In	Description
		<p>support ticket request to investigate the removal of a web server certificate.</p> <ul style="list-style-type: none"> Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field. <p>This field cannot be modified on an edit.</p>

Table 804: POST Workflow Definitions Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this. <div data-bbox="618 1297 1382 1465" style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration Authorization Methods Tab on page 367.</p> </div> <div data-bbox="618 1486 1382 1654" style="background-color: #a8c9e6; padding: 10px; border-radius: 5px;"> <p> Note: The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request.</p> </div>

Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).										
Value	Description																
Id	A string indicating the Keyfactor Command reference GUID of the condition.																
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).																
Outputs	An object indicating the next step in the workflow. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>continue</td> <td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td> </tr> </tbody> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.												
Value	Description																
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.																
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.																
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.																

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.40.7 GET Workflow Definitions Steps

The GET /Workflow/Definitions/Steps method is used to retrieve the workflow definition step structure for the workflow definition steps. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition steps.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/workflows/definitions/read/`

Table 805: GET Workflow Definitions Steps Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Workflow Definitions Search Feature on page 303 . The query fields supported for this endpoint are: <ul style="list-style-type: none">• DisplayName• ExtensionName• SupportedWorkflowTypes
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 806: GET Workflow Definitions Steps Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> • Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> • PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> • ConvertFrom-Csv • ConvertFrom-Json • ConvertFrom-Markdown • ConvertFrom-SddlString • ConvertFrom-StringData • ConvertTo-Csv • ConvertTo-Html • ConvertTo-Json • ConvertTo-Xml • ForEach-Object • Get-Command • Where-Object • CustomPowerShell <p>Run a PowerShell script that has been imported into the Keyfactor Command database. All scripts in the database that have been configured with the workflow category will be available for use. See Extensions Scripts on page 1704 for</p>

Name	Description
	<p>adding scripts to the database.</p> <ul style="list-style-type: none"> RequireApproval Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this. <div data-bbox="727 743 1406 909" style="background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p> Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration Authorization Methods Tab on page 367.</p> </div> <div data-bbox="727 936 1406 1129" style="background-color: #a8c8f9; padding: 10px; border-radius: 10px;"> <p> Note: The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request.</p> </div> <div data-bbox="727 1157 1406 1388" style="background-color: #a8f9a8; padding: 10px; border-radius: 10px;"> <p> Tip: The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see Issued Request Alert Operations on page 189).</p> </div> <ul style="list-style-type: none"> RESTRRequest Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file. OAuthRESTRRequest Run a REST (API) request using an identity provider other than Active Directory and Token authentication. The REST request contents are embedded within the step. It does not call out to an external file.

Name	Description
	<ul style="list-style-type: none"> EnrollmentAgent (Enrollment Only) <p>On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.</p> <p>For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the <i>Enrollment Agent</i> template or the <i>Enrollment Agent (Computer)</i> template) and must have a Certificate Request Agent EKU. Note that the built-in <i>Enrollment Agent</i> and <i>Enrollment Agent (Computer)</i> templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.</p> <div data-bbox="727 1192 1404 1381" style="border: 1px solid orange; border-radius: 10px; padding: 10px; background-color: #ffe4c4;"> <p> Important: This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.</p> </div> SubjectFormatter (Enrollment Only) <p>On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the <i>Build from this Active Directory information</i> option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template, which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template</p>

Name	Description
	<p>configured with the subject as <i>Build from this Active Directory information</i> must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.</p> <div data-bbox="727 495 1406 793" style="border: 1px solid orange; background-color: #f9a825; padding: 10px; margin: 10px 0;"> <p> Important: The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the <i>Keyfactor Windows Enrollment Gateway Installation and Configuration Guide</i>.</p> </div> <ul style="list-style-type: none"> <li data-bbox="699 825 1406 957"> <p>• EnrollStep Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step.</p> <li data-bbox="699 972 1406 1073"> <p>• NOOPStep An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow.</p> <li data-bbox="699 1087 1406 1220"> <p>• RevokeStep Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.</p>
SupportedWorkflowTypes	<p>An array of strings containing a list of the workflow types supported by the workflow definition step. Possible built-in values are:</p> <ul style="list-style-type: none"> <li data-bbox="699 1360 1406 1528"> <p>• CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.</p> <li data-bbox="699 1682 1406 1751"> <p>• CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor</p>

Name	Description
	<p>Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.</p> <p>For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.</p> <ul style="list-style-type: none"> Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.40.8 GET Workflow Definitions Types

The GET /Workflow/Definitions/Types method is used to retrieve the workflow definition types that have been defined for use. This method returns HTTP 200 OK on a success with information about the defined workflow definition types.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/workflows/definitions/read/

Table 807: GET Workflow Definitions Types Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Workflow Definitions Search Feature on page 303 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> Name
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>WorkflowType</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 808: GET Workflow Definitions Types Response Data

Name	Description												
WorkflowType	A string indicating the display name of the workflow type.												
KeyType	A string indicating the key type for the workflow. The built-in enrollment and revocation workflows use <i>Templates</i> as the key type. The built-in certificate entered collection and certificate left collection workflows use <i>Certificate Collections</i> as the key type.												
ContextParameters	An object containing the tokens that the workflow type provider has the ability to replace. These will vary depending on the workflow type.												
BuiltInSteps	<p>An object containing the information about the built-in step(s) for the workflow type (e.g. the enrollment step of the enrollment type). Possible steps include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DisplayName</td> <td>A string indicating the display name for the step.</td> </tr> <tr> <td>ExtensionName</td> <td>A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> • EnrollStep • RevokeStep </td> </tr> <tr> <td>Outputs</td> <td>An array of strings containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete.</td> </tr> <tr> <td>ConfigurationParametersDefinition</td> <td>An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.</td> </tr> <tr> <td>SignalsDefinition</td> <td>An object containing the signals defined for the workflow definition step. These will vary depending on the step.</td> </tr> </tbody> </table>	Name	Description	DisplayName	A string indicating the display name for the step.	ExtensionName	A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> • EnrollStep • RevokeStep 	Outputs	An array of strings containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete.	ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.	SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.
Name	Description												
DisplayName	A string indicating the display name for the step.												
ExtensionName	A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> • EnrollStep • RevokeStep 												
Outputs	An array of strings containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete.												
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.												
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.												

Name	Description
	 Note: There are no built-in steps for workflows of types <i>certificate entered collection</i> and <i>certificate left collection</i> .

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.40.9 PUT Workflow Definitions Definition ID Steps

The PUT `/Workflow/Definitions/{definitionid}/Steps` method is used to add or update the workflow steps for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/workflows/definitions/modify/`

 **Note:** If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 809: PUT Workflow Definitions {definitionid} Steps Input Parameters

Name	In	Description
definitionid	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to update.</p> <p>Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 2542) to retrieve a list of all the workflow definitions to determine the GUID.</p>

Name	In	Description								
request	Body	<table border="1"> <thead> <tr> <th data-bbox="396 394 581 464">Name</th> <th data-bbox="581 394 1399 464">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="396 464 581 520">DisplayName</td> <td data-bbox="581 464 1399 520">A string indicating the display name for the step.</td> </tr> <tr> <td data-bbox="396 520 581 653">UniqueName</td> <td data-bbox="581 520 1399 653">A string indicating the unique name for the step. Table 810: PUT Workflow Definitions {definitionid} Steps Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

Name	Description										
	<ul style="list-style-type: none"> • Revocation <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table border="1" data-bbox="365 598 1398 1696"> <thead> <tr> <th data-bbox="365 598 557 661">Name</th> <th data-bbox="557 598 1398 661">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="365 661 557 758">Id</td> <td data-bbox="557 661 1398 758">A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td> </tr> <tr> <td data-bbox="365 758 557 821">DisplayName</td> <td data-bbox="557 758 1398 821">A string indicating the display name for the step.</td> </tr> <tr> <td data-bbox="365 821 557 951">UniqueName</td> <td data-bbox="557 821 1398 951">A string indicating the unique name for the step. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.</p> <p>For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the <i>Enrollment Agent</i> template or the <i>Enrollment Agent (Computer)</i> template) and must have a Certificate Request Agent EKU. Note that the built-in <i>Enrollment Agent</i> and <i>Enrollment Agent (Computer)</i> templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.</p>

For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the \$(id). </td> </tr> </tbody> </table>	Name	Description		 the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the \$(id).		
Name	Description						
	 the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the \$(id).						
Signals	<p>An array of objects containing data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step (see <i>ExtensionName</i>). Possible RequireApproval values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>RoleIds</td> <td>An array of integers indicating the security roles whose members are allowed to approve the request.</td> </tr> <tr> <td>SignalName</td> <td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i>.</td> </tr> </tbody> </table> <p> Important: If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances.</p>	Value	Description	RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .
Value	Description						
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.						
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .						
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p>						

Name	Description																
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the condition.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Outputs</td> <td>An object indicating the next step in the workflow. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>continue</td> <td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the condition.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).</td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID of the condition.	Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).	Outputs	An object indicating the next step in the workflow. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>continue</td> <td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td> </tr> </tbody> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.
Name	Description																
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the condition.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).</td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID of the condition.	Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).										
Value	Description																
Id	A string indicating the Keyfactor Command reference GUID of the condition.																
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).																
Outputs	An object indicating the next step in the workflow. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>continue</td> <td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td> </tr> </tbody> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.												
Value	Description																
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.																
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.																
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.																

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.40.10 POST Workflow Definitions Definition ID Publish

The POST `/Workflow/Definitions/{definitionid}/Publish` method is used to mark the most recent version of the workflow definition with the specified GUID as the published, active, version. When a definition is published, all new or restarted workflow instances (see [Workflow Instances on page 2628](#)) will be able to use the updated version of the workflow. This method returns HTTP 200 OK on a success with details about the workflow definition.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/workflows/definitions/modify/`

Table 811: POST Workflow Definitions {definitionid} Publish Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to publish. Use the <code>GET /Workflow/Definitions</code> method (see GET Workflow Definitions on page 2542) to retrieve a list of all the workflow definitions to determine the GUID.

Table 812: POST Workflow Definitions {definitionid} Publish Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

Name	Description										
	<ul style="list-style-type: none"> • Revocation <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table border="1" data-bbox="365 598 1398 1696"> <thead> <tr> <th data-bbox="365 598 558 661">Name</th> <th data-bbox="558 598 1398 661">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="365 661 558 758">Id</td> <td data-bbox="558 661 1398 758">A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td> </tr> <tr> <td data-bbox="365 758 558 821">DisplayName</td> <td data-bbox="558 758 1398 821">A string indicating the display name for the step.</td> </tr> <tr> <td data-bbox="365 821 558 951">UniqueName</td> <td data-bbox="558 821 1398 951">A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td> </tr> <tr> <td data-bbox="365 951 558 1696">ExtensionName</td> <td data-bbox="558 951 1398 1696"> <p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none"> • Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> • PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> • ConvertFrom-Csv • ConvertFrom-Json • ConvertFrom-Markdown </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step. Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).										
Value	Description																
Id	A string indicating the Keyfactor Command reference GUID of the condition.																
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see Adding, Copying or Modifying a Workflow Definition on page 237 for an example).																
Outputs	An object indicating the next step in the workflow. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>continue</td> <td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td> </tr> </tbody> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.												
Value	Description																
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.																
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.																
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.																

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.41 Workflow Instances

The Workflow Instances component of the Keyfactor API includes methods necessary to programmatically retrieve, restart, delete and submit data into workflow instances.

Table 813: Workflow Instances Endpoints

Endpoint	Method	Description	Link
/{{instanceId}}	DELETE	Delete the workflow instance with the specified GUID.	DELETE Workflow Instances Instance Id below
/{{instanceId}}	GET	Retrieve the workflow instance with the specified GUID.	GET Workflow Instances Instance ID on the next page
/	GET	Retrieve a list of the workflow instances.	GET Workflow Instances on page 2655
/My	GET	Retrieve the workflow instances created by the user making the API request.	GET Workflow Instances My on page 2660
/AssignedToMe	GET	Retrieve the workflow instances assigned to the user making the API request.	GET Workflow Instances AssignedToMe on page 2665
/{{instanceId}}/Stop	POST	Rejects a workflow instance, preventing it from continuing.	POST Workflow Instances Instance Id Stop on page 2670
/{{instanceId}}/Signals	POST	Input data to the workflow instance with the specified GUID.	POST Workflow Instances Instance ID Signals on page 2671
/{{instanceId}}/Restart	POST	Restart the specified workflow instance after a failure.	POST Workflow Instances Instance Id Restart on page 2673

3.6.41.1 DELETE Workflow Instances Instance Id

The DELETE /Workflow/Instances/{{instanceId}} method is used to delete the workflow instance with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/workflows/instances/manage/

Table 814: DELETE Workflow Instances {instanceid} Input Parameters

Name	In	Description
instanceid	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to delete.</p> <p>Use the <i>GET /Workflow/Instances</i> method (see GET Workflow Instances on page 2655) to retrieve a list of all the workflow instances to determine the GUID.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (??) at the top of the Management Portal page next to the **Log Out** button.

3.6.41.2 GET Workflow Instances Instance ID

The *GET /Workflow/Instances/{instanceid}* method is used to retrieve the initiated workflow with the specified instance GUID. Both in progress and completed workflows will be returned. This method returns HTTP 200 OK on a success with details about the workflow instance.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

- /workflows/instances/read/
- OR
- /workflows/instances/read/pending/
- OR
- /workflows/instances/read/mine/

Users with */mine/* or */pending/* will only be able to retrieve the workflow instances created by them (*/mine/*) or assigned to them (*/pending/*) unless they also have the higher level just */read/*.

Table 815: GET Workflow Instances {instanceid} Input Parameters

Name	In	Description
instanceid	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to retrieve.</p> <p>Use the <i>GET /Workflow/Instances</i> method (see GET Workflow Instances on page 2655) to retrieve a list of all the workflow instances to determine the GUID. Note that the integer workflow IDs (returned with <i>GET /Workflow/Instances/{instanceid}</i>) cannot be used with the API; only the GUID from <i>GET /Workflow/Instances</i> can be used in this case.</p>

Table 816: GET Workflow Instances {instanceId} Response Data

Name	Description				
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.				
Status	A string indicating the current status of the workflow instance. The possible statuses are: <ul style="list-style-type: none"> • CanceledForRestart • Complete • Failed • Rejected • Running • Suspended 				
CurrentStepID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.				
StatusMessage	A string indicating the current status message for the workflow instance. Possible status messages vary and may include: <ul style="list-style-type: none"> • Access is denied • Awaiting # more approval(s) from approval roles. • Either the credentials are invalid, or the CA on [CA hostname] is not running • Issued • Issued. The private key was successfully retained. • Post-process Failed: [Message indicating reason for failure generally from the CA] • Pre-process failed: [Message indicating details of the failure] • Revoked • Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure] • Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure] • Step [custom step name] failed: [Message indicating details of the failure] • Taken Under Submission. The certificate template requires manager approval, and is marked as pending. • Workflow rejected by user with Id #. 				
Signals	An array of objects containing the data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step. Possible RequireApproval values are: <table border="1" data-bbox="397 1554 1404 1722"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SignalName</td> <td>A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i>.</td> </tr> </tbody> </table>	Value	Description	SignalName	A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i> .
Value	Description				
SignalName	A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i> .				

Name	Description										
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StepSignalId</td> <td>A string indicating the Keyfactor Command reference GUID of the signal in the step.</td> </tr> <tr> <td>SignalReceived</td> <td>A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false). For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.</td> </tr> </tbody> </table>	Value	Description	StepSignalId	A string indicating the Keyfactor Command reference GUID of the signal in the step.	SignalReceived	A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false). For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.				
Value	Description										
StepSignalId	A string indicating the Keyfactor Command reference GUID of the signal in the step.										
SignalReceived	A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false). For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.										
Definition	<p>An object containing the workflow definition. Workflow definition data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the workflow definition.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name defined for the workflow definition.</td> </tr> <tr> <td>Version</td> <td>An integer indicating the version number of the workflow definition.</td> </tr> <tr> <td>WorkflowType</td> <td> <p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.	DisplayName	A string indicating the display name defined for the workflow definition.	Version	An integer indicating the version number of the workflow definition.	WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. CurrentStepDisplayName	A string indicating the display name defined for the workflow instance step.				
CurrentStepUniqueName	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.				
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <div data-bbox="444 1335 1406 1423" style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin: 10px 0;"> <pre>"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</pre> </div> <p>Or</p> <div data-bbox="444 1488 1406 1577" style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin: 10px 0;"> <pre>"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</pre> </div>				
LastModified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.				

Name	Description																		
StartDate	A string indicating the date and time when the instance was initiated.																		
InitialData	<p>An object containing the data included in the workflow instance when the workflow was initiated. Initial workflow instance data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Operation Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertificateAuthority</td> <td>Enrollment and Revocation</td> <td>A string indicating the certificate authority that will be used to enroll against, for enrollment requests, or that issued the certificate, for revocation requests in <i>hostname\logical name</i> format.</td> </tr> <tr> <td>CertificateId</td> <td>Certificate Collection and Revocation</td> <td>An integer indicating the Keyfactor Command reference ID for the certificate.</td> </tr> <tr> <td>SerialNumberString</td> <td>Revocation</td> <td>A string indicating the serial number of the certificate being revoked.</td> </tr> <tr> <td>Thumbprint</td> <td>Revocation</td> <td>A string indicating the thumbprint of the certificate being revoked.</td> </tr> <tr> <td>RevokeCode</td> <td>Revocation</td> <td>An integer containing the specific reason that the certificate is being revoked. Available values are:</td> </tr> </tbody> </table>	Name	Operation Type	Description	CertificateAuthority	Enrollment and Revocation	A string indicating the certificate authority that will be used to enroll against, for enrollment requests, or that issued the certificate, for revocation requests in <i>hostname\logical name</i> format.	CertificateId	Certificate Collection and Revocation	An integer indicating the Keyfactor Command reference ID for the certificate.	SerialNumberString	Revocation	A string indicating the serial number of the certificate being revoked.	Thumbprint	Revocation	A string indicating the thumbprint of the certificate being revoked.	RevokeCode	Revocation	An integer containing the specific reason that the certificate is being revoked. Available values are:
Name	Operation Type	Description																	
CertificateAuthority	Enrollment and Revocation	A string indicating the certificate authority that will be used to enroll against, for enrollment requests, or that issued the certificate, for revocation requests in <i>hostname\logical name</i> format.																	
CertificateId	Certificate Collection and Revocation	An integer indicating the Keyfactor Command reference ID for the certificate.																	
SerialNumberString	Revocation	A string indicating the serial number of the certificate being revoked.																	
Thumbprint	Revocation	A string indicating the thumbprint of the certificate being revoked.																	
RevokeCode	Revocation	An integer containing the specific reason that the certificate is being revoked. Available values are:

Name	Operation Type	Description																																		
OperationStart	Revocation	A string indicating the time at which the revocation workflow was initiated.																																		
Template	Enrollment	A string indicating the certificate template short name used for the enrollment request.																																		
IncludeChain	Enrollment	A Boolean indicating whether to include the certificate chain in the enrollment response (true) or not (false).																																		
SANs	Enrollment	<p>An object indicating the subject alternative names (SANs) for the certificate requested in the enrollment, each type an array of strings. Possible values for the key are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> <tr> <td>directory</td> <td>Directory Name</td> </tr> <tr> <td>uri</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>ip4</td> <td>IP v4 Address</td> </tr> <tr> <td>ip6</td> <td>IP v6 Address</td> </tr> <tr> <td>registeredid</td> <td>Registered ID (an OID)</td> </tr> <tr> <td>ms_ntprincipalname</td> <td>MS_NTPrincipalName (a string)</td> </tr> <tr> <td>ms_ntdsreplication</td> <td>MS_NTDSReplication (a GUID)</td> </tr> </tbody> </table> <p>For example:</p>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)														
Value	Description																																			
rfc822	RFC 822 Name																																			
dns	DNS Name																																			
directory	Directory Name																																			
uri	Uniform Resource Identifier																																			
ip4	IP v4 Address																																			
ip6	IP v6 Address																																			
registeredid	Registered ID (an OID)																																			
ms_ntprincipalname	MS_NTPrincipalName (a string)																																			
ms_ntdsreplication	MS_NTDSReplication (a GUID)																																			

Name	Description	
Name	Operation Type	Description
		<pre> "SANS": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] } </pre>
AdditionalAttributes	Enrollment	An object indicating values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process.
Metadata	Enrollment	An object indicating values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field.
Format	Enrollment	A string indicating the desired output format for the certificate. A value of STORE indicates that the certificate is intended to be delivered into one or more certificate stores.
CustomName	Enrollment	A string indicating a custom friendly name for the certificate.
Subject	Enrollment	A string containing the subject name of the requested certificate using X.500 format.
RenewalCertificate	Enrollment	An object containing the certificate information for the certificate that is being renewed. Certificate data includes:

Name	Description

For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre data-bbox="1008 1604 1354 1671">"JobProperties": ["NetscalerVserver"]</pre>							
Name	Description														
write	<p>ificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see GET Certificates Locations ID on page 1116) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>														
Properties	<p>An object for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre data-bbox="1008 1604 1354 1671">"JobProperties": ["NetscalerVserver"]</pre>

PrivateKeyConverter	Enrollment	An internally used Keyfactor Command field.										
Referenceld	A integer indicating the Keyfactor Command reference ID for the workflow instance.											

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.41.3 GET Workflow Instances

The GET /Workflow/Instances method is used to retrieve the list of workflows that have been initiated. Both in progress and completed workflows are included. This method returns HTTP 200 OK on a success with details about the workflow instances.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/workflows/instances/read/

Table 817: GET Workflow Instances Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Workflow Instances Search Feature on page 321. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • DefinitionId (workflow definition ID) • Id (workflow instance GUID) • InitiatingUserName (DOMAIN\username) • LastModified • ReferenceId (workflow instance integer ID) • StartDate • Status • Title • WorkflowType
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CurrentStepDisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 818: GET Workflow Instances Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.
Status	<p>A string indicating the current status of the workflow instance. The possible statuses are:</p> <ul style="list-style-type: none"> • CanceledForRestart • Complete • Failed • Rejected • Running • Suspended
CurrentStepID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.
StatusMessage	<p>A string indicating the current status message for the workflow instance. Possible status messages vary and may include:</p> <ul style="list-style-type: none"> • Access is denied • Awaiting # more approval(s) from approval roles. • Either the credentials are invalid, or the CA on [CA hostname] is not running • Issued • Issued. The private key was successfully retained. • Post-process Failed: [Message indicating reason for failure generally from the CA] • Pre-process failed: [Message indicating details of the failure] • Revoked • Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure] • Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure] • Step [custom step name] failed: [Message indicating details of the failure] • Taken Under Submission. The certificate template requires manager approval, and is marked as pending. • Workflow rejected by user with Id #.

Name	Description				
	<p>the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.</p> <ul style="list-style-type: none"> Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field. 				
CurrentStepDisplayName	A string indicating the display name defined for the workflow instance step.				
CurrentStepUniqueName	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.				
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <p style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</p> <p>Or</p> <p style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</p>				
LastModified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.				
StartDate	A string indicating the date and time when the instance was initiated.				
ReferenceId	A integer indicating the Keyfactor Command reference ID for the workflow instance.				

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.41.4 GET Workflow Instances My

The GET /Workflow/Instances/My method is used to retrieve the list of initiated workflows created by the user making the API request—as a result of enrolling for a certificate, for example, or revoking a certificate. This method returns HTTP 200 OK on a success with details about the workflow instances.

Note: If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/workflows/instances/read/

OR

/workflows/instances/read/mine/

Table 819: GET Workflow Instances My Input Parameters

Table 821: GET Workflow Instances AssignedToMe Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Workflow Instances Search Feature on page 321. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • DefinitionId (workflow definition ID) • Id (workflow instance GUID) • InitiatingUserName (DOMAIN\username) • LastModified • ReferenceId (workflow instance integer ID) • StartDate • Status • Title • WorkflowType
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CurrentStepDisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 822: GET Workflow Instances AssignedToMe Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.
Status	<p>A string indicating the current status of the workflow instance. The possible statuses are:</p> <ul style="list-style-type: none"> • CanceledForRestart • Complete • Failed • Rejected • Running • Suspended <p>Only instances with a Status of <i>Suspended</i> are returned using this method.</p>
CurrentStepID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.
StatusMessage	<p>A string indicating the current status message for the workflow instance. Possible status messages vary and may include:</p> <ul style="list-style-type: none"> • Access is denied • Awaiting # more approval(s) from approval roles. • Either the credentials are invalid, or the CA on [CA hostname] is not running • Issued • Issued. The private key was successfully retained. • Post-process Failed: [Message indicating reason for failure generally from the CA] • Pre-process failed: [Message indicating details of the failure] • Revoked • Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure] • Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure] • Step [custom step name] failed: [Message indicating details of the failure] • Taken Under Submission. The certificate template requires manager approval, and is marked as pending. • Workflow rejected by user with Id #. <p>Only instances with a StatusMessage of <i>Awaiting # more approval(s) from</i></p>

Name	Description										
	<i>approval roles</i> . are returned using this method.										
Definition	<p>An object containing the workflow definition. Workflow definition data includes:</p> <table border="1" data-bbox="586 422 1398 1719"> <thead> <tr> <th data-bbox="592 430 829 493">Name</th> <th data-bbox="829 430 1391 493">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="592 493 829 583">Id</td> <td data-bbox="829 493 1391 583">A string indicating the Keyfactor Command reference GUID of the workflow definition.</td> </tr> <tr> <td data-bbox="592 583 829 674">DisplayName</td> <td data-bbox="829 583 1391 674">A string indicating the display name defined for the workflow definition.</td> </tr> <tr> <td data-bbox="592 674 829 764">Version</td> <td data-bbox="829 674 1391 764">An integer indicating the version number of the workflow definition.</td> </tr> <tr> <td data-bbox="592 764 829 1711">WorkflowType</td> <td data-bbox="829 764 1391 1711"> <p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> • CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. • CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.	DisplayName	A string indicating the display name defined for the workflow definition.	Version	An integer indicating the version number of the workflow definition. Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.
Name	Description				
	<p>removal of a web server certificate.</p> <ul style="list-style-type: none"> Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field. 				
CurrentStepDisplayName	A string indicating the display name defined for the workflow instance step.				
CurrentStepUniqueName	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.				
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <p style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</p> <p>Or</p> <p style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</p>				
LastModified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.				

Name	Description
StartDate	A string indicating the date and time when the instance was initiated.
ReferenceId	A integer indicating the Keyfactor Command reference ID for the workflow instance.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.41.6 POST Workflow Instances Instance Id Stop

The POST `/Workflow/Instances/{instanceid}/Stop` method is used to stop the workflow instance with the specified GUID, preventing it from continuing. This endpoint returns 204 with no content upon success.

 **Note:** Only workflow instances with a Status of *Suspended* can be stopped.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/workflows/instances/manage/

Table 823: POST Workflow Instances {instanceid} Stop Input Parameters

Name	In	Description
instanceid	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to stop. Use the <code>GET /Workflow/Instances</code> method (see GET Workflow Instances on page 2655) to retrieve a list of all the workflow instances to determine the GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.41.7 POST Workflow Instances Instance ID Signals

The POST /Workflow/Instances/{instanceId}/Signals method is used to input signals to the workflow instance with the specified GUID. This endpoint returns 204 with no content upon success.

Note: If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

Note: A locking conflict may occur if two (or more) users attempt to provide input to a workflow instance (e.g. approve a request) at exactly the same time. If this happens, input from only one of the users will be reflected in the Management Portal, and the workflow instance will not be moved along to the next step if it should have been with input from the two users. The other input is still accepted, however, and there is a scheduled task that runs daily and attempts to continue all suspended workflows that may be eligible to continue but have not done so due to locking conflicts.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
The user executing the request must hold at least one security role ID configured in the workflow definition step for which signal data is being input.

Table 824: POST Workflow Instances {instanceid} Signals Input Parameters

Name	In	Description						
instanceid	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to which to input a signal.</p> <p>Use the GET /Workflow/Instances method (see GET Workflow Instances on page 2655) to retrieve a list of all the workflow instances to determine the GUID.</p>						
SignalKey	Body	<p>Required. A string indicating the key for the signal. This is made up of the unique name for the step within the definition plus the signal type, separated by a period (UniqueName.SignalType). For a Require Approval step, the key input type will be <i>ApprovalStatus</i>, so the full <i>SignalKey</i> will look something like:</p> <pre>RequireApproval1.ApprovalStatus</pre> <p>Use the GET /Workflow/Definitions/{definitionid} method (see GET Workflow Definitions Definition ID on page 2494) to return workflow details including the workflow steps to determine the <i>UniqueName</i> of the step for which you want to input a signal or one of the GET methods for workflow instances (see GET Workflow Instances on page 2655, GET Workflow Instances AssignedToMe on page 2665, or GET Workflow Instances My on page 2660) to return the <i>CurrentStepUniqueName</i>.</p>						
Data	Body	<p>Required. An object providing the input information for the signal. The key(s) will vary depending on the signal. RequireApproval signal data values are:</p> <table border="1"> <thead> <tr> <th>Key</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>Approved</td> <td>Required. A Boolean indicating whether the request is approved (true) or denied (false).</td> </tr> <tr> <td>Comment</td> <td>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</td> </tr> </tbody> </table> <p>For example, to approve a Require Approval step called <i>RequireApproval1</i> with a comment:</p> <pre>{ "SignalKey": "RequireApproval1.ApprovalStatus", "Data": { "Approved": "True", "Comment": "Here is my comment." } }</pre>	Key	Value	Approved	Required. A Boolean indicating whether the request is approved (true) or denied (false).	Comment	A string containing a comment to associate with the signal. The maximum comment length is 500 characters.
Key	Value							
Approved	Required. A Boolean indicating whether the request is approved (true) or denied (false).							
Comment	A string containing a comment to associate with the signal. The maximum comment length is 500 characters.							

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.41.8 POST Workflow Instances Instance Id Restart

The POST `/Workflow/Instances/{instanceid}/Restart` method is used to restart the workflow instance with the specified GUID. This can be used either after it has reached a failed state and the failure has been corrected (e.g. a CA was not responding when an enrollment was attempted or a PowerShell script failed to run to completion) or midstream while it's still active but in a suspended state waiting for signals to introduce a new version of the workflow definition. The workflow instance will restart from the beginning. This endpoint returns 204 with no content upon success.

Note: Only workflow instances with a Status of *Failed* or *Suspended* can be restarted.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

`/workflows/instances/manage/`
`/workflows/instances/read/`

Table 825: POST Workflow Instances {instanceid} Restart Input Parameters

Name	In	Description
instanceid	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to restart.</p> <p>Use the <code>GET /Workflow/Instances</code> method (see GET Workflow Instances on page 2655) to retrieve a list of all the workflow instances to determine the GUID.</p> <div style="border: 1px solid #ccc; border-radius: 5px; padding: 5px; margin-top: 10px;"> <p> Note: When you restart an instance, it will be issued a new instance ID.</p> </div>
version	Body	An integer indicating the version number of the workflow definition. If no version is specified, the workflow will be restarted using the most recently published version.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.7 API Change Log

In this section you will find the change history for the Keyfactor API endpoints from version 9.0 onwards.

3.7.1 v9 API Change Logs

Find the change logs for Keyfactor API major release 9.0 and subsequent incremental releases below.

Release Type	Release Date	Link to Change Log
Major	August 2021	API Change Log v9.0 below
Incremental	September 2021	API Change Log v9.1 on page 2676
Incremental	October 2021	API Change Log v9.2 on page 2677
Incremental	November 2021	API Change Log v9.3 on page 2678
Incremental	December 2021	API Change Log v9.4 on page 2678
Incremental	January 2022	API Change Log v9.5 on page 2678
Incremental	February 2022	API Change Log v9.6 on page 2679
Incremental	March 2022	API Change Log v9.7 on page 2679
Incremental	April 2022	API Change Log v9.8 on page 2679
Incremental	May 2022	API Change Log v9.9 on page 2679

3.7.1.1 API Change Log v9.0

API changes for Keyfactor Command version 9.0 Major release

Table 826: API Change Log v9.0

Endpoint	Method	Action	Notes
/Agents/Approve	POST	Add	
/Agents/Disapprove	POST	Add	
/CertificateCollections	PUT	Add	
/CertificateCollections/Copy	POST	Add	
/Certificates/{id}/History	GET	Add	
/Certificates/{id}/Security	GET	Add

/SSL/Networks/{id}/Scan	POST	Add	

3.7.1.2 API Change Log v9.1

API changes for Keyfactor Command version 9.1 incremental release

Table 827: API Change Log v9.1

Endpoint	Methods	Action	Notes
/CertificateStores/{id}/Inventory	GET	Add	
/Enrollment/PFX/Replace	POST	Fix	SuccessfulStores collection now only includes Ids of stores that were successfully processed.
/Enrollment/PFX/Deploy	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertStoreTypes	POST/PUT	Update	EntryParameters can now be set via these methods.
/CertificateStores/Certificates/Add	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateStores/Certificates/Remove	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateCollections/{id}/Permissions	GET	Deprecate	

3.7.1.3 API Change Log v9.2

API changes for Keyfactor Command version 9.2 incremental release

Table 828: API Change Log v9.2

Endpoint	Methods	Action	Notes
/Certificates	GET	Fix	No longer fails if a collection id is not provided.
/OrchestratorJobs/JobHistory	GET	Fix	Request no longer fails for 'Dynamic' job types.
/Reports/Schedules/{id}	DELETE	Fix	Response code is now 200 when the user role does not have <i>Modify – Report</i> permission.

3.7.1.4 API Change Log v9.3

API changes for Keyfactor Command version 9.3 incremental release

Table 829: API Change Log v9.3

Endpoint	Methods	Action	Notes
/JobTypes/Custom	POST	Fix	No longer requires default field values.

3.7.1.5 API Change Log v9.4

API changes for Keyfactor Command version 9.4 incremental release

Table 830: API Change Log v9.4

Endpoint	Methods	Action	Notes
/Workflow/Certificates/Pending	GET	Update	Now returns the associated metadata.

3.7.1.6 API Change Log v9.5

API changes for Keyfactor Command version 9.5 incremental release

Table 831: API Change Log v9.5

Endpoint	Methods	Action	Notes
/Enrollment/PFX	POST	Update	No longer requires a certificate authority name to be provided.

3.7.1.7 API Change Log v9.6

API changes for Keyfactor Command version 9.6 incremental release.

No API endpoint changes were made in this release.

3.7.1.8 API Change Log v9.7

API changes for Keyfactor Command version 9.7 incremental release

Table 832: API Change Log v9.7

Endpoint	Methods	Action	Notes
/KeyfactorAPI/License	GET	Add	

3.7.1.9 API Change Log v9.8

API changes for Keyfactor Command version 9.8 incremental release.

No API endpoint changes were made in this release.

3.7.1.10 API Change Log v9.9

API changes for Keyfactor Command version 9.9 incremental release

Table 833: API Change Log v9.9

Endpoint	Methods	Action	Notes
/Reports/<any>	GET	Fix	Spaces within the sortField no longer results in an exception.
/Reports/{id}/Schedules	GET	Fix	An invalid sortField no longer results in an exception.
/Agents	GET	Update	New query parser to support the AgentId GUID.

3.7.2 v10 API Change Logs

Find the change logs for Keyfactor API major release 10.0 and subsequent incremental and hot fix releases below.

Release Type	Release Date	Link to Change Log
Major	September 2022	API Change Log v10.0 below
Incremental	November 2022	API Change Log v10.1 on page 2686
Incremental	January 2023	API Change Log v10.2 on page 2686
Hot Fix	April 2023	API Change Log v10.3.1 on page 2686
Incremental	May 2023	API Change Log v10.4 on page 2687
Hot Fix	July 2023	API Change Log v10.4.3 on page 2687
Hot Fix	September 2023	API Change Log v10.4.5 on page 2688
Hot Fix	September 2023	API Change Log v10.4.6 on page 2688

3.7.2.1 API Change Log v10.0

API changes for Keyfactor Command version 10.0 Major release

Table 834: API Change Log v10.0

Endpoint	Methods	Action	Notes
/Agents/{id}	GET	Add	
/Agents/Reset	POST	Add	
/AgentBlueprint	GET	Add	
/AgentBlueprint/{id}	GET, DELETE	Add	
/AgentBlueprint/{id}/Jobs	GET	Add	
/AgentBlueprint/{id}/Stores	GET	Add	
/AgentBluePrint/ApplyBlueprint	POST	Add	
/AgentBluePrint/GenerateBluePrint	POST	Add	
/Alerts/Denied	GET, PUT, POST	Add	
/Alerts/Denied/{id}	GET, DELETE	Add	
/Alerts/Expiration	GET, PUT, POST	Add	
/Alerts/Expiration/{id}	GET, DELETE	Add	
/Alerts/Expiration/Schedule	GET, PUT	Add	
/Alerts/Expiration/Test	POST	Add	
/Alerts/Expiration/TestAll	POST	Add	
/Alerts/IssuedAlerts	GET, PUT, POST	Add	
/Alerts/IssuedAlerts/{id}	GET, DELETE	Add	
/Alerts/Issued/Schedule	GET, PUT	Add	
/Alerts/KeyRotation	GET, PUT, POST	Add	

Endpoint	Methods	Action	Notes
/Alerts/KeyRotation/{id}	GET, DELETE	Add	
/Alerts/KeyRotation/Schedule	GET, PUT	Add	
/Alerts/KeyRotation/Test	POST	Add	
/Alerts/KeyRotation/TestAll	POST	Add	
/Alerts/Pending	GET, PUT, POST	Add	
/Alerts/Pending/{id}	GET, DELETE	Add	
/Alerts/Pending/Schedule	GET, PUT	Add	
/Alerts/Pending/Test	POST	Add	
/Alerts/Pending/Test/{id}	POST	Add	
/CertificateAuthorities	GET	Update	Schedules are now included in the results.
/CertificateAuthorities	POST	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/CertificateAuthorities/{id}	PUT	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/CertificateAuthorities/{id}	DELETE	Update	Deletion is now prevented if schedules are associated.
/CertificateCollections	POST	Update	Query parameter no longer needed when a valid CopyFromId is provided.
/CertificateCollections/{id}/Permissions	POST	Deprecated	Replaced by /Security/Roles/{id}/Permissions/Collection.
/Certificates/Analyze	POST	Add	
/Certificates/IdentityAudit/{id}	GET	Add	

Endpoint	Methods	Action	Notes
/CertificateStoreContainers	POST	Add	
/CertificateStoreContainers/{id}	PUT, DELETE	Add	
/CertificateStores/Server	GET, POST, PUT	To Be Deprecated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/CertificateStores	GET, POST, PUT	Updated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/Enrollment/PFX (v2)	POST	Add	
/Enrollment/Settings/{id}	GET	Add	
/JobTypes/Custom	POST	Update	DefaultValue property is no longer required, validation is now performed on the JobTypeFields/DefaultValue property, validation prevents names containing spaces.
/JobTypes/Custom/{id}	DELETE	Update	Includes validation so that deletion is prevented if at least one associated approved orchestrator implements the capability.
/MacEnrollment	GET, PUT	Add	
/Monitoring/Revocation	GET, POST	Update	Renamed from /Workflow/RevocationMonitoring

Endpoint	Methods	Action	Notes
/Monitoring/Revocation/{id}	GET, PUT, DELETE	Update	Renamed from /Workflow/RevocationMonitoring/{id}
/Monitoring/Revocation/Test	POST	Add	
/Monitoring/Revocation/TestAll	POST	Add	
/Orchestrators/JobHistory	GET	Update	Added JobId field.
/Orchestrators/ScheduledJobs	GET	Add	
/OrchestratorJobs/Reschedule	POST	Add	
/OrchestratorJobs/Unschedule	POST	Add	
/OrchestratorJobs/Acknowledge	POST	Add	
/Security/Identities/{id}	GET	Add	
/Security/Roles/{id}/Identities	GET, POST	Add	
/Security/Roles/{id}/Containers	GET, POST	Add	
/Security/Roles/{id}/Copy	POST	Add	
/Security/Roles/{id}/Permissions	GET	Add	
/Security/Roles/{id}/Permissions/Global	GET, POST, PUT	Add	
/Security/Roles/{id}/Permissions/Collections	GET, POST, PUT	Add	Replaced the /CertificateCollections/{id}/Permissions endpoint functionality.
/Security/Roles/{id}/Permissions/Containers	GET, POST, PUT	Add	Returns only containers that have a permission set for the selected security role.
/SMTP	GET, PUT	Add	
/SMTP/Test	POST	Add	
/Templates	GET, PUT	Update	Includes template-specific policy information.
/Templates/{id}	GET	Update	Includes template defaults.

Endpoint	Methods	Action	Notes
/Templates/Settings	GET, PUT	Update	Includes global template policies.
/Template/SubjectParts	GET	Add	
/Templates/Global/Settings	GET, PUT	Add	
/Templates/Import	POST	Add	
/Workflow/Certificates/Pending	GET	Update	Now supports query fields of Requester and RequestType.
/Workflow/Definitions/Steps/{extensionName}	GET	Add	
/Workflow/Definitions/{definitionId}	GET, PUT, DELETE	Add	
/Workflow/Definitions	GET, POST	Add

3.7.2.2 API Change Log v10.1

API changes for Keyfactor Command version 10.1 incremental release

Table 835: API Change Log v10.1

Endpoint	Methods	Action	Notes
/Templates	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/{id}	GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/Settings	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.

3.7.2.3 API Change Log v10.2

API changes for Keyfactor Command version 10.2 incremental release

Table 836: API Change Log v10.2

Endpoint	Methods	Action	Notes
/Security/My	GET	Add	Returns all the security roles and global permissions for the requesting user.
/Enrollment/CSR	POST	Update	The workflow instance ID has been added to the response.
/Enrollment/CSR	POST	Update	A new PrivateKey input field has been added to support private key retention on CSR enrollment.
/Enrollment/PFX	POST	Update	The workflow instance ID has been added to the response.
/Certificates/Analyze	POST	Update	The endpoint requires Global Certificates-Read or Certificates-Import permissions.

3.7.2.4 API Change Log v10.3.1

API changes for Keyfactor Command version 10.3.1 hot fix release

Table 837: API Change Log v10.3.1

Endpoint	Methods	Action	Notes
/Reports/{id}/Schedules	POST	Fixed	Reports can be scheduled when the user scheduling the report only has permission to view one certificate collection.

3.7.2.5 API Change Log v10.4

API changes for Keyfactor Command version 10.4 incremental release

Table 838: API Change Log v10.4

Endpoint	Methods	Action	Notes
/Enrollment/CSR	POST	Fixed	Includes SANs entered outside the CSR only when the <i>Allow CSR SAN Entry</i> application setting is set to true. SANs entered outside the CSR replace SANs in the CSR rather than appending to SANs from the CSR.
/Workflow/Instances	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/AssignedToMe	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/My	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/{instanceId}	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.

3.7.2.6 API Change Log v10.4.3

API changes for Keyfactor Command version 10.4.3 hot fix release

Table 839: API Change Log v10.4.3

Endpoint	Methods	Action	Notes
/CertificateAuthority/Test	POST	Fixed	EJBCA version 8 is supported.
/Enrollment/Renew	POST	Fixed	EJBCA version 8 is supported.
/Templates/Import	POST	Fixed	EJBCA version 8 is supported.

3.7.2.7 API Change Log v10.4.5

API changes for Keyfactor Command version 10.4.5 hot fix release

Table 840: API Change Log v10.4.5

Endpoint	Methods	Action	Notes
/CSRGeneration/Generate	POST	Update	3072-bit RSA keys are supported.
/Enrollment/CSR	POST	Update	3072-bit RSA keys are supported.
/Enrollment/PFX	POST	Update	3072-bit RSA keys are supported.
/Enrollment/Renew	POST	Update	3072-bit RSA keys are supported.

3.7.2.8 API Change Log v10.4.6

API changes for Keyfactor Command version 10.4.6 hot fix release

Table 841: API Change Log v10.4.6

Endpoint	Methods	Action	Notes
/Enrollment/CSR	POST	Fixed	Includes SANs entered outside the CSR only when the <i>Allow CSR SAN Entry</i> application setting is set to true. SANs entered outside the CSR replace SANs in the CSR rather than appending to SANs from the CSR.
/Workflow/Instances	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/AssignedToMe	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/My	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/{instanceId}	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.

3.7.3 v11 API Change Logs

Find the change logs for Keyfactor API major release 11.0 below.

Release Type	Release Date	Link to Change Log
Major	October 2023	API Change Log v11.0 below

3.7.3.1 API Change Log v11.0

API changes for Keyfactor Command version 11.0 major release

Table 842: API Change Log v11.0

Endpoint	Methods	Action	Notes
AppSetting	GET, PUT	Added	
AppSetting/{id}	GET	Added	
AppSetting/{id}/Set	PUT	Added	
AppSetting/{name}/Set	PUT	Added	
CertificateAuthority/SourceCount	GET	Added	
CertificateAuthority/ConfigurationTenants	GET	Added	
CertificateAuthority/HealthMonitoring/Schedule	GET	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients	GET	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients	POST	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients	GET	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients	POST	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients/{id}	DELETE	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients/{id}	GET	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients/{id}	PUT	Added	

Endpoint	Methods	Action	Notes
CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id}	DELETE	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id}	GET	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id}	PUT	Added	
CertificateAuthority/Import	POST	Added	
CertificateAuthority/ConfigurationTenants	GET	Changed	The endpoint is now renamed to GET /CertificateAuthority/AvailableForests and the definition is changed to: Returns a list of available forests that are in Active Directory.
Certificates/CSV	GET	Added	
Certificates/IdentityAudit/{id}	GET	Added to V2 definitions	This API endpoint is available in both the V1 and V2 definitions in the Keyfactor API Reference and Utility and acts exactly the same in both.
CertificateCollections/{id}/Permissions	POST	Removed	Instead use POST Security/Roles/{id}/Permissions/Collection.
CertificateCollections/{id}	DELETE	Added	
CertificateCollections/NavItems	GET	Added	

Endpoint	Method-s	Action	Notes
CertificateCollections/CollectionList	GET	Added	
CertificateCollections/{id}/Favorite	PUT	Added	
CertificateStores/Server	GET, POST, PUT	Deprec- ated	
CertificateStoreTypes	GET	Changed	<p>The API will return ALL certificate store types if at least one of these conditions are met:</p> <ul style="list-style-type: none"> • The end-user has one of the /certificate_stores/read/ global permissions. • The end-user has permission to at least one certificate store container.
ComponentInstallation/{id}	DELETE	Added	
ComponentInstallation/	GET	Added	
EventHandlerRegistration/{id}	GET, DELETE, PUT	Added	
EventHandlerRegistration/	GET, POST	Added	
Extensions/Scripts/{id}	DELETE, GET	Added	
Extensions/Scripts	GET, POST, PUT	Added	
IdentityProviders/{id}	GET, PUT	Added	
IdentityProviders	GET	Added	
IdentityProviders/Types	GET	Added	

Endpoint	Methods	Action	Notes
Permissions	GET	Added	
PermissionSets/{id}	GET, DELETE	Added	
PermissionSets	GET, POST, PUT	Added	
Scheduling	POST	Added	
Security/Containers/{id}/Roles	GET, POST	Added	
Security/Audit/Collections/{id}	GET	Added	
Security/Claims/{id}	GET, DELETE	Added	
Security/Claims	GET, POST, PUT	Added	
Security/Claims/Roles	GET	Added	
Security/Identities	GET	Changed	The non-working query string field has been removed.
Security/Roles/{id}/Permissions/PamProviders	GET, PUT	Added	
Security/Roles (V1) Security/Roles/{id} (V1) Security/Roles/{id}/Identities(V1) Security/Roles/{id}/copy(V1)	GET, POST, PUT	Deprecated in V1	All SecurityRoles API endpoints (except DELETE / {id}) have been deprecated from the V1 API, as they only work against Active Directory users. There are new Security/Roles endpoints in the V2 API
Security/Roles(V2) Security/Roles/{id}(V2)	GET, POST, PUT	Added in V2	Security/ Roles API endpoints have been recreated in V2 API to work with both OAUTH and AD users.

Endpoint	Methods	Action	Notes
Templates/{id}	GET	Changed	Now returns an object with a TemplatePolicy property and a KeyAlgorithms property that show the policies and algorithms the template supports.
Templates/Import	GET, POST	Changed	Now supports multiple algorithms.
Templates/Settings	GET, PUT	Changed	The Template Policy property used to update global application settings now contains four properties: ECDSA, RSA, Ed448, and Ed25519. These replace the AllowEd448, AllowEd25519, RSAValidCurves, and ECCValidCurves.

4.0 Installing Servers

The Keyfactor Command solution by Keyfactor allows you to issue and manage certificates across enterprise infrastructures to allow you to achieve end-to-end visibility, control, and automation across all your machine identities so you can turn the impossible into the possible. It includes a web-based Management Portal running on a SQL backend providing the command and control center for managing certificates in the enterprise.

Keyfactor Command provides:

- **Visibility**
Identify risks and prevent outages more effectively with a complete and continuous inventory of all your cryptographic assets.
- **Control**
Have ultimate flexibility to make all certificates trusted, compliant, and up-to-date—and keep them that way.
- **Automation**
Replace manual, error-prone tasks with automated key and certificate discovery, management, and renewal.
- **Orchestration**
Move from DevOps to DevSecOps by orchestrating and expanding cryptography to secure software delivery pipelines.

In addition to the Management Portal, Keyfactor also offers:

- Several agents and orchestrators for managing certificates in certificates stores via the Management Portal (see [Installing Orchestrators on page 2875](#)).
- Several certificate authority gateways to support management of and enrollment for certificates from remote and cloud-based certificate providers via the Management Portal.
- The Keyfactor API that integrates with the product to provide for customization (see [Keyfactor API Reference on page 843](#)).
- A certificate authority policy module with several policy handlers to provide policy control at the Microsoft CA level (see [Keyfactor CA Policy Module on page 2844](#)).
- An SSH Key Manager that extends beyond certificate management and traditional PKI to give security and network teams a simple, centralized solution to discover and manage SSH keys across their server and cloud infrastructure (see [SSH on page 525](#)).

Uniquely designed for PKI administrators to operate an enterprise PKI, it's never been easier to issue, revoke, renew, or replace a digital certificate. With exceptionally robust reporting and management capabilities for all the certificates in an IT environment, the PKI administrator has a truly scalable and entirely secure system for operating an enterprise PKI.

4.1 Logical Architecture

Keyfactor Command is an n-tier application, consisting of a web/presentation layer, application tier, and database tier. In addition, Keyfactor Command optionally includes a number of enrollment and management components to help facilitate secure and/or automated certificate issuance and delivery to various server and client platforms. The following sections provide views of the Keyfactor Command architecture from a logical and physical standpoint.

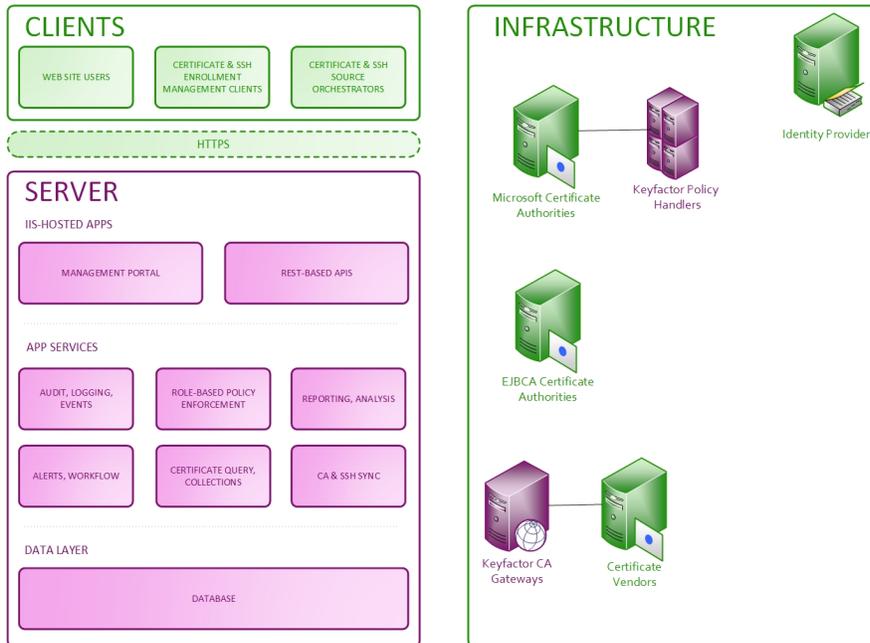

Figure 441: Keyfactor Command Logical Architecture Diagram

The Keyfactor Command solution includes the following logical components:

- Client / Orchestrator Tier:
 - Certificate Enrollment and Management Tools—While many certificate management functions can be performed in a completely agentless fashion, Keyfactor Command provides a number of enrollment and management tools to enable enhanced functionality where needed.
 - Certificate Source Orchestrators (aka Agents) and Gateways—Keyfactor Command gathers information about an enterprise’s certificates and SSH keys from a number of different sources, including Microsoft and EJBCA CA databases, SSL scans, SSH key scans, API-based import, Java keystores, PEM certificate stores, F5 devices, NetScaler devices, Amazon Web Services (AWS) locations, select certificate vendor certificates via gateways, and manual import through the Keyfactor Command Management Portal.
- Web Tier:
 - Management Portal—Keyfactor Command includes a web-based Management Portal that provides a PKI operations dashboard for administrators. It also enables certificate officers to

easily search for and locate certificates and then perform management functions on them such as revocation or recovery. In addition, Keyfactor Command allows every certificate to be tagged with additional customer-defined metadata about the certificate, such as points of contact, certificate/app owners, etc. From within the Management Portal, administrators can inventory and manage secure shell (SSH) keys across the enterprise, while users can issue new SSH keys.

- Enrollment Web Pages—Keyfactor Command includes issuance capabilities to a wide array of platforms, including Mac auto-enrollment, PKCS#12-based certificate issuance, and web-based CSR submission for administrator enrollment. PKCS#12 (PFX) and CSR enrollment are supported against Microsoft CAs in the local forest, remote CAs—with or without trust relationships—and non-domain-joined Microsoft and EJBCA CAs.
- Web APIs—Keyfactor Command is implemented with a robust and continually growing set of APIs that allow integration of Keyfactor Command functionality with the set of Keyfactor Command clients and orchestrators, as well as third-party or customer-created software or scripts.
- App Tier:
 - Event History and Audit Logging—Keyfactor Command maintains a record of operations that are performed on a certificate and the individual who performed the operation. This includes information such as initial synchronization date, additions to and removals from certificate stores, certificate recovery, and certificate revocation.
 - Role-Based Policy Enforcement—Keyfactor Command offers a rich, role-based permissions model that allows you to create your own roles as needed within the Keyfactor Command Management Portal. Users can be assigned to roles based upon Active Directory group memberships or individually, and then each role can be assigned granular Keyfactor Command permissions such as report creation, certificate revocation or renewal, or metadata update.
 - Dashboard and Report Engine—Keyfactor Command contains a dynamic dashboard along with several built-in reports generated using the Logi Analytics Platform.
 - Certificate Query & Collections—Keyfactor Command allows certificate administrators to query the certificate database using various search criteria. In addition, the bulk of Keyfactor Command's reporting and automated notification functionality can be driven through certificate collections, which are a user-definable mechanism that allows organizations to report on groups of certificates based on selection criteria.
 - Workflow Builder—The workflow builder in Keyfactor Command allows you to easily automate event-driven tasks when a certificate is requested or revoked. The workflows can be configured with multiple steps between the start and end of the operation that offer a simple way to configure notifications, approvals, and end-to-end automation. This provides for operational agility in an intuitive and easy-to-configure manner. The workflow builder is highly customizable with options to execute PowerShell scripts, invoke REST requests, send email messages, and require one or more approvals built in, and facilities to build custom steps to allow many more functions to be built as needed.
 - Alert Notice Generator—Keyfactor Command allows you to configure customized email notifications for impending certificate expiration, revocation expiration, pending certificate requests, issued certificate requests and denied certificate requests. These notifications

can be sent at configurable intervals, and may contain ASCII or HTML content, along with relevant information about the certificate or request in question (e.g. subject DN, issuer, thumbprint, template, custom metadata, etc.)

- Certificate Request Alerting—Keyfactor Command provides interfaces through which administrators can request certificates that require CA-level manager approval, interfaces where the approvers can either issue or deny the certificate request, and interfaces where the requesters can then download the certificates. This, along with the notice generator, provides an end-to-end flow for certificate requests that require CA-level manager approval.
- Alert Handlers—In addition to the notice generator that provides email alerts for SSH key and certificate expiration and enrollment workflow, Keyfactor Command also provides optional handlers that can be used in the certificate request and expiration alerts to output the information to the event log rather than sending it via email, run a PowerShell script, or automatically renew expiring certificates that are found in certificate store locations.
- Keyfactor Command Service—The Keyfactor Command Service (a.k.a. the timer service) is designed to continually keep the Keyfactor Command SQL database synchronized with the contents of every configured Microsoft and EJBCA CA database in the organization as well as external certificates located on servers it can scan. The service can perform full or partial scans of different CAs at user-defined intervals. This enables a rapidly-accessible, easily queried mirror of CA database information that can then be put to use via Keyfactor Command. Synchronization of CA information is supported for Microsoft CAs joined to the local forest, remote domain-joined Microsoft CAs—with or without trust relationships—and non-domain-joined Microsoft and EJBCA CAs. The Keyfactor Command Service is also responsible for executing a variety of periodic tasks, including scheduled reports, alerts and cleanup jobs.
- Data Tier:
 - SQL Database—Keyfactor leverages a Microsoft SQL Server database to store the information that Keyfactor Command uses.
- Microsoft Certification Authority Components:
 - RFC 2818 Policy Handler—The RFC 2818 Policy Handler integrates with the Microsoft CA to allow you to automate the addition of a DNS SAN matching the CN of the requested certificate for selected templates.
 - SAN Attribute Policy Handler—The SAN Attribute Policy Handler allows the addition of SANs not included in the CSR when making a CSR enrollment request. The added SANs will overwrite any existing SANs in the CSR. This functionality is the same as that seen with the Microsoft default policy module for the CA as a whole when the CA EDITF_ATTRIBUTESUBJECTALTNAME2 flag is set except the SAN Attribute Policy Handler provides the ability to control SAN addition on a template-by-template basis without the need to enable the Microsoft CA EDITF_ATTRIBUTESUBJECTALTNAME2 flag.
 - Whitelist Policy Handler—The Whitelist Policy Handler integrates with the Microsoft CA to allow you to restrict certificate enrollment on that CA for a configured certificate template or templates to only designated client machines. This allows you, for example, to force certificate enrollment for web server certificates to be accepted only via the Keyfactor Command

Management Portal and denied when coming from the Microsoft certificates MMC or IIS on the target servers for web server certificates.

- Enterprise Infrastructure:
 - Certification Authorities—Keyfactor Command has been built from the ground up to make it easier to operate organizational PKIs. This allows you to benefit from Keyfactor Command’s extended features around Microsoft CA capabilities such as certificate templates, enrollment and recovery agents, and private key recovery. Keyfactor Command’s integration with EJBCA provides support for capabilities such as certificate profiles, end entity profiles, enrollment, and revocation.
 - Identity Providers—Keyfactor Command relies on an identity provider to support authentication to the Management Portal and the Keyfactor API and supporting group memberships for Keyfactor Command role assignments. Historically, the product has been integrated with Microsoft Active Directory, using AD for Microsoft CA and certificate template enumeration and for the inclusion of AD account attributes in the content of issued certificates. With the release of Keyfactor Command version 11.0, support for identity providers expands beyond Active Directory. Users may choose between Active Directory and an open authorization (OAuth) 2.0 compliant identity provider with a complete implementation of the OpenID Connect (OIDC) protocol including the Keyfactor-provided Keyfactor Identity Provider.

4.2 Physical Architecture

[Figure 442: Keyfactor Command Physical Architecture Diagram](#) shows the physical architecture of the Keyfactor Command solution.

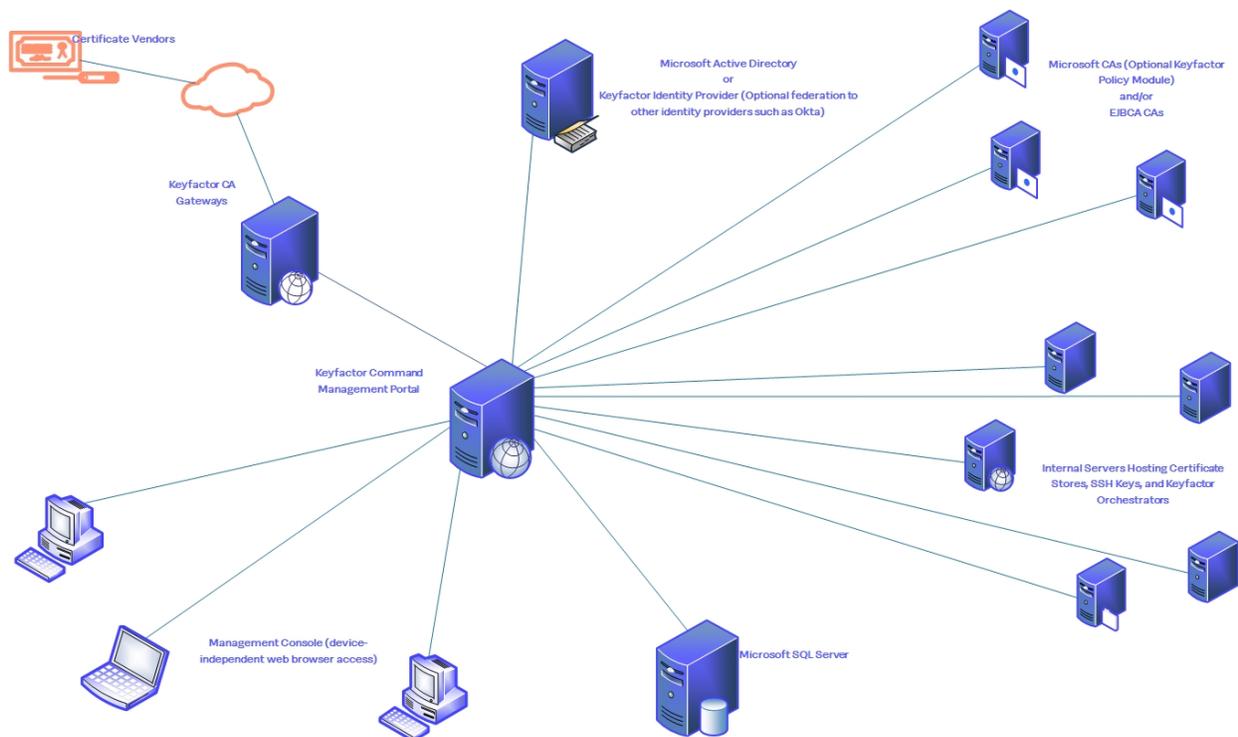

Figure 442: Keyfactor Command Physical Architecture Diagram

For simplicity, the servers in [Figure 442: Keyfactor Command Physical Architecture Diagram](#) are shown as single physical instances. In practice, these servers may be virtual machines and may be load balanced or clustered to meet availability or performance requirements. The diagram includes some optional components—including the Keyfactor vendor gateways and Keyfactor orchestrators—which are not covered in this guide. For more information about these components, see the [Installing Orchestrators on page 2875](#) guide and the documentation for each of the gateways.

- Keyfactor Command-Dedicated Servers¹:
 - Keyfactor Command Server—This server hosts the Keyfactor Command Management Portal, the Keyfactor Command Services roles, and the Logi Analytics Platform for report generation. These roles run as ASP.NET (4.5 or higher) applications on IIS. Both Windows Server 2019 and 2022 are supported.
- Enterprise-Shared Servers:
 - Microsoft SQL Server—Keyfactor Command supports Microsoft SQL Server 2017, 2019 and 2022 all with TLS encryption enabled for its primary database. While a dedicated SQL deployment is certainly an option, many organizations maintain a well-established SQL server farm to support multiple applications within the organization; if preferred, Keyfactor Command can easily make use of such a service. Keyfactor does not recommend locating the Keyfactor Command roles on the SQL server in a production deployment.

¹The roles described in this section may be co-located on a single physical or virtual server or may be further separated to multiple machines.

- Web Reverse Proxy—If Internet-based access is required, the Keyfactor Command services can be published through a variety of reverse proxy products such as Microsoft UAG/TMG, F5, SiteMinder, or Citrix NetScaler.
- Network-based Hardware Security Module (HSM not pictured)—In certain configurations, Keyfactor Command requires the use of Enrollment Agent (EA) and/or Key Recovery Agent (KRA) certificates. To provide additional security over these certificates' private keys, Keyfactor strongly recommends the use of a Hardware Security Module (HSM) such as the Thales NetHSM if these features will be used.

4.3 Solution Design

Keyfactor Command supports a number of different deployment architectures to help provide for different needs from small and simple to highly available. The solution can be as simple as one Keyfactor Command server hosting all the Keyfactor Command roles (other than the policy handlers, which are installed on a Microsoft CA) or the roles can be separated onto different machines to provide increased security or distribute the load. Redundant servers can be added to provide for high availability—either within the same data center or across data centers. Keyfactor expects that the specifics of a high availability deployment plan would be finalized as part of the project rollout.

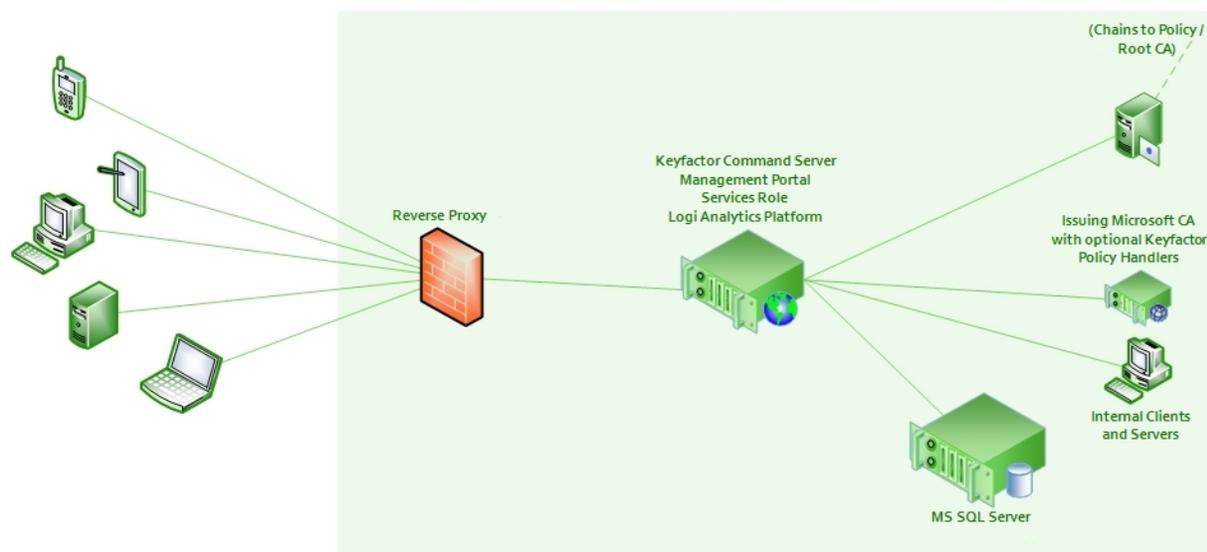

Figure 443: Simple Keyfactor Command Solution Design

4.4 Keyfactor Command Server

The Keyfactor Command solution by Keyfactor allows you to issue and manage certificates across enterprise infrastructures to allow you to achieve end-to-end visibility, control, and automation across all your machine identities so you can turn the impossible into the possible.

4.4.1 System Requirements

[Table 843: System Requirements](#) provides the recommendations for minimum system specifications used by Keyfactor Command components. All servers may be deployed as virtual machines and may be part of a clustering or load-balanced architecture, if desired. If the Keyfactor Command roles are co-located, the specifications may need to be scaled accordingly. All Microsoft-supported methods for making SQL Server highly available are supported. For most high availability requirements, Keyfactor recommends using always on availability groups (see [SQL Server on page 2742](#)).

Important: SSH management in Keyfactor Command with the Keyfactor Bash Orchestrator (see [SSH on page 525](#)) is only supported when using Active Directory as an identity provider (see [Selecting an Identity Provider for Keyfactor Command on page 2704](#)). The SSH option in the Management Portal will only appear when Keyfactor Command is installed using Active Directory as an identity provider (and with a license that supports SSH).

Table 843: System Requirements

Component	Minimum Requirements
Keyfactor Command Server (Management Portal, Keyfactor API, and Services roles)	<ul style="list-style-type: none">Windows Server 2019 or 2022Internet Information Services (IIS) with:<ul style="list-style-type: none">Basic Authentication—if you plan to use Active Directory as an identity provider (see Selecting an Identity Provider for Keyfactor Command on page 2704)Windows Authentication—if you plan to use Active Directory as an identity provider with Windows authentication (see Selecting an Identity Provider for Keyfactor Command on page 2704)ASP.NET 4.7 or greaterThe Active Directory Module for Windows PowerShellSee Install IIS and .NET on the Keyfactor Command Server on page 2768.ASP.NET Core Hosting Bundle version 6.0 (x64). 	<div data-bbox="630 283 971 493" style="text-align: center;"> </div> <div data-bbox="630 611 943 653" style="text-align: center;"> <h2>Run server apps</h2> </div> <p data-bbox="511 669 1062 787">Do you want to run web/server applications? The ASP.NET Core Hosting Bundle includes the .NET Runtime and ASP.NET Core Runtime. If installed on a machine with IIS, it'll also add the ASP.NET Core IIS Module.</p> <div data-bbox="630 810 940 873" style="text-align: center; border: 1px solid blue; padding: 5px; width: fit-content; margin: 0 auto;"> Download Hosting Bundle </div> <p data-bbox="505 898 1300 926"><i>Figure 444: Select the Download Hosting Bundle Option Under Run Server Apps</i></p> <p data-bbox="505 936 1385 999">You can use the following PowerShell command to check the .NET core version (s) installed on a server (if any):</p> <div data-bbox="553 1010 1404 1062" style="background-color: #f0f0f0; padding: 5px; border-radius: 5px;"> <pre>dotnet --list-runtimes</pre> </div> <p data-bbox="505 1094 1406 1188">Output from this command will look something like this if you have the correct 6.0 x64 version of the .NET Hosting Bundle installed (notice the path is in C:\Program Files, not C:\Program Files (x86), indicating this is the x64 version):</p> <div data-bbox="553 1199 1404 1283" style="background-color: #f0f0f0; padding: 5px; border-radius: 5px;"> <pre>Microsoft.AspNetCore.App 6.0.21 [C:\Program Files\dotnet\shared\Microsoft.AspNetCore.App]</pre> </div> <div data-bbox="505 1314 1404 1482" style="background-color: #ffe5cc; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p>⚠ Important: The ASP.NET Core Hosting Bundle should not be installed before installing IIS. If the hosting bundle is installed before IIS is installed, the bundle will not function correctly after the IIS install and will require repair.</p> </div> <ul data-bbox="477 1503 1122 1608" style="list-style-type: none"> .NET Framework 4.7.2 or greater 4 GB RAM, 2 GHz CPU, 40 GB disk Keyfactor Command license key for the current release
Microsoft SQL Database	Ability to connect to a Microsoft SQL Server 2017, 2019, or 2022 all with TLS encryption enabled and compatibility level 130 or higher. 8 GB RAM, 2+ GHz CPU (>= 2 cores), 500 GB disk

Component	Minimum Requirements
Browser to Access the Management Portal	<ul style="list-style-type: none"> • Chrome: 99.0.4844.74+ • Firefox: 98.0+ • Microsoft Edge: 99.0.1150.30+
EJBCA CA (Optional)	<ul style="list-style-type: none"> • EJBCA Enterprise version 7.8.1 or later is supported. • The EJBCA REST API must be enabled to interoperate with Keyfactor Command (see System Configuration -> Protocol Configuration in the EJBCA administration portal).

4.4.2 Planning & Preparing

Before you install Keyfactor Command, you need to consider the components that make it up and its dependencies and decide where you want each role to reside, which roles—if any—you want to be highly available, and which features you’re going to enable. It’s possible to start with a non-redundant implementation and then add redundancy at a later time, but it’s best to plan ahead for this if it’s the desired goal.

Your license for Keyfactor Command may not include all the roles described in this document, so some sections of this guide may not apply to your implementation.

Once you’ve made these planning decisions, you then need to follow the steps outlined in this section that need to be taken prior to a Keyfactor Command implementation to install the prerequisites, create the required supporting components, and gather the necessary information to complete the Keyfactor Command installation and configuration process.

4.4.2.1 Selecting an Identity Provider for Keyfactor Command

Identity providers are used to provide a method for authenticating access to Keyfactor Command. Keyfactor Command supports Microsoft Active Directory and open authorization (OAuth) 2.0 compliant identity providers with a complete implementation of the OpenID Connect (OIDC) protocol. Keyfactor Command has been tested with the following identity providers:

- Active Directory

Microsoft’s Active Directory has historically been the only identity provider supported by Keyfactor Command. With Active Directory, you can authenticate users defined in the Active Directory forest to which the Keyfactor Command server is joined and users from forests in a trust with this forest using integrated Windows authentication. Users may alternatively be authenticated to Keyfactor Command using Basic authentication when you opt for Active Directory as your identity provider. Active Directory supports user, group and computer accounts.

- Keyfactor Identity Provider

Keyfactor Identity Provider is a lightweight application that is easily installed in the same environment as Keyfactor Command to provide standalone authentication separate from Active Directory. It may be used directly to supply authentication or it may be used to federate authentication to another OAuth 2.0 compliant identity provider (e.g. Okta, Ping Identity). Keyfactor Identity Provider runs in a Linux-based Docker container. Keyfactor Identity Provider supports users and groups.

- Auth0

Auth0 is a cloud-based OAuth 2.0 compliant identity and access management (IAM) solution owned by Okta.

A given Keyfactor Command server may be configured with only one identity provider. If desired, you may configure an environment with multiple Keyfactor Command servers and configure a different identity provider for each Keyfactor Command server.

Important: SSH management in Keyfactor Command with the Keyfactor Bash Orchestrator (see [SSH on page 525](#)) is only supported when using Active Directory as an identity provider. The SSH option in the Management Portal will only appear when Keyfactor Command is installed using Active Directory as an identity provider (and with a license that supports SSH).

Installing Keyfactor Identity Provider

If you've opted to use Keyfactor Identity Provider as your identity provider for Keyfactor Command, you'll need to install and configure it before installing Keyfactor Command. Keyfactor Identity Provider runs in a Docker container on a Linux machine and is configured to use a Microsoft SQL database to store its data (configuration, user and group accounts, etc).

Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

System Requirements

Keyfactor Identity Provider has the following requirements:

- Linux
- Docker
- Java version 12 or later
- Microsoft SQL Server

This guide assumes you are starting from a base of already having a Linux server with Docker installed. Instructions for installing and configuring Linux and Docker are beyond the scope of this guide. Some helpful web pages include:

- <https://ubuntu.com/server/docs/installation>
- <https://docs.docker.com/engine/install/ubuntu/>

Preparing

To get ready to install Keyfactor Identity Provider you will need to gather a few pieces of information, copy some certificate files to your Linux machine, and set up a database and user in SQL.

Prepare Certificates

Keyfactor Identity Provider uses two certificates:

- The public key certificate of the Microsoft SQL server that will host the database for Keyfactor Identity Provider to allow it to connect to the SQL server using an encrypted connection (see [Using SSL to Connect to SQL Server on page 2746](#)).
- An SSL certificate with private key in the name of the server hosting the Docker container for Keyfactor Identity Provider to allow administrators to connect to the web-based administration interface for Keyfactor Identity Provider over an encrypted channel.

To prepare the SQL certificate:

1. On the Microsoft SQL server, open the certificates MMC for the local machine store using one of these methods:
 - Using the GUI:
 - a. Open an empty instance of the Microsoft Management Console (MMC).
 - b. Choose **File->Add/Remove Snap-in...**
 - c. In the *Available snap-ins* column, highlight **Certificates** and click **Add**.
 - d. In the Certificates snap-in popup, choose the radio button for Computer account, click **Next**, accept the default of Local computer, and click **Finish**.
 - e. Click **OK** to close the Add or Remove Snap-ins dialog.
 - Using the command line:
 - a. Open a command prompt using the “Run as administrator” option.
 - b. Within the command prompt type the following to open the certificates MMC:

```
certlm.msc
```
2. Drill down to the Personal folder under Certificates for the Local Computer. Locate the certificate used to secure connections to your SQL server (see [Using SSL to Connect to SQL Server on page 2746](#)).
3. Right-click the certificate and choose All Tasks->Export....

4. Follow the export wizard, choosing not to export the private key, choosing a format of P7B, and opting to including the chain certificates.

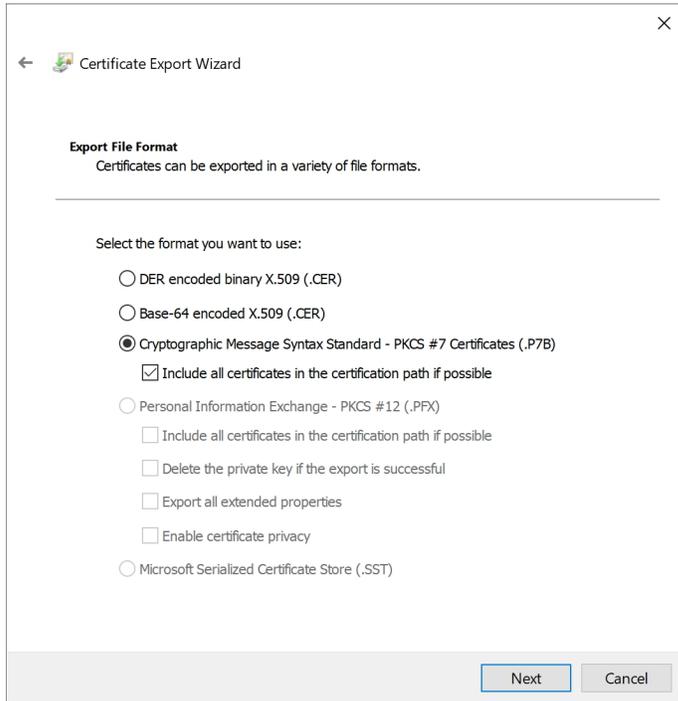

Figure 445: Export the SQL Server Certificate as a P7B

5. Copy the exported file to a working directory on the Docker host.
6. On the Docker host, use OpenSSL to extract the certificate and chain from the P7B file with a command similar to the following:

```
sudo openssl pkcs7 -inform der -in /my/path/mycert.p7b -print_certs -out  
/my/path/mycert.cer
```

7. Use the Java keytool command to create a Java Keystore containing all of the certificates that are part of the chain required to trust the certificate used to secure connections to your SQL server (these should be in your incoming .cer file):

```
sudo keytool -import -file /my/path/mycert.cer -keystore /my/path/sql-keystore -  
storepass "MySuperSecureStorePassword"
```

To prepare the SSL certificate:

1. Acquire the SSL certificate using the Fully Qualified Domain Name (FQDN) of the server or alias used for the Keyfactor Identity Provider Docker host. This is the name that you will use to access Keyfactor Identity Provider via a browser for management purposes and that Keyfactor

Command will use to access Keyfactor Identity Provider for authentication purposes.

2. Copy the certificate together with its private key to a working directory on the Docker host.
3. Depending on the method you used to acquire your certificate, you may need to manipulate it on the Docker host to get it into the correct format. You need separate PEM-encoded unencrypted private key and certificate files. If your certificate is a PKCS#12 file, you can use OpenSSL commands similar to the following to extract the certificate and key:

Extract just the certificate, not any chain certificates or the key:

```
sudo openssl pkcs12 -in /my/path/mycert.pfx -clcerts -nokeys -out  
/my/path/mycert.cer
```

Extract just the key:

```
sudo openssl pkcs12 -in /my/path/mycert.pfx -nocerts -out /my/path/mycert_key.pem
```

Decrypt the key:

```
sudo openssl rsa -in /my/path/mycert_key.pem -out /my/path/mycert_key-plain.pem
```

Important: The decrypted key file should be handled carefully and stored securely. During the container deployment, the certificate and key files will be copied to:

```
/install/path/certificates/ssl
```

Permissions should be set on the key file in this location such that the service account running the Docker container has read permission on it and no other users have access of any kind. By default, Docker containers run as root, so the permissions would look like something like this:

```
-r----- 1 root root 1704 Jul 10 09:12 appsvr18keyexamplecom-key-plain.pem
```

Following the deployment, the key file in the working directory (not the directory listed above) should be removed.

SQL Setup

Keyfactor Identity Provider uses Microsoft SQL Server with SQL authentication, not Windows authentication. Your SQL server must be configured to support mixed mode authentication in order to use the SQL authentication. The database for Keyfactor Identity Provider needs to be created in SQL before the deployment is done and appropriate permissions granted for the SQL user you will configure in Keyfactor Identity Provider to make the connection to SQL.

On your Microsoft SQL server:

1. Identify an existing SQL login using SQL authentication (not Windows authentication) or create a new login to be used for Keyfactor Identity Provider to authenticate to SQL.

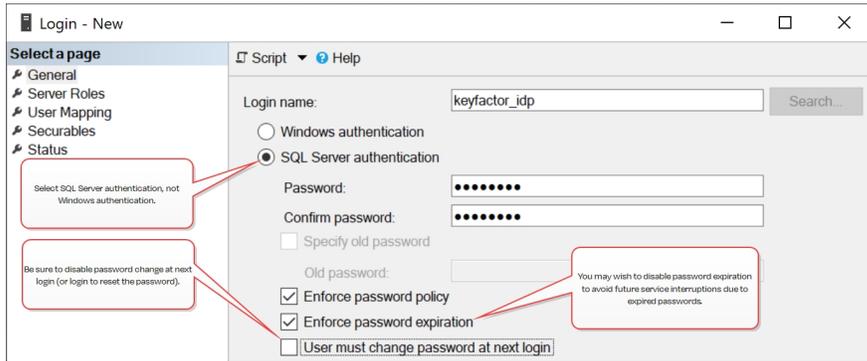

Figure 446: Add a SQL Authentication Login

2. Create a new database in SQL and grant the SQL login you created in the previous step at least dbo permissions on the database. You can do this either by setting it as the database owner while creating the database or by going back into the login after the database is created and granting the access on the User Mapping tab.

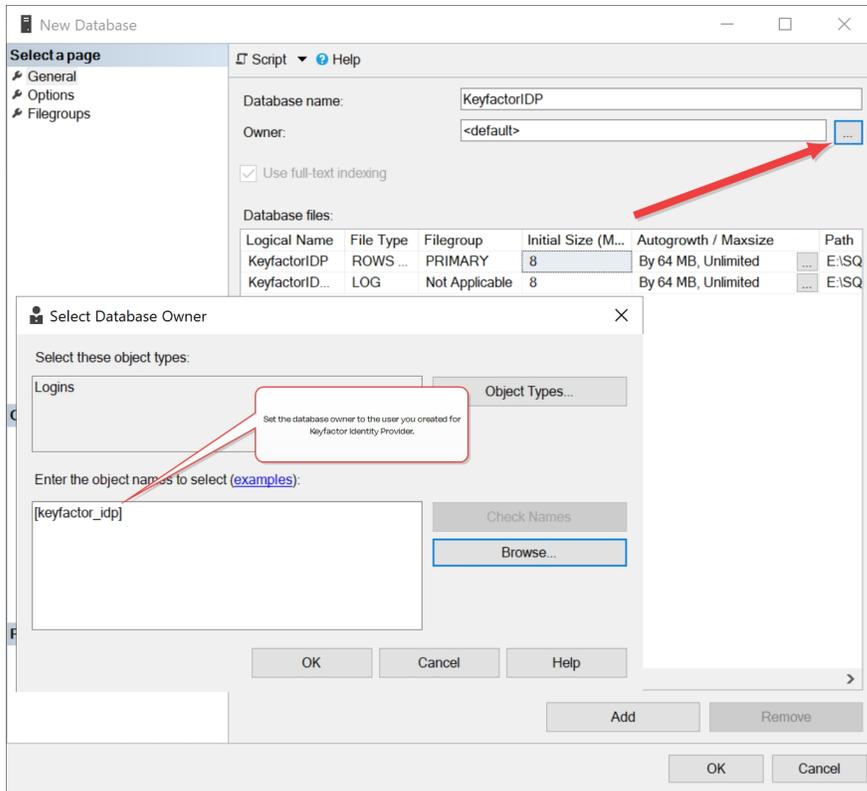

Figure 447: Add a SQL Database

Gather Information

You will need the following information in order to appropriately configure the installation file for the Keyfactor Identity Provider container:

- A username and password for the initial administrative user that will be created in Keyfactor Identity Provider. By default, the username *admin* is used.
- The fully qualified domain name (FQDN) that you will use to access Keyfactor Identity Provider from a browser. This is typically the hostname of the container host.
- The FQDN or IP address of the SQL server hosting the database for Keyfactor Identity Provider. If you choose to use the IP address, the SSL certificate on the SQL server will need to include the IP address as a SAN. If you configured your database in a non-default instance or your SQL is running on a non-standard port, you will need this information as well.
- The name of the database you created in SQL for Keyfactor Identity Provider.
- The username and password for the login you created in SQL for Keyfactor Identity Provider.
- The path to the *sql-keystore* Java keystore you created as per [Prepare Certificates on page 2706](#).
- The paths to the server certificate (*mycert.cer*) and unencrypted private key (*mycert_key-plain.pem*) you prepared as per [Prepare Certificates on page 2706](#).
- The IP address of at least one DNS server in your environment that can be used to resolve the hostname of the SQL server if that server isn't publicly routable.
- The path for the Keyfactor Identity Provider image you will install. The Keyfactor Identity Provider artifactory can be found here:

```
keyfactor.jfrog.io/con-develop-us-engineering/command/authentication-server:latest
```

Check with your Keyfactor Client Success Manager for credentials.

Installing Using Docker Compose

The following section covers installing Keyfactor Identity Provider using a Docker compose file.

To install Keyfactor Identity Provider in a Linux container and start the container using Docker compose:

1. Create a directory from which you will run the Docker container (e.g. `/opt/kyfidp`).
2. Copy the *sql-keystore* Java keystore you created (see [Prepare Certificates on page 2706](#)) into the directory you created for the Docker container and set the permissions appropriately. It needs to be readable by the user the Docker container will run as (by default root) and its group. For example:

```
sudo chown root:root sql-keystore
```

```
sudo chmod 440 sql-keystore
```

3. Copy the certificate and key for the Docker host (see [Prepare Certificates on page 2706](#)) into the directory you created for the Docker container and set the permissions appropriately. They need to be readable by the user the Docker container will run as (by default root) and its group. For example:

```
sudo chown root:root appsrvr18keyexamplecom-server.cer
```

```
sudo chown root:root appsrvr18keyexamplecom-key-plain.pem
```

```
sudo chmod 440 appsrvr18keyexamplecom-server.cer
```

```
sudo chmod 440 appsrvr18keyexamplecom-key-plain.pem
```

4. From your Docker host, retrieve the Keyfactor Identity Provider image from the artifactory with commands similar to the following (using credentials provided to you by Keyfactor; the password is saved in `my_password.txt`):

```
cat my_password.txt | sudo docker login keyfactor.jfrog.io --username username --password-stdin
```

```
sudo docker pull keyfactor.jfrog.io/con-develop-us-engineering/command/authentication-server:latest
```

Important: Remove the `my_password.txt` file when complete.

5. Create a Docker compose file (`compose.yaml`) in the directory you created for the Docker container similar to the following, using inputs as per [Table 844: Keyfactor Identity Provider Container Parameters](#) and referencing the artifactory you pulled. The fields highlighted in red below indicate fields that need to be edited or that you may wish to edit.

Important: When editing the file, be sure to preserve the indenting exactly as found. YAML requires a very specific file layout to function. If the indenting (multiples of two spaces) or layout is incorrect, you will receive an error when trying to install.

```
services:
  auth:
    image: keyfactor.jfrog.io/con-develop-us-engineering/command/authentication-server:latest
    container_name: kyfidp
    ports:
```

```

- "1443:8443"
environment:
  KC_HTTPS_CERTIFICATE_FILE: /etc/x509/https/tls.crt
  KC_HTTPS_CERTIFICATE_KEY_FILE: /etc/x509/https/tls.key
  KC_SPI_THEME_DEFAULT: Keyfactor-Keycloak-Theme

  KEYCLOAK_ADMIN: admin
  KEYCLOAK_ADMIN_PASSWORD: 'MySuperSecureAdminPassword' # The password needs quotes under
some circumstances if it contains special characters

  KC_HOSTNAME: appsrvr18.keyexample.com

# This field is only required if you're using a port other than 443
  KC_HOSTNAME_PORT: 1443

# This user must be dbo on KC_DB_URL_DATABASE
  KC_DB_USERNAME: keyfactor_idp
  KC_DB_PASSWORD: 'MySuperSecureSQLUserPassword' # The password needs quotes under some
circumstances if it contains special characters
  KC_DB_URL_HOST: sqlsrvr05.keyexample.com
  KC_DB_URL_DATABASE: KeyfactorIDP
  KC_DB: mssql
  KC_TRANSACTION_XA_ENABLED: false
  KC_DB_URL_PROPERTIES: ';encrypt-
t=true;trustServerCertificate=false;sendStringParametersAsUnicode=false;Integrated Secur-
ity=False;Persist Security Info=True;trustStore=/temp/sql-
keystore;trustStorePassword=MySuperSecureJKSStorePassword;'

# This value must be configured even if you do not have a reverse proxy
  KC_PROXY: none

command:
  - start --import-realm

volumes:
  - ./appsrvr18keyexamplecom-server.cer:/etc/x509/https/tls.crt
  - ./appsrvr18keyexamplecom-key-plain.pem:/etc/x509/https/tls.key
  - ./sql-keystore:/temp/sql-keystore

# Optionally set the DNS server(s) for the Keyfactor Identity Provider server
dns:
  - 192.168.12.2
  - 192.168.12.3
restart: always

```

6. Set the permissions on the `compose.yaml` file such that the file is owned by root and readable only by root (this assumes your Docker daemon is running as root, which is typical). For example:

```
sudo chown root:root compose.yaml
```

```
sudo chmod 400 compose.yaml
```

Tip: If you need to make edits to the compose file, you will need to make the file writable again. For example:

```
sudo chmod 600 compose.yaml
```

7. Execute the following command to install and run the container in the foreground:

```
sudo docker compose up
```

You can instead run it in the background by adding the `-d` flag like so, but it can sometimes be helpful to run it in the foreground initially so that you can easily review the log output live:

```
sudo docker compose up -d
```

Tip: To stop and start the container again after installation is complete, use the following commands:

```
sudo docker compose stop
```

```
sudo docker compose start
```

Or:

```
sudo docker compose restart
```

If you need to delete the container and try the install again, use this command:

```
sudo docker compose down
```

This will not remove the configurations made in the SQL database.

To review logs generated from the container, identify the container ID or name with this command:

```
sudo docker container ls
```

Then use the following command to output the current log (with the optional `--follow` to make output continuous):

```
sudo docker container logs [--follow] [container ID or name]
```

Table 844: Keyfactor Identity Provider Container Parameters

Section	Parameter	Description
image		Required* . The path to the artifactory and image for the Keyfactor Identity Provider implementation.
container_name		A name to give to the container, if desired, for ease of reference.
environment	KC_HTTPS_CERTIFICATE_FILE	Required . The path and filename of the location within the container where the SSL certificate for the Docker host (see Prepare Certificates on page 2706) will live.
environment	KC_HTTPS_CERTIFICATE_KEY_FILE	Required . The path and filename of the location within the container where the SSL certificate key for the Docker host (see Prepare Certificates on page 2706) will live.
environment	KC_SPI_THEME_DEFAULT	Required . The theme for the Keyfactor Identity Provider implementation.
environment	KEYCLOAK_ADMIN	Required . The username for the initial administrative user for Keyfactor Identity Provider. The default is <i>admin</i> .
environment	KEYCLOAK_ADMIN_PASSWORD	Required* . Set a secure password for the initial administrative user for Keyfactor Identity Provider.
environment	KC_HOSTNAME	Required* . This is the fully qualified domain name of the Docker host where you are deploying your container.
environment	KC_HOSTNAME_PORT	The port number you will use to access Keyfactor Identity Provider via a browser. This field only needs to be populated if you won't be using 443. If you'll be using 443, the entry should be commented out or removed.
environment	KC_DB	Required* . The type of SQL server. Only Microsoft SQL Server is supported (mssql).
environment	KC_DB_URL_HOST	Required* . The fully qualified domain name of the Microsoft SQL server that will host the database for Keyfactor Identity Provider.
environment	KC_DB_URL_DATABASE	Required* . The name of the Keyfactor Identity Provider database you pre-created in SQL per SQL Setup on page 2708 .

Section	Parameter	Description
environment	KC_DB_PASSWORD	Required* . The password for the SQL login to which you granted database ownership permissions on the Keyfactor Identity Provider database per SQL Setup on page 2708 .
environment	KC_DB_USERNAME	Required* . The username for the SQL login to which you granted database ownership permissions on the Keyfactor Identity Provider database per SQL Setup on page 2708 .
environment	KC_DB_URL_PROPERTIES	Required* . The SQL database connection string including the password you set to secure the Java keystore that holds the SQL server's certificate as per Prepare Certificates on page 2706 .
environment	KC_TRANSACTION_XA_ENABLED	A Boolean that indicates whether the database for the installation supports XA transactions.
environment	KC_PROXY	The proxy address forwarding mode if the server is behind a reverse proxy.
ports		The first number in the ports field indicates the port number you will use to access Keyfactor Identity Provider via a browser and that Keyfactor Command will use to access Keyfactor Identity Provider. If there are no other containers using this port on this Docker host, you may use 443. If 443 is already in use, you will need to change this to an alternate port (e.g. 1443). The second number in the ports field indicates the port number the Docker container uses internally. Do not change this number.
command		The command to start the container and import the realm JSON.
volumes		In this section you set the file names for the certificate and key files you copied into the directory for your Docker container. The volumes section sets mappings between files that exist on the host and locations in the running container.
dns		In this section, add at least one IP for a DNS server that can be used to resolve hostname information for your SQL server from the Keyfactor Identity Provider container if the SQL server's address is not externally routable.

Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation

Once the Keyfactor Identity Provider completes successfully, you should be able to open the administration console for it in a browser and gather the information you will need to complete the Keyfactor Command installation referencing it.

1. Use a browser to open the Keyfactor Identity Provider management interface. For example:

`https://appsrvr18.keyexample.com:1443`

Click the **Administration Console** link and sign in with the initial administrative user and password you defined with the `KEYCLOAK_ADMIN` and `KEYCLOAK_ADMIN_PASSWORD` settings.

Note: Keyfactor Command communicates with Keyfactor Identity Provider over HTTPS, so be sure that you are working with Keyfactor Identity Provider over HTTPS to confirm that it is working correctly with no certificate errors.

2. In the Keyfactor Identity Provider Administration Console, select Keyfactor in the realm dropdown.

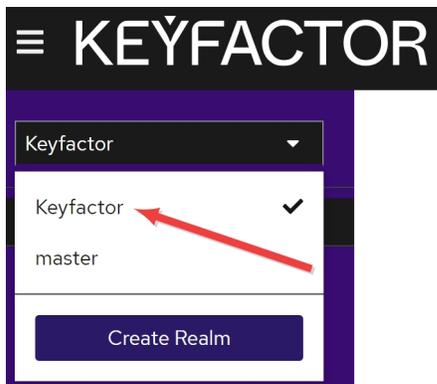

Figure 448: Select a Realm in the Keyfactor Identity Provider Administration Console

3. In the Keyfactor Identity Provider Administration Console, browse to *Clients > Client list* and click the *Command-OIDC-Client* client.

Clients

Clients are applications and services that can request authentication of a user. [Learn more](#)

Client secret Regenerate

Figure 450: Regenerate the Keyfactor Identity Provider Secret

- In the Client details on the Credentials tab click the **Copy** button next to the *Client secret* field to copy the unmasked version of the client secret to the clipboard (you do not need to display it

unmasked first) and save this in a secure location. You will need it during the Keyfactor Command configuration.

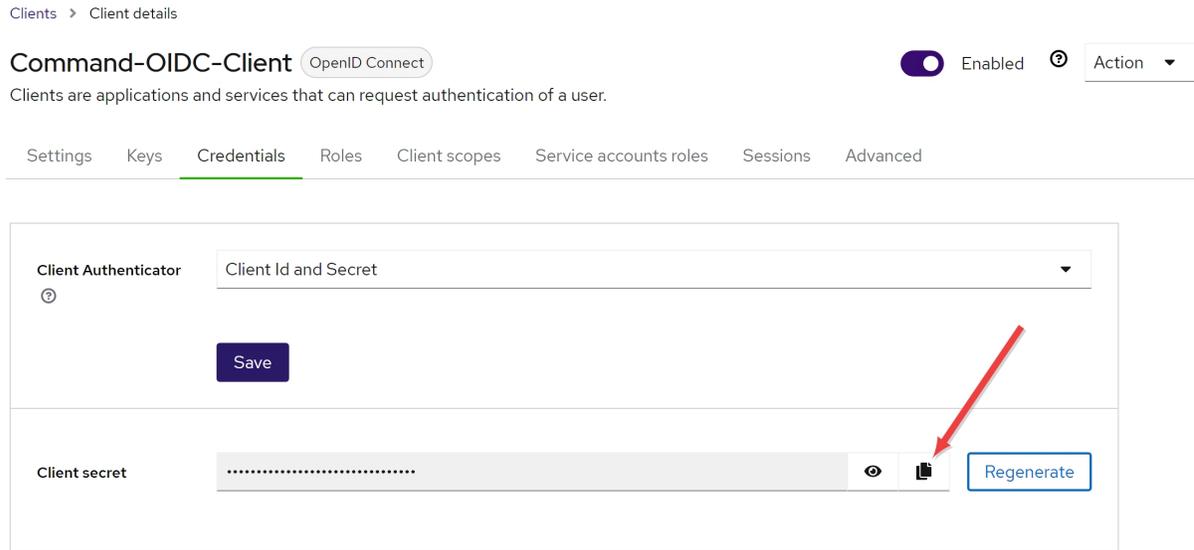

Figure 451: Copy the Keyfactor Identity Provider Secret

6. In the Client details on the Settings tab, populate the *Valid redirect URIs* and *Valid post logout redirect URIs* fields. The values for these fields are made up of the fully qualified domain name or alias you will use to access your Keyfactor Command server, the virtual directory name you will use to access the Keyfactor Command Management Portal (KeyfactorPortal by default), a specific endpoint for the URI, and the name you will give to Keyfactor Identity Provider when configuring Keyfactor Command (see [Authentication Tab on page 2787](#)). For example:

- Valid redirect URIs:

`https://keyfactor.kexample.com/KeyfactorPortal/callback/Command-OIDC`

- Valid post logout redirect URIs:

`https://keyfactor.kexample.com/KeyfactorPortal/signout-callback/Command-OIDC`

Important: Case matters for the virtual directory name—use *KeyfactorPortal* rather than *keyfactorportal* if you plan to accept the default virtual directory name.

Figure 453: OpenID Endpoint Configuration Link

8. In the browser window for the **OpenID Endpoint Configuration** link, review the settings. You may find it helpful to use a JSON formatting browser extension to make the data easier to read. The data you need from this configuration info is:
 - Issuer (a.k.a. Authority)
 - Authorization Endpoint
 - Token Endpoint
 - User Info Endpoint
 - jwks_uri (a.k.a. JSONWebKeySetUri)

Make note of these URLs, without the quotation marks. You will need them during the Keyfactor Command configuration.

```

object {53}
  issuer : "https://appsrvr186.keyexample.com:3443/realms/Keyfactor"
  authorization_endpoint : "https://appsrvr186.keyexample.com:3443/realms/Keyfactor/protocol/openid-connect/auth"

```

Figure 454: OpenID Endpoint Configuration Settings

- In the Keyfactor Identity Provider Administration Console, browse to *Realm settings* and select the Sessions tab.

On the Sessions tab, locate the *SSO Session Max* value. This value should match the *Session Expiration* parameter value configured in the Keyfactor Command configuration wizard on the Authentication tab. The *Session Expiration* value determines the length of time a browser session in the Keyfactor Command Management Portal will remain logged in before the user is prompted to re-authenticate regardless of whether the session is idle or in active use.

Locate the *SSO Session Idle* value and set it to a value that is appropriate to your environment. This value determines the length of time an idle browser session in the Keyfactor Command Management Portal will remain logged in before automatically logging out the user if no input from the user is received.

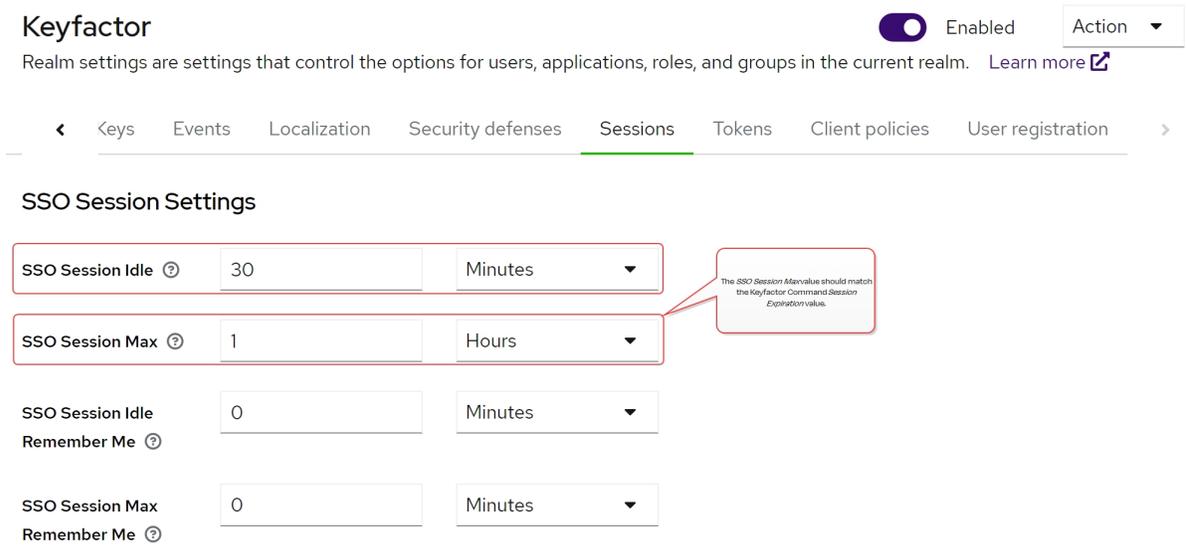

Figure 455: SSO Session Values

- In the Keyfactor Identity Provider Administration Console, browse to *Realm settings* and select the Tokens tab. On the Tokens tab, locate the *Access Token Lifespan* value. This value should be greater than or equal to the *Cookie Expiration* parameter value configured in the Keyfactor Command configuration wizard on the Authentication tab

The *Cookie Expiration* value determines the length of time the authentication cookie for the Keyfactor Command Management Portal browser session is considered valid. After half of the setting's duration, Keyfactor Command will attempt to use a refresh token to update the cookie. If this fails, the user's session will be terminated. The cookie renewal is seamless from the user's perspective (there is no prompt for credentials).

Access tokens

Access Token Lifespan Minutes ?
It is recommended for this value to be shorter than the SSO session idle timeout: 30 minutes

Access Token Lifespan For Implicit Flow Hours ?

Client Login Timeout Minutes ?

Figure 456: Access Token Lifespan

11. In the Keyfactor Identity Provider Administration Console, browse to *Users*. Click **Add user** to add at least one new user to be granted administrative permissions in Keyfactor Command during the Keyfactor Command installation.

Note: The admin user created during the Keyfactor Identity Provider installation can't be used for Keyfactor Command authentication because it is in the master realm, not the Keyfactor realm.

Tip: Once the Keyfactor Command installation is complete, additional users and groups that you have added into Keyfactor Identity Provider can be added through the Keyfactor Command Management Portal and granted varying roles; only one user is required initially so a user can open the Management Portal at the conclusion of the installation.

Figure 458: Locate the Keyfactor Identity Provider User's ID

- In the user details on the Credentials tab, click **Set password** and set a password for the new user.

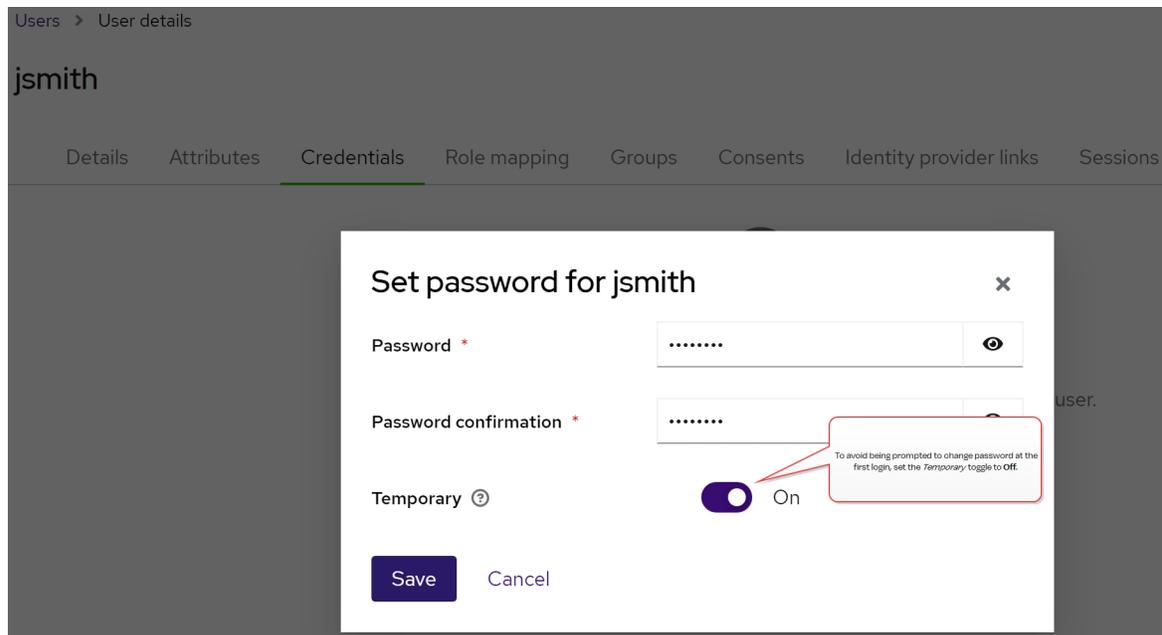

Figure 459: Set a Password for the Keyfactor Identity Provider User

From here you can create more administrative users, standard users, and groups (see [Using Keyfactor Identity Provider below](#)) or configure federation to an alternate OAuth provider (see [Federating from Keyfactor Identity Provider on page 2732](#)).

Using Keyfactor Identity Provider

Once you have finished configuring Keyfactor Identity Provider, you're ready to add roles, optional groups, users, and service accounts into it to be used for authentication to Keyfactor Command. Alternatively, you may choose to federate to an additional OAuth provider (see [Federating from Keyfactor Identity Provider on page 2732](#)), in which case you don't need to add users in Keyfactor Identity Provider, but you will still need roles, optional groups, and service accounts, since it's the roles in Keyfactor Identity Provider that are used to create claims in Keyfactor Command to grant access to users holding these roles.

Note: You can grant access to Keyfactor Command on a user-by-user basis rather than with roles, but the management overhead of this method is much greater. Keyfactor recommends using roles.

Roles and Groups

To add roles and groups in Keyfactor Identity Provider:

1. Use a browser to open the Keyfactor Identity Provider management interface. For example:

<https://appsrvr18.keyexample.com:1443>

Click the **Administration Console** link and sign in with an administrative user and password (see [Installing Using Docker Compose on page 2710](#)).

2. In the Keyfactor Identity Provider Administration Console, select Keyfactor in the realm dropdown.

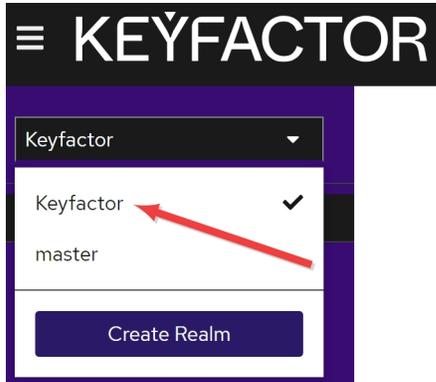

Figure 460: Select a Realm in the Keyfactor Identity Provider Administration Console

3. In the Keyfactor Identity Provider Administration Console, browse to *Realm roles*. Click **Create role** to add a new role to be used to grant permissions in Keyfactor Command. Enter a **Role name** and **Description**.

Note: The Role name is used when referencing the role from Keyfactor Command to create a claim and map it to a security role to grant permissions to users.

Realm roles > Create role

Create role

Role name *

Description

Figure 461: Add a Keyfactor Identity Provider Role

Repeat this step for each role that you will use from Keyfactor Command. For example, administrators, power users, and limited access users.

4. If desired, you can organize your roles into groups. This can simplify the process of assigning the roles to your users. To create a group, in the Keyfactor Identity Provider Administration Console, browse to *Groups*. Click **Create group** to add a new organizational group. Enter a **Name** for the group.

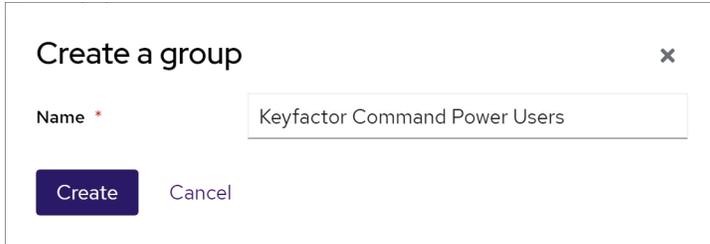

Figure 462: Add a Keyfactor Identity Provider Group

5. Once the group creation is complete, open the group details. In the group details on the Role mapping tab, click **Assign role** and select the role or roles to assign to this group.

Groups > Group details

Figure 463: Assign a Role to a Group in Keyfactor Identity Provider

Repeat these two steps for each group that you will use to manage roles in Keyfactor Identity Provider.

Users

Be sure to create your roles and groups before adding your users.

To add users in Keyfactor Identity Provider:

1. Use a browser to open the Keyfactor Identity Provider management interface. For example:

<https://appsrvr18.keyexample.com:1443>

Click the **Administration Console** link and sign in with an administrative user and password (see [Installing Using Docker Compose on page 2710](#)).

2. In the Keyfactor Identity Provider Administration Console, select Keyfactor in the realm dropdown.

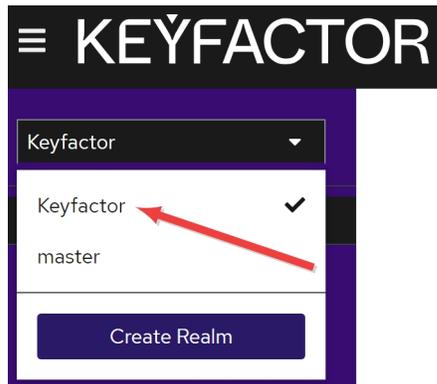

Figure 464: Select a Realm in the Keyfactor Identity Provider Administration Console

3. In the Keyfactor Identity Provider Administration Console, browse to *Users*. Click **Add user** to add a user. Enter at minimum a **Username**, and click **Join Groups**. In the *Select groups to join* dialog, select an appropriate group for this user and click **Join**.

 **Tip:** By joining a group, your user now inherits the roles of this group.

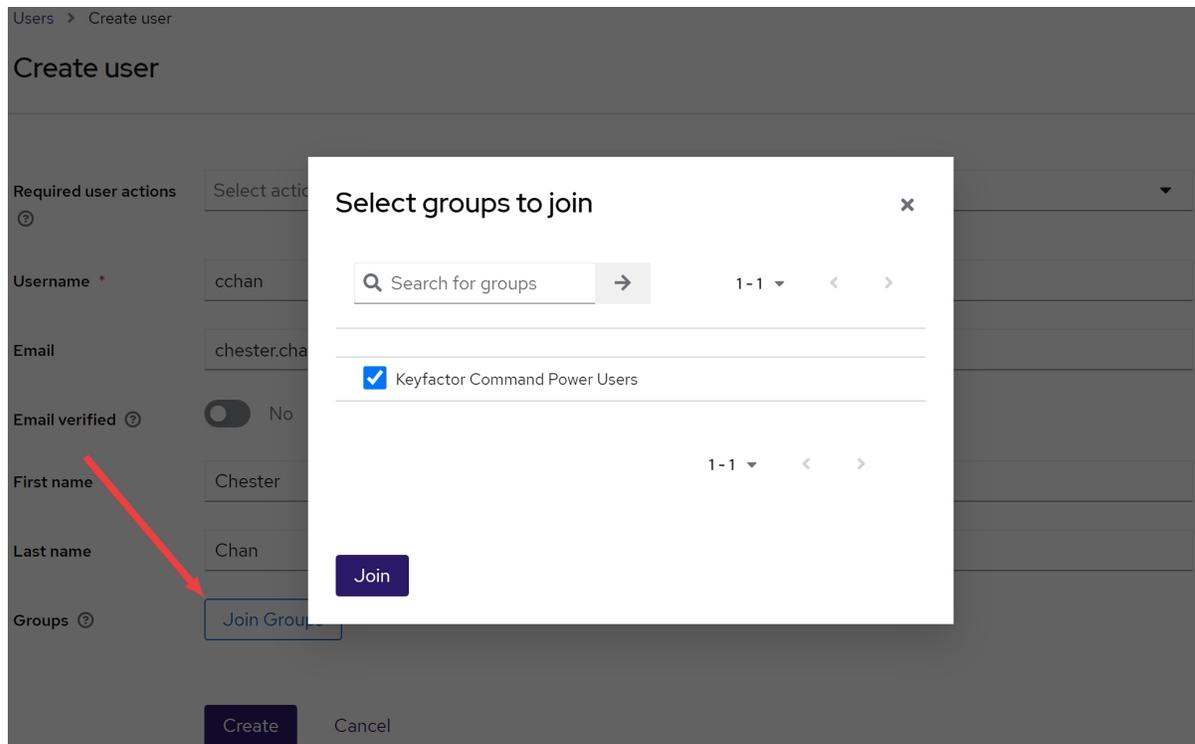

Figure 465: Add a Keyfactor Identity Provider User

4. Once the user creation is complete, open the user details. In the user details on the Credentials tab, click **Set password** and set a temporary password for the new user. The user will be prompted to set a new password on initial logon unless you toggle the **Temporary** option to **Off**.

Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

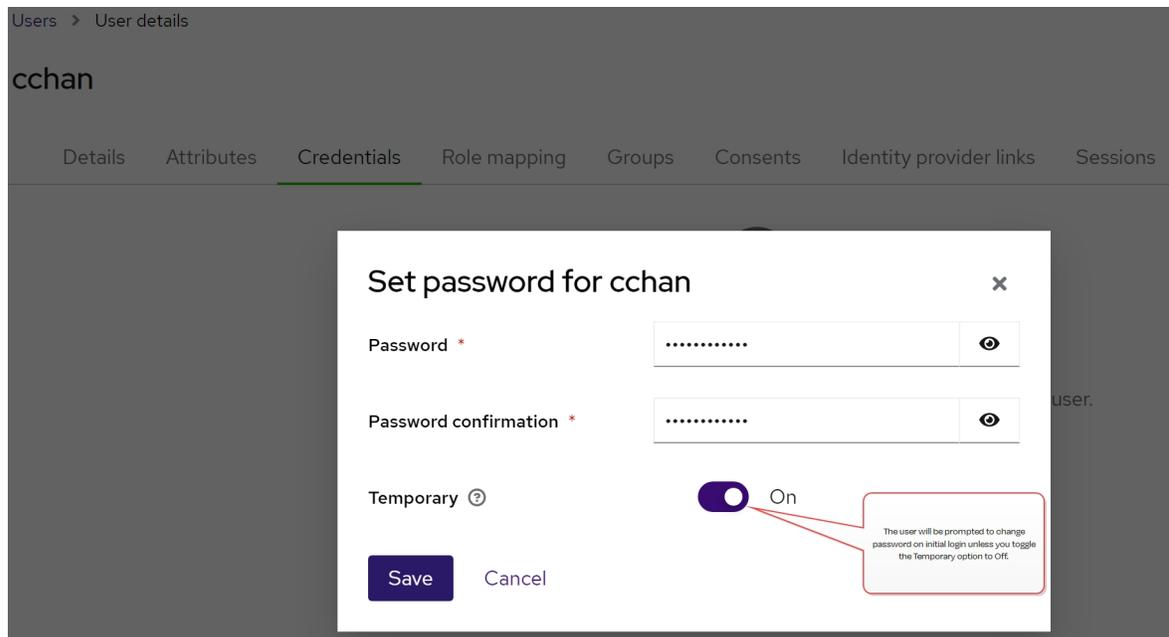

Figure 466: Set a Password for the Keyfactor Identity Provider User

Repeat these steps for each user who will access Keyfactor Command using an identity provider other than Active Directory.

5. If you prefer to add roles directly rather than via groups, in the user details on the Role mapping tab, click **Assign role** and select a role for the new user.

Tip: Roles assigned via group membership won't appear on the Role mapping tab unless you uncheck the **Hide inherited roles** checkbox.

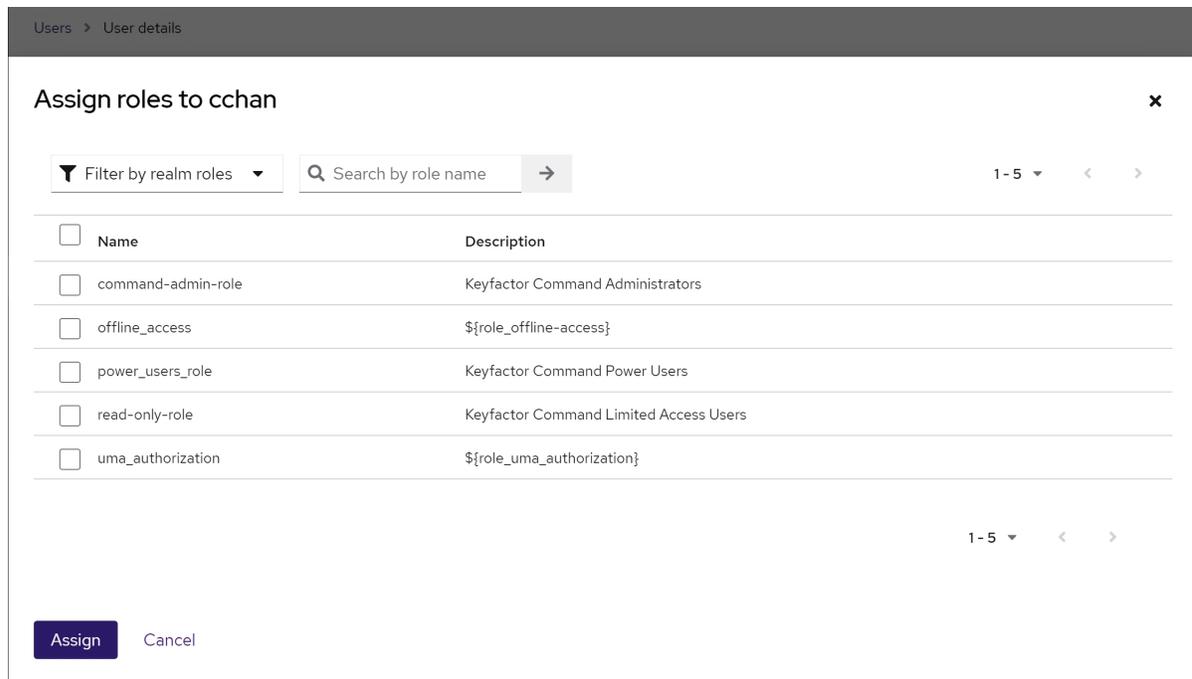

Figure 467: Assign a Role to a Keyfactor Identity Provider User

Service Accounts

Keyfactor Command uses client records in Keyfactor Identity Provider to provide some service account functions. You will or may need this type of service account if you plan to:

- Install Keyfactor Command (a service account is added to allow Keyfactor Command to make API requests to Keyfactor Identity Provider)
- Use the Keyfactor API
- Use the Keyfactor Universal Orchestrator

 **Note:** Client accounts for these functions should be created in Keyfactor Identity Provider even if you plan to use federation for your users. Token authentication requests for these type of functions are not federated.

To add clients for service account in Keyfactor Identity Provider:

1. Use a browser to open the Keyfactor Identity Provider management interface. For example:

<https://appsrvr18.keyexample.com:1443>

Click the **Administration Console** link and sign in with an administrative user and password (see [Installing Using Docker Compose on page 2710](#)).

2. In the Keyfactor Identity Provider Administration Console, select Keyfactor in the realm dropdown.

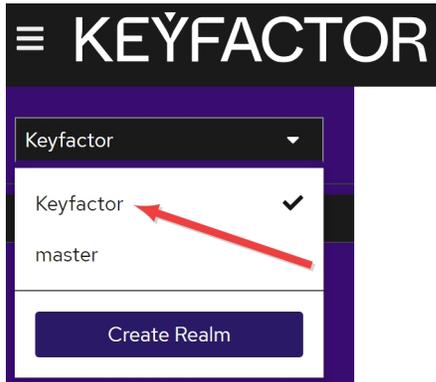

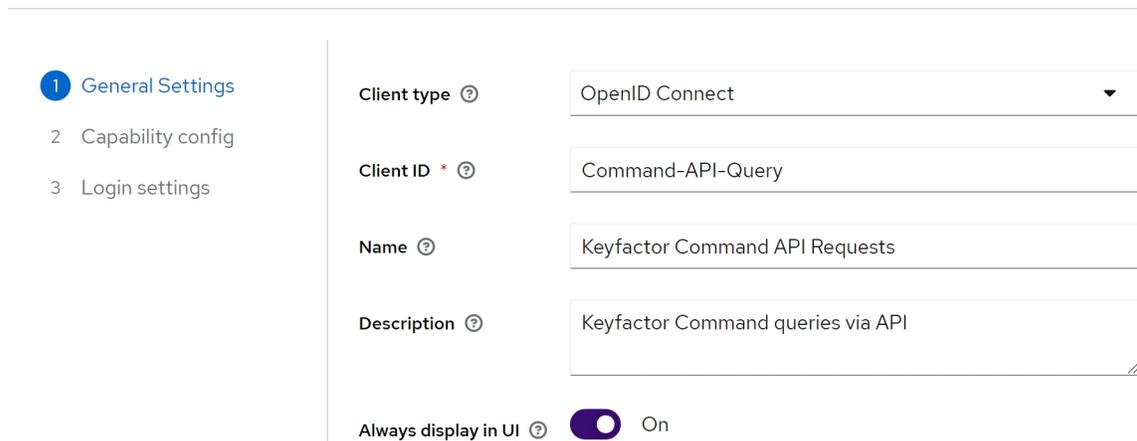

Figure 468: Select a Realm in the Keyfactor Identity Provider Administration Console

3. In the Keyfactor Identity Provider Administration Console, browse to *Clients*. Click **Create client** to add a service account. On the General Settings tab, select a **Client type** of *OpenIdConnect* and enter a unique **Client ID**. This Client ID will be how you will reference the service account from Keyfactor Command. It should not contain spaces. Give the client a **Name** and **Description**. Toggle the **Always display in UI** option to *On* to allow the account to always appear in the UI even when it's not in active use. Click **Next**.

- On the Login settings tab, click **Save**. You do not need to populate any of the data on this tab.
- In the Client details on the Credentials tab, click the **Copy** button next to the *Client secret* field to copy the unmasked version of the client secret to the clipboard (you do not need to display it unmasked first) and save this in a secure location. For the service account Keyfactor Command uses to make API requests, you will need this and the Client ID during the Keyfactor Command configuration.

Federating from Keyfactor Identity Provider

Keyfactor Command can be used with a variety of OAuth 2.0 compliant providers via federation through Keyfactor Identity Provider. Once you have finished configuring Keyfactor Identity Provider, you're ready to federate to an additional OAuth provider, if desired. You may choose to manage your users and groups in Keyfactor Identity Provider and not add federation to an additional provider. Federation can be added at any time. The examples below show configuring Okta as a federated

identity provider. If you're not using Okta, this may give you sufficient information to configure the identity provider of your choice, since configuration tends to be similar.

The below configuration steps assume that you have already completed the installation of Keyfactor Identity Provider (see [Installing Keyfactor Identity Provider on page 2705](#)) and have created at least one role in Keyfactor Identity Provider that you will use to grant permissions in Keyfactor Command (see [Using Keyfactor Identity Provider on page 2724](#)). Keyfactor Command access control with Keyfactor Identity Provider and federation works by granting permissions in Keyfactor Command to Keyfactor Identity Provider roles, assigning those roles to users in Keyfactor Identity Provider, and importing user records from the federated identity provider automatically on login for any user attempting to access Keyfactor Command (see [Figure 473: Federated Identity Provider Login Flow](#)). The user accounts in the federated identity provider need to be assigned roles that mirror the roles in Keyfactor Identity Provider to provide a seamless first-time login experience for users.

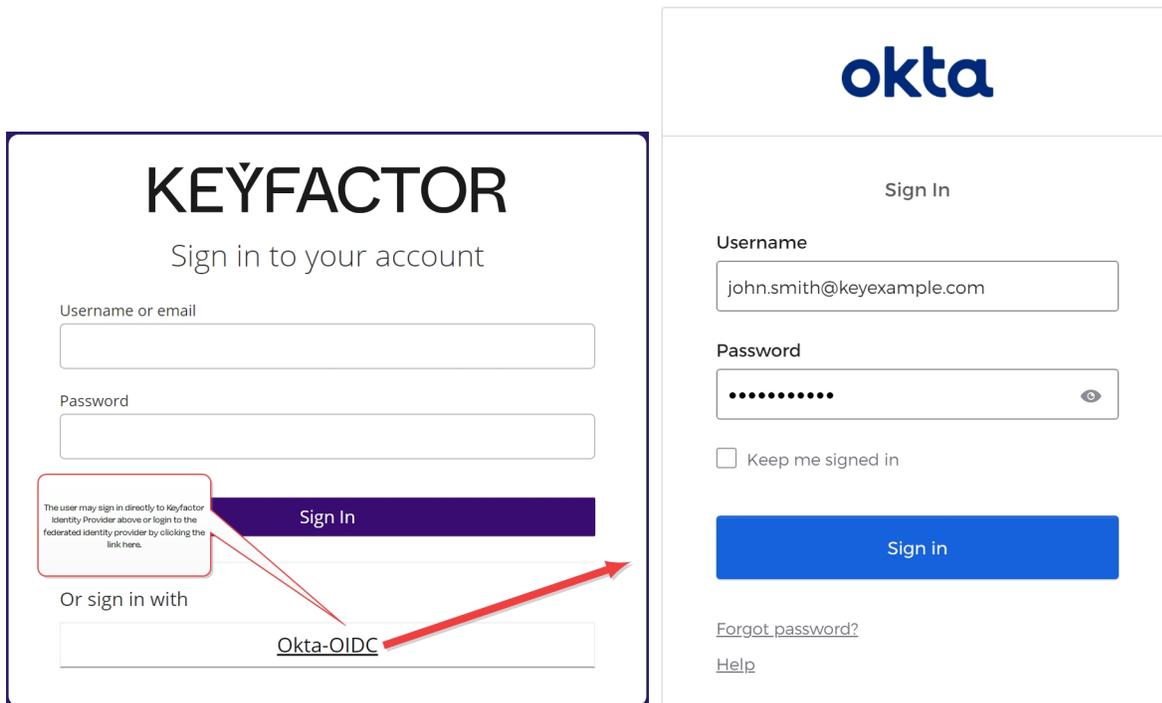

Figure 472: Login Page with Choice of Federated Identity Provider

No changes are needed to the configuration of the OAuth provider in Keyfactor Command when you add federation because all requests are brokered through Keyfactor Identity Provider. At login, the user is presented with a Keyfactor Identity Provider login prompt where he or she can choose to login directly to Keyfactor Identity Provider or click a link that will redirect to the login page of the federated identity provider.

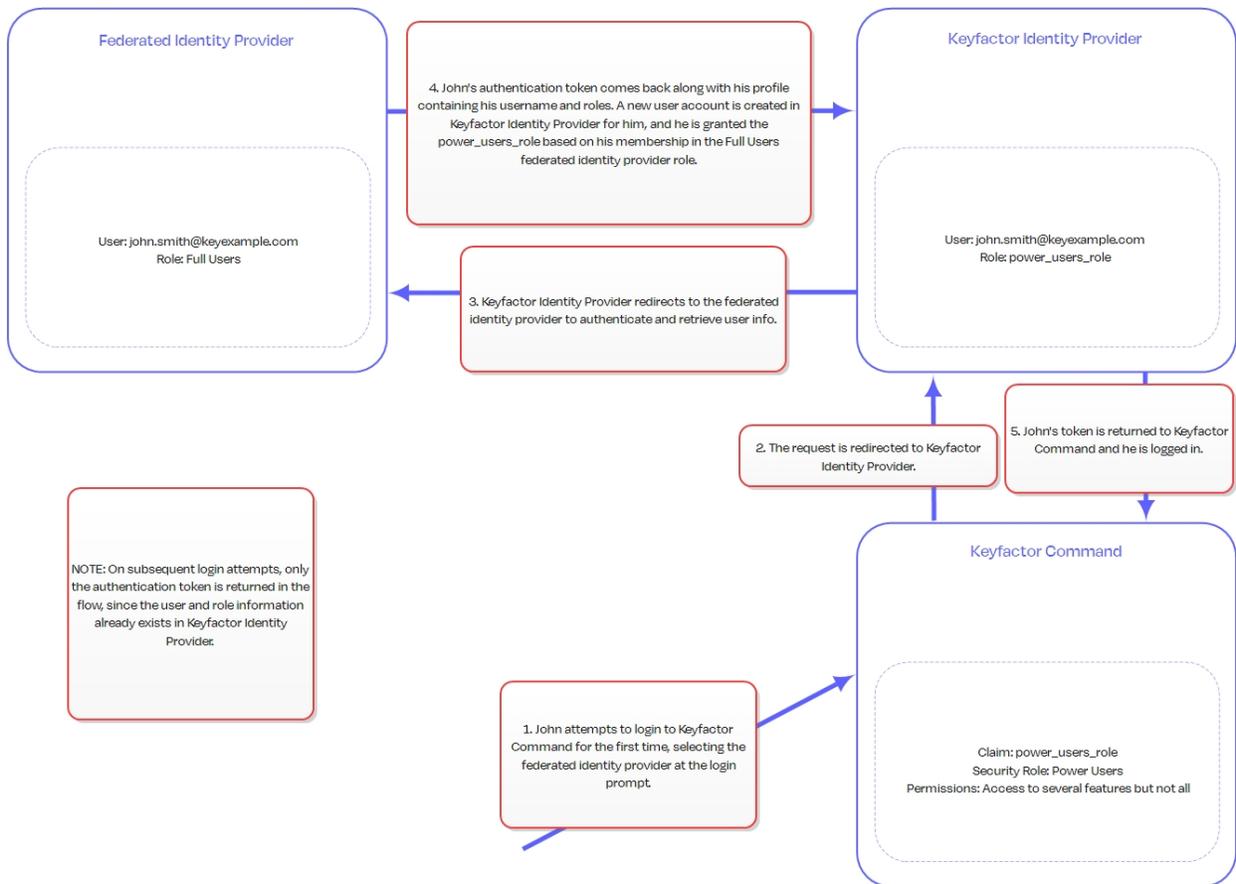

Figure 473: Federated Identity Provider Login Flow

Federating to an Okta OpenID Connect Application

Federating to an Okta OpenID Connect application involves some information gathering and configuration on the Okta side and some configuration in Keyfactor Identity Provider.

To configure the Okta OIDC application and gather information:

1. Login to your Okta management console, browse to *Applications > Applications* and open the details for the application you will be federating. On the General tab, locate your *Client ID* and *Client Secret* and make note of these. You will need these when configuring the federated link from Keyfactor Identity Provider. Confirm that your application is configured to *Require PKCE as additional verification*. Keyfactor strongly recommends the use of this option for best security practice.

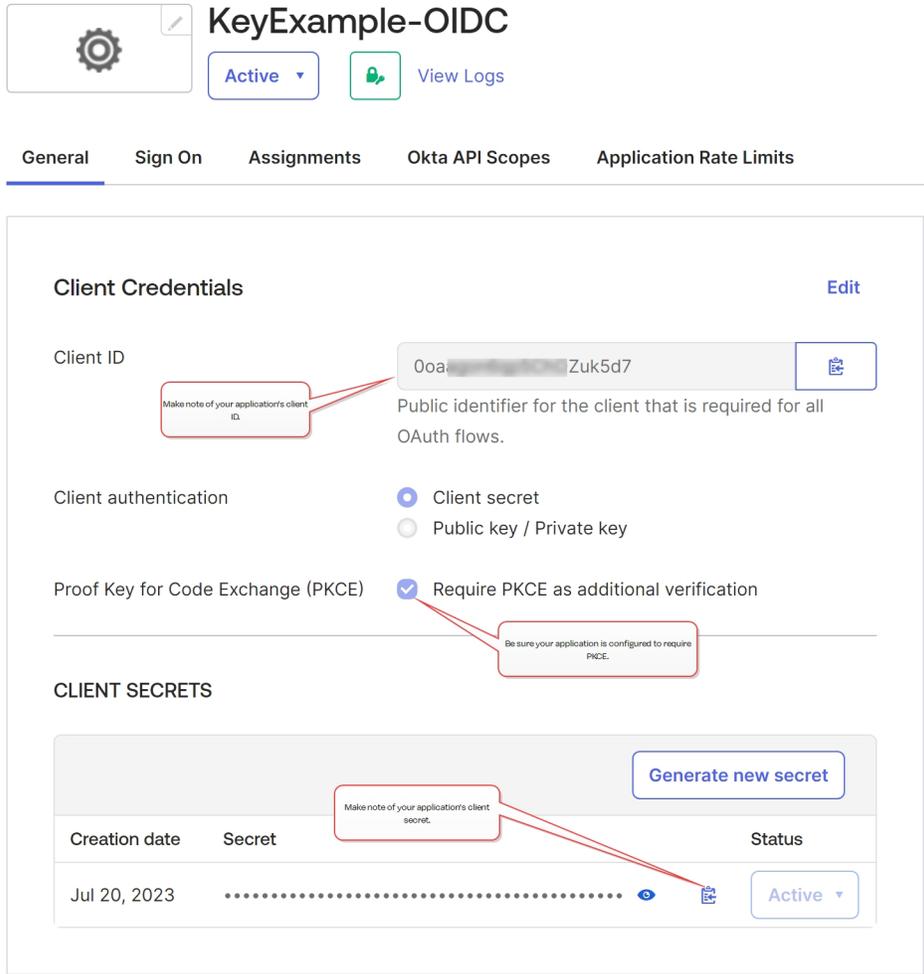

Figure 474: Client ID and Secret in Okta OIDC Application

2. In the Okta OIDC application on the General tab, scroll down to the LOGIN section. Update these values as follows:

- Sign-in redirect URIs

The URI for the Keyfactor Identity Provider federated identity provider endpoint. For example:

```
https://appsrvr18.keyexample.com:1443/realm/Keyfactor/broker/Okta-OIDC/endpoint
```

Where **appsrvr18.keyexample.com** is the fully qualified domain name of the server on which you installed or will install Keyfactor Identity Provider, **Keyfactor** is the name of the realm in Keyfactor Identity Provider (the default is Keyfactor), and **Okta-OIDC** is the name you give to the federated identity provider broker you create in Keyfactor Identity Provider to link to your Okta OIDC application.

- Sign-out redirect URIs

The URI to which users should be redirected on logout. For example:

```
https://appsrvr18.keyexample.com:1443/realms/Keyfactor/broker/Okta-
OIDC/endpoint/logout_response
```

Where `appsrvr18.keyexample.com` is the fully qualified domain name of the server on which you installed or will install Keyfactor Identity Provider, `Keyfactor` is the name of the realm in Keyfactor Identity Provider (the default is Keyfactor), and `Okta-OIDC` is the name you give to the federated identity provider broker you create in Keyfactor Identity Provider to link to your Okta OIDC application.

Login initiated by	App Only
Initiate login URI ?	

Figure 475: Redirect URIs for the Okta OIDC Application

3. In the Okta management console, browse to *Security > API*, and on the Authorization Servers tab, open the authorization server for your application. In the authorization server details on the Claims tab, click **Add Claim** to create a new claim to send role information to Keyfactor Identity Provider to allow you to map roles in Okta to roles in Keyfactor Identity Provider and then use the roles to assign permissions in Keyfactor Command.

In the Edit Claim dialog:

- Give the claim a **Name** to indicate its purpose. You will need to reference this name when creating maps in your Keyfactor Identity Provider federated identity provider.
- Set **Include in token type** to *ID Token Always*.
- Select a **Value type** of *Groups*.
- Enter a **Filter** to control which Okta roles are included with the user information delivered to Keyfactor Identity Provider. To deliver all the groups, you can choose *Matches regex* and enter a regex of `.*` or use a *Starts with* filter, for example, if all the roles you wish to use with Keyfactor Identity Provider start with the same value (e.g. `kyf`).
- Set **Include in** to *Any scope*.

Figure 476: Create an Authorization Server Role Claim

To configure Keyfactor Identity Provider to add a federated identity provider for the Okta OIDC application:

1. Use a browser to open the Keyfactor Identity Provider management interface. For example:

<https://appsrvr18.keyexample.com:1443>

Click the **Administration Console** link and sign in with an administrative user and password (see [Installing Using Docker Compose on page 2710](#)).

2. In the Keyfactor Identity Provider Administration Console, select Keyfactor in the realm drop-down.

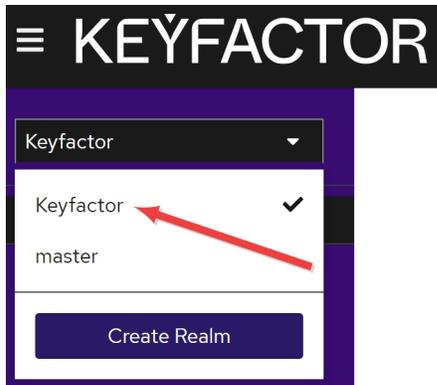

Figure 477: Select a Realm in the Keyfactor Identity Provider Administration Console

3. In the Keyfactor Identity Provider Administration Console, browse to *Identity providers* and click **Add provider**. In the top section, accept the default **Redirect URI**, in the **Alias** field enter the name you used when constructing your redirect URIs in Okta in the previous step, and enter a compatible **Display Name**.

Tip: The alias field is used as the *identity provider hint* during the configuration of Keyfactor Command if you wish to bypass the Keyfactor Identity Provider login and send users directly to the Okta login.

Identity providers > Add OpenID Connect provider

Add OpenID Connect provider

Prompt

Figure 482: Deliver the Okta openid and profile to the Keyfactor Identity Provider Identity Provider

- At the top of the identity providers page, switch to the Mappers tab and click **Add mapper**. Here you're mapping the usernames from Okta to the Username field in Keyfactor Identity Provider to allow user records for each Okta user to automatically be generated in Keyfactor Identity Provider.

On the Add Identity Provider Mapper dialog:

- Give the mapper a **Name** that will help you identify it.
- Choose a **Sync mode override** of *Import*.
- Choose a **Mapper type** of *Username Template Importer*.
- Set the **Template** to `${CLAIM.preferred_username}`.

Note: This assumes the value in the Okta *preferred_username* is the one you wish to use as the username for login to Keyfactor Command.

- Choose a **Target** of *LOCAL*.

Add Identity Provider Mapper

Name *	Sub Mapper
Sync mode override *	Import
Mapper type	Username Template Importer
Template	\${CLAIM.preferred_username}
Target	LOCAL

Figure 483: Map the Okta preferred_username to the Keyfactor Identity Provider Identity Provider Username

- Return to the Provider details and click **Add mapper** again. Here you're mapping the roles from Okta to the roles in Keyfactor Identity Provider to allow the user records for each Okta user in Keyfactor Identity Provider to automatically be assigned roles in Keyfactor Identity Provider.

On the Add Identity Provider Mapper dialog:

- Give the mapper a **Name** that will help you identify it. If you'll be adding mappings for more than one Okta group, you may find it helpful to use a consistent naming pattern (e.g. Role Mapper: Admins, Role Mapper: Power Users).
- Choose a **Sync mode override** of *Import*.
- Choose a **Mapper type** of *Claim to Role*.
- Set the **Claim** to the name of the claim you created in Okta to include roles in the claim passed to Keyfactor Identity Provider (e.g. *kyf_role*) as per the Okta steps, above.
- Click Select Role and choose the role in Keyfactor Identity Provider that should be mapped to the incoming Okta role.

Note: This step assumes that you've already set up a role in Keyfactor Identity Provider for this purpose (see [Using Keyfactor Identity Provider on page 2724](#)).

Repeat this step for any additional roles from Okta that should be mapped to Keyfactor Identity Provider roles, using the same Claim name for each (all the roles are passed in the same claim). Any roles that come in with the claim that you do not create a mapping for will be ignored.

Add Identity Provider Mapper

Name *	Role Mapper: Admins
Sync mode override *	Import
Mapper type	Claim to Role
Claim	kyf_role
Claim Value	Command Admins
Role	command-admin-role Select Role

[Save](#) [Cancel](#)

Figure 484: Map the Okta Roles to the Keyfactor Identity Provider Identity Provider Roles

Configuration is complete. No changes are needed to the configuration in Keyfactor Command. It's helpful to restart the web server services (run an `iisreset`) on the Keyfactor Command server after making the changes to clear any cached data.

4.4.2.2 SQL Server

Keyfactor Command uses a Microsoft SQL Server database to store configuration and synchronized certificate information. Standard edition or above of SQL Server is required. In a production implementation, Keyfactor recommends that SQL Server be installed on a separate server from the Keyfactor Command roles.

Note: Microsoft SQL 2017, 2019, and 2022 all with TLS encryption enabled are supported.

Although you can implement a SQL server especially for Keyfactor Command, in many environments an existing shared SQL server or cluster is used. Keyfactor Command creates one database with a user-defined name and can successfully co-exist with other databases in the same SQL instance.

SQL should be installed with a case-insensitive collation setting.

Connecting to SQL over SSL

By default, Keyfactor Command connects to SQL using an encrypted connection. This requires configuration of an SSL certificate on your SQL server.

If your SQL server is not configured correctly for SSL, you'll see an error message similar to the following when you try to make a connection from Keyfactor Command:

```
Unable to establish a connection to the database server. Please ensure that the server name is correct and sufficient privileges have been granted to the connection account.: Encountered an invalid or untrusted certificate and could not connect to the database. TLS encryption is enabled by default. Please visit 'Planning and Preparing --> SQL Server' In the Keyfactor Installing Server guide to resolve this.
```

Log message will look something like:

```
2022-09-09 11:35:13.0142 CSS.CMS.Install.ConfigurationWizard.ViewModels.DatabaseViewModel [Error] - Unable to establish a connection to the database server. Please ensure that the server name is correct and sufficient privileges have been granted to the connection account.
2022-09-09 11:35:13.0142 CSS.CMS.Install.ConfigurationWizard.ViewModels.DatabaseViewModel [Error] - Encountered an invalid or untrusted certificate and could not connect to the database. TLS encryption is enabled by default. Please visit 'Planning and Preparing --> SQL Server' in the Keyfactor Installing Server guide to resolve this.
at CSS.CMS.Install.ConfigurationWizard.ViewModels.DatabaseViewModel.a(Object A_0, RunWorkerCompletedEventArgs A_1)
A connection was successfully established with the server, but then an error occurred during the login process. (provider: SSL Provider, error: 0 - The certificate chain was issued by an authority that is not trusted.)
```

To acquire a new SSL certificate or check for an existing certificate, see [Using SSL to Connect to SQL Server on page 2746](#).

If you would prefer not to use an encrypted channel for your connection to SQL, see [Configurable SQL Connection Strings on page 2750](#).

Database Encryption

Keyfactor Command uses Microsoft SQL Server column encryption with the ENCRYPTBYKEY and DECRYPTBYKEY cryptographic functions to protect sensitive data. The type of data protected in this way includes:

- Service account credentials
- SMTP credentials
- Certificate store passwords
- Certificate and pending certificate request private keys
- API secrets
- The 64-byte key used to sign audit log records

SQL encryption is built in to the product and cannot be disabled. In addition to SQL encryption, Keyfactor Command offers optional application-level encryption. This option allows you to encrypt

select sensitive data stored in the Keyfactor Command database using a separate encryption methodology utilizing a Keyfactor Command-defined certificate on top of the SQL server encryption. This additional layer of encryption protects the data in cases where the SQL Server master keys cannot be adequately protected. For more information, see [Application-Level Encryption on page 2752](#).

Database Backup

Backup of the SQL server Database Master Key (DMK) for the Keyfactor Command database is of critical importance in database backup and recovery operations. The backup file of the DMK and the password for it should be stored in a safe, well-documented location. Without the file and password created with this process, some data that is encrypted within the Keyfactor Command database will be unrecoverable in a disaster recovery scenario. For more information, see [SQL Encryption Key Backup on page 821](#).

High Availability

For a highly available solution, Keyfactor recommends using always on availability groups. The availability groups feature of SQL Server sits on top of Windows Server failover clustering and provides the ability to automatically synchronize multiple copies of databases across geographically dispersed SQL Servers. Although the availability groups feature relies on Windows clustering, it does not require shared storage, so it is appropriate for a geo-redundant deployment. The availability groups feature is the current recommended solution from Microsoft. Because Keyfactor Command makes use of SQL database encryption, when availability groups are configured, the Keyfactor Command service master key (SMK) must be synchronized between all participating nodes in the availability group. This can be accomplished by backing up the SMK from one SQL server and restoring it to the other servers in the availability group. For more information, see [SQL Encryption Key Backup on page 821](#).

Grant Permissions in SQL

The user installing Keyfactor Command needs permissions to administer the SQL server and add databases and users (logins) in SQL. Full sysadmin permissions are needed to upgrade from a previous version of Keyfactor Command if the user running the upgrade is not the same user who installed the previous version of Keyfactor Command.

Windows Authentication

If you opt to use Windows authentication for the Keyfactor Command connection to SQL during the installation, the user who installs Keyfactor Command needs appropriate permissions in SQL. To grant this, add the user who will install Keyfactor Command to the SQL server login list:

1. On the SQL server open the SQL Server Management Studio, connect to the database, and open **Security**.
2. Right-click on **Logins** and choose **New Login**.

3. Select the **Windows authentication** radio button.
4. Enter the domain name and user name of the administrative user who will be installing Keyfactor Command in the **Login name** field.
5. On the Login Properties page for this user, open Server Roles and check either the sysadmin role or the dbcreator, public and securityadmin roles, depending on whether this is a new install or an upgrade (see above).
6. Accept the remainder of the defaults and click **OK**.

Once Keyfactor Command has been deployed, the Windows user used for the install can be removed from the Logins under Security in the SQL Server Management Studio. Ongoing connectivity to the database is maintained using logins automatically created in SQL for the Keyfactor Command application pool users (see [Create Service Accounts for Keyfactor Command on page 2757](#)) specifically for the purpose during the installation.

SQL Authentication

If you opt to use SQL authentication, appropriate permissions need to be granted to the SQL user entered in the initial connection dialog of the Keyfactor Command Configuration Wizard. You may choose to create (or use an existing) SQL user for the installation and create a separate SQL user for ongoing connectivity or use the same user for both purposes.

Note: Your SQL server must be configured to support mixed mode authentication in order to use the SQL authentication option.

To create a new SQL user for the initial SQL connection:

1. On the SQL server open the SQL Server Management Studio, connect to the database, and open **Security**.
2. Right-click on **Logins** and choose **New Login**.
3. Select the **SQL Server authentication** radio button.
4. Enter a user name for the SQL user in the **Login name** field and enter and confirm a **Password**. You may wish to uncheck the **User must change password at next login** box.
5. On the Login Properties page for this user, open Server Roles and check either the sysadmin role or the dbcreator, public and securityadmin roles, depending on whether this is a new install or an upgrade (see above).
6. Accept the remainder of the defaults and click **OK**.

Once Keyfactor Command has been deployed, this SQL user may be removed if it is not also serving the role of providing ongoing connectivity. During installation, you enter a SQL user name and password for a login to maintain ongoing connectivity. If this login already exists in SQL, it will be granted appropriate permissions. If this login does not already exist in SQL, it will be created and granted appropriate permissions.

Note: Automatically generated service accounts are not created with the db_owner role. Instead, a keyfactor_db_role is created and granted to the service accounts. This role has permission on each of the schemas (dbo, ssl, ssh, cms_agents, etc.) and permission on the encryption certificate.

Using SSL to Connect to SQL Server

By default, Keyfactor Command connects to SQL using an encrypted connection using an SSL certificate configured on your SQL server.

You can check whether your SQL server has been configured with an SSL certificate in one of two ways:

SQL Server Configuration Manager

1. On the SQL server, open the SQL Server Configuration Manager and drill down under SQL Server Network Configuration to find *Protocols for [YOUR INSTANCE NAME]*.
2. Right-click on Protocols for [YOUR INSTANCE NAME] and choose **Properties**.
3. Check the Certificate tab of the Properties dialog to see if a certificate has been configured and is still valid. If your certificate has a friendly name, it will appear here listed in the dropdown by its friendly name.

Important: A certificate will only appear here if it has a CN¹, usually the FQDN of the SQL server. If a certificate has been configured without this, it will not appear to be configured through this UI.

¹The Subject property of the certificate must indicate that the common name (CN) is the same as the host name or fully qualified domain name (FQDN) of the server computer or it must match the DNS suffix if using a wildcard certificate. When using the host name, the DNS suffix must be specified in the certificate. If SQL Server is running on a failover cluster, the common name must match the host name or FQDN of the virtual server and the certificates must be provisioned on all nodes in the failover cluster.

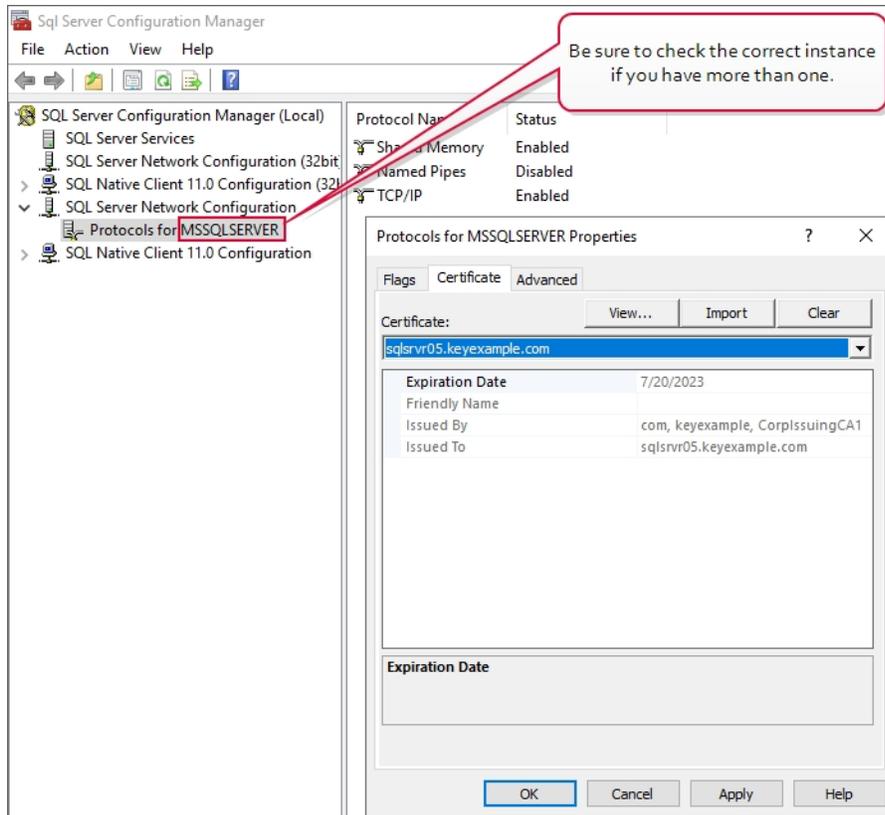

Figure 485: SQL Server Configuration Manager View Active SSL Certificate

Registry

1. On the SQL server, open the registry editor and browse to (where `[MSSQL15.MSSQLSERVER]` is the correct version of SQL server for your server):

```
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Microsoft SQL Server\  
[MSSQL15.MSSQLSERVER]\MSSQLServer\SuperSocketNetLib
```

2. In the SuperSocketNetLib registry key, look for a Certificate value.
3. Validate that the Certificate value has a thumbprint configured. This should match the thumbprint of an active certificate with a Server Authentication ECU in the Local Machine certificate store.

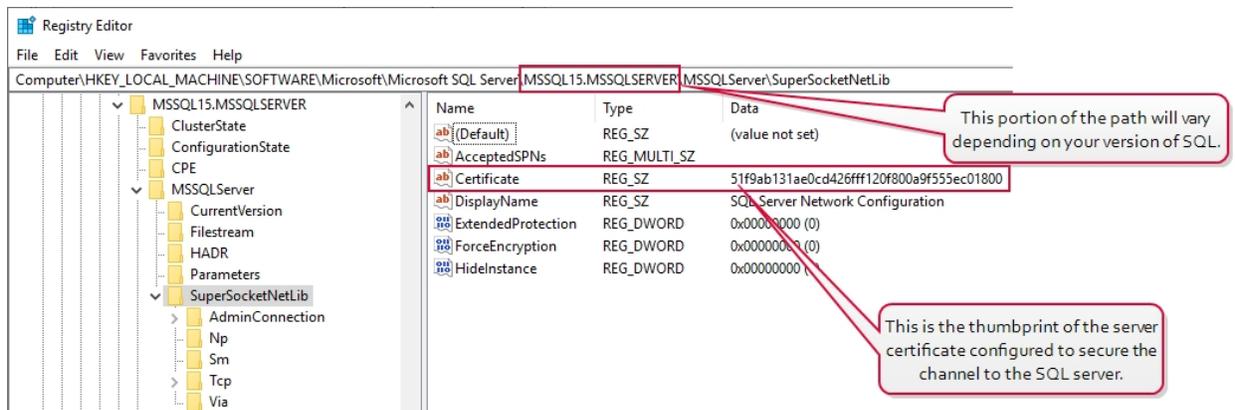

Figure 486: Registry View Active SSL Certificate

To acquire a new certificate for your SQL server:

1. On the SQL server open the Services.msc MMC and scroll down to locate the *SQL Server ([YOUR INSTANCE NAME])* service.
2. Check the *Log On As* column for the name of the service account that the service is running as.

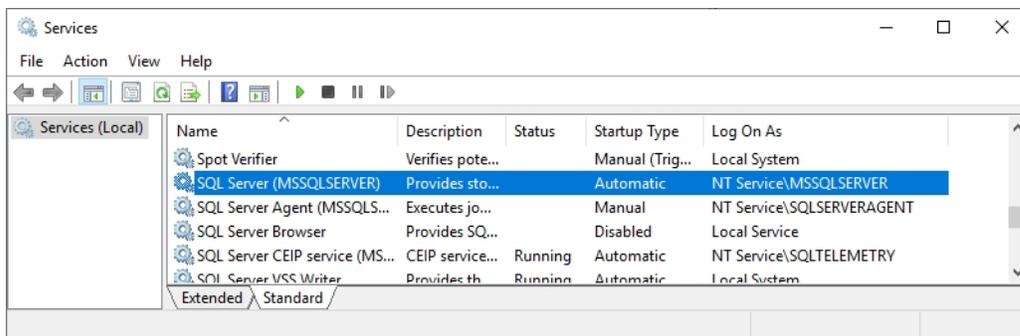

Figure 487: View SQL Server Services

3. Identify a template with a Server Authentication EKU (a typical web server template).
4. On the SQL server, do one of following:
 - Using the GUI:
 - a. Open an empty instance of the Microsoft Management Console (MMC).
 - b. Choose **File->Add/Remove Snap-in...**
 - c. In the *Available snap-ins* column, highlight **Certificates** and click **Add**.
 - d. In the Certificates snap-in popup, choose the radio button for Computer account, click **Next**, accept the default of Local computer, and click **Finish**.
 - e. Click **OK** to close the Add or Remove Snap-ins dialog.

- Using the command line:
 - a. Open a command prompt using the “Run as administrator” option.
 - b. Within the command prompt type the following to open the certificates MMC:

certlm.msc

5. Enroll for the certificate using your preferred method, being sure to give the certificate a CN (it will not appear in the configuration tool without this) and add subject alternative names (SANs) to it for all the IP addresses, server names, and FQDNs that you might use to reference the SQL server when communicating with it, including DNS aliases. Install it, along with its private key, into the Local Machine certificate store on the SQL server. One way to do this is in the certificates MMC:
 - a. Drill down to the Personal folder under **Certificates** for the Local Computer, right-click, and choose **All Tasks->Request New Certificate....**
 - b. Follow the certificate enrollment wizard, selecting the template you identified for this purpose, and providing appropriate SANs along with any required information.

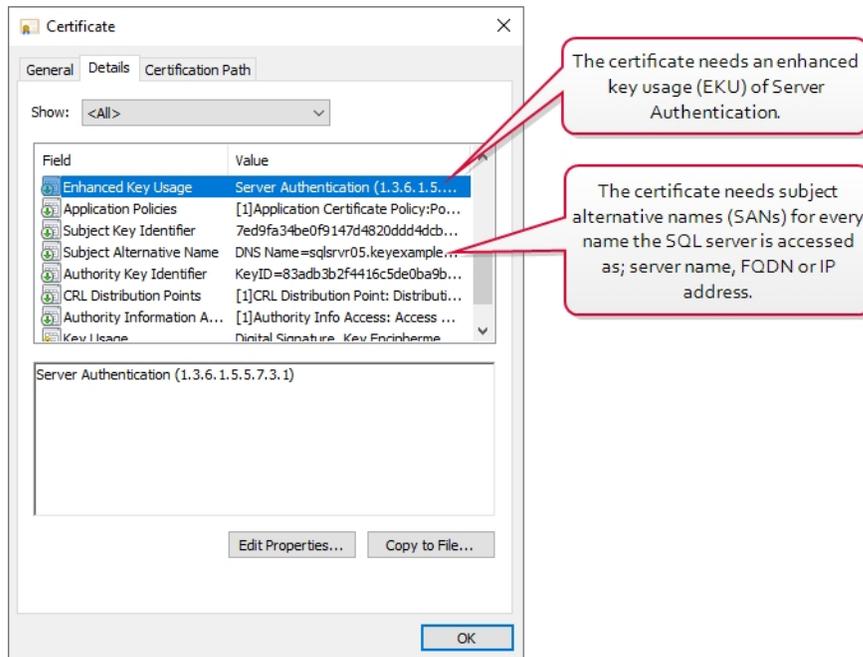

Figure 488: SQL Server SSL Certificate Details

6. Drill down to the Personal folder under **Certificates** for the Local Computer, locate your certificate, right-click, and choose **All Tasks->Manage Private Keys....**
7. In the Permissions for private keys dialog, click **Add**, add the SQL service account, and grant that service account **Read** but not **Full control** permissions. If the SQL server is running as

NT Service[YOUR INSTANCE NAME] as shown in [Figure 487: View SQL Server Services](#), be sure to change the location to your local machine and enter the object name as “*NT SERVICE*[YOUR INSTANCE NAME]” as shown in [Figure 489: Grant Private Key Permissions for SQL Server](#).

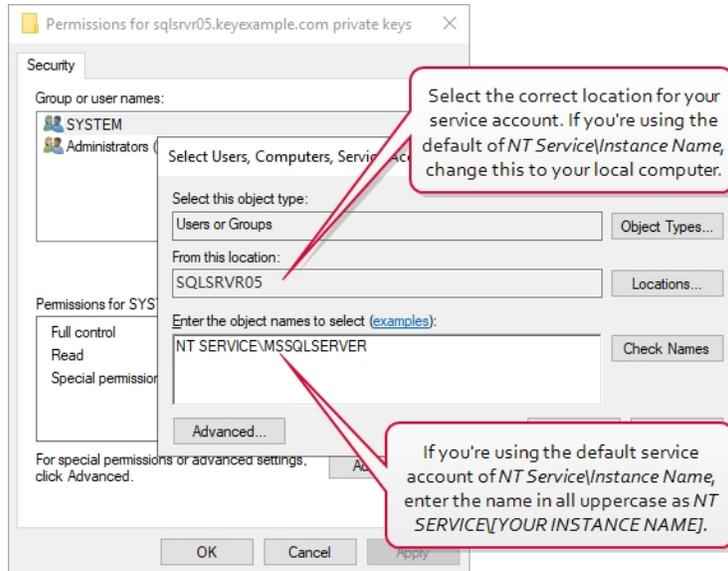

Figure 489: Grant Private Key Permissions for SQL Server

8. Click **OK** to save.
9. Configure the SSL certificate in SQL using either the SQL Server Configuration Manager or registry as shown above for checking whether there is an existing certificate configured (see [SQL Server Configuration Manager on page 2746](#)).
10. After you’ve acquired a new certificate, made the private key permission changes, and associated it in SQL, you’ll need to restart the *SQL Server (Instance Name)* service (see [Figure 487: View SQL Server Services](#)) before these changes will take effect.

Configurable SQL Connection Strings

Keyfactor Command supports using a template SQL connection string that can be created to fit the needs of the overall deployment. This template will be used as a starting point and will not be overwritten by the configuration wizard. For instance, you can set the timeout setting in one place, and once the configuration wizard is run, this is reflected in all places where a connection string is used. The template can be changed at any time to update the connection strings.

To create a customized connection string, after installing the Keyfactor Command software but before running the configuration wizard, modify both the EFModels and SqlDirect connection strings in the **SqlConnectionStrings.json** file found in the *Configuration* folder under your installation directory. By default, this is:

C:\Program Files\Keyfactor\Keyfactor Platform\Configuration

The settings that can be modified are described in the following Microsoft article:

<https://docs.microsoft.com/en-us/dot-net/api/system.data.sqlclient.sqlconnection.connectionstring?view=dotnet-plat-ext-6.0>

Note: The *Data Source*, *Initial Catalog*, *Integrated Security*, *User ID* and *Password* settings are reserved for the configuration wizard to use to configure and save the authentication for the connection string, but other settings found in the template string are left as-is.

```
{
  "ConnectionStrings": {
    "SqlDirect": "Data Source=<SQL_MACHINE_FQDN>;Initial
Catalog=<SQL_DB_NAME>;Integrated Security=True;Persist Security
Info=True;Command Timeout=360",
    "EFModels":
      "metadata=res://*/EFModels.csdl|res://*/EFModels.ssdl|res://*/EFModels.msl;provider=Microsoft.Data.SqlClient;provider connection string='Data
Source=<SQL_MACHINE_FQDN>;Initial Catalog=<SQL_DB_NAME>;Integrated
Security=True;Persist Security Info=True;Command Timeout=360;Multiple Active
Result Sets=True;Application Name=EntityFramework'"
  }
}
```

Note that *Data Source*, *Initial Catalog*, *Integrated Security*, *User ID* (not shown) and *Password* (not shown) are reserved for the configuration wizard to use to configure and save the authentication for the connection string.

Figure 490: Default SQL Connection Strings

Disable Encryption

If you prefer to connect to your SQL server over a non-encrypted channel (and thus avoid configuring an SSL certificate for your SQL server), you can use the *Encrypt* keyword in the connection strings with a value of *False*.

```
{
  "ConnectionStrings": {
    "SqlDirect": "Data Source=<SQL_MACHINE_FQDN>;Initial
Catalog=<SQL_DB_NAME>;Integrated Security=True;Persist Security
Info=True;Command Timeout=360",
    "EFModels":
      "metadata=res://*/EFModels.csdl|res://*/EFModels.ssdl|res://*/EFModels.msl;provider=Microsoft.Data.SqlClient;provider connection string='Data
Source=<SQL_MACHINE_FQDN>;Initial Catalog=<SQL_DB_NAME>;Integrated
Security=True;Persist Security Info=True;Command
Timeout=360;Encrypt=False;Multiple Active Result Sets=True;Application
Name=EntityFramework'"
  }
}
```

Figure 491: SQL Connection Strings with Encrypt Channel Disabled

Use a SQL Server Listening on Multiple IP Addresses

If you're using a SQL server cluster that's configured to listen for incoming connections on more than one IP address to support redundancy or access from multiple networks/subnets, you can use

the *MultiSubnetFailover* keyword in the connection strings with a value of *True*.

```
{
  "ConnectionStrings": {
    "SqlDirect": "Data Source=<SQL_MACHINE_FQDN>;Initial
Catalog=<SQL_DB_NAME>;Integrated Security=True;Persist Security Info=True;Command
Timeout=360",
    "EFModels":
"metadata=res://*/EFModels.csdl|res://*/EFModels.ssdl|res://*/EFModels.msl;provider
=Microsoft.Data.SqlClient;provider connection string='Data
Source=<SQL_MACHINE_FQDN>;Initial Catalog=<SQL_DB_NAME>;Integrated
Security=True;Persist Security Info=True;Command
Timeout=360;MultiSubnetFailover=True;Multiple Active Result Sets=True;Application
Name=EntityFramework'"
  }
}
```

Figure 492: SQL Connection Strings with MultiSubnetFailover Option Enabled

Application-Level Encryption

Keyfactor Command uses data encryption for sensitive data—such as private keys for certificates—stored in the Keyfactor Command database (see [SQL Server on page 2742](#)). This option encrypts only the data in the database deemed to be of a sensitive nature, not the entire database. By default, the data is encrypted using SQL encryption, but you have the option to add another level of security with application-level encryption. If you choose to enable this option, you will need a certificate for this purpose installed in the Personal Certificate store of the Local Computer on each Keyfactor Command server. The certificate must have a key usage of either key encipherment or data encipherment enabled. Microsoft certificate templates only allow you to configure data encipherment (“Allow encryption of user data”) as a suboption to key encipherment (“Allow key exchange only with key encryption”). You do not need to enable both. You may use the certificate acquired in the name of the Keyfactor Command web site (see [Acquire a Public Key Certificate for the Keyfactor Command Server on page 2767](#)), assuming it supports the appropriate key usage, or you may enroll for a separate certificate for this purpose. The same certificate must be used on all Keyfactor Command servers and the certificate must be available in the certificate store on the machine when you run the Keyfactor Command installation. A hardware security module (HSM) may be used, if desired. To support the use of an HSM, the Windows CSP driver for the HSM must be installed on the Keyfactor Command server. Be aware that transactions accessing the encrypted data—such as enrolling for PFX certificates, downloading PFX certificates, running inventory, and adding certificates to certain types of certificate stores (e.g. F5, NetScaler)—will require accessing the HSM. A slow HSM will slow down these processes.

Note: In an environment where there are multiple copies of Keyfactor Command pointing to the same database, each server running a Keyfactor Command instance will need to have the same encryption certificate AND the corresponding private key.

Note: The thumbprint of the certificate used for application-level encryption is stored in the registry on the Keyfactor Command server(s)—rather than in the Keyfactor Command database—to provide a further level of separation from SQL.

Important: If the certificate used for application-level encryption or the private key for this certificate are removed from the Keyfactor Command server while data in the database is encrypted with this certificate, access to this data will be lost. Take care to ensure that this certificate and its private key remain in place or that there are backups of both the certificate and private key (with any necessary password) that can be accessed in the event that the certificate needs to be restored.

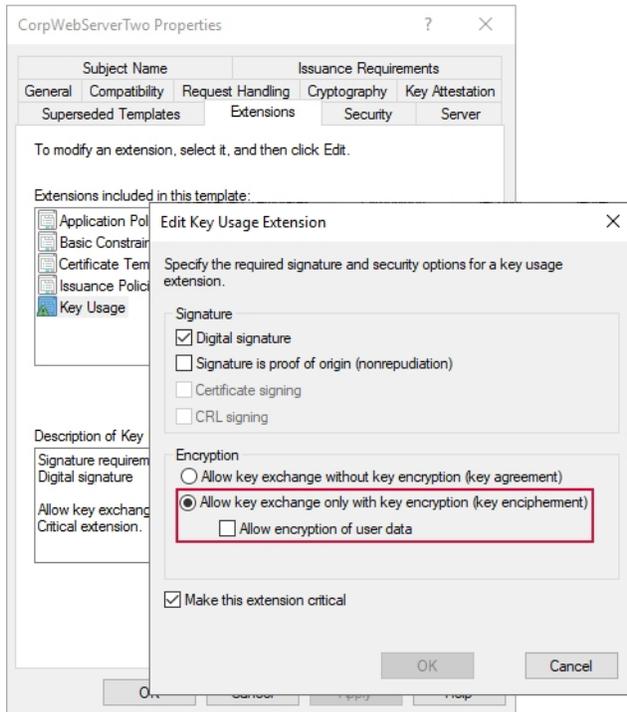

Figure 493: Certificate Template with Key Encipherment Key Usage

Cryptographic Provider

The certificate you use for application-level encryption must be issued using a key storage provider (KSP) or at least installed on the Keyfactor Command server using a KSP in order to allow Keyfactor Command to grant permissions on the certificate's private key appropriately during installation. If Keyfactor Command is not able to access the private key of the application-level certificate, you may receive a 500.30 error trying to access the Management Portal or you may find you can access the Management Portal but not all features function and you find errors such as these in the log (which of these occurs depends on other configuration factors):

```
Unable to decrypt enveloped PKCS7 data
```

```
Keyset does not exist
```

You can check the provider on your certificate with a command similar to the following issued in an administrative command prompt:

```
certutil -store MY [thumbprint of the application encryption certificate]
```

Output from this command should like similar to the following for a KSP certificate:

```
MY "Personal"
===== Certificate 3 =====
Serial Number: 1800000f39f4c506c41239c566000200000f39
Issuer: CN=CorpIssuingCA1, DC=Keyexample, DC=com
NotBefore: 10/27/2023 4:19 PM
NotAfter: 10/26/2025 4:19 PM
Subject: CN=keyfactor.keyexample.com
Non-root Certificate
Template: CorpWebServerv2, Corp Web Server v2
Cert Hash(sha1): 89b5099bc1f7146185331017db60373afb136edb
  Key Container = te-CorpWebServerv2-8b4d6ca7-e5ec-472f-a096-8b4aa590b22b
  Unique container name: 153703d13e6c7339e297f44547260e6d_00139f2c-9f21-4793-b740-bb3fe658245c
  Provider = Microsoft Software Key Storage Provider
Private key is NOT exportable
Encryption test passed
CertUtil: -store command completed successfully.
```

Output from this command should like similar to the following for a CSP certificate (legacy CSPs vary):

```
MY "Personal"
===== Certificate 0 =====
Serial Number: 59000006513beacf07ce121e45000100000651
Issuer: CN=CorpIssuingCA1, DC=Keyexample, DC=com

NotAfter: 10/26/2025 4:32 PM
Subject: CN=keyfactor.keyexample.com
Non-root Certificate
Template: CorpWebServer, Corp Web Server
Cert Hash(sha1): a3a1299d3f5d209c89573c356495547b67d92f15
  Key Container = d5549bc8ea7af0f51d8b26ffbe9617b8_00139f2c-9f21-4793-b740-bb3fe658245c
  Simple container name: te-CorpWebServer-c6c249ac-66d3-427e-aff0-8de81250887f
  Provider = Microsoft RSA SChannel Cryptographic Provider
Private key is NOT exportable
Encryption test passed
CertUtil: -store command completed successfully.
```

If you have a certificate in PFX format with CSP and would like to import it as a KSP, you can use a command similar to the following:

```
certutil -importPFX -csp KSP MY <PFX Path and FileName> NoExport
```

Alternately, if you're unable to use a certificate with a KSP, you may use a CSP and manually grant the Keyfactor Command application pool user(s) private key read permissions on the certificate (see [Using SSL to Connect to SQL Server on page 2746](#)).

4.4.2.3 Certificate Authorities

In most cases, if you are installing Keyfactor Command then you have at least one Microsoft or EJBCA Certificate Authority (CA) in your environment. As you're planning for Keyfactor Command, you'll need to make the following decisions about the CA(s) and certificate templates for your environment:

- Which CAs should be synchronized to the Keyfactor Command database?

Your license may not allow you to synchronize all of your CAs. Certificates belonging to offline root or policy CA *chain* certificates can be monitored without impacting your license.

Note: Keyfactor Command contains a constraint that prevents any two certificate authorities from having the same logical name and host name combination. Think about the logical name and host name configuration of the CAs that will be implemented with Keyfactor Command and check for duplicates.

- If you have Microsoft CAs, what authorization method will you use to configure the CAs (see [Grant the Keyfactor Command Users and Service Account\(s\) Permissions on the CAs on page 2832](#))?

- If your Keyfactor Command license includes certificate enrollment:

- Which CA(s) will be used to issue certificates based on CSRs through the Keyfactor Command Management Portal?
- Which CA(s) will be used to issue PFXs through the Keyfactor Command Management Portal?
- Which certificate template(s) will be used to generate CSRs through the Keyfactor Command Management Portal? In most cases, these templates will already exist.
- Which certificate template(s) will be configured for CSR enrollment in the Keyfactor Command Management Portal? In most cases, these templates will already exist.
- Which certificate template(s) will be configured for PFX enrollment in the Keyfactor Command Management Portal? In most cases, these templates will already exist.

- If your Keyfactor Command license includes Mac auto-enrollment, which CA(s) will be used to automatically issue certificates to Macs running the Mac auto-enrollment agent?

As part of the Keyfactor Command installation preparation, you may need to create a certificate template for this purpose.

Tip: This information is not needed to complete the initial installation and configuration, but will be needed to do post-installation configuration in the Keyfactor Command Management Portal.

4.4.2.4 Keyfactor Command Server(s)

A Keyfactor Command server implementation is made up of several Keyfactor Command roles:

Keyfactor Command Management Portal

The server with this role provides the web-based administration interface that is used to view and report on certificates issued in the environment and enroll for certificates. This role runs under Microsoft IIS. Configuration for the Keyfactor Command implementation as a whole is also done through the Keyfactor Command Management Portal. The Logi Analytics Platform for reporting is hosted on the server with this role.

This role is required on all Keyfactor Command servers.

Keyfactor Command Windows Services

The server with this role hosts back-end services required to support Keyfactor Command. This includes the Keyfactor Command Service, which is used for all periodic tasks throughout Keyfactor Command, including CA synchronization, monitoring alerts, and report automation.

This role is required on all Keyfactor Command servers.

Keyfactor Command Web API

The server with this role hosts the Keyfactor API. The Keyfactor API is also included in the Management Portal role, since the Management Portal makes extensive use of this API.

This role is optional. If you choose not to install this role, you will still be able to use the Keyfactor API. This role is available as a separate component for users who wish to install the Keyfactor API on a separate server from the Management Portal server.

Keyfactor Command Orchestrator Service API

The server with this role hosts the back-end service for receiving requests from and sending requests to Keyfactor agents and orchestrators.

This role is optional. If you choose not to install this role, you will not be able to use agents and orchestrators with Keyfactor Command.

In many environments, the Keyfactor Command Management Portal, Windows Services, Web API, and Orchestrator Service API roles are collocated on a single server (or pair of servers if redundancy is desired). Both physical and virtual servers are supported.

Tip: See [Install: Select Components on page 2782](#) for related information.

For a high availability (HA) solution using the same roles on all nodes, note that the following conditions apply:

- All servers must point to the same Keyfactor Command SQL database.
- All servers must be configured with the same encryption certificate AND the corresponding private key (see [Database Tab on page 2799](#)).
- Keyfactor recommends that the Keyfactor Command Service be configured to run all services on each node. This allows the service to manage the jobs most efficiently—the service will check out jobs via a locking mechanism that will enforce that any jobs are running on only one service at a time. However, you do have the option to manually tune the jobs on the servers if desired (such that server A always does jobs 1, 2 and 3 and server B always does jobs 4, 5 and 6).
- Review load balancing rules and configuration, if applicable. Load balancing configuration is beyond the scope of this guide.

Keyfactor does not recommend installing any of these roles on a CA or on a SQL server in a production environment.

As you plan for Keyfactor Command, you need to decide upon an architecture for the implementation and prepare servers with sufficient resources accordingly. See [System Requirements on page 2702](#) for more information about planning for servers with sufficient resources to support the planned roles.

Licensing

The Keyfactor Command product is licensed by component. Your license for Keyfactor Command may not include all the features described in this guide. If you choose to add additional components to your Keyfactor Command license in the future, these features can generally be configured without the need to reinstall Keyfactor Command.

4.4.2.5 Create Service Accounts for Keyfactor Command

Several of the Keyfactor Command roles operate under a service account. You can either create a single service account for all these roles or create separate service accounts for each role. If multiple Keyfactor Command roles will be installed on the same server, some of the below roles will be redundant.

Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

The roles that require a service account are:

Keyfactor Command Installer

The user who runs the Keyfactor Command installation must have local administrator permissions on the Keyfactor Command server(s) and must be granted permissions in SQL if Windows authentication for SQL will be used during the installation (see [Grant Permissions in SQL on page 2744](#)). You can either grant these permissions to an existing user or you can create a Keyfactor Command installer account and grant the appropriate permissions to this account.

Additionally, the user installing Keyfactor Command must have the SeBackupPrivilege and SeRestorePrivilege rights on the Keyfactor Command server. Normally, administrators are granted these permissions by default, but you should confirm the permissions prior to starting the install. These permissions can be set through Group Policy or Local Security Policy, and can be found under “Local Policies\User Rights Assignment” as “Back up files and directories” and “Restore files and directories”.

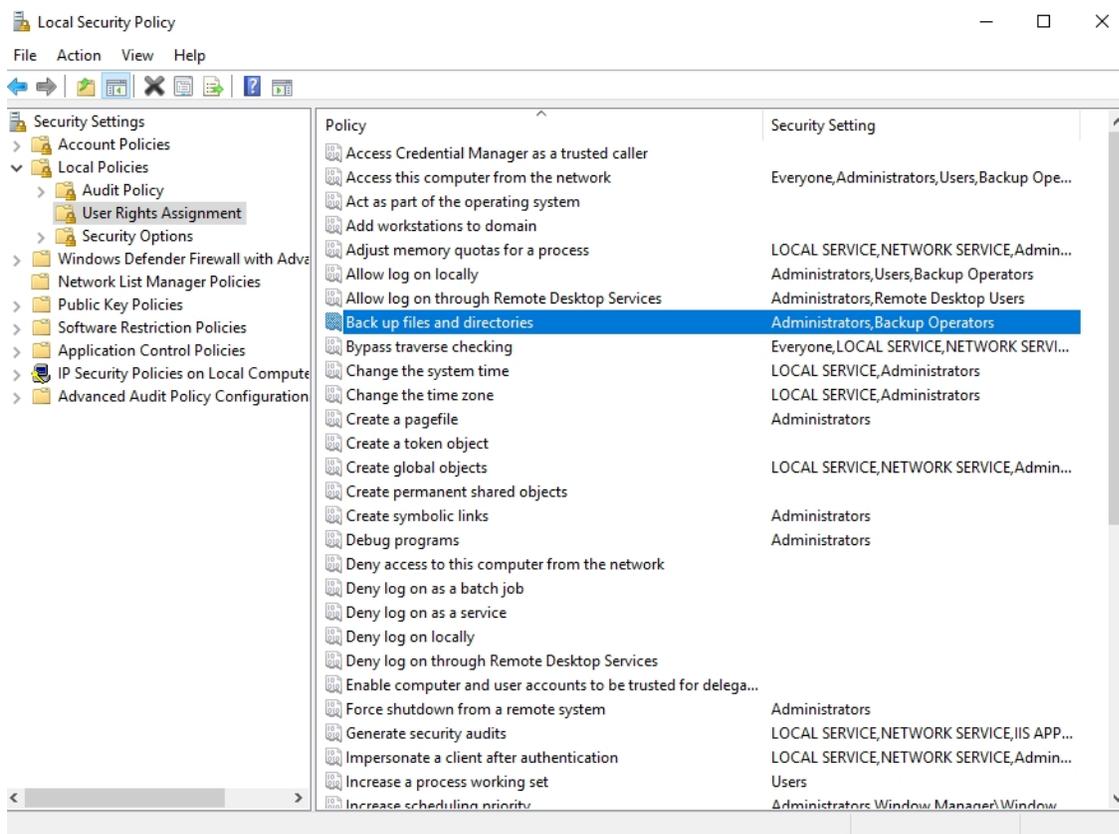

Figure 494: Local Security Policy

For more information on this from Microsoft, see:

<https://docs.microsoft.com/en-us/windows/win32/api/userenv/nf-userenv-load-userprofilea#remarks>

Keyfactor Command Service

The Keyfactor Command Service (a.k.a. the timer service) runs on the Keyfactor Command services server. It synchronizes certificates to the SQL database and initiates notification and reporting tasks. This service runs in the context of an Active Directory or local service account.

The user with this role will be granted permission on each of the SQL schemas (dbo, ssl, ssh, cms_agents, etc.) and permission on the encryption certificate in SQL through the keyfactor_db_role which is created during configuration.

The user with this role must have the “Log on as a service” right on the Keyfactor Command server. Normally, this permission is granted automatically as part of the installation process. You can confirm the permissions through Group Policy or Local Security Policy in “Local Policies\User Rights Assignment”. Validate that the user associated with the Keyfactor Command Service has been added to “Log on as a service” directly or indirectly (via group membership).

The user with this role needs to be able to create log files and write to them. During installation, this permission is granted by granting “Create files / write data” and “Create folders / append data” permissions on the log directory (C:\Keyfactor\logs) to the local users group on the assumption that the local users group will contain either “NT AUTHORITY\authenticated users” or “DOMAIN\Domain Users” and that the service account user will be granted permissions via at least one of these. If this is not the case, permissions for the service account user will need to be granted manually to the log directory.

The user with this role needs to be granted permissions on any certificate authorities from which certificates will be synchronized. Additional certificate authority permission may be needed depending on the features that will be used. For more information, see [Grant the Keyfactor Command Users and Service Account\(s\) Permissions on the CAs on page 2832](#).

Keyfactor Command Management Portal (Application Pool)

The Keyfactor Command Management Portal uses an application pool under IIS to operate. This application pool runs in the context of an Active Directory or local service account.

The user with this role will be granted permission on each of the SQL schemas (dbo, ssl, ssh, cms_agents, etc.) and permission on the encryption certificate in SQL through the keyfactor_db_role which is created during configuration.

The user with this role must have the “Log on as a batch job” and “Impersonate a client after authentication” rights on the Keyfactor Command server. In a typical IIS installation, these rights are granted to the IIS_IUSRS group and the user running any application pool created in IIS inherits these rights without being added to the IIS_IUSRS group. For more information about the IIS_IUSRS group, see:

<https://learn.microsoft.com/en-us/iis/get-started/planning-for-security/understanding-built-in-user-and-group-accounts-in-iis>

You can confirm the permissions or set them manually for the application pool user through Group Policy or Local Security Policy in “Local Policies\User Rights Assignment”. Validate that either the IIS_IUSRS group or the user associated with the Keyfactor Command application pool has been

added to “Log on as a batch job” and “Impersonate a client after authentication” directly or indirectly (via group membership).

The user with this role needs to be able to create log files and write to them. During installation, this permission is granted by granting “Create files / write data” and “Create folders / append data” permissions on the log directory (C:\Keyfactor\logs) to the local users group on the assumption that the local users group will contain either “NT AUTHORITY\authenticated users” or “DOMAIN\Domain Users” and that the service account user will be granted permissions via at least one of these. If this is not the case, permissions for the service account user will need to be granted manually to the log directory.

The user with this role needs to be granted permissions on any certificate authorities from which certificates will be synchronized. Additional certificate authority permission may be needed depending on the features that will be used. For more information, see [Grant the Keyfactor Command Users and Service Account\(s\) Permissions on the CAs on page 2832](#).

Note: If you’re using Active Directory as an identity provider, the Application Pool account must have read permission on any groups being created. This will allow Keyfactor Command to query for group membership on the groups.

Logi Report Access

The Logi Analytics Platform uses a service account to allow Logi to connect to Keyfactor Command via the Keyfactor API to display the dashboard information. This uses an application pool under IIS to operate. The application pool runs in the context of an Active Directory or local service account. A separate application pool is needed for this service, though the same service account may be used for both.

Keyfactor Command Orchestrators API

The Keyfactor Command Orchestrators API IIS application accepts connections from Keyfactor Command orchestrators and uses an application pool under IIS to operate. This application pool runs in the context of an Active Directory or local service account. If this role will be installed on the server hosting the Keyfactor Command Management Portal role, a separate application pool is needed for this service, though the same service account may be used for both.

Keyfactor Command Keyfactor API

The Keyfactor Command Keyfactor API uses an application pool under IIS to operate. This application pool runs in the context of an Active Directory or local service account. The Keyfactor API is an integral part of Keyfactor Command and is not an optional installation. The Keyfactor API can be configured to support custom applications. If the Keyfactor Command Keyfactor API role will be installed on the server hosting the Keyfactor Command Management Portal role, a separate application pool is needed for this service, though the same service account may be used for both.

Keyfactor Command Claims Proxy

For implementations using an identity provider other than Active Directory, the claims proxy proxies authentication tokens between the Management Portal and the Keyfactor API to enable communications between the portal and the API. This application pool runs in the context of an Active Directory or local service account. A separate application pool is needed for this service, though the same service account may be used for both.

This role does not exist in implementations using Active Directory as an identity provider.

Substitutable Text Token Query Access

Keyfactor Command supports the use of substitutable special text tokens in workflow and alert emails, conditions, and data manipulation steps to replace a variable with data from the certificate request, certificate, or certificate metadata at processing time. For tokens that relate to the certificate requester, this involves querying the identity store to retrieve information about the requester. If you're using Active Directory as an identity provider, this query is done in the context of the Keyfactor Command Management Portal application pool user (see [Keyfactor Command Management Portal \(Application Pool\) on page 2759](#)), which must be running as an Active Directory user in that case. If you're using an identity provider other than Active Directory, queries cannot be completed to the identity provider for substitutable special text tokens and tokens requiring this are not supported.

EJBCA End Entity for EJBCA CA Access

Keyfactor Command supports synchronization of certificates and certificate enrollment from EJBCA certificate authorities by configuring a client certificate issued from the EJBCA CA on the CA record in the Management Portal. This client certificate needs to be associated with an end entity in EJBCA that can be assigned sufficient permissions to perform all necessary CA tasks from Keyfactor Command.

Explicit Credentials for Microsoft CA Access

Keyfactor Command supports synchronization of certificates and certificate enrollment from Microsoft certificate authorities in remote forests (forests other than the forest in which Keyfactor Command is installed which are not in a two-way trust with the Keyfactor Command forest) by configuring a service account from the forest in which the CA resides on the CA record in the Management Portal. All communication to retrieve existing certificates, enroll for new certificates, revoke certificates, and recover certificate keys from the remote CA is done in the context of this service account. Explicit credentials for remote CA access is configured in the Keyfactor Command Management Portal after installation is complete rather than in the configuration wizard.

You may need additional service accounts to support the use of Keyfactor Command orchestrators and/or gateways in your environment. Please see:

- [Create Service Accounts for the Universal Orchestrator on page 2884](#)
- [Create a Service Account for the Keyfactor Bash Orchestrator on page 2994](#)

- [Create Service Accounts for the Java Agent on page 2969](#)
- The installation guide for each gateway.

The service account(s) need to be created in Active Directory prior to installation of the Keyfactor Command software, and the person installing the Keyfactor Command software needs to know the service account(s) domain, username and password. The same service account may be used for multiple roles, if desired. For example, you might have one service account for orchestrators, another for gateways, and a third for all server roles.

Table 845: Typical Service Accounts

Account	Uses
Keyfactor Command Service Account	Keyfactor Command Service, Keyfactor Command Management Portal (Application Pool), Keyfactor API, Keyfactor Command Logi Report Access
Keyfactor Orchestrator Service Account	Keyfactor Orchestrator access to Keyfactor Command Server and Keyfactor Orchestrator on-machine operations, where applicable

4.4.2.6 Create Groups to Control Access to Keyfactor Command Features

Keyfactor Command uses groups to control access to the various Keyfactor Command features. The Keyfactor Command Management Portal supports multiple groups with different levels of access to the portal. During the installation, at least one group or user must be entered to grant full administrative access to the portal. After installation, additional groups can be configured through the Keyfactor Command Management Portal to grant more limited access to the portal.

Important: The built-in Active Directory groups Domain Admins and Enterprise Admins cannot be used directly to grant access to the Management Portal due to how these groups function within Windows. You can create a custom Active Directory group, reference that group in the Management Portal, and add the built-in Domain Admins or Enterprise Admins group to that custom group, if desired.

Groups that you may find it useful to identify or add following the initial installation include:

Keyfactor Command Enrollment

Users who are a member of this group or groups may use PFX and/or CSR enrollment through the Keyfactor Command Management Portal. Access control for enrollment is configured in the Keyfactor Command Management Portal after installation is complete.

Keyfactor Command My SSH Key

Users who are a member of this group or groups may acquire SSH keys through the Keyfactor Command My SSH Key portal. Access control for the My SSH Key portal is configured in the Keyfactor Command Management Portal after installation is complete.

Keyfactor Java Agents

Service accounts that are a member of this group are allowed to auto-register as Keyfactor Java Agents in Keyfactor Command, if auto-registration is configured, providing for more hands-free management of Java and PEM certificate stores. This group is not required if auto-registration with user validation will not be used.

Keyfactor Bash Orchestrators

Service accounts that are a member of this group are allowed to auto-register as Bash orchestrators in Keyfactor Command, if auto-registration is configured, providing for more hands-free management of Bash orchestrators. This group is not required if auto-registration with user validation will not be used.

Keyfactor Mac Auto-Enrollment Users

Users who are members of this group are allowed to auto-register for Mac auto-enrollment in Keyfactor Command, if auto-registration is configured, providing for more hands-free management of Mac auto-enrollment. The same group may be used to grant users permissions on the template that will be used for Mac auto-enrollment. This group is not required if auto-registration with user validation will not be used and a different group will be used to grant permission on the template.

Keyfactor Universal Orchestrators

Service accounts that are a member of this group are allowed to auto-register as Keyfactor Universal Orchestrators in Keyfactor Command, if auto-registration is configured, providing for more hands-free management of certificate stores managed by the Keyfactor Universal Orchestrator. This group is not required if auto-registration with user validation will not be used.

Note: The same group may be used for multiple roles. Existing groups may be used. For example, if all employees of your organization are members of the Active Directory Domain Users group and you wish to allow all employees to acquire SSH keys, you may use the Domain Users group for the Keyfactor Command My SSH Key function.

Tip: If you're using Active Directory as an identity provider and wish to grant access in the Management Portal to users from trusted Active Directory forests, create a domain local group in the Active Directory domain in which Keyfactor Command is installed, put the cross-forest users and groups in this local group and grant access in Keyfactor Command to this domain local group.

4.4.2.7 Configure Certificate Chain Trusts for CAs

The Keyfactor Command server needs to trust the chain certificates for all the CAs you will reference within Keyfactor Command in order for all operations to complete successfully. In many environments, root and intermediate trusts for domain-joined Microsoft CAs are pushed out automatically.

If this is not the case in your environment or if you are using non-domain-joined CAs (e.g. EJBCA CAs), you will need to configure these chain trusts on the Keyfactor Command server manually.

The certificate for each root CA must be installed in the Trusted Root Certification Authorities store under Local Computer on the Keyfactor Command server. If your public key infrastructure (PKI) also has issuing CAs, the issuing CA certificates must be installed in the Intermediate Certification Authorities store under Local Computer on the Keyfactor Command server.

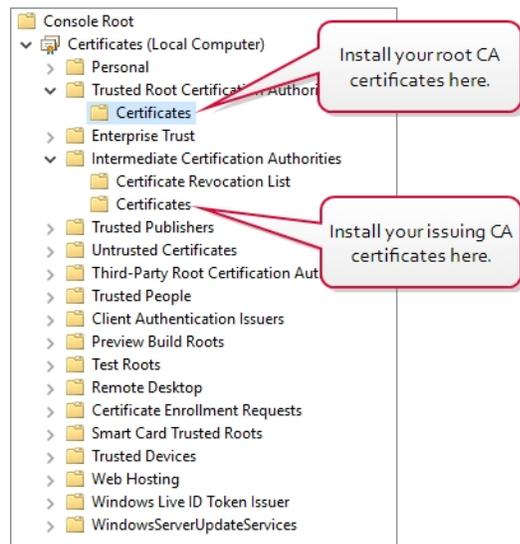

Figure 495: Install CA Chain Certificates on the Keyfactor Command Server

4.4.2.8 Hostname Identification and Resolution

Prior to the installation of Keyfactor Command, you need to determine the DNS alias(es) by which the Keyfactor Command roles will be accessed, if any, and configure them in your hostname resolution solution so that they will be resolvable prior to installation. For example, if you're licensed for SSH key management and wish to publish the My SSH Key portal externally to support SSH key acquisition by users outside the company firewall, you will probably wish to reference the server by a DNS alias rather than its actual hostname. For example, you may wish to use `keyfactor.keyexample.com` rather than `webservr23.keyexample.local`. This is particularly significant if you will be using redundant servers with load balancing.

For DNS aliases used internally in environments using Active Directory as an identity provider, you will need to consider whether the servers to be accessed will be authenticated using Kerberos authentication. Out of the box, the Keyfactor Command Management Portal uses integrated Windows authentication and will default to Kerberos authentication in most environments. Although some features of the Keyfactor Command Management Portal may support NTLM authentication in some environments, the dashboard and enrollment functions do not support NTLM. If you will be using Kerberos authentication, your DNS aliases need to be configured as "A" records rather than CNAME records because Kerberos does not function well with CNAME records under Microsoft IIS.

The roles for which you need hostnames during the Keyfactor Command installation are:

SQL Server

For a small environment you may choose to use the server's actual name. If you plan to use SQL clustering, you will need an alias that represents the cluster. Using an alias for the SQL server allows for database portability in the future.

Email

During the Keyfactor Command installation you configure the email server that will be used to send email notifications.

Keyfactor Command Management Portal

This is the primary management server and may hold all Keyfactor Command roles in a small implementation.

Keyfactor Command Logi Dashboard and Reports

This hostname must match the hostname entered for the Management Portal.

Keyfactor Command Orchestrators API

This hostname is only required if your Keyfactor Command license includes orchestrator functionality. If all Keyfactor Command roles are combined on one server, this will be the same hostname as used for the Keyfactor Command Management Portal.

Keyfactor Command Keyfactor API

This hostname must match the hostname entered for the Management Portal unless you are installing a secondary instance of the Keyfactor API.

Centralized Logging Solution

This hostname is only required if you choose to enable the option to copy Keyfactor Command audit logs entries in real time, as they are generated, to a separate server for collection and analysis by a centralized logging solution (e.g. rsyslog, Logstash).

Prior to beginning the Keyfactor Command installation, ensure that the selected hostnames resolve successfully.

4.4.2.9 Firewall Considerations

Keyfactor Command needs to be able to communicate internally between the various Keyfactor Command components installed on different servers, if applicable, and to the SQL server, certificate authorities, centralized logging server (if applicable), your identity provider. If there are any firewalls in the environment that control internal traffic, these may need to be updated to allow the appropriate level of communication. [Table 846: Protocols Keyfactor Command Uses for Communication](#) shows each Keyfactor Command component and the protocols they use to communicate. In

environments using Active Directory as an identity provider, all Keyfactor Command components require a healthy Active Directory environment with the ability to use Kerberos, LDAP, and DNS.

Table 846: Protocols Keyfactor Command Uses for Communication

Keyfactor Command Component	Protocols and Ports	Target
Keyfactor Command Management Portal	HTTP/HTTPS (TCP 80/443)	Client browser (e.g. Microsoft Edge)
Keyfactor Command Management Portal	HTTP/HTTPS (TCP 80/443)	Certificate revocation list (CRL) distribution points
Keyfactor Command Management Portal	HTTP/HTTPS (TCP 80/443)	EJBCA Certificate Authorities
Keyfactor Command Management Portal	RPC/DCOM (TCP 135 plus random high ports typically in the range 49152 – 65535)	Microsoft Certificate Authorities
Keyfactor Command Management Portal	RPC/DCOM (TCP 135 plus random high ports typically in the range 49152 – 65535)	Keyfactor vendor gateways to cloud CAs (e.g. Entrust, Symantec)
Keyfactor Command Management Portal	MS SQL (default TCP 1433)	SQL Server
Keyfactor Command Management Portal	Varies depending on the implemented solution (TCP 514 for rsyslog, TCP 5000 for Logstash are some standard defaults)	Centralized logging solution
Keyfactor Command	Active Directory (TCP/UDP 389)	Microsoft Active Directory queries
Keyfactor Command SSH Management	Active Directory Web Services (TCP 9389)	Microsoft Active Directory for group membership enumeration
All Orchestrators and Agents	HTTP/HTTPS (TCP 80/443)	Keyfactor Command Orchestrator API endpoint
Keyfactor Universal Orchestrator with Extension Relying on PowerShell Remoting and WinRM	PowerShell Remoting (default TCP 5985 and 5986)	Windows Servers to which certificate files will be distributed

Keyfactor Command Component	Protocols and Ports	Target
(IIS and Remote File Extensions)		
Keyfactor Universal Orchestrator (SSL Endpoint Management)	Any configured for scanning	The SSL endpoint being scanned by the SSL discovery or monitoring job
Keyfactor Universal Orchestrator with Extension Relying on HTTP/HTTPS (F5 and Citrix NetScaler Certificate Store Management)	HTTP/HTTPS (TCP 80/443)	F5 or NetScaler Devices
Keyfactor Universal Orchestrator (Remote Certificate Authority)	RPC/DCOM (TCP 135 plus random high ports typically in the range 49152 – 65535)	Microsoft Certificate Authorities
Keyfactor Bash Orchestrator	SSH (TCP 22 by default)	Remote control targets for SSH management
Keyfactor Gateways to Cloud CAs	HTTP/HTTPS (TCP 80/443)	Cloud providers (e.g. Entrust, Symantec)
Keyfactor Cloud Gateway	Active Directory Web Services (TCP 9389)	Microsoft Active Directory for group membership enumeration

4.4.2.10 Acquire a Public Key Certificate for the Keyfactor Command Server

Keyfactor recommends using HTTPS to secure the channel between clients and the Keyfactor Command server(s). This requires at least one SSL certificate. You will need an SSL certificate or certificates for each of the hostnames you have identified (see [Hostname Identification and Resolution on page 2764](#)).

Acquire the certificate(s) using the Fully Qualified Domain Name (FQDN) of the server or alias used for the Keyfactor Command server(s). For example:

```
keyfactor.keyexample.com
```

The certificate(s) may be installed on the Keyfactor Command server(s) prior to installation of the Keyfactor Command software or may be installed at the time of Keyfactor Command installation. See [Configure SSL for the Default Web Site on the Keyfactor Command Server on page 2774](#) for more information.

If installed ahead of time, the certificate(s) should be placed in the Personal Certificate store of the Local Computer using the Certificates MMC Snap-In.

4.4.2.11 Install IIS and .NET on the Keyfactor Command Server

Internet Information Services (IIS) and .NET 4.7.2 or greater must be installed on the Keyfactor Command server(s) prior to installation of the Keyfactor Command software.

IIS is a standard Windows role added through the Windows Server Manager tool and .NET is a standard Windows feature added through the Windows Server Manager tool. You may need to update to .NET 4.7.2 or greater with a downloadable update package or through Windows update.

 **Important:** IIS needs to be configured to allow requests using the HTTP verbs DELETE, GET, POST and PUT to reach the Default Web Site (or other web site if you choose to install to an alternate web site). These are enabled by default. To check whether any of these have been disabled, open the IIS Management console, drill down to highlight the Default Web Site, double-click **Request Filtering** in the center pane, and review the information on the **HTTP Verbs** tab.

To verify the version of .NET installed, either:

1. Open the Registry Editor:

```
regedit
```

2. Navigate to:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\NET Framework Setup\NDP\v4\Full
```

3. Validate that the **Release** attribute value indicates a version of .NET Framework that is 4.7.2 or higher is installed, as shown in [Table 847: .NET Framework Release Values](#).

Or:

1. Open a command prompt or PowerShell window and type the following command:

```
reg query "HKLM\Software\Microsoft\NET Framework Setup\NDP\v4\Full"
```

2. Validate that the **Release** attribute value indicates a version of .NET Framework that is 4.7.2 or higher is installed, as shown in [Table 847: .NET Framework Release Values](#).

Table 847: .NET Framework Release Values

.NET Framework	Release Value (Decimal)	Release Value (Hexadecimal)
.NET Framework 4.6.2	394802 or 394806	60632 or 60636

.NET Framework	Release Value (Decimal)	Release Value (Hexadecimal)
.NET Framework 4.7	460805	70805
.NET Framework 4.7.1	461308 or 461310	709FC or 709FE
.NET Framework 4.7.2	461808 or 461814	70BF0 or 70BF6
.NET Framework 4.8	528040, 528049, 528372, or 528449	80EA8, 80EB1, 80FF4, 81041

Installing IIS and ASP.NET on Windows Server 2019 and 2022

The following figures show the components of IIS and ASP.NET necessary to support Keyfactor Command on Windows Server 2019 and 2022. Your Keyfactor Command server may have additional roles or features installed that are not shown in these figures.

Important: Do not install the IIS *WebDAV Publishing* feature. Keyfactor Command will not operate correctly if this feature is installed.

Keyfactor Command makes use of the Active Directory tools for PowerShell to do group membership queries in Active Directory in some functions (e.g. when using a group to create a mapping between a Linux logon for SSH and one or more SSH keys). The *Active Directory module for Windows PowerShell* is installed as a feature as part of the *Remote Server Administrator Tools*.

Note that it is possible to install IIS and the necessary features using PowerShell rather than the below-referenced GUI-based installation method. The correct PowerShell command for this is:

```
Install-WindowsFeature Web-Server, Web-Asp-Net45, Web-Default-Doc, Web-Dir-Browsing, Web-Http-Errors,
Web-Static-Content, Web-Http-Logging, Web-Stat-Compression, Web-Filtering, Web-Basic-Auth, Web-
Windows-Auth, Web-Net-Ext45, Web-ISAPI-Ext, Web-ISAPI-Filter, Web-Mgmt-Console, RSAT-AD-PowerShell
```

Tip: To check and see if all the required roles and features have been installed, use `Get-WindowsFeature` with the same list of roles and features like so:

```
Get-WindowsFeature Web-Server, Web-Asp-Net45, Web-Default-Doc, Web-Dir-Browsing,
Web-Http-Errors, Web-Static-Content, Web-Http-Logging, Web-Stat-Compression, Web-
Filtering, Web-Basic-Auth, Web-Windows-Auth, Web-Net-Ext45, Web-ISAPI-Ext, Web-
ISAPI-Filter, Web-Mgmt-Console, RSAT-AD-PowerShell
```

Output from this command will look something like the following, which shows some required features installed and some missing. Make sure all roles and features in the query output are marked *Installed* before continuing.

```

Get-WindowsFeature Web-Server, Web-Asp-Net45, Web-Default-Doc, Web-Dir-Browsing, Web-Http-Err
ons, Web-Static-Content, Web-Http-Logging, Web-Stat-Compression, Web-Filtering, Web-Basic-Auth, Web-Windows-Auth, Web
-Net-Ext45, Web-ISAPI-Ext, Web-ISAPI-Filter, Web-Mgmt-Console, RSAT-AD-PowerShell

Display Name                                     Name                                     Install State
-----
[X] Web Server (IIS)                             Web-Server                             Installed
  [X] Default Document                           Installed
  [X] Directory Browsing                         Installed
  [X] HTTP Errors                               Installed
  [X] Static Content                             Installed
  [X] HTTP Logging                              Installed
  [X] Static Content Compression                Web-Stat-Compression                  Installed
  [X] Request Filtering                         Web-Filtering                         Installed
  [ ] Basic Authentication                     Web-Basic-Auth                       Available
  [ ] Windows Authentication                   Web-Windows-Auth                     Available
  [ ] .NET Extensibility 4.8                   Web-Net-Ext45                        Available
  [ ] ASP.NET 4.8                               Web-Asp-Net45                        Available
  [ ] ISAPI Extensions                         Web-ISAPI-Ext                        Available
  [ ] ISAPI Filters                            Web-ISAPI-Filter                     Available
[X] IIS Management Console                       Web-Mgmt-Console                     Installed
  [ ] Active Directory module for Windows ...  RSAT-AD-PowerShell                   Available

```

Some of the required IIS roles and features are installed on this machine, but several are still missing.

Figure 496: Use Get-WindowsFeature to Determine if All Required Roles and Features are Installed

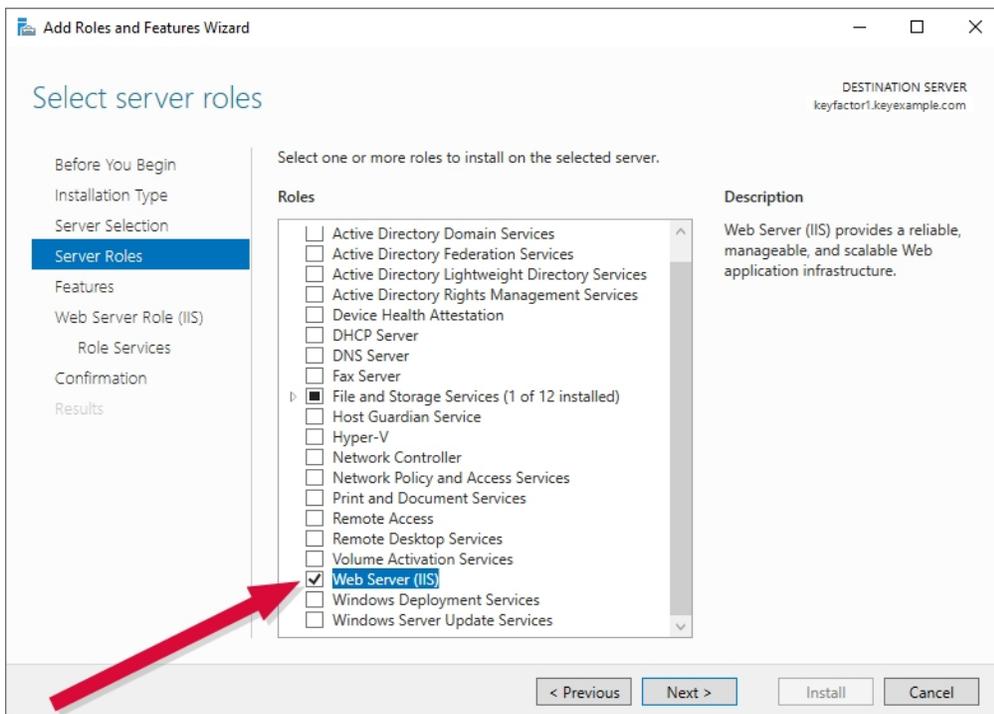

Figure 497: Web Server Role

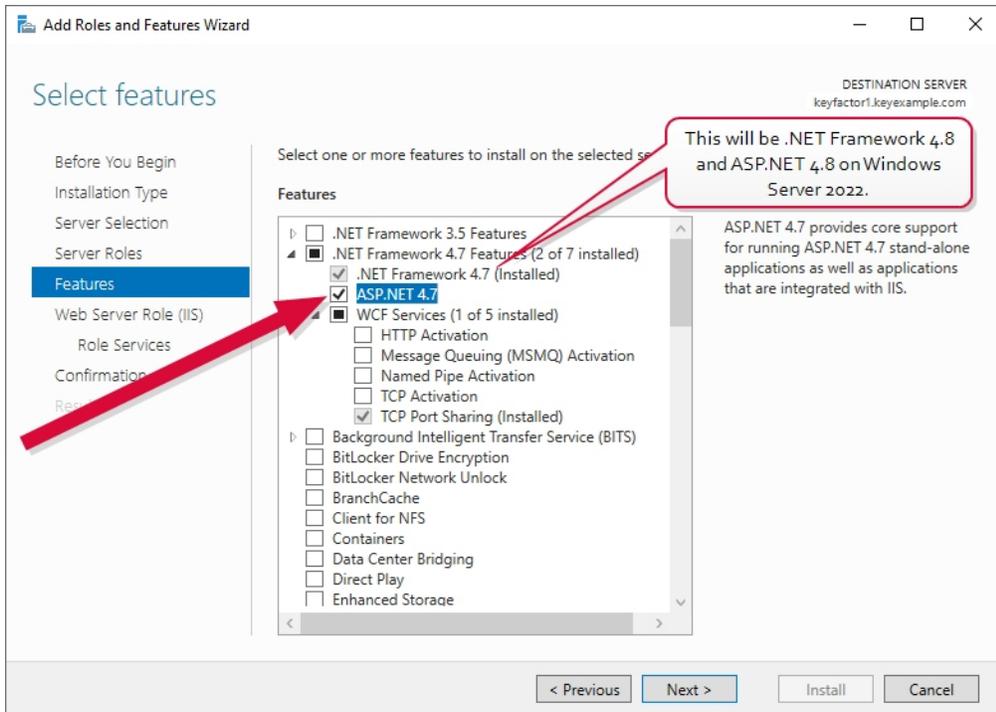

Figure 498: .NET 4.7 Feature

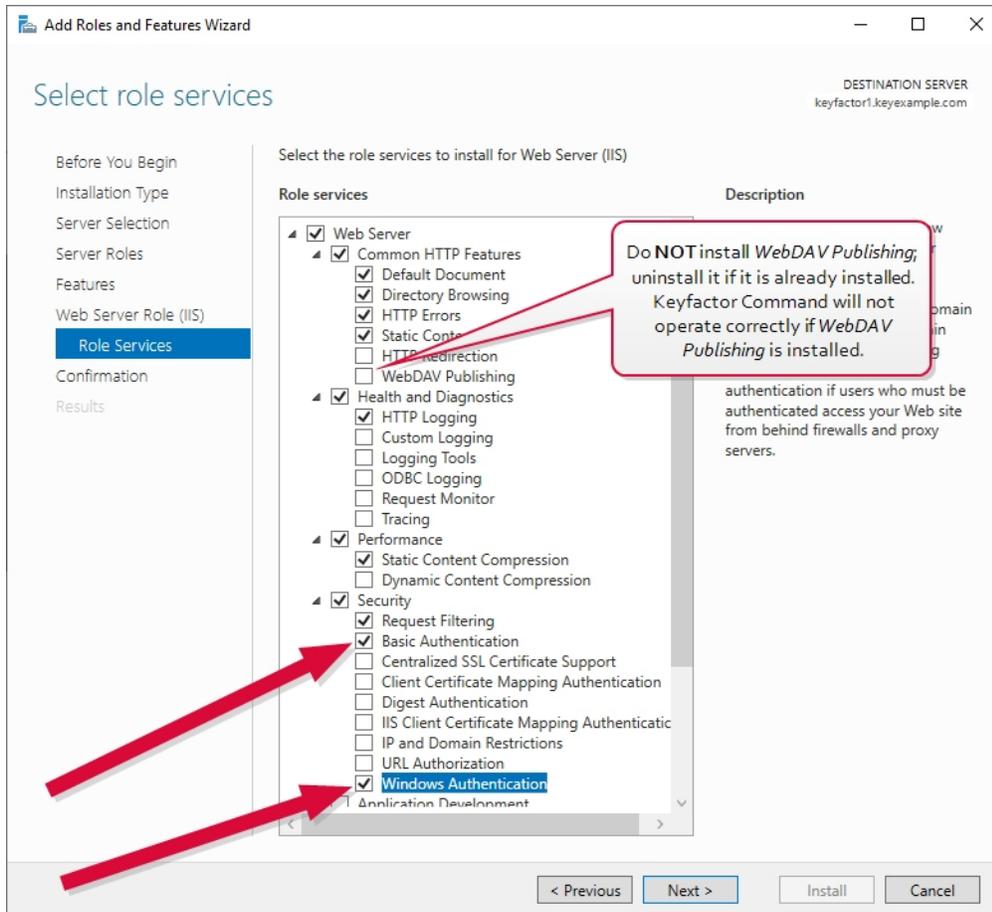

Figure 499: Role Services Page One

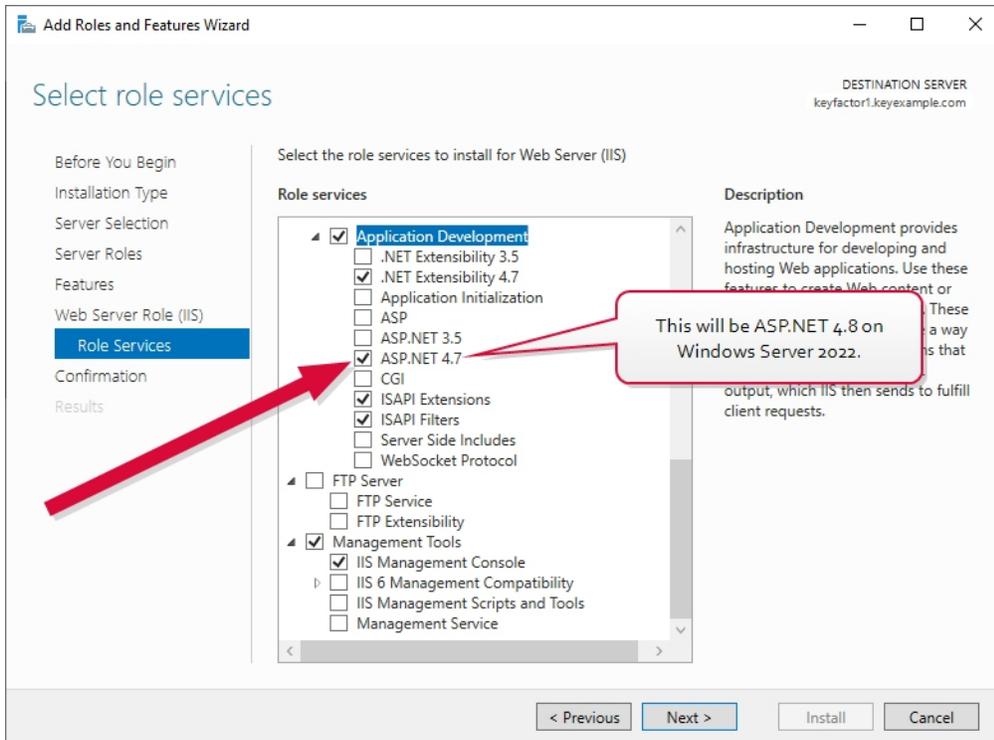

Figure 500: Role Services Page Two

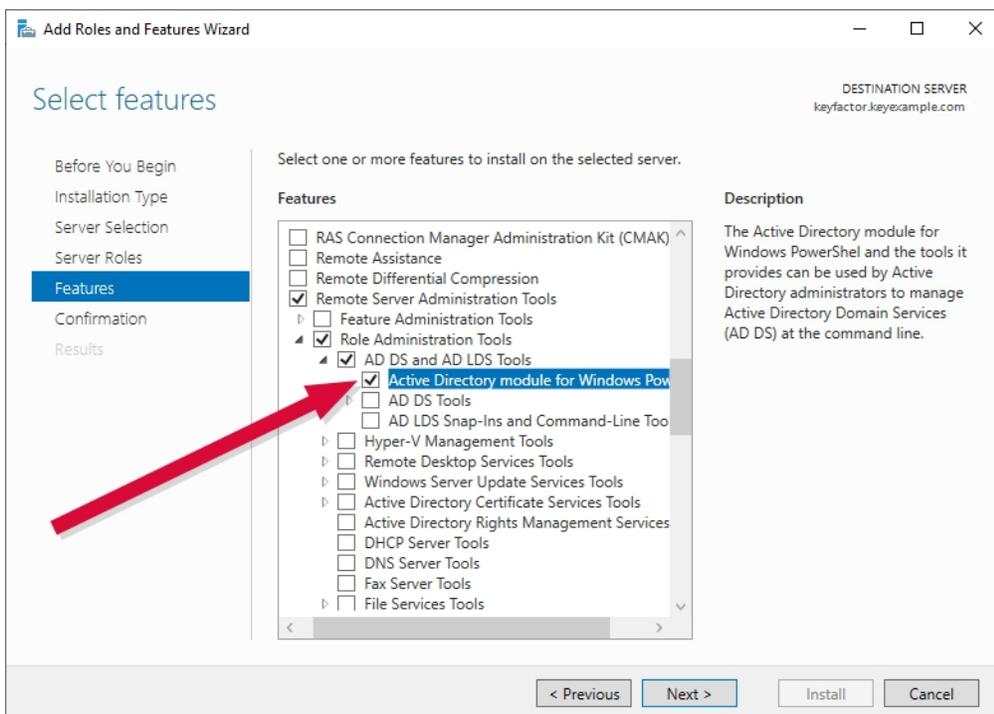

Figure 501: Active Directory Module for Windows PowerShell

4.4.2.12 Configure SSL for the Default Web Site on the Keyfactor Command Server

Once you have acquired an SSL certificate for Keyfactor Command and installed IIS, you can open the IIS Management Console and associate the certificate with the Default Web Site. You can do this either before or after installing Keyfactor Command.

To import your SSL certificate and associate it with the Default Web Site:

1. Open the IIS Manager MMC snap-in.
2. Navigate to the connection for the current host. (The top level in IIS.)
3. On the current host Home page, open (double-click) Server Certificates. If your SSL certificate already appears in this list, you can skip steps 4-7.
4. On the Server Certificates page, select Import... under Actions.
5. In the Certificate file (.pfx) field, choose the browse option and navigate to the .pfx or .p12 file containing your certificate.
6. Enter the password for your certificate, select the Personal Certificate Store, check the Allow this certificate to be exported box if desired, and click **OK**.
7. Your certificate should now appear in the list of Server Certificates. Confirm that the Issued To column shows your certificate name correctly (e.g. keyfactor.keyexample.com).
8. Navigate to the Default Web Site and on the Default Web Site Home page, select Bindings... under Actions.
9. In the Site Bindings dialog, highlight the https entry if it exists and choose Edit. If an https entry does not exist, click **Add**.
10. In the Edit Site Bindings dialog, select https in the Type dropdown (this will already be selected and grayed out if you selected Edit in the previous step), select the certificate you just imported in the SSL certificate dropdown box, and click **OK**.

Note that these instructions assume that your SSL certificate has been provided in PKCS12 format file. If you are requesting a certificate directly from an on-premise CA through IIS or are generating a CSR through this IIS installation to submit to a CA, the configuration steps will be different.

4.4.2.13 Configure the Keyfactor Command Server to Require SSL

For best security practice, the Keyfactor Command web site should be configured to require SSL for all access. To do this:

1. Open the IIS Manager MMC snap-in.
2. Navigate to the Default Web Site.
3. Under the Default Web Site Home, select **SSL Settings**.
4. On the SSL Settings page, check the **Require SSL** box and, under Actions, click **Apply**.

Important: The Keyfactor Command web application is not configured to support HTTP Strict Transport Security (HSTS) by default. HSTS is a web security policy mechanism that helps to protect websites against protocol downgrade attacks and cookie hijacking. An application enables HSTS by returning an HTTP response header that instructs users' browsers to only interact with the site using secure transport methods. HSTS is supported by all modern browsers. To accommodate this, configure the server to always send the *Strict-Transport-Security* HTTP header on HTTPS connections:

```
Strict-Transport-Security: max-age=31536000; includeSubDomains
```

The max-age parameter is given in seconds; the value shown above is equivalent to one year.

Instructions for implementation of HSTS are beyond the scope of this guide.

4.4.2.14 Prepare for External Log Shipping over TLS (Optional)

Keyfactor Command offers the option to copy audit logs in real time to a separate server for collection and analysis with a centralized logging solution (e.g. rsyslog, Splunk, Elastic Stack). This can be done either over standard UDP/TCP connections, or you can opt to secure the connection to the backend log collection solution using TLS. This requires a backend solution that supports receiving logs over TLS and, typically, a client certificate on the Keyfactor Command server and a server certificate on the backend server.

The following instructions cover using rsyslog on the backend and will differ if you are using an alternative log collection solution.

Acquire the client certificate(s) using the Fully Qualified Domain Name (FQDN) of the server or alias used for the Keyfactor Command server(s) (see [Hostname Identification and Resolution on page 2764](#)). For example:

```
keyfactor.keyexample.com
```

The certificate must be installed on the Keyfactor Command server(s) prior to installation of the Keyfactor Command software.

To acquire a client certificate for use in log shipping using a Microsoft CA, first create or identify a template that has an extended key usage (EKU) of *Client Authentication* and make it available for enrollment on a CA to which the Keyfactor Command server has access with enrollment permissions for the Keyfactor Command server. If desired, you can use a template that has both the *Client Authentication* and *Server Authentication* EKUs and use it for certificates on both sides of the communication. Start by copying a computer template if you want to enroll for the certificate using the Microsoft MMC as described below and without needing to set the private key of the certificate as exportable.

To enroll for a client certificate using the MMC:

1. On the Keyfactor Command server, do one of following:
 - Using the GUI:
 - a. Open an empty instance of the Microsoft Management Console (MMC).
 - b. Choose **File->Add/Remove Snap-in...**
 - c. In the *Available snap-ins* column, highlight **Certificates** and click **Add**.
 - d. In the Certificates snap-in popup, choose the radio button for Computer account, click **Next**, accept the default of Local computer, and click **Finish**.
 - e. Click **OK** to close the Add or Remove Snap-ins dialog.
 - Using the command line:
 - a. Open a command prompt using the “Run as administrator” option.
 - b. Within the command prompt type the following to open the certificates MMC:

```
certlm.msc
```
2. Drill down to the Personal folder under **Certificates** for the Local Computer, right-click, and choose **All Tasks->Request New Certificate...**
3. Follow the certificate enrollment wizard, selecting the template you created or identified for use for this purpose, and providing any required information, being sure to set the CN to the FQDN of the Keyfactor Command server.

Tip: If you have an existing Keyfactor Command and wish to enroll through Keyfactor Command, you can request the certificate using the PFX enrollment option and either push it out to the Keyfactor Command local machine store using an IIS personal certificate store managed with a Keyfactor Universal Orchestrator installed on Windows with the IIS custom extension (see [Installing Custom-Built Extensions on page 2940](#)) as part of the enrollment process or import it to the certificate store using the PFX generated from Keyfactor Command.

Note: The Keyfactor Command server needs to be configured to trust the CA that issued the certificate to the rsyslog server. If you have opted to acquire certificates from a CA for which a root trust is not already configured on the Keyfactor Command server, this will need to be configured.

To acquire a server certificate for use in log shipping using a Microsoft CA, first create or identify a template that has an extended key usage (EKU) of *Server Authentication* and make it available for enrollment on a CA to which the server from which you are requesting the certificate has access with enrollment permissions for the server from which you are requesting the certificate.

To enroll for a server certificate using the MMC:

1. On a Windows server with appropriate enrollment access, do one of following:
 - Using the GUI:
 - a. Open an empty instance of the Microsoft Management Console (MMC).
 - b. Choose **File->Add/Remove Snap-in...**
 - c. In the *Available snap-ins* column, highlight **Certificates** and click **Add**.
 - d. In the Certificates snap-in popup, choose the radio button for Computer account, click **Next**, accept the default of Local computer, and click **Finish**.
 - e. Click **OK** to close the Add or Remove Snap-ins dialog.
 - Using the command line:
 - a. Open a command prompt using the “Run as administrator” option.
 - b. Within the command prompt type the following to open the certificates MMC:

```
certlm.msc
```

2. Drill down to Certificates in the Personal folder under **Certificates** for the Local Computer and locate your newly created certificate. Right-click on the certificate and choose **All Tasks->Export...**
3. Follow the certificate export wizard, being sure to answer **Yes, export the private key** and choosing the option to **Include all certificates in the certificate path if possible**. Set a password to secure the exported private key.
4. In the MMC, drill down to the Personal folder under **Certificates** for the Local Computer, right-click, and choose **All Tasks->Request New Certificate...**
5. Securely copy the resulting PFX file to your rsyslog server and place it in a temporary working directory.
6. Use openssl to break the PFX file apart into separate certificate and key files and remove the encryption on the key file (rsyslog does not provide a method for providing the password necessary to use the encrypted file) as follows:
 - a. Execute the following command to pull the key out of the PFX file (provide the input password for the PFX when prompted and the output password for the PEM key file when prompted):

```
openssl pkcs12 -in mycertfile.pfx -nocerts -out mykey.pem
```

- b. Execute the following command to pull the certificate out of the PFX file (provide the input password for the PFX when prompted):

```
openssl pkcs12 -in mycertfile.pfx -clcerts -nokeys -out mycert.pem
```

- c. Execute the following command to pull the chain certificate(s) out of the PFX file (provide the input password for the PFX when prompted):

```
openssl pkcs12 -in mycertfile.pfx -cacerts -nokeys -chain -out cacerts.pem
```

- d. Execute the following command to remove the encryption from the key so that a password will not be required when accessing the key file (provide the PEM key password you set in the first step):

```
openssl rsa -in mykey.pem -out mynewkey.key
```

7. Identify a secure location on the rsyslog server to store the certificates and key file (e.g. /etc/tls/certs and /etc/tls/private) and copy the certificates and key to these locations, setting appropriately secure permissions on the files. The key needs to be readable by the rsyslog daemon.

Tip: If you have an existing Keyfactor Command and wish to enroll through Keyfactor Command, you can request the certificate using the PFX enrollment option, opt to download it as a ZIP PEM, copy the zip file to the rsyslog server, unzip, and distribute the files as described in the final step, above.

Configuration of rsyslog for TLS support may vary depending on your needs. In addition to the standard rsyslog package for your Linux server, you will need GNU TLS packages to support TLS communication. For example, for Ubuntu the required packages are:

```
rsyslog
rsyslog-gnutls
gnutls-bin
```

The following is an example rsyslog.conf file configured for TLS support:

```
# /etc/rsyslog.conf configuration file for rsyslog
#
# For more information install rsyslog-doc and see
# /usr/share/doc/rsyslog-doc/html/configuration/index.html
#
# Default logging rules can be found in /etc/rsyslog.d/50-default.conf
#####
#### MODULES ####
#####

module(load="imuxsock") # provides support for local system logging
#module(load="immark") # provides --MARK-- message capability

# provides UDP syslog reception
```

```

#module(load="imudp")
#input(type="imudp" port="514")

# provides TCP syslog reception
#module(load="imtcp")
#input(type="imtcp" port="514")

# provides kernel logging support and enable non-kernel klog messages
module(load="imklog" permitnonkernelfacility="on")

#####
#### GLOBAL DIRECTIVES ####

```

A filter similar to the following can be used to redirect all Keyfactor Command related traffic to a particular file:

```
:syslogtag, isequal, "Keyfactor" /var/log/keyfactor/audit.log
```

4.4.3 Installing

The following installation instructions cover installing all Keyfactor Command server components on a single server performing all Keyfactor Command roles. You may choose to separate the roles onto different servers. If you do, the installation process will vary from the described process.

4.4.3.1 Install the Keyfactor Command Components on the Keyfactor Command Server(s)

Before you begin the installation, make sure that you have reviewed the system requirements (see [System Requirements on page 2702](#)), completed the prerequisites (see [Planning & Preparing on page 2704](#)), and have your Keyfactor Command license file ready to upload during the configuration.

The following installation steps show all possible Keyfactor Command features enabled. Your Keyfactor Command license may not cover all Keyfactor Command features. If it does not, unlicensed features will not be shown in the configuration wizard. You may skip those configuration steps.

To begin the Keyfactor Command installation, execute the KeyfactorPlatform.msi file from the Keyfactor Command installation media and install as follows.

1. On the first installation page, click **Next** to begin the setup wizard.

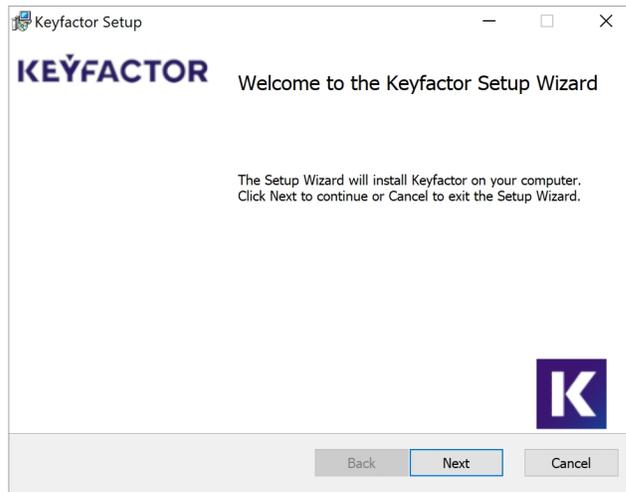

Figure 502: Install: Begin Setup Wizard

2. On the next page, read and accept the license agreement and click **Next**. Click **Print** to review a printed copy if desired.
3. On the next page, select the components to install. For a server with the default roles collocated, leave the default options and click **Next** to continue. If desired, you can highlight Keyfactor Command and click **Browse** to select an alternate installation location for the files. The default installation location is:

C:\Program Files\Keyfactor\Keyfactor Platform\

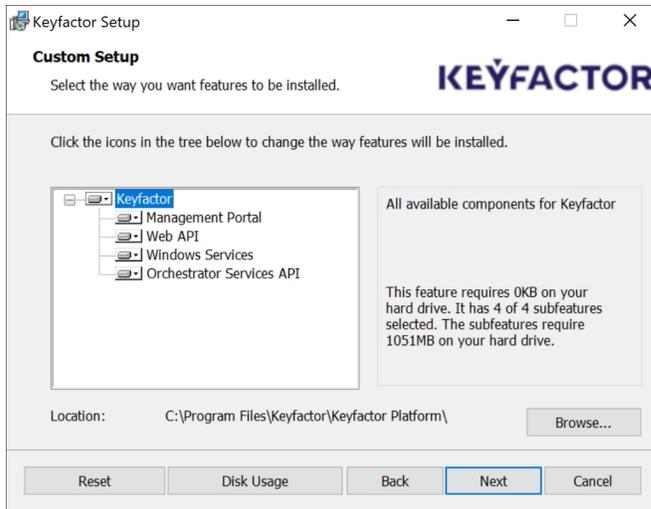

Figure 503: Install: Select Components

 **Tip:** Refer to [Keyfactor Command Server\(s\) on page 2756](#) for a description of these components.

Table 848: Available components for Keyfactor.

Component	Description
Management Portal	Mandatory. Web-based management console for configuring all aspects of Keyfactor. The Keyfactor API will be installed with this component.
Windows Services	Mandatory. Includes the timer Windows service to manage timed events, such as CA Sync, PKI monitoring and system maintenance.
Web API	Optional. The Keyfactor API component. This allows the Keyfactor API for external use to be installed on a separate server from the Management Portal, if desired.
Orchestrator Services API	Optional. Not required if neither agents nor orchestrators will be utilized by Keyfactor Command. Web based orchestrator services API.

- On the next screen, click **Install**.
- On the final installation wizard page, leave the *Launch the Configuration Wizard now* box selected and click **Finish**. The configuration wizard should start automatically. This can take several seconds.
- On the Keyfactor Command Database Configuration page, enter the name, IP address, or fully qualified domain name (FQDN) of your SQL server and select a Credential Type of either

Windows or SQL.

Important: Keyfactor Command uses an encrypted channel to connect to the SQL server by default, which requires configuration of an SSL certificate on the SQL server (see [Using SSL to Connect to SQL Server on page 2746](#)). The name or IP address you enter here for your SQL server must be available as a SAN in this certificate unless you have disabled the encrypted connection for Keyfactor Command (see [Configurable SQL Connection Strings on page 2750](#)).

- If you select **Windows** as the Credential Type for connecting to SQL, click the **Connect** button.

The screenshot shows the 'Keyfactor Database Configuration' dialog box. The 'Server' field contains 'sqlsrvr05.keyexample.com'. The 'Credential Type' section has 'Windows' selected with a radio button, and 'SQL' is unselected. The 'Database Name' field contains 'Command'. There are 'Connect', 'Browse', 'Continue', and 'Close' buttons.

Figure 504: Windows Authentication

- If you select **SQL** as the Credential Type for connecting to SQL, the window will expand to include fields to enter a SQL username and password. Enter a username and password to authenticate to SQL, and click the **Connect** button.

Note: The password must not contain single or double quotes. An error will be shown if single or double quotes are used in the password.

The screenshot shows the 'Keyfactor Database Configuration' dialog box. The 'Server' field contains 'sqlsrvr05.keyexample.com'. The 'Credential Type' section has 'SQL' selected with a radio button, and 'Windows' is unselected. The 'User' field contains 'john_smith'. The 'Password' field is masked with dots. The 'Database Name' field contains 'Command'. There are 'Connect', 'Browse', 'Continue', and 'Close' buttons.

Figure 505: SQL Authentication

Note: For the permissions required for this user, see [Grant Permissions in SQL on page 2744](#).

Note: Keyfactor Command supports configuration of a base SQL connection template that is used for all connections Keyfactor Command makes to SQL. For more information, see [Configurable SQL Connection Strings on page 2750](#).

Note: Your SQL server must be configured to support mixed mode authentication in order to use the SQL option.

7. After the **Connect** button is clicked, the database name field will be activated. You can either enter the name of the desired database—for either a new or existing database—or click **Browse** to scroll through a list of existing databases.

Note: On subsequent runs of the configuration wizard, the database name field will be pre-populated with the database name used on the last completed run. Any change to the server connection fields (server name, authentication type, etc.) will require the Connect button to be used again to unlock the database name field and the Continue button.

8. Click the **Continue** button. You will receive a confirmation dialog if any changes will be made to the database at this stage.

Note: If any of the following situations occurs, you will receive a message:

- The selected database does not exist and will be created.
- The selected database is empty and not associated with Keyfactor Command; it will be populated with the Keyfactor Command schema.
- The selected database does not match the current product schema and will be upgraded.
- The selected database is not empty and is not associated with Keyfactor Command.
- The user does not have access to the database.
- An SSL certificate is not correctly configured on the SQL server.

9. On the Keyfactor Command Encryption Warning page, read and understand the warning. Make note of the referenced documents to provide to your SQL team. Take advantage of the option to make a backup of the Database Master Key (DMK) by entering a path to a directory on your SQL server along with a filename for the backup file and a password to encrypt the file and clicking **Backup**. The user running the Keyfactor Command installer must have write permissions to this directory. Click **Continue**.

Important: Keyfactor Command uses Microsoft SQL Server encryption to protect security sensitive data, including service account credentials. Backup of the SQL server Database Master Key (DMK) is of critical importance in database backup and recovery

operations. The backup file of the DMK and the password should be stored in a safe, well-documented location. Without the file and password created with this process, some data that is encrypted within the Keyfactor Command database will be unrecoverable in a disaster recovery scenario. For more information, see [SQL Encryption Key Backup on page 821](#).

If you choose to install Keyfactor Command in the default location, the referenced documents can later be found here:

C:\Program Files\Keyfactor\Keyfactor Platform\Configuration\DMKBackup.docx
 C:\Program Files\Keyfactor\Keyfactor Platform\Configuration\DMKRestore.docx

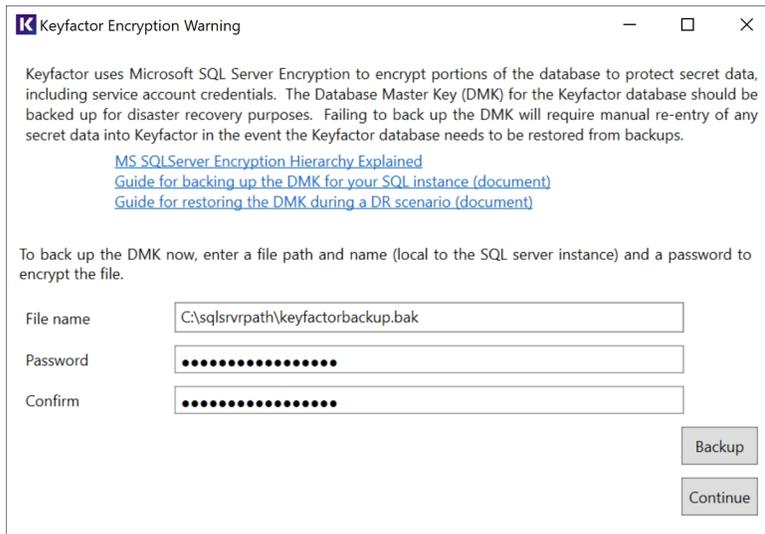

Figure 506: Configure: Backup Database Master Key

- On the Keyfactor Command License upload page, click **Upload** and browse to locate the license file provided to you by Keyfactor. This file should have the extension CMSLICENSE. Once the uploaded license shows as valid, click **Continue**.

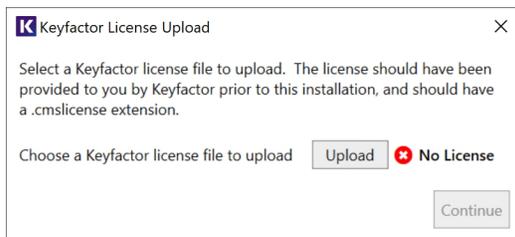

Figure 507: Configure: Upload License

11. In the Keyfactor Command configuration wizard, you can choose to upload a configuration file to populate the fields. You may have a file saved from a previous run of the configuration wizard or you may be provided one by Keyfactor. To upload a file, in the configuration wizard, click **File** at the top of the wizard and choose **Open Data File**. Browse to locate the configuration file. Configuration files have an extension of .cmscfg. The file may be protected with a password. If it is, you will need to provide this password to open the file. Continue with the remainder of the steps, reviewing the tabs to assure that the data is complete and correct.

 **Note:** If you open a configuration file that contains configuration information for an identity provider other than Active Directory but does not set OAuth enabled to true, the additional identity provider information will not be loaded.

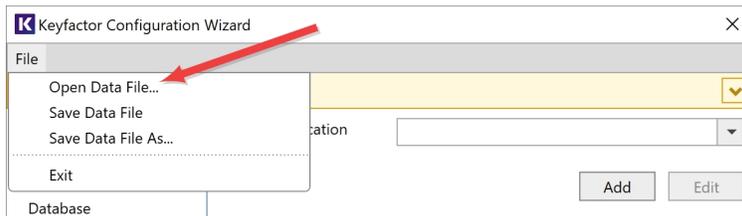

Figure 508: Configure: Open Data File

 **Note:** At the bottom of the configuration wizard, if the database server name is longer than will fit in the provided window, it will be truncated and an ellipsis will be added.

12. Application Pools Tab

A separate application pool is required for each virtual directory that will be created for Keyfactor Command in IIS. If you've chosen to install all the Keyfactor Command components, this will be five application pools for the virtual directories with the following names, by default:

- KeyfactorAgents (Keyfactor Command agent and orchestrator service endpoint)
- KeyfactorAnalysis (Keyfactor Command dashboard and reporting)
- KeyfactorAPI (Keyfactor API)
- KeyfactorProxy (Authentication for an identity provider other than Active Directory)
- KeyfactorPortal (Keyfactor Command Management Portal)

On the Application Pools tab of the configuration wizard, click **Add**, change the default application pool name, if desired, and enter the user name (DOMAIN\username format) and password of the Active Directory service account under which the application pool will run. You may use the people picker button () to browse for the account. Click the verify button () to confirm that the username and password entered are valid. Assuming the verification completes successfully, click **Save**.

 **Tip:** The same service account may be used for all application pools.

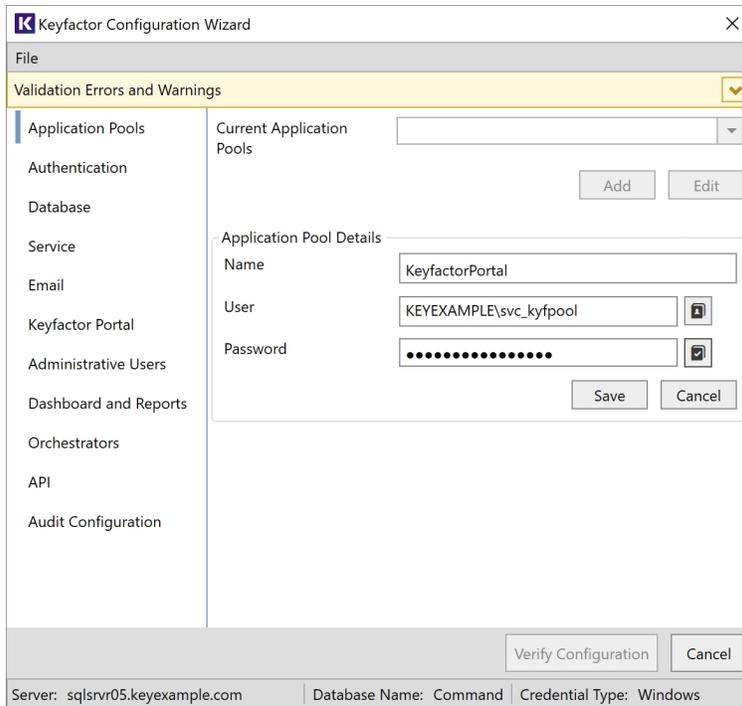

Figure 509: Configure: Application Pools

13. Authentication Tab

On the Authentication tab of the configuration wizard, check the **Use OAuth** box if you wish to use an identity provider other than Active Directory as either your primary identity provider or a federation gateway to another identity provider. If you do not select this, you will be using the default identity provider of Microsoft Active Directory. If you checked OAuth, configure it as follows.

Important: Only one identity provider may be configured at a time on each Keyfactor Command instance.

On the Authentication tab in the top section, accept the defaults for the **Session Expiration** and **Cookie Expiration** or modify these if appropriate for your environment. The *Session Expiration* value determines the length of time a browser session in the Keyfactor Command Management Portal will remain logged in before the user is prompted to re-authenticate regardless of whether the session is idle or in active use. The *Cookie Expiration* value determines the length of time the authentication cookie for the Keyfactor Command Management Portal browser session is considered valid. After half of the setting's duration, Keyfactor Command will attempt to use a refresh token to update the cookie. If this fails, the user's session will be terminated. The cookie renewal is seamless from the user's perspective (there is no prompt for credentials).

Note: For Keyfactor Identity Provider, these values should match those configured for the *SSO Session Max* and *Access Token Lifespan* in Keyfactor Identity Provider (see [Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716](#)). If you've opted not to issue refresh tokens in Keyfactor Identity Provider, the **Cookie Expiration** value should match the **Session Expiration** value.

Claims Proxy Section

On the Authentication tab in the Claims Proxy section, enter the FQDN that you will use to access the Keyfactor CommandManagement Portal in the **Host Name** field. This can be either the actual host name of the server on which you are installing the Keyfactor Command Administration component or a DNS alias pointing to the server. If you have multiple Keyfactor CommandManagement Portal servers with load balancing, this will be a DNS name pointing to your load balancer. Select the Default Web Site in the **Web Site** dropdown, or other web site as desired. Accept the default for the **Virtual Directory** and select the application pool for this virtual directory that you created earlier in the **Application Pool** dropdown.

Note: When you install Keyfactor Command using an identity provider other than Active Directory, a virtual directory called, by default, KeyfactorProxy is created in IIS for OAuth authentication. If you later disable OAuth, this virtual directory will still exist. This virtual directory is not used if you opt to use Active Directory as an identity provider. During Keyfactor Command uninstallation it will be removed, or you may opt to remove it manually if you are switching from OAuth to Active Directory for authentication.

The screenshot shows the 'Keyfactor Configuration Wizard' window. On the left is a navigation pane with categories: Application Pools, Authentication, Database, Service, Email, Keyfactor Portal, Administrative Users, Dashboard and Reports, Orchestrators, API, and Audit Configuration. The 'Authentication' section is expanded, showing 'Use OAuth' checked, 'Session Expiration' set to 60, and 'Cookie Expiration' set to 5. Below this is the 'Claims Proxy' section with 'Host Name' set to 'keyfactor.keyexample.com', 'Web Site' set to 'Default Web Site', 'Virtual Directory' set to 'KeyfactorProxy', and 'Application Pool' set to 'KeyfactorProxy'. The 'Identity Provider' section is also expanded, showing 'Identity Provider Parameters' with 'Authentication Scheme' set to 'Command-OIDC', 'Display Name' set to 'Command-OIDC', and 'Type' set to 'Generic'. At the bottom are 'Verify Configuration' and 'Cancel' buttons. A status bar at the very bottom shows 'Server: sqlsrvr05.keyexample.com', 'Database Name: Command', and 'Credential Type: Windows'.

Figure 510: Configure: Identity Providers—OAuth Claims Proxy Section

 **Tip:** There is no *Use SSL* check box for this component because SSL is required.

Identity Provider Section

On the Authentication tab in the Identity Provider section, enter an **Authentication Scheme** and **Display Name** for your identity provider. The Authentication Scheme should be entered without spaces. This is used in constructing URLs that reference the identity provider from Keyfactor Command. In the **Type** dropdown, select an appropriate type for your identity provider. Most identity providers can be supported with the *Generic* type. For Auth0, select the *Auth0* type.

For Keyfactor Identity Provider, the Authentication Scheme you enter here must match the name you used when configuring the redirect URIs for Keyfactor Identity Provider (see [Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716](#)).

Populate the identity provider parameters according to [Table 849: Identity Provider Parameters](#) and click **Save**. The fields that appear will vary depending on the selected *Type*. HTTPS is required for URL parameters. For more information about identity providers, see [Selecting an Identity Provider for Keyfactor Command on page 2704](#).

Figure 511: Configure: Identity Providers—OAuth Identity Provider Section

Note: If you return to the configuration wizard and re-run it to add a new identity provider or change the identity provider that's in active use for the system (disable one and enable another), you should restart the web server services (run an `iisreset`) after making the change to clear any cached data. If you're using more than one Keyfactor Command server in a cluster configuration, the web server services should be restarted on all of them.

Table 849: Identity Provider Parameters

Name	Type	Example	Description
Admin Querying Client Id	1 - String	Command-API-Query	The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider. For Keyfactor Identity Provider, this is created as a client (see Service Accounts on page 2730). Keyfactor recommends that you use a different client for this purpose than the client

Name	Type	Example	Description
			used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>). This parameter is required.
Admin Querying Client Secret	1 - String		The client secret of the service account that Keyfactor Command uses to make API calls to the identity provider. For Keyfactor Identity Provider, this is created as a client (see Service Accounts on page 2730). This parameter is required.
Audience	1 - String	Command-OIDC-Client	The audience value for the identity provider. For Keyfactor Identity Provider, this should be set to the same value as the <i>Client Id</i> . For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">Command-OIDC-Client</div> This parameter is required.
Auth0 API URL	1 - String		The unique identifier defined in Auth0 or a similar identity provider for the API. This parameter only appears if <i>Auth0</i> is selected as the type and is required in that case.
Authority	1 - String	https://my-keyidp-server.keyexample.com/realms/Keyfactor	The issuer/authority endpoint URL for the identity provider. For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716). It is automatically returned by the <i>Discovery Document Endpoint</i>

Name	Type	Example	Description
			<p>Fetch step. Review it to confirm that it appears correct.</p> <p>This parameter is required.</p> <div data-bbox="959 401 1427 1650" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: When you add or update an identity provider, the provider's discovery document is validated based on this authority URL. The discovery document is also validated periodically in the background. The following are validated:</p> <ul style="list-style-type: none"> • That the discovery document is reachable using the Authority value provided and can be parsed into a valid discovery document. • That the Authority URL matches the Issuer returned in the discovery document. • That all the URLs on the discovery document are using HTTPS. • That the JSONWebKeySetUri value is included on the discovery document. • That any endpoint configuration values (Authorization Endpoint, Token Endpoint, UserInfo Endpoint, JSONWebKeySetUri) that have been saved or are being saved match—including case—the values returned in the discovery document. The UserInfo Endpoint is not a required configuration field, but if a value is provided, it </div>

Name	Type	Example	Description
			 must match what's in the discovery document. If any of these validation tests fail, any identity provider changes in process will not be saved and an error will be displayed or logged.
Authorization Endpoint	1 - String	https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/auth	<p>The authorization endpoint URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.</p> <p>This parameter is required.</p>
Client Id	1 - String	Command-OIDC-Client	<p>The ID of the client application created in the identity provider for primary application use.</p> <p>For Keyfactor Identity Provider, this should be:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">Command-OIDC-Client</div> <p>For more information, see Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716.</p> <p>This parameter is required.</p>
Client	2 -		The secret for the client application

Name	Type	Example	Description
Secret	Secret		<p>created in the identity provider for primary application use.</p> <p>For Keyfactor Identity Provider, see Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716 for help locating this. It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See Privileged Access Management (PAM) on page 742 for more information. <p>This parameter is required.</p>
Discovery Document Endpoint	1 - String	https://my-keyidp-server.keyexample.com/realms/Keyfactor/.well-known/openid-configuration	<p>The discovery URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is the link to the OpenID Endpoint Configuration page, which can be found on the Realm Settings page (see Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716).</p> <p>Populate this value and click Fetch to populate the remainder of the fields in this section, if desired.</p> <p>If you opt not to populate this field or if the discovery document does not return</p>

Name	Type	Example	Description
			a valid response, the remainder of the fields in this section of the configuration will need to be configured manually. This value is not stored in the database.
Fallback Unique Claim Type	1 - String	cid	A backup value used to reference the type of claim used for users in the identity provider in case the primary referenced name does not contain a value. This parameter is required.
JSON Web Key Set Uri	1 - String	https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/certs	The JWKS (JSON Web Key Set) URL for the identity provider. For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct. This parameter is required.
Name Claim Type	1 - String	preferred_username	The name used to reference the type of user claim for the identity provider. For Keyfactor Identity Provider, this should be: <div style="border: 1px solid #ccc; border-radius: 15px; padding: 5px; display: inline-block; margin: 5px 0;">preferred_username</div> This parameter is required.
Role Claim Type	1 - String	groups	The value used to reference the type of group claim for the identity provider. For Keyfactor Identity Provider, this should be:

Name	Type	Example	Description
			<div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; background-color: #f0f0f0;">groups</div> <p>This parameter is required.</p>
Scope	1 - String		<p>One or more scopes that are requested during the OIDC protocol when Keyfactor Command is the relying party. Multiple scopes should be separated by spaces.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
Sign Out URL	1 - String	https://my-auth0-instance.us.auth0.com/oidc/logout	<p>The signout URL for the identity provider.</p> <p>This parameter only appears if <i>Auth0</i> is selected as the type and is required in that case.</p>
Timeout	1 - String	60	<p>The number of seconds a request to the identity provider is allowed to process before timing out with an error.</p>
Token Audience	1 - String		<p>An audience value to be included in token requests delivered to the identity provider when making a token request where Keyfactor Command is acting as the OAuth client.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
Token Endpoint	1 - String	https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/token	<p>The token endpoint URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on</p>

Name	Type	Example	Description
			<p>page 2716). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.</p> <p>This parameter is required.</p>
Token Scope	1 - String		<p>One or more scopes that should be included in token requests delivered to the identity provider when making a token request where Keyfactor Command is acting as the OAuth client. Multiple scopes should be separated by spaces.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
Unique Claim Type	1 - String	sub	<p>The value used to reference the type of claim used for users in the identity provider. For Keyfactor Identity Provider, this should be (for subject):</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">sub</div> <p>This parameter is required.</p>
User Info Endpoint	1 - String	https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/certs	<p>The user info endpoint URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.</p>
User Query	1 -	https://my-keyidp-serv-	The user query endpoint URL for the

Name	Type	Example	Description
Endpoint	String	<code>er.keyexample.com</code> <code>/admin/realms/Keyfactor</code>	identity provider. For Keyfactor Identity Provider, this is the base URL for the Keyfactor Identity Provider REST API and has an expected value of: <pre>https://<host>/admin/realms/<realm_name></pre> This parameter is required.

14. Database Tab

On the Database tab in the top section, select an Authentication Mode for ongoing communications to SQL server—**Windows Authentication** or **SQL Server Authentications**. Your SQL server must be configured to support mixed mode authentication in order to use the SQL server authentication option.

- If you select Windows Authentication, login(s) will be created in SQL for the application pool user(s) you created on the Application Pools tab and granted appropriate permissions (other than the application pool for the Logi Analytics Platform, which does not need database access).
- If you choose SQL server authentication, enter a **User** and **Password** of a SQL administrator for the Keyfactor Command SQL database. If the user does not exist in SQL, it will be created and granted the necessary permissions for management of the Keyfactor Command database. If the user already exists in SQL, it will be granted the necessary permissions. If the database you originally connected to is an Azure database, **SQL Server Authentication** is the only option provided.

For more information, see [Grant Permissions in SQL on page 2744](#).

If desired, check the **Configure Encryption** box. This option allows you to encrypt select sensitive data stored in the Keyfactor Command database using a separate encryption methodology utilizing a Keyfactor Command-defined certificate on top of the SQL server encryption noted above. This additional layer of encryption protects the data in cases where the SQL Server master keys cannot be adequately protected. Read and understand the encryption warning. This warning applies to implementations with more than one Keyfactor Command server.

Note: In an environment where there are multiple copies of Keyfactor Command pointing to the same database, each server running a Keyfactor Command instance will need to have the same encryption certificate AND the corresponding private key.

Select **Application and SQL** for the **Encryption Type** and click the **Select** button to choose a certificate from the Personal Certificate store of the Local Computer with which to encrypt the data. Only valid certificates with the appropriate key usage will appear in the selection dialog. See [Acquire a Public Key Certificate for the Keyfactor Command Server on page 2767](#).

If you enable application-level encryption, your certificate must either be using a key storage provider (KSP) or you must manually grant permissions to the certificate's private key (see [Application-Level Encryption on page 2752](#)).

 **Tip:** If you need to reset the encryption level to remove application-level encryption, run the configuration wizard again and select the **SQL Only** option. You must ensure that the server you are re-running the configuration wizard on has both the certificate used for application-level encryption and its associated private key. When Keyfactor Command notices that application-level encryption has been disabled, it will process all the secrets in the database and remove the additional encryption. The data will then be re-saved to the secrets table using only SQL-level encryption.

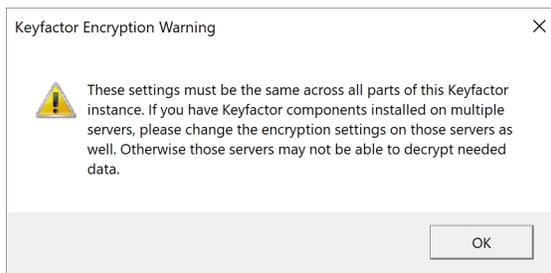

Figure 512: Configure: Encryption Warning

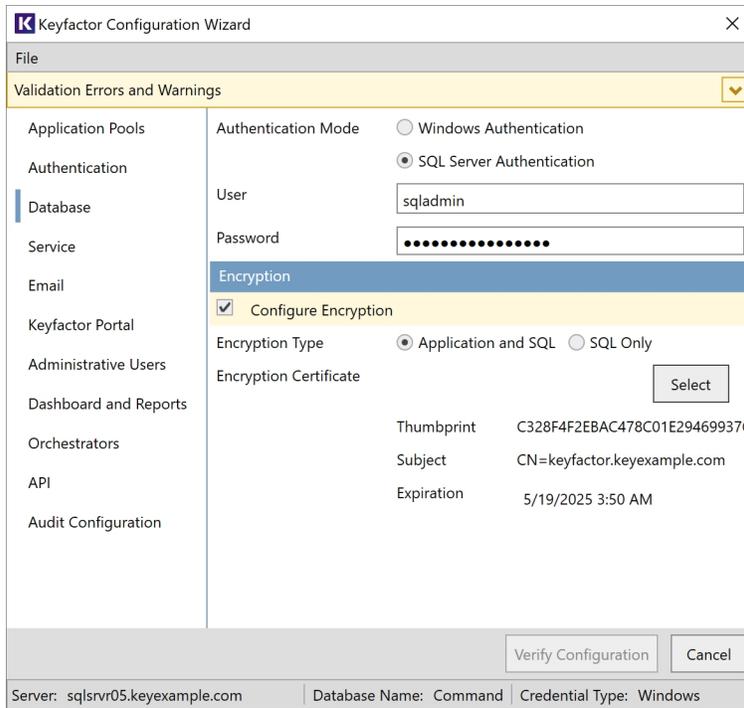

Figure 513: Configure: Database

15. Service Tab

On the Service tab, enter the user name and password of the Active Directory (DOMAIN\username format) or local (HOSTNAME\username format) service account under which the Keyfactor Command Service will run. This can be the same service account used for the application pool(s) or a different service account. You may use the people picker button (👤) to browse for the account. Click the verify button (✅) to confirm that the username and password entered are valid. If desired, check the **Start service on bootup** box to start the Keyfactor Command Service at system start.

 **Tip:** Checking **Start service on bootup** sets all jobs of type TimerService to *true* in the Keyfactor Command service appsettings.json file. These settings can be modified on a job-by-job basis in this appsettings.json file (see [Keyfactor Command Service Job Settings on page 778](#) for more information).

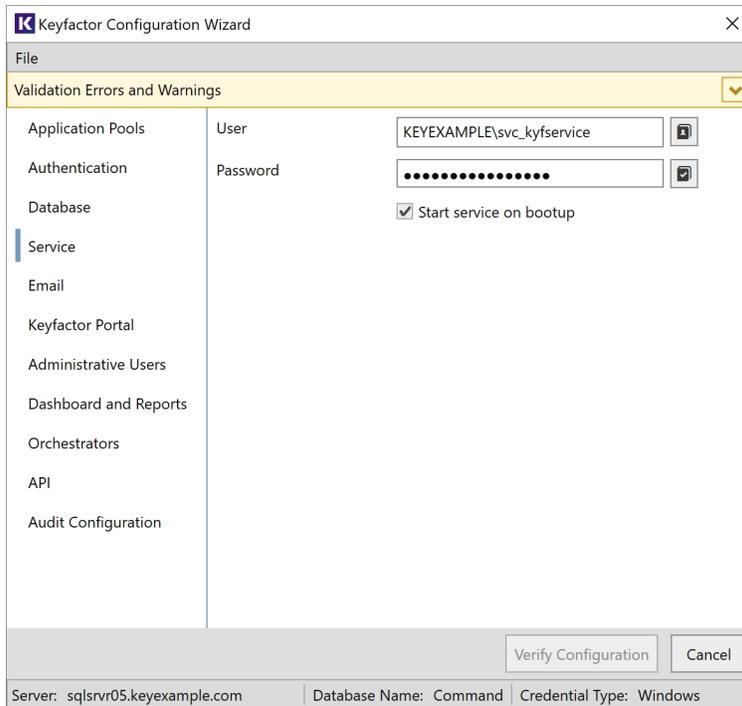

Figure 514: Configure: Service

16. Email Tab

On the Email tab, enter the FQDN of your SMTP server, the SMTP port (default is 25), and the sender name and account. Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server (using Active Directory credentials) or you may be able to put anything in this field (if your mail server supports anonymous connections). You may use the people picker button (👤) to browse for the sender account if you are using a valid account. Select the **Use SSL** box if this option is supported by your mail server and select the appropriate authentication method for your environment. If your mail server requires that you provide a username and password for a valid user, enter that Active Directory username and password in the fields at the bottom of the page after selecting the **Explicit credentials** radio button. You may use the people picker button (👤) to browse for the account. Click the verify button (👤) to confirm that the username and password entered are valid. The user you select here must match the email address you set in the *Sender Account* field if you select *Explicit credentials*. The information entered on this tab may later be changed in the Keyfactor Command Management Portal.

The screenshot shows the 'Keyfactor Configuration Wizard' window with the 'Email' tab selected. The left sidebar lists various configuration categories, with 'Email' highlighted. The main area contains the following fields and options:

- Host:** smtp.keyexample.com
- Port:** 25
- Sender Name:** Keyexample Certificate Management
- Sender Account:** Command@keyexample.com
- Relay Authentication:** Use SSL; Anonymous; Explicit credentials
- User:** (empty field)
- Password:** (empty field)

At the bottom, there are 'Verify Configuration' and 'Cancel' buttons. A status bar at the very bottom displays: Server: sqlsrvr05.keyexample.com | Database Name: Command | Credential Type: Windows

Figure 515: Configure: Email

17. Keyfactor Portal Tab

On the Keyfactor Portal tab in the top section, enter the FQDN that you will use to access the Keyfactor Command Management Portal in the **Host Name** field. This can be either the actual host name of the server on which you are installing the Keyfactor Command Administration component or a DNS alias pointing to the server. If you have multiple Keyfactor Command Management Portal servers with load balancing, this will be a DNS name pointing to your load balancer. Select the Default Web Site in the **Web Site** dropdown, or other web site as desired. Accept the default for the **Virtual Directory** and select the application pool for this virtual directory that you created earlier in the **Application Pool** dropdown. Check or uncheck the **Use SSL** box as appropriate for your environment.

Enrollment Section

In the Enrollment section of the page, modify the default **Certificate Subject Format** field, if desired. The subject values provided in this field are substituted at processing time for any entered by the user in PFX enrollment or provided with enrollment defaults if the template used is set to supply in request.

The data in the subject format takes precedence over any data entered during PFX enrollment or supplied by enrollment defaults (see [Enrollment Defaults Tab on page 398](#)). For example, if you define the following subject format:

CN={CN},E={E},O=Key Example\, Inc.,OU={OU},L=Chicago,ST=IL,C=US

The organization for certificates generated through PFX enrollment will always be *Key Example, Inc.* regardless of what is shown on the PFX enrollment page during enrollment.

This setting also applies to CSRs generated using the CSR generation method.

Data from the default subject *does not* display in the PFX enrollment form. To define defaults that will display in the PFX enrollment form (and can be modified by users), use enrollment defaults (see [Enrollment Defaults Tab on page 398](#)).

Note: Backslashes are required before any commas embedded within values in the subject field (e.g. O=Key Example\, Inc.). Quotation marks should not be used in the strings in the fields except in the case where these are part of the desired subject value, as they are processed as literal values.

Tip: The default subject format *does not* apply to enrollments done using the CSR enrollment method or any requests done with the Keyfactor API.

PFX Enrollment Section

In the PFX Enrollment section of the page, uncheck the **Enabled** box if you do not wish to support PFX enrollment. If you wish to support PFX enrollment, leave the **Enabled** box checked. Select the **Domain** radio button if you wish PFX files to be protected with the user's Active Directory password or select the **Auto-Generated** radio button if you wish PFX files to be protected with a one-time password. Check the **Alphanumeric Password Characters** box if you wish the one-time password used to protect PFX files to contain numbers and letters. Uncheck the **Alphanumeric Password Characters** box if you wish the one-time password used to protect PFX files to contain numbers, letters and special characters. In the **Password Length** field, enter a number for the number of characters the one-time password should have. The minimum value is 8. If you select the **Domain** radio button, the data entered in the password fields is not relevant.

CSR Enrollment Section

In the CSR Enrollment section of the page, uncheck the **Enabled** box if you do not wish to support CSR enrollment. If you wish to support CSR enrollment, leave the **Enabled** box checked.

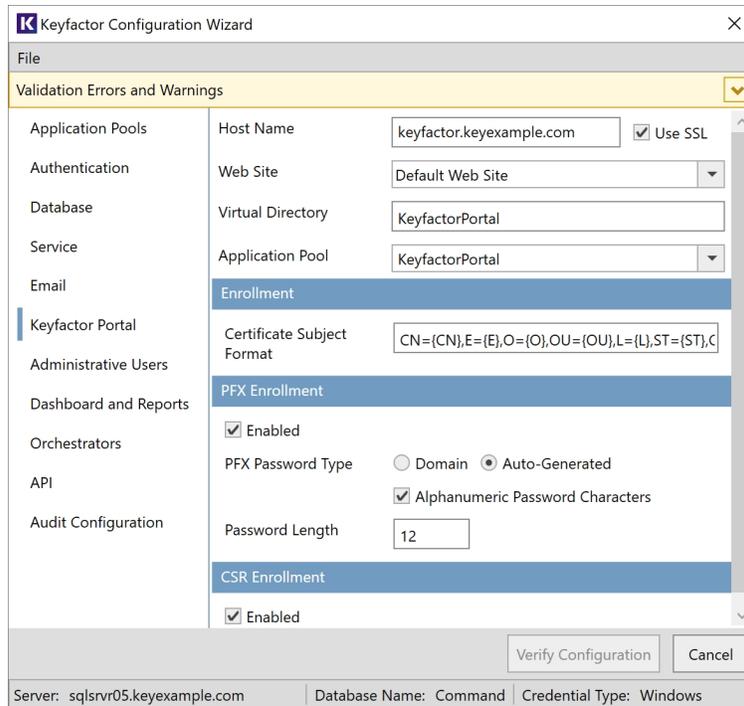

Figure 516: Configure: Keyfactor Portal

18. Administrative Users Tab

On the Administrative Users tab, click **Add** to add users or groups that you will use to control administrative access to the Keyfactor Command Management Portal.

Enter only the users and/or group(s) to which you want to grant full administrative rights to the Keyfactor Command Management Portal. Following initial configuration, you can create other permission levels and grant those permission levels to other users or groups through the Keyfactor Command Management Portal. See [Security Roles and Claims on page 622](#) for more information.

Users and Groups for Active Directory as an Identity Provider

For each user to be added:

- In the **Identity Provider** dropdown, select Active Directory.
- In the **Claim Type** dropdown, select ADUser for a user account or ADGroup for a group created in Active Directory.
- In the **Claim Value** field enter the user or group name for the account in DOMAIN\name format (e.g. KEYEXAMPLE\Keyfactor Administrators).
- In the **Description** field enter a description to help you identify the user or group (e.g. the user's name).

Important: The built-in Active Directory groups Domain Admins and Enterprise Admins cannot be used directly to grant access to the Management Portal due to how these groups function within Windows. You can create a custom Active Directory group, reference that group in the Management Portal, and add the built-in Domain Admins or Enterprise Admins group to that custom group, if desired.

Important: For environments using Active Directory as an identity provider, the administrative group must be created as a Global or Universal group. If the administrative group is created as a domain-local group, it will not be recognized by the Management Portal Security Roles and Identities configuration. Configuration of the Management Portal will be incomplete until the group is deleted and recreated as a Global or Universal group.

The screenshot shows the 'Keyfactor Configuration Wizard' window. The 'Administrative Users' step is selected in the left-hand navigation pane. The main area displays configuration options for an identity provider:

- Identity Provider:** Active Directory
- Claim Type:** ADGroup
- Claim Value:** KEYEXAMPLE\Keyfac
- Description:** Keyfactor Command Global Administrators

Buttons for 'Add', 'Verify Configuration', and 'Cancel' are visible. The status bar at the bottom shows: Server: sqlsrvr05.keyexample.com | Database Name: Command | Credential Type: Windows.

Figure 517: Configure: Administrative Users for Active Directory

Users for an Identity Provider Other Than Active Directory

For each user to be added:

- In the **Identity Provider** dropdown, select OAuth.
- In the **Claim Type** dropdown, select OAuthSubject for a user account created in your OAuth identity provider, OAuthRole for a role created in your OAuth identity provider, or OAuthClientId for a client application created in your OAuth identity provider. If your

claim doesn't fall into one of these categories, select OAuthOid.

- In the **Claim Value** field enter the GUID for the user account, role name for the role, or client ID for the client (see [Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716](#)). If you selected OAuthOid, enter an appropriate ID to identify the claim.
- In the **Description** field enter a description to help you identify the user (e.g. the user or group name).

The screenshot shows the 'Keyfactor Configuration Wizard' window. On the left is a navigation pane with categories: Application Pools, Authentication, Database, Service, Email, Keyfactor Portal, Administrative Users (selected), Dashboard and Reports, Orchestrators, API, and Audit Configuration. The main area displays the configuration for 'Administrative Users'. It features an 'Add' button at the top. Below it are three rows of configuration fields, each with an 'Identity Provider' dropdown (set to 'OAuth'), a 'Claim Type' dropdown, and a 'Claim Value' text box with a delete 'X' button. The first row has 'OAuthSubject' as the claim type and '5bec5f34-cf77-4fe6-' as the claim value, with a description of 'John Smith'. The second row has 'OAuthRole' as the claim type and 'command_administr' as the claim value, with a description of 'Keyfactor Command Global Administrators'. The third row has 'OAuthClientId' as the claim type and '490-23' as the claim value, with a description of 'Keyfactor API Automated Service'. At the bottom of the main area are 'Verify Configuration' and 'Cancel' buttons. A status bar at the very bottom shows 'Server: sqlsrvr05.keyexample.com', 'Database Name: Command', and 'Credential Type: Windows'.

Figure 518: Configure: Administrative Users for OAuth

19. Dashboard and Reports Tab

On the Dashboard and Reports tab, enter the FQDN of the server hosting the Keyfactor Command Management Portal—where the Logi Analytics Platform is installed—in the **Host Name** field. This can be either the actual host name of the server on which you are installing the Keyfactor Command Management Portal component or a DNS alias pointing to the server. Check or uncheck the **Use SSL** box as appropriate for your environment. Select the Default Web Site in the **Web Site** dropdown, or other web site as desired. Accept the default for the **Virtual Directory** and select the application pool for this virtual directory that you created earlier in the **Application Pool** dropdown.

Note: If you are installing the Management Portal in a load balanced configuration, see [Appendix - Logi Load Balancing: Keyfactor Command Configuration Wizard Setup on page 2872](#).

The screenshot shows the 'Keyfactor Configuration Wizard' window. The 'Dashboard and Reports' section is selected in the left-hand navigation pane. The main configuration area contains the following fields and options:

- Host Name:** A text box containing 'keyfactor.keyexample.com' and a checked 'Use SSL' checkbox.
- Web Site:** A dropdown menu with 'Default Web Site' selected.
- Virtual Directory:** A text box containing 'KeyfactorAnalysis'.
- Application Pool:** A dropdown menu with 'KeyfactorAnalysis' selected.

At the bottom of the wizard, there are 'Verify Configuration' and 'Cancel' buttons. A status bar at the very bottom displays: 'Server: sqlsrvr05.keyexample.com | Database Name: Command | Credential Type: Windows'.

Figure 519: Configure: Dashboard and Reports

20. Orchestrators

On the Orchestrators tab, enter the FQDN of the server hosting the Keyfactor Command orchestrators web site in the **Host Name** field. This can be either the actual host name of the server on which you are installing the Keyfactor Command Services (Orchestrator Services API) components or a DNS alias pointing to the server. Select the Default Web Site in the **Web Site** dropdown, or other web site as desired. Accept the default for the **Virtual Directory** and select the application pool for this virtual directory that you created earlier in the **Application Pool** dropdown. Check or uncheck the **Use SSL** box as appropriate for your environment.

Reenrollment Section (Optional)

In the **Template For Submitted CSRs** field, from the dropdown, select the template to be used for reenrollment requests made from the Certificate Stores page.

In the **CA For Submitted CSRs** field, enter the certificate authority used for reenrollment requests made from the Certificate Stores page. The CA should be entered in the format FQDN\Logical Name.

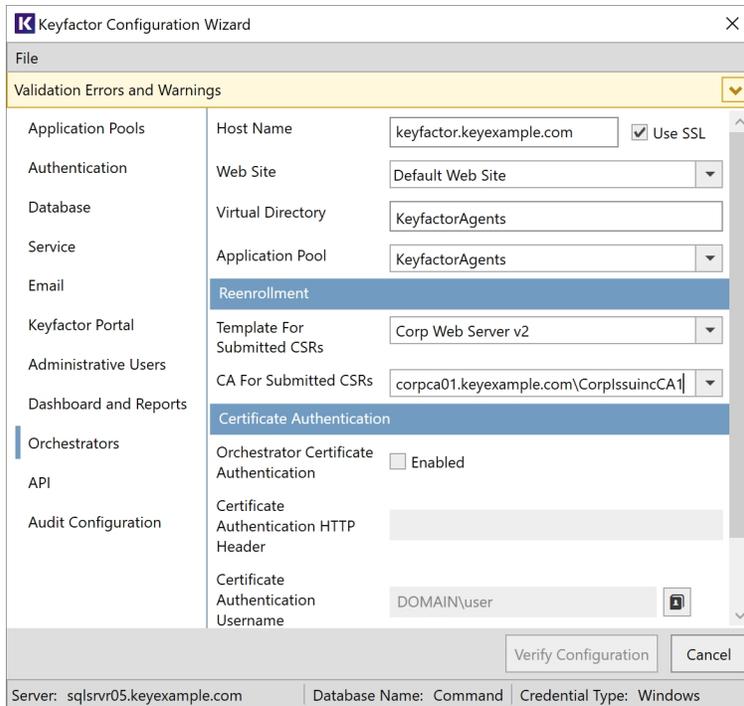

Figure 520: Configure: Orchestrators with Standard Authentication

Certificate Authentication Section (Optional)

In the Certificate Authentication section of the Orchestrators tab, check the **Enabled** box if you wish to support client certificate enrollment from the Keyfactor Universal Orchestrator. In the **Certificate Authentication HTTP Header** field, enter the HTTP header under which the orchestrator connection proxy should send the client authentication certificate. Keyfactor Command uses the certificate supplied in this header to identify the orchestrator attempting to authenticate. In the **Certificate Authentication Username** and **Certificate Authentication Password** fields, enter the credentials for the Active Directory user configured on the proxy to authenticate the orchestrator(s) to the Keyfactor Command server.

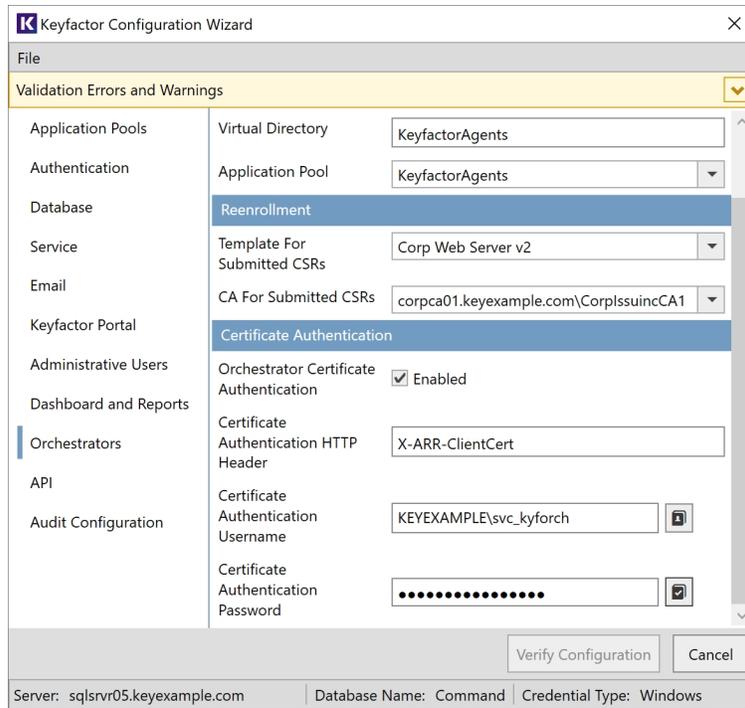

Figure 521: Configure: Orchestrators with Client Certificate Authentication

21. API Tab

On the API tab, enter the FQDN of the server hosting the Keyfactor Command KeyfactorAPI service in the **Host Name** field. This can be either the actual host name of the server on which you are installing the Keyfactor Command Services (Keyfactor API) components or a DNS alias pointing to the server. Select the Default Web Site in the **Web Site** dropdown, or other web site as desired. Accept the default for the **Virtual Directory** and select the application pool for this virtual directory that you created earlier in the **Application Pool** dropdown. Check or uncheck the **Use SSL** box as appropriate for your environment.

Tip: Keyfactor Command includes embedded documentation which includes links to the Keyfactor API Reference and Utility from within the documents. If the API is installed in a non-standard virtual directory, these links will not work from the documentation. Keyfactor, recommends accepting the default virtual directory during installation of Keyfactor Command to avoid issues with this.

Figure 522: Configure: API

22. Auditing Configuration Tab

On the Auditing Configuration tab, enter the number of years to retain audit data in the **Audit Entry Retention Period (years)** field. By default, seven years of data is retained. The audit log cleanup job runs once daily and removes any audit log entries older than the time specified in the retention parameter except those in the following protected categories:

- Security
- CertificateCollections
- ApplicationSettings
- SecurityIdentities
- SecurityRoles

Linux SysLog Server Section

In the Linux SysLog Server section of the page, check the **Connect to SysLog** to enable the option to copy audit logs in real time to a separate server for collection and analysis with a centralized logging solution (e.g. rsyslog, Splunk, Elastic Stack). In the **Host Name** field, enter the fully qualified domain name of the server that will be receiving the logs. Set the **Port** to the port on which your log receipt application is listening to receive the logs. The default value is 514 (the default rsyslog port). If desired, turn on **Use TLS SysLogging**. When you click **Save**, Keyfactor Command will verify that a connection can be made to the specified server on the

specified port. Additional configuration on both the Keyfactor Command server and log receipt server are needed to make TLS communications work (see [Prepare for External Log Shipping over TLS \(Optional\) on page 2775](#)). If you have not yet completed these configurations, you will receive a validation error on save if the Use TLS SysLogging option is enabled.

The auditing settings can be updated on the auditing tab of the applications settings page following installation (see [Application Settings: Auditing Tab on page 608](#)).

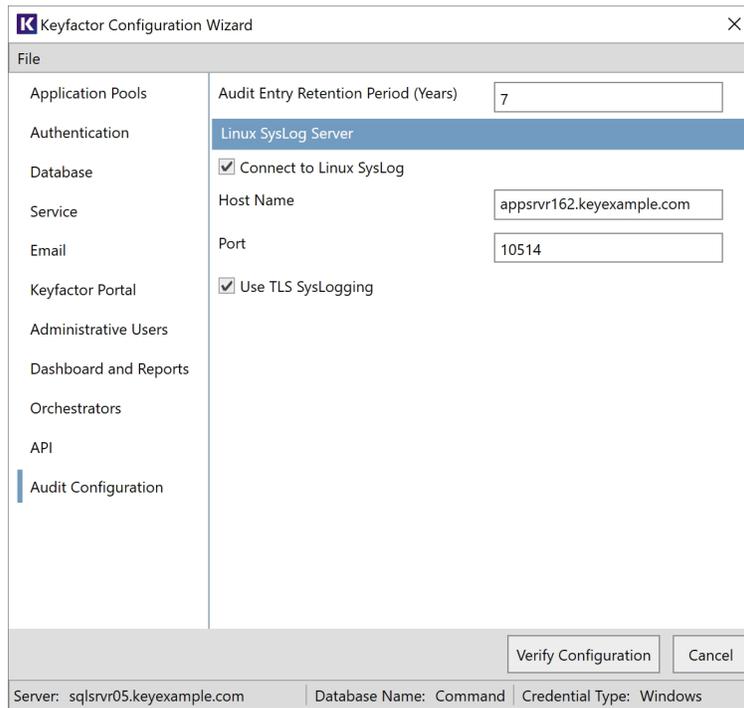

Figure 523: Configure: Audit

23. At this point in the configuration, if you have populated all the required fields, the yellow warning banner at the top of the configuration wizard should have disappeared. If it is still visible, click the dropdown arrow to open the Warnings page and review the warning(s) to see what needs to be corrected. Under some circumstances you will be allowed to continue with the configuration even if the yellow warning banner is still present. You will know this is the case if the **Verify Configuration** button is active. Under these circumstances, you should review the warnings before continuing.

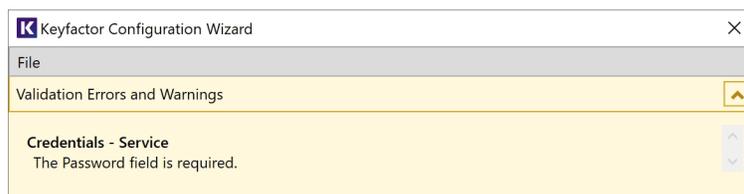

Figure 524: Configure: Configuration Warnings

24. Before completing the configuration wizard, you may choose to save a copy of the configuration as a file for future use. To download the configuration as a file, in the configuration wizard, click **File** at the top of the wizard and choose **Save Data File**. Browse to a location where you want to save the configuration file, enter a file name and click **Save**. You will be prompted to enter a password to encrypt the data in the file. You may choose to protect the file with a password or not. If you use a password at this time, you will need to provide this password to open the file. Keyfactor highly recommends using a strong password to protect the file. If you do not wish to use a password to protect the file, sensitive information (e.g. passwords for the service accounts entered in the configuration wizard) will be removed from the file. Once you enter a password or uncheck the encryption box, click **OK** to save the file.

⚠ Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

Figure 525: Configure: Save Configuration as a File

25. At the bottom of the Keyfactor Command Configuration Wizard dialog, click **Verify Configuration**.
26. On the Configuration Operations page, review the planned operations and then click **Apply Configuration**. Prior to clicking **Apply Configuration**, you can revisit any of the Configuration Wizard tabs to review or make changes by clicking **Edit Configuration**.

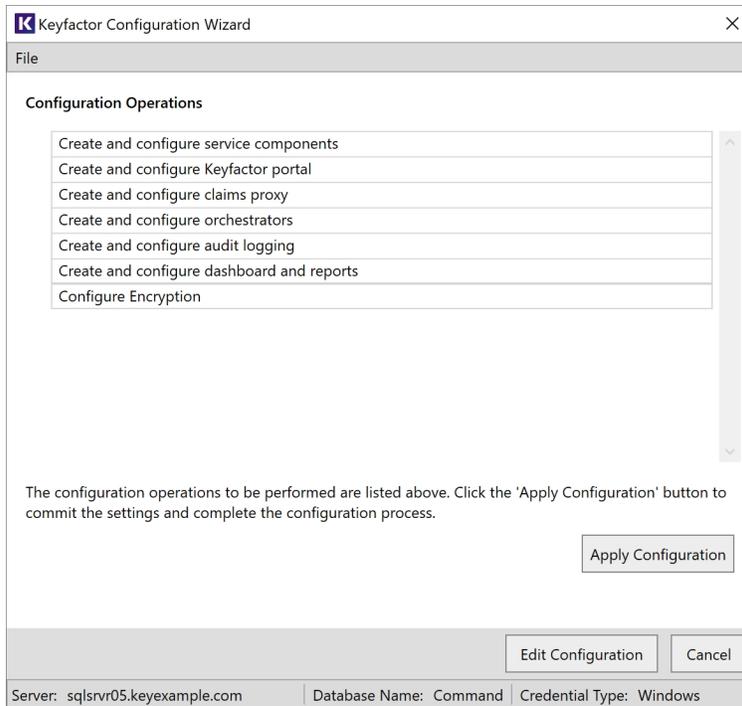

Figure 526: Configure: Configuration Operations

27. When the configuration completes successfully, you will see the below message. If you didn't save a copy of the configuration earlier, you may do so at this time by clicking **Save Settings**. Otherwise, click **Close** to close the dialog.

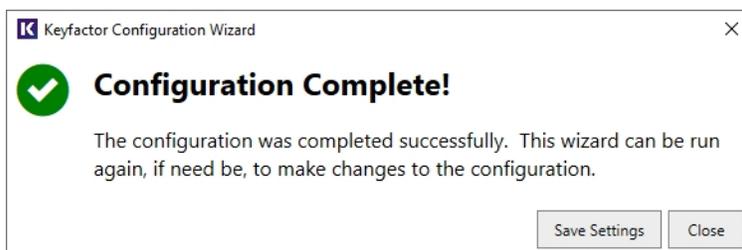

Figure 527: Configure: Configuration Complete

4.4.3.2 Install the Keyfactor Command Server from the Command Line

The Keyfactor Command server can optionally be configured using a pair of configuration files and a command run from the command line. You may be provided one or both of these files by your Keyfactor Customer Success Manager. The configuration files for command-line configuration are:

- Keyfactor Command Configuration File

This file, with an extension of `.cmscfg`, contains information in XML format to configure the Keyfactor Command database. This file can be generated by installing Keyfactor Command,

running the configuration wizard and populating all the fields as desired, and then saving a copy of the configuration either with or without a password to encrypt sensitive information in the file (see [Install the Keyfactor Command Components on the Keyfactor Command Server\(s\) on page 2780](#)). Keyfactor highly recommends using a strong password to protect the file. A file that has not been protected with a password will be missing the sensitive information that would be protected by the password encryption (e.g. service account passwords).

- Input Parameters File

This file, with an extension of .xml, contains information in XML format to connect to and configure SQL, open the Keyfactor Command configuration file, locate the Keyfactor Command license, and create application pools, if desired.

To configure and, optionally, install Keyfactor Command from the command line:

1. Install the Keyfactor Command software using one of these methods:

- Follow the initial instructions for [Install the Keyfactor Command Components on the Keyfactor Command Server\(s\) on page 2780](#) except on the final installation wizard page, uncheck the *Launch the Configuration Wizard now* box and click **Finish**. The configuration wizard should not open.
- Open an administrative command prompt and execute a command similar to the following:

```
start /wait msixec /i <full path to install file>\KeyfactorPlatform.msi /Live  
<path for msixec logs> /Quiet
```

This will install the default components of Keyfactor Command in a non-interactive way (/Quiet), output log information to a file (/Live), and wait to return to the command prompt until the installation is complete (start /wait).

If you wish to install a set of features other than the default features, you can add the ADDLOCAL parameter and specify the features you wish to install. For example, the following command will install the *Orchestrator Service API* and *Windows Services* features:

```
start /wait msixec /i <full path to install file>\KeyfactorPlatform.msi  
ADDLOCAL=AgentServicesFeature,ServiceFeature /Live <path for msixec logs>  
/Quiet
```

The following features are available:

- AgentServicesFeature
This installs the Orchestrator Service API feature.
- ConfigurationFeature
This installs the configuration wizard and is required for all installations.
- ServiceFeature
This installs the Windows Services feature, which includes the Keyfactor Command Service (a.k.a. the timer service).
- VCRedistFeature

This installs the Microsoft Visual C++ Redistributable and is required for all installations unless it has been separately installed.

- WebApiFeature

This installs the WebAPI feature, which includes the Keyfactor API.

- WebConsoleFeature

This installs the Management Portal feature, which includes the Keyfactor Command Management Portal and the Keyfactor API.

The features you decide to install will depend on the role the server will be playing in your Keyfactor Command implementation. [Table 850: Features Required for Each Server Role](#) shows the minimum features that need to be installed for each of the server roles shown in the table columns. If you're installing all the required features on a single server, you need everything. If you don't intend to use any orchestrators (see [Installing Orchestrators on page 2875](#)), you do not need to install the *AgentServicesFeature*.

Table 850: Features Required for Each Server Role

ADDLOCAL Parameter	Single Server	Management Portal	Windows Services	Keyfactor API	Orchestrator Service API
ConfigurationFeature	✓	✓	✓	✓	✓
VCRedistFeature	✓	✓	✓	✓	✓
WebConsoleFeature	✓	✓			
ServiceFeature	✓		✓		
WebApiFeature				✓	
AgentServicesFeature	✓				✓

2. Acquire a Keyfactor Command configuration file from your Keyfactor Customer Success Manager or create one by installing and configuring Keyfactor Command on a test machine. It's not practical to attempt to generate this file manually, though a file can be edited once generated (other than password-protected fields).
3. Create an input parameters file. See [Table 851: Input Parameters XML File Fields](#). A sample file can be found in the Configuration directory under the directory in which you installed Keyfactor Command. By default, this is:

C:\Program Files\Keyfactor\Keyfactor Platform\Configuration\InputParameters.xml

4. Open an administrative command prompt, change to the Configuration directory under the directory in which you installed Keyfactor Command (by default this is C:\Program Files\Keyfactor\Keyfactor Platform\Configuration), and execute a command similar to the following, referencing your input parameters file and using the appropriate parameters for the ConfigurationWizardConsole tool (see [Table 852: ConfigurationWizardConsole.exe Options](#)):

```
.\ConfigurationWizardConsole.exe -p C:\Stuff\InputParameters.xml -u
```

Tip: Check the Keyfactor Command log and the Windows application event log for errors if the installation does not complete successfully (see [Configure Logging on page 2829](#)).

Table 851: Input Parameters XML File Fields

Parameter	Description
Protected	A Boolean indicating whether sensitive information in the Keyfactor Command configuration file is protected with a password (true) or not (false).
Password	A string containing the password used to protect the Keyfactor Command configuration file if <i>Protected</i> is set to true .
ConfigurationFile	The full path to the Keyfactor Command configuration file (e.g. C:\Stuff\myconfig.omscfg).
DatabaseServer	The hostname or IP address of the SQL server where the Keyfactor Command database will be installed, with optional port. For example: <ul style="list-style-type: none"> Local with default port: mysql.keyexample.com Azure SQL myazuresql.database.windows.net,1433
Database	The name of the database in SQL for Keyfactor Command. If a database with this name exists, it will be used (see <i>ForceDatabaseConversion</i>). If it doesn't, it will be created (see <i>CreateDatabaseIfMissing</i>).
CreateDatabaseIfMissing	A Boolean indicating whether the SQL database should be created if it does not exist (true) or not (false). If this is set to false and a database does not exist, an error will be generated and the configuration will not continue.
ForceDatabaseConversion	A Boolean indicating whether a pre-existing SQL database should be converted for use by Keyfactor Command (true) or not (false). If this is set to false and a pre-existing database that has not already been converted for Keyfactor Command use is found, an error will be generated and the configuration will not continue.
ForceDatabaseUpgrade	A Boolean indicating whether a pre-existing SQL database should be upgraded from a previous version of Keyfactor Command (true) or not (false). If this is set to false and a pre-existing database that is running a version of Keyfactor Command that does not match the version being installed is found, an error will be generated and the configuration will not continue.
ContinueOnSqlGrantError	A Boolean indicating whether the configuration should continue if an error is encountered when attempting to set SQL permissions.
SqlUsername	A string containing the SQL username to be used to authenticate to the SQL server if you have opted to use SQL authentication. For an on-

Parameter	Description						
	premise SQL server, the server must be configured to support mixed mode authentication in order to use the SQL option. This option can be used to connect to cloud-based (e.g. Azure) SQL servers. Leave this field blank if you are using Windows integrated authentication. The credentials of the logged on user executing the command will be used to authenticate to SQL.						
SqlPassword	A string containing the SQL password to be used to authenticate to the SQL server. Leave this field blank if you are using Windows integrated authentication.						
LicenseFile	The full path to your Keyfactor Command license file (e.g. C:\Stuff\keyexample.cmslicense).						
AppliationPoolsToCreate	<p>An array of application pools to create. A separate application pool is required for each virtual directory that will be created for Keyfactor Command in IIS. If you choose to install all the roles, this will be either four or five application pools for the virtual directories with the following names, by default:</p> <ul style="list-style-type: none"> • KeyfactorAgents (Keyfactor Command agent and orchestrator service endpoint) • KeyfactorAnalysis (Keyfactor Command dashboard and reporting) • KeyfactorAPI (Keyfactor API) • KeyfactorPortal (Keyfactor Command Management Portal) • KeyfactorProxy (Keyfactor Command proxy to your identity provider for OAuth support; only created if an identity provider other than Active Directory is used as the identity provider) <p>Application pool fields include:</p> <table border="1"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the name of the application pool to create.</td> </tr> <tr> <td>Username</td> <td>A string containing the user name of the Active Directory (DOMAIN\username format) or local (HOSTNAME\username format) service account under which the application pool will run.</td> </tr> </tbody> </table> <div style="background-color: #e0f2f1; padding: 5px; border-radius: 10px; margin-top: 10px;"> <p> Tip: The same service account may be used for all application pools.</p> </div>	Parameter	Description	Name	A string containing the name of the application pool to create.	Username	A string containing the user name of the Active Directory (DOMAIN\username format) or local (HOSTNAME\username format) service account under which the application pool will run.
Parameter	Description						
Name	A string containing the name of the application pool to create.						
Username	A string containing the user name of the Active Directory (DOMAIN\username format) or local (HOSTNAME\username format) service account under which the application pool will run.						

Parameter	Description						
	<table border="1"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Password</td> <td>A string containing the password of the Active Directory or local service account under which the application pool will run.</td> </tr> <tr> <td>FailIfExists</td> <td>A Boolean indicating whether the configuration will fail if the application pool already exists (true) or not (false).</td> </tr> </tbody> </table> <p>For example:</p> <pre> <ApplicationPoolsToCreate> <!--Remove this section if none are to be created--> <WizardApplicationPool> <Name>KeyfactorPortalPool</Name> <Username>KEYEXAMPLE\svc_kyfpools</Username> <Password>MySecurePassword</Password> <FailIfExists>true</FailIfExists> </WizardApplicationPool> <WizardApplicationPool> <Name>KeyfactorAPIPool</Name> <Username>KEYEXAMPLE\svc_kyfpools</Username> <Password>MySecurePassword</Password> <FailIfExists>true</FailIfExists> </WizardApplicationPool> <WizardApplicationPool> <Name>KeyfactorAnalysisPool</Name> <Username>KEYEXAMPLE\svc_kyfpools</Username> <Password>MySecurePassword</Password> <FailIfExists>true</FailIfExists> </WizardApplicationPool> <WizardApplicationPool> <Name>KeyfactorAgentsPool</Name> <Username>KEYEXAMPLE\svc_kyfpools</Username> <Password>MySecurePassword</Password> <FailIfExists>true</FailIfExists> </WizardApplicationPool> </ApplicationPoolsToCreate> </pre>	Parameter	Description	Password	A string containing the password of the Active Directory or local service account under which the application pool will run.	FailIfExists	A Boolean indicating whether the configuration will fail if the application pool already exists (true) or not (false).
Parameter	Description						
Password	A string containing the password of the Active Directory or local service account under which the application pool will run.						
FailIfExists	A Boolean indicating whether the configuration will fail if the application pool already exists (true) or not (false).						

Table 852: ConfigurationWizardConsole.exe Options

Switch	Description
-p, --paramfile	The full path to the input parameters XML file. This switch is required .
-u, --unattended	Do not output errors at the console. Errors will be redirected to the Windows event log.
-d, --database	Create the database in SQL but do not configure Keyfactor Command.
-s, --scriptpath	The full path to a non-standard location for the scripts used during a database upgrade. By default, these are found in the following path: <div style="border: 1px solid #ccc; padding: 5px; margin: 5px 0;"> C:\Program Files\Keyfactor\Keyfactor Platform\Configuration\DatabaseUpgrade </div> This option is typically only used by Keyfactor Support.
--help	Display the help.
--version	Display the version information.

4.4.4 Initial Configuration

Once the installation and configuration wizards are complete, only a few configuration tasks remain before Keyfactor Command will be up and running at a basic level. This section details the basic post-install configuration steps that need to be completed to get Keyfactor Command up and running. See the *Keyfactor Command Reference Guide* for more advanced configuration guidance. See the separate installation guides for client components such as the Keyfactor Universal Orchestrator, Keyfactor Java Agent, and Keyfactor CA Gateways.

After you have completed all the steps in this guide, the certificate search and report functions in the Keyfactor Command Management Portal should be functioning. Further configuration, as described in the *Keyfactor Command Reference Guide*, is required to make these features function:

- Using the Keyfactor Command Management Portal [Dashboard on page 6](#)
- Configuring Enrollment through the Keyfactor Command Management Portal (see [Certificate Template Operations on page 381](#))
- [Security Roles and Claims on page 622](#) for the Keyfactor Command Management Portal
- [Revocation Monitoring on page 210](#), [Expiration Alerts on page 167](#) and [Pending Certificate Request Alerts on page 178](#)
- Using the Workflow Builder (see [Workflow on page 229](#))
- External Certificate Synchronization with [SSL Discovery on page 453](#) and [Certificate Stores on page 408](#)
- Managing [SSH on page 525](#) Keys

4.4.4.1 Configure Kerberos Authentication

In environments using Active Directory as an identity provider, the Keyfactor Command Management Portal uses integrated Windows authentication by default. Integrated authentication consists of both NTLM and Kerberos authentication types. In some environments, NTLM will work for integrated authentication and users will be able to open the Keyfactor Command Management Portal without further configuration, though not all aspects of the portal support NTLM, including the dashboard and enrollment. In other environments, NTLM will not work at all for the Management Portal, so only Kerberos will be supported. Further configuration is required to make Kerberos authentication work correctly. Even if NTLM is supported and you don't intend to use the portions of the Management Portal that don't work with NTLM, Kerberos is generally preferred for best security practice with Active Directory.

Common scenarios in which NTLM will not work are multi-domain forests and authentication attempts between domains and servers that support only NTLMv2 using clients attempting NTLM.

Configuring the environment to support Kerberos includes these topics:

- Configure browsers to support Integrated Windows Authentication (see [Configure Browsers for Integrated Windows Authentication below](#))
- Configure the service principal name (SPN) for the Keyfactor Command server (see [Configure the Service Principal Name for the Keyfactor Command Server on page 2824](#))
- Configure Kerberos constrained delegation (see [Configure Kerberos Constrained Delegation \(Optional\) on page 2824](#))

Note: Basic authentication can be used with Active Directory instead of integrated Windows authentication.

Configure Browsers for Integrated Windows Authentication

To support integrated Windows authentication using either NTLM or Kerberos in environments using Active Directory as an identity provider, the browser must be configured correctly to support this integration. This becomes particularly important when only Kerberos is used, as the browser won't allow the user to continue if Kerberos authentication fails, whereas with NTLM authentication, the integration won't work (the user will be prompted to enter a password), but the user will be allowed to continue to the Keyfactor Command Management Portal. Many modern browsers support integrated authentication. The following instructions cover adding the Keyfactor Command server to Windows's trusted sites to support integrated authentication for Microsoft Edge and Google Chrome. Configuring Firefox to support integrated authentication is beyond the scope of this guide.

Important: Internet Explorer is no longer supported for Keyfactor Command. For a list of supported browsers, see [System Requirements on page 2702](#).

To configure Windows to support integrated authentication:

1. In Windows either do a search for Internet Options or open Control Panel or Settings and locate Internet Options.
2. In Internet Options, go to the Security tab.
3. On the Security tab, highlight **Local intranet** and click **Sites**.
4. On the Local intranet sites popup, click **Advanced**.
5. On the Local intranet dialog, enter the fully qualified domain name of your Keyfactor Command server and click **Add**.
6. Click **Close** and **OK** until you have closed all the dialogs.
7. Exit your browser (this setting applies to Microsoft Edge and Google Chrome) and open it again to attempt your authentication.

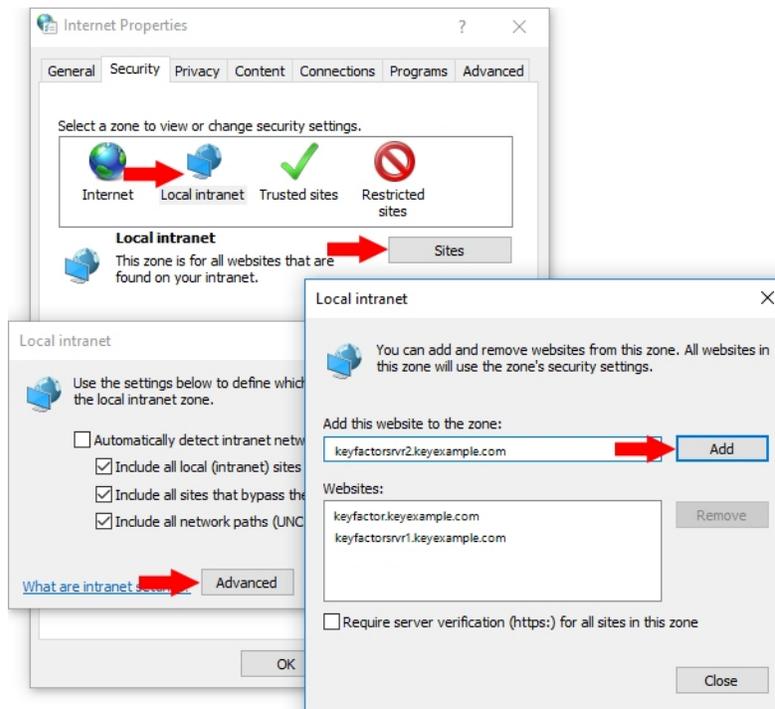

Figure 528: Configure Local Intranet Zone in Internet Properties

Important: It is not sufficient to put the Keyfactor Command server in the **Trusted sites** zone. The server needs to be in the **Local intranet** zone for proper integrated authentication functionality (assuming these zones are still configured as per the default configuration).

Configure the Service Principal Name for the Keyfactor Command Server

In environments using Active Directory as an identity provider, configure the service principal name (SPN) for the Keyfactor Command server as follows:

1. On a server that has the `setspn` command available (typically it is available on domain controllers, as it installs as part of the Active Directory Domain Services role), open a command prompt using the “Run as administrator” option.
2. Run the following command (where `keyfactor.keyexample.com` is the fully qualified domain name of your Keyfactor Command server or the DNS alias you are using to reference your Keyfactor Command server, if applicable, and `KEYEXAMPLE\svc_keyfactorpool` is the domain name and service account name of the service account under which the Keyfactor Command application pool for the Management Portal is running):

```
setspn -s HTTP/keyfactor.keyexample.com KEYEXAMPLE\svc_keyfactorpool
```

Configure Kerberos Constrained Delegation (Optional)

If you are using Active Directory as an identity provider and either of these scenarios is true in your environment, you will need to configure Kerberos delegation to the CAs from the Keyfactor Command server hosting the Keyfactor Command Management Portal:

- You wish to use the option in Keyfactor Command to allow interactions with the CA via the Keyfactor Command Management Portal (e.g. certificate approval or revocation) to be done in the context of the user logged into the Keyfactor Command Management Portal rather than in the context of the Keyfactor Command service account under which the application pool is running or an explicit user configured in the CA configuration within Keyfactor Command.
- You wish to enroll for certificates through the Keyfactor Command Management Portal after authenticating to the portal using Kerberos authentication rather than Basic authentication. If you wish to use the Keyfactor Command Management Portal but don't wish to configure delegation or an explicit user configured in the CA configuration within Keyfactor Command, you will need to set the Keyfactor Command Management Portal to support Basic authentication only.

Configuring Kerberos delegation in Active Directory allows the user's Kerberos credentials to be delegated from the Keyfactor Command server to the CA(s) to allow the Keyfactor Command server to act on behalf of the user.

The types of interactions affected by delegation in the Keyfactor Command Management Portal include:

- Enrollment for certificates
- Approval of pending certificate requests
- Denial of pending certificate requests
- Revocation of certificates
- Certificate key recovery

Note: You have the option to turn off delegation for these functions using the *Delegate* settings on each CA configured in Keyfactor Command (see [Authorization Methods Tab on page 367](#) in the *Keyfactor Command Reference Guide*). Delegation is configured separately for management and enrollment functions.

There are two different approaches to configuring constrained delegation:

- With the traditional version of constrained delegation, you configure the service account under which the Keyfactor Command Management Portal application pool runs and the machine account of the Keyfactor Command server to be allowed to delegate **to** each of your CAs.
- With the newer resource-based constrained delegation introduced in Windows server 2012, you configure each of your CAs to be allowed to receive delegation **from** the service account under which the Keyfactor Command Management Portal application pool runs and the machine account of the Keyfactor Command server. This option requires at least one domain controller that's server 2012 or better, though there can be 2008 or 2008 R2 domain controllers in the mix.

With both approaches to constrained delegation, you need to set the service principal name (SPN) for the Keyfactor Command server (see [Configure the Service Principal Name for the Keyfactor Command Server on the previous page](#)).

Note: If you're using a Keyfactor CA gateway and the gateway service is running as an Active Directory service account, delegation to that gateway is configured differently than is described below. Refer to the gateway documentation for more information.

Traditional Delegation

Note: Traditional constrained Kerberos delegation across multiple domains is only supported in newer versions of Windows Server for domain controllers. If yours is a multi-domain environment and you cannot locate your CAs following the below instructions, you may need to configure traditional unconstrained Kerberos delegation or configure traditional constrained delegation using ADSIEdit rather than the below method. To configure traditional unconstrained delegation, you would select "Trust this computer for delegation to any service (Kerberos only)" in each of the step 2s, below, and then skip the remainder of the steps in that set of instructions. For assistance configuring traditional constrained delegation using ADSIEdit, contact Keyfactor support (support@keyfactor.com). If none of the traditional constrained delegation methods work in your multi-domain environment, you may need to pursue resource-based constrained delegation instead, which is more forgiving of multi-domain environments.

To configure Kerberos constrained delegation on the machine account of the Keyfactor Command server:

1. Open Active Directory Users and Computers and browse to locate the **machine** account of the Keyfactor Command server and open its properties.

2. On the Delegation tab for the machine account, choose “Trust the computer for delegation to specified services only” and under that “Use any authentication protocol” and then click **Add**.
3. In the Add Services dialog, click **Users or Computers** and browse to locate the computer account for one of the CAs to which you wish to delegate.

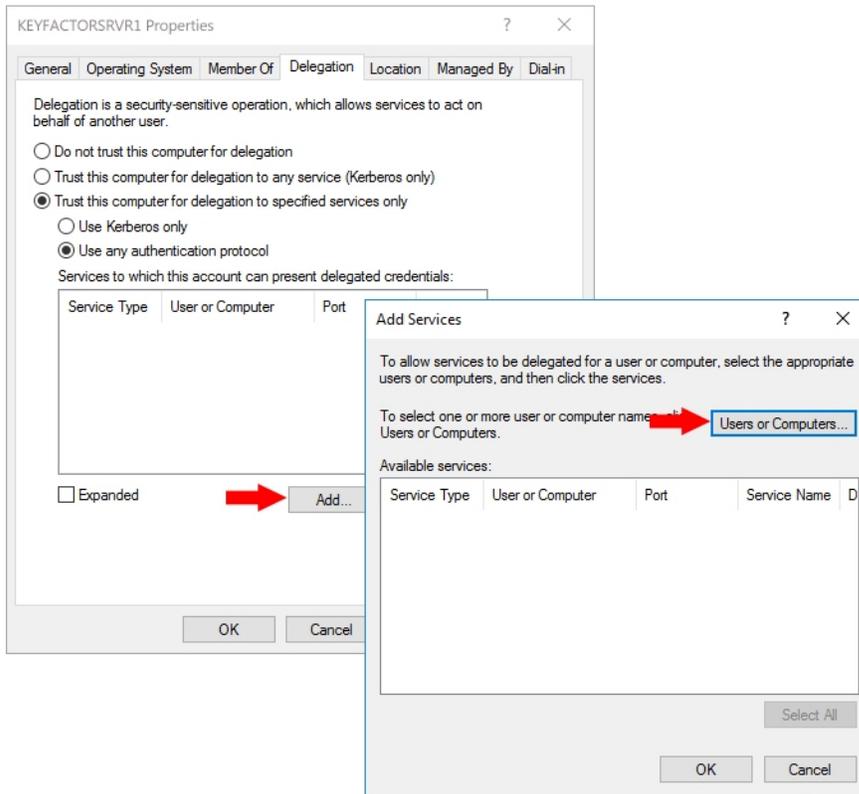

Figure 529: Configure Kerberos Constrained Delegation on the Keyfactor Command Machine Account

4. In the Add Services dialog once the available services have populated, highlight both the **HOST** and the **rpcss** services (hold down the CTRL key when clicking the second service to select both at the same time) and click **OK**.

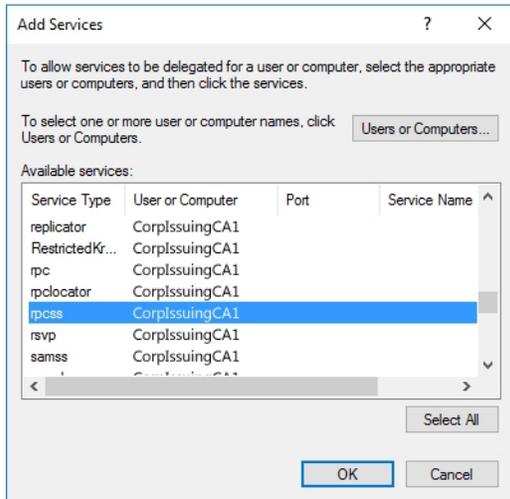

Figure 530: Add HOST and rpcss Service Types for Kerberos Constrained Delegation

5. Back on the Delegation tab of the machine account Properties, you should see the HOST and rpcss services populate the “Services to which this account can present delegated credentials box”. The server names do not appear as fully qualified domain names until you close the properties dialog and open it again.
6. Repeat steps 3 and 4 for any other CAs to which you wish to delegate and then click **OK**.

To configure Kerberos constrained delegation on the **service** account under which the Keyfactor Command application pool is running:

1. Open Active Directory Users and Computers and browse to locate the service account under which the Keyfactor Command application pool is running and open its properties.
2. On the Delegation tab for the service account, choose “Trust the computer for delegation to specified services only” and under that “Use Kerberos only” and then click **Add**.

 **Important:** This is a different configuration setting than for the machine account.

 **Tip:** The Delegation tab only appears on the properties sheet after you have configured a custom SPN.

3. In the Add Services dialog, click **Users or Computers** and browse to locate the computer account for one of the CAs to which you wish to delegate.
4. In the Add Services dialog once the available services have populated, highlight both the **HOST** and the **rpcss** services (hold down the CTRL key when clicking the second service to select both at the same time) and click **OK**.

- Back on the Delegation tab of the service account Properties, you should see the HOST and rpcss services populate the “Services to which this account can present delegated credentials box”. The server names do not appear as fully qualified domain names until you close the properties dialog and open it again.

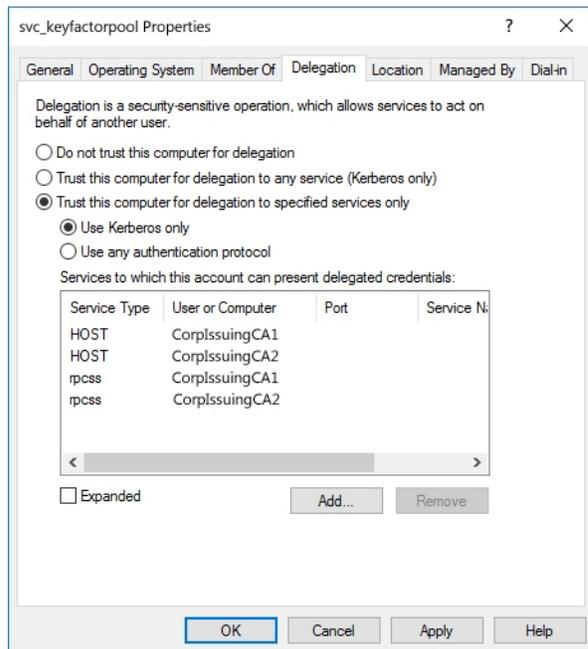

Figure 531: Configure Kerberos Constrained Delegation on the Keyfactor Command Service Account

- Repeat steps 3 and 4 for any other CAs to which you wish to delegate and then click **OK**.

Resource-Based Delegation

To configure Kerberos resource-based constrained delegation:

- Create at least one Active Directory security group that will be used for granting delegation permission.

Tip: The type of group to use and domain to place it in will vary depending on your forest structure and the location of the accounts and resources in the forest. If your Keyfactor Command server(s), CA(s) and application pool service account are all in the same domain, any type of group in that same domain will do. If your Keyfactor Command server (s), CA(s) and/or application pool service account are separated across multiple domains, it becomes more complicated. If you add one or more cross-forest trusts into the mix that you want to do delegation across, that adds another level of complexity. Universal groups cannot be used in a cross-forest scenario, as they are not supported cross-forest. Some possible scenarios include:

- All components (Keyfactor Command server(s), CA(s) and application pool service account) in the same domain: Create a group of any type in the same domain as these components.
- Keyfactor Command server(s) and application pool service account in child domain A and all CAs in the parent domain or child domain B with no cross-forest involvement: Create a universal group in the domain with the CAs (the parent domain or child domain B).
- Keyfactor Command server(s), application pool service account and CA(s) for forest A in the same domain, CAs in a single domain in forest B, forests A and B in a two way trust: Create a group of any type in the forest A domain where the Keyfactor Command server(s) reside and a group of type *domain local* in the forest B domain where the CAs reside; follow the below instructions for both domains and groups.

2. Add the service account under which the Keyfactor Command Management Portal application pool runs to this new security group.
3. Add the machine account for the Keyfactor Command server to this new security group. Repeat for additional Keyfactor Command servers.
4. On an Active Directory domain controller running Windows Server 2012 or better, open a PowerShell window using the “Run as administrator” option. If you’re in a multi-domain or cross-forest environment, use a domain controller in the resource domain where the CAs exist.
5. In the PowerShell window, run the following commands, where *KerberosDelegationGroup* is the name of your group for Kerberos delegation and *IssuingCA* is the machine name (no trailing \$) of the CA you wish to delegate to:

```
$mygroup = Get-ADGroup -Identity KerberosDelegationGroup
Set-ADComputer IssuingCA -PrincipalsAllowedToDelegateToAccount $mygroup
```

6. Repeat the Set-ADComputer step for any additional CAs.
7. In the PowerShell window, run the following command for each CA to confirm that the group has been associated with the PrincipalsAllowedToDelegateToAccount property on the CA account:

```
Get-ADComputer IssuingCA -Properties PrincipalsAllowedToDelegateToAccount
```

4.4.4.2 Configure Logging

Keyfactor Command provides extensive logging for visibility and troubleshooting. By default, Keyfactor Command places its log files in the C:\Keyfactor\logs directory, generates logs at the *Info* logging level and stores the primary logs for two days before deleting them. If you wish to change these defaults you can open the configuration file for each type of log on each Keyfactor Command server where you wish to adjust logging, and edit the file in a text editor (e.g. Notepad) using the “Run as administrator” option. Each component has its own NLog configuration file and NLog logging output path.

For more information, see [Editing NLog on page 796](#).

4.4.4.3 Configure CA Certificate Synchronization

The Keyfactor Command certificate management, notification and reporting features make use of a SQL database containing certificates from many locations, including:

- Certificates synchronized from Microsoft or EJBCA CAs managed by Keyfactor
- Certificates synchronized from domain-joined Microsoft CAs in your primary forest and forests with which the forest shares a trust
- Certificates synchronized from non-domain-joined EJBCA and Microsoft CAs
- Certificates synchronized from your domain-joined Microsoft CAs in non-trusted forests
- Certificates automatically imported based on SSL synchronization locations
- Certificates imported via Keyfactor CA Gateways from locations such as Entrust and Symantec clouds
- Manually imported certificates
- Certificates inventoried from certificate stores using Keyfactor Command Orchestrators

In order to get these certificates into the Keyfactor Command database so that you can begin using the management, notification and reporting features, you need to configure—at a minimum—CA synchronization. For more information:

- See [Certificate Authorities on page 349](#) for information on configuring CA synchronization for your Microsoft and EJBCA CAs.
- See [SSL Discovery on page 453](#) for information on configuring SSL discovery and monitoring.
- See the separate documentation for each type of CA gateway you have along with [Certificate Authorities on page 349](#) for information on configuring CA synchronization for your CA gateways.
- See [Add Certificate on page 74](#) for information on manually importing a certificate.
- See [Installing Orchestrators on page 2875](#) and [Orchestrators on page 481](#) and [Certificate Stores on page 408](#) for information on inventorying certificates from certificate stores.

For information on using the Keyfactor Command Management Portal, see [Using the Management Portal on page 2](#).

Acquire a Client Certificate for EJBCA CA Authentication

Keyfactor Command uses a client certificate to authenticate to the EJBCA certificate authority to support certificate synchronization, enrollment, and revocation. The certificate that Keyfactor Command uses for authentication needs:

- An extended key usage (EKU) of Client Authentication
- A key usage that includes Digital Signature

X.509v3 extensions	Usages

Figure 533: Certificate Download for EJBCA Client Certificate

Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

The certificate needs to be granted appropriate access to the EJBCA CA to allow Keyfactor Command interactions with the CA to take place (see [Grant the Keyfactor Command Users and Service Account\(s\) Permissions on the CAs on the next page](#)).

Grant the Keyfactor Command Users and Service Account(s) Permissions on the CAs

In order for Keyfactor Command to be able to synchronize certificates from the CAs to the Keyfactor Command database, the service account under which Keyfactor Command makes a connection to the CA must have permissions to *read* the CA databases. For full Keyfactor Command functionality, additional permissions are needed. The permissions needed vary depending on the type of CA and the type of authorization you intend to configure to allow Keyfactor Command and users in Keyfactor Command to interact with the CA.

Microsoft CAs

When you configure Keyfactor Command access to a Microsoft CA, you have the option to enable the *Use Explicit Credentials* option. When this option is enabled, you enter a set of credentials that will be used specifically to access that Microsoft CA, and all management and enrollment tasks for that CA are done in the context of that service account. If you do not enable the *Use Explicit Credentials* option, management tasks (e.g. revocation, certificate synchronization) and enrollments are done in the context of the service account(s) you configure for the Keyfactor Command Service and Keyfactor API the application pool for Keyfactor Command (which are the same service account in many implementations) and individual users. The exact combination of what happens in the context of who depends on the configuration of the delegation options (*Delegate Management Operations* and *Delegate Enrollment*) on the CA when the *Use Explicit Credentials* option is not enabled. Delegation is supported for Basic and Kerberos authentication (see [Configure Kerberos Constrained Delegation \(Optional\) on page 2824](#)) but not NTLM or Token authentication. Use of explicit credentials is mutually exclusive of delegation.

The users and service account(s) you will be using to connect to your Microsoft CA(s) from Keyfactor Command need some set of the following permissions on the CA, based on the configuration of authorization for the CA:

- Read
To support CA synchronization
- Issue and Manage Certificates
To support certificate revocation and key recovery
- Manage CA
To support CRL publication following revocation
- Request Certificates
To support certificate enrollment through Keyfactor Command

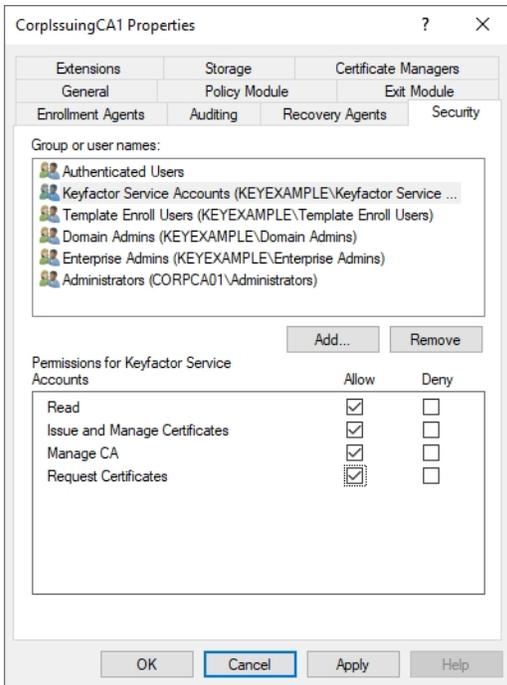

Figure 534: Microsoft CA Permissions

[Table 853: Microsoft CA Permission Matrix](#) provides information on what permissions are required on the Microsoft CA based on possible authorization configurations.

In the management console for each CA that Keyfactor Command will be interacting with, open the properties for the CA and grant the users and service account(s) for Keyfactor Command the appropriate permissions for your environment before continuing.

Tip: In order to support PFX and CSR enrollment through the Management Portal, the user initiating the enrollment in the Management Portal must be granted “Request Certificates” permission in the CA if enrollment delegation is enabled. In many environments, all Authenticated Users are granted this permission, allowing the Management Portal users to inherit the permission.

Table 853: Microsoft CA Permission Matrix

EJBCA CAs

Management (e.g. revocation, certificate synchronization) and enrollment requests to an EJBCA CA are made in the context of the end entity associated with the client certificate selected in each CA configuration in the Keyfactor Command Management Portal to provide authentication to the EJBCA CA (see [Acquire a Client Certificate for EJBCA CA Authentication on page 2830](#)). The access rule created or used for this needs to grant sufficient permissions to allow the end entity to synchronize certificates. For full functionality, it needs the following permissions:

- `/administrator/`
To support Keyfactor Command making API requests to the EJBCA CA
- `/ca/[your_ca_name]/`
To support Keyfactor Command access to your CA
- `/ca_functionality/create_certificate/`
To support certificate enrollment through Keyfactor Command
- `/ca_functionality/create_crl/`
To support CRL publication following revocation
- `/ca_functionality/view_ca/`

To support retrieval of CA information

- /ca_functionality/view_certificate/

To support CA synchronization

- /ca_functionality/view_certificate_profiles/

To support template import

- /endentityprofilesrules/[your_end_entity_profile_name]/create_end_entity/

To support creation of end entities (a new end entity is created for each Keyfactor Command certificate enrollment unless the *Enforce Unique DN* option is enabled and the new certificate's DN matches that of an existing certificate)

- /endentityprofilesrules/[your_end_entity_profile_name]/edit_end_entity/

To support certificate enrollment with the *Enforce Unique DN* option through Keyfactor Command and certificate renewal through Keyfactor Command

- /endentityprofilesrules/[your_end_entity_profile_name]/revoke_end_entity/

To support certificate revocation through Keyfactor Command

- /endentityprofilesrules/[your_end_entity_profile_name]/view_end_entity/

To support certificate enrollment through Keyfactor Command

- /ra_functionality/create_end_entity

To support creation of end entities (a new end entity is created for each Keyfactor Command certificate enrollment unless the *Enforce Unique DN* option is enabled and the new certificate's DN matches that of an existing certificate)

- /ra_functionality/edit_end_entity

To support certificate enrollment with the *Enforce Unique DN* option through Keyfactor Command and certificate renewal through Keyfactor Command

- /ra_functionality/revoke_end_entity

To support certificate revocation through Keyfactor Command

- /ra_functionality/view_end_entity

To support certificate enrollment through Keyfactor Command

- /system_functionality/view_administrator_privileges

To support overall functionality

Where "Sample" is the name of your end entity profile or profiles.

Figure 535: EJBCA Access Permissions

You may either create a new access rule that limits access to just these required permissions, or use an existing access rule. In either case, you need to add the certificate used to authenticate Keyfactor Command to the EJBCA CA as a member of that access rule.

Members

Role : Keyfactor Role

Figure 536: Add Client Certificate as Member of EJBCA Access Rule

Enable and Start the Keyfactor Command Service

The Keyfactor Command Service runs on the Keyfactor Command server hosting the Services role and controls database synchronization, among other jobs. During the Keyfactor Command configuration process you configured the service account under which the Keyfactor Command Service will run and may have configured the service to start automatically at server boot time (see [Configure: Service on page 2802](#)).

 **Tip:** The Keyfactor Command Service can be installed on every server that Keyfactor Command is installed on—for instance in a high availability scenario. This allows the service to check out jobs via a locking mechanism that enforces that any jobs are running on only one

service at a time. There is a timeout setting for the service locking mechanism that may be adjusted if needed. ¹

To start the service (if it hasn't started automatically):

1. On the Keyfactor Command server hosting the Services role, open the Services MMC.
2. In the Services MMC confirm that the Keyfactor Command Service is set to a Startup Type of Automatic (if desired). If the service is not running, click the green arrow to start it.

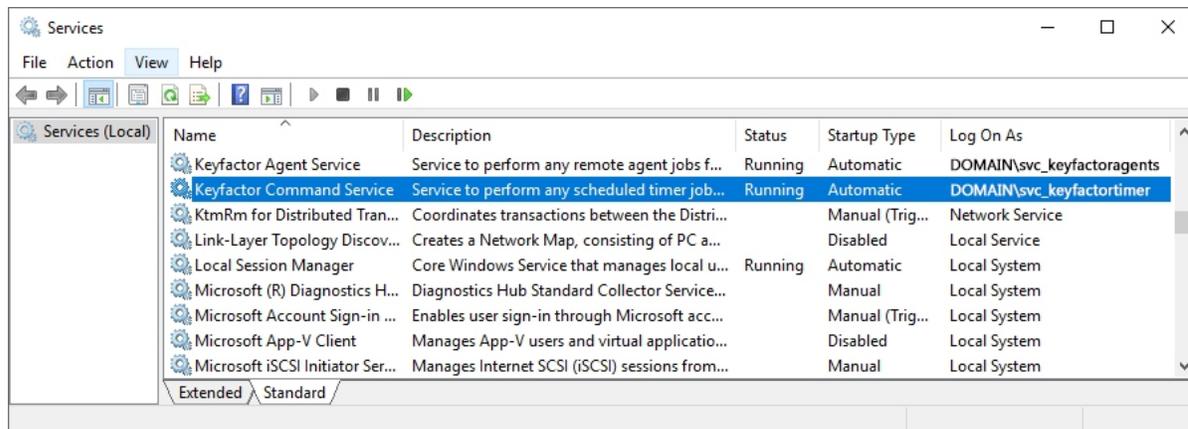

Figure 537: Keyfactor Command Service

If you have configured a synchronization schedule for your CA (see [Configure CA Certificate Synchronization on page 2830](#)), the CA(s) will begin to synchronize when the first scheduled scan time is reached. Scans scheduled at intervals match to clock times, so a scan set at an interval of 15 minutes will run at 6:00, 6:15, 6:30, 6:45, etc. You can check the Keyfactor Command timer service log file on the Keyfactor Command Services server to confirm that synchronization is operating as expected. You can also use the Certificate Search feature in the Keyfactor Command Management Portal to confirm the certificates are appearing in the Keyfactor Command database. The database synchronization begins with the oldest certificates in the CA database, which may be expired or revoked. Be sure to toggle the *Include Revoked* and *Include Expired* options, see [Include Expired and Revoked Certificates in Certificate Search on the next page](#), when checking to see if synchronization is working. See [Certificate Search Page on page 34](#) for information on using the search.

¹Adjust the timeout setting for the service locking mechanism:

1. Navigate to the Configuration folder (default location: *C:\Program Files\Keyfactor\Keyfactor Platform\Configuration*)
2. Open the file: **ConfigurationWizardConsole.exe.config**
3. Edit the value on the line: `<add key="Keyfactor.Sql.DbCommandTimeout" value="1800" />`

Certificate Search ⁹

Clicking "Advanced" allows you to build a query based on multiple criteria using AND/OR logic. Select a field and comparison operator in the drop-downs and then enter a comparison value. Click "Insert" to add the search criteria to the query field below the selection fields. Each time you click the "Insert" button, an AND is added between the previous search criteria and the newly added one. You can change the AND to an OR if desired. You can use parentheses around portions of the query along with AND/OR to change the query meaning.

Field: CN Comparison: equal to Value: []

Include Revoked Include Expired

Figure 538: Include Expired and Revoked Certificates in Certificate Search

4.4.4.4 Create or Identify Certificate Templates for Enrollment

This step only needs to be completed if your Keyfactor Command license includes certificate enrollment and you plan to use this feature.

Note: Keyfactor Command and this documentation use the term *template* generically to refer to Microsoft certificate templates and EJBCA certificate templates. EJBCA templates are built from the EJBCA end entity profile and certificate profile and named using a naming scheme of `<end entity profile name>_<certificate profile name>` and `<end entity profile name> (<certificate profile name>)` for the template name and template display name.

The enrollment function in the Keyfactor Command Management Portal is generally used by administrators to request certificates for use on servers, network devices, and similar equipment. There's a good chance that certificate templates for these purposes already exist in your environment. To prepare for the Keyfactor Command installation, you need to gather a list of the CAs that will be used to issue certificates through the Keyfactor Command Management Portal and a list of the *template names* (vs template display names) of the templates that will be used for this (Microsoft CAs) or certificate profiles and end entity profiles (EJBCA CAs). If any new templates or profiles need to be created for this purpose, they should be created before completing the Keyfactor Command post-installation steps.

For Microsoft CAs, the security settings on your existing templates may need to be modified to allow users to enroll for certificates using them through the Keyfactor Command Management Portal, depending on how the templates have been used previously. For CAs in the local forest (the forest in which Keyfactor Command is installed) and forests in a two-way trust with the local forest, enrollment through the Keyfactor Command Management Portal is often done in the context of the user logged into the portal. This differs from enrolling for a certificate through the Microsoft certificates MMC, where requests for computer certificates (such as web server certificates) are done in the context of the machine account from which the certificate is requested, not the user account, and thus the machine account needs permissions, not the user. When using the Keyfactor Command Management Portal, each of the users who will use one of the enrollment functions needs **Read** and **Enroll** permissions on the templates they will be using through the portal (see [Grant the Keyfactor Command Users and Service Account\(s\) Permissions on the CAs on page 2832](#) for more details).

Tip: Enrollment through the Keyfactor Command Management Portal against remote Microsoft CAs (CAs in a forest with either no trust with the forest in which Keyfactor

Command is installed or a one-way trust) are done in the context of the service account configured on the Management Portal CA record for *Explicit Credentials* (see [Create Service Accounts for Keyfactor Command on page 2757](#)).

The Keyfactor Command Management Portal offers the option of using a different set of CAs and templates for each of the two different enrollment methods—PFX and CSR. As you collect your list of CAs and templates, you will need to decide whether you want to use the same CAs and templates for both types of enrollment or whether each type of enrollment will have a unique list of CAs and templates.

The list of templates used for enrollment in the Keyfactor Command Management Portal is configured through the Keyfactor Command Management Portal template management. Although in previous releases of Keyfactor Command, the templates and CAs for enrollment were configured during installation, this is now done as a post-install step in the Management Portal. See [Certificate Authorities on page 349](#) and [Certificate Template Operations on page 381](#).

4.4.4.5 Configure Renewal Handler Permission

The expiration renewal event handler allows you to execute a certificate renewal automatically for each expiring certificate that is found in a supported certificate store for each expiration alert when the alert task is triggered by the execution of the expiration alerts. In order for the renewal handler to execute successfully, the Active Directory service account under which the Keyfactor Command Service runs must have select permissions in the Keyfactor Command Management Portal. In addition, if you wish to test the execution of expiration alerts with renewal handlers and your IIS application pool runs in the context of a different Active Directory service account than the Keyfactor Command Service, the Active Directory service account for the Keyfactor API IIS application pool must also be granted these permissions.

Note: If your Microsoft CA has been configured with the *Use Explicit Credentials* option, the permissions described here need to be granted to the user specified by the *Use Explicit Credentials* option, not either of the above-referenced service accounts. If you're using an EJBCA CA, no further permissions need to be granted and this step may be skipped.

If you don't plan to use the expiration renewal handler, you can skip this step.

To configure permissions for the service account(s) to support use of the expiration renewal handler:

1. In the Keyfactor Command Management Portal, browse to *System Settings Icon*  > *Security Roles & Identities*.
2. On the Security Roles and Identities page on the Security Roles tab, click **Add** to create a new role to be used just to grant permissions to the service account(s) to support use of the expiration renewal handler.
3. On the Details tab, give it an appropriate name and description to reflect this usage.

4. On the Global Permissions tab:
 - a. Select *Certificate Enrollment* and click the **Enroll PFX** toggle to enable it.
 - b. Select *Certificate Store Management* and click the **Read** and **Schedule** toggles to enable them.
 - c. Select *Certificates* and click the **Read** toggle to enable it.
 - d. Select *Management Portal* and click the **Read** toggle to disable it, if enabled.
5. Click **Save** to save the role.
6. On the Security Roles and Identities page on the Security Identities tab, click **Add** to add a new security identity.
7. In the Security Identities dialog, enter the Active Directory user name of the service account under which the Keyfactor Command Service runs using DOMAIN\username format and click **Save**. If the account resolves correctly, the new identity will be saved and the dialog will close.

Figure 539: Configure Expiration Renewal Handler: Add New Identity

8. If your IIS application pool runs as a different Active Directory service account from that used for the Keyfactor Command Service, repeat steps six and seven for the IIS application pool service account.
9. In the Security Identity Editor section of the page, double-click the Keyfactor Command Service identity in the identity grid, right-click the row in the identity grid and choose **Edit Roles** from the right-click menu, or highlight the Keyfactor Command Service identity in the identity grid and click **Edit Roles** at the top of the identity grid.
10. In the Roles dialog, select the role you created for the expiration renewal handler in the Available Roles list and use the right arrow to move the role to the Current Roles list. Click **Save** to assign the role to the identity.

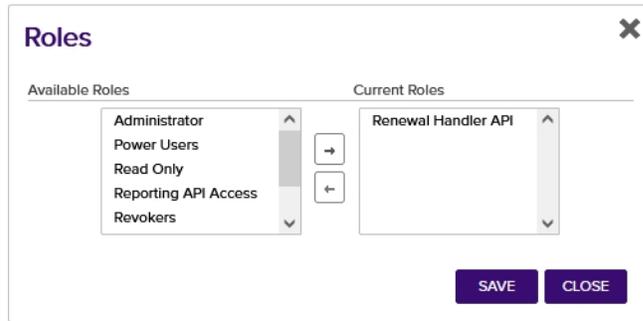

Figure 540: Configure Expiration Renewal Handler: Assign Role to Identity

11. If your IIS application pool runs as a different Active Directory service account from that used for the Keyfactor Command Service, repeat steps nine and ten for the IIS application pool service account.

4.4.4.6 Create a Certificate Template for Mac Auto-Enrollment

This step only needs to be completed if your Keyfactor Command license includes Mac auto-enrollment and you plan to use this feature.

To create the certificate template that will be used for Mac auto-enrollment:

1. On the CA that will issue the Mac auto-enrollment certificates, open the Certification Authority management tool.
2. In the Certification Authority management tool, drill down to locate the Certificate Templates folder. Right-click the **Certificate Templates** folder and choose **Manage**. This will open the Certificate Templates Console.
3. In the Certificate Templates Console, right-click the User template and choose **Duplicate Template**.
4. If prompted with a Duplicate Template dialog (some versions of Windows), choose Windows Server 2003 Enterprise and click **OK**.
5. **General Tab:** In the Properties of New Template dialog on the General tab, enter **Mac Auto-Enrollment** (or an alternate name of your choosing) in the **Template display name** field. The **Template name** will be auto-populated based on the text you enter in the **Template display name**. Select a **Validity period** for the certificate that's appropriate for your environment.
6. **Extensions Tab:** If you plan to use the certificates to authenticate to enterprise systems, you will need to ensure that **Client Authentication** is set as the only application policy in the certificate. To do this, in the **Extensions included in this template** section of the Extensions tab, highlight **Application Policies** and click the **Edit...** button. In the Edit Application Policies Extensions dialog, remove the **Encrypting File System** and **Secure Email** policies and click **OK**.

7. Security Tab: In the Properties of New Template dialog on the Security tab, add the Active Directory group of users who will be allowed to auto-enroll from Macs and grant this group **Read**, **Enroll**, and **Autoenroll** permissions on the template.
8. Click **OK** to save the new template.
9. Back in the Certification Authority management tool, right-click the **Certificate Templates** folder and choose **New->Certificate Template to Issue**. Select the **Mac Auto-Enrollment** template from the list presented and click **OK**.

4.5 Keyfactor CA Policy Module

The Keyfactor CA Policy Module includes four certificate authority policy handlers that can be used to alter or restrict the functionality of a Microsoft certificate authority. The policy handlers are installed on the Microsoft CA and enabled through the Microsoft CA properties page. The available policy handlers are:

RFC 2818 Policy Handler

Automate inclusion of a DNS SAN matching the CN of the requested certificate in certificate enrollments for a defined set of CA templates.

SAN Attribute Policy Handler

Allow the addition of SANs not included in the CSR when making a CSR enrollment request. The added SANs will overwrite any existing SANs in the CSR. This functionality is the same as that seen with the Microsoft default policy module for the CA as a whole when the CA EDITF_ATTRIBUTESUBJECTALTNAME2 flag is set except the SAN Attribute Policy Handler provides the ability to control SAN addition on a template-by-template basis without the need to enable the Microsoft CA EDITF_ATTRIBUTESUBJECTALTNAME2 flag.

vSCEPTM Policy Handler

Allow secure control of on-device key generation during certificate enrollment for iOS and Mac devices.

Whitelist Policy Handler

Enforce that certificate requests for a given template or templates can only be initiated from a given computer or set of computers.

Important: If you're upgrading from a previous version of the Keyfactor CA Policy Module, refer to the *Keyfactor Command Upgrade Overview* for important upgrade instructions and a required upgrade script. Newer versions of Keyfactor CA Policy Module **cannot** be installed over the top of existing Keyfactor CA Policy Module installations to complete an upgrade.

4.5.1 System Requirements

The Keyfactor CA Policy Module is supported on Microsoft certificate authorities running on Windows Server 2016 or higher. It interoperates with Keyfactor Command versions 9.0 or greater.

The policy module requires the Microsoft .NET **Desktop** Runtime version 6.0 (x64). Version 6.0 is available for download from Microsoft:

<https://dotnet.microsoft.com/download/dotnet/6.0/runtime>

At the above link, this would be the **Download x64** option under the “Run desktop apps” heading.

You can use the following PowerShell command to check the .NET core version(s) installed on a server (if any):

```
dotnet --list-runtimes
```

Output from this command will look something like this if you have the correct 6.0 x64 version of the .NET Desktop Runtime installed (notice the paths are in C:\Program Files, not C:\Program Files (x86), indicating this is the x64 version):

```
Microsoft.NETCore.App 6.0.11 [C:\Program Files\dotnet\shared\Microsoft.NETCore.App]  
Microsoft.WindowsDesktop.App 6.0.11 [C:\Program  
Files\dotnet\shared\Microsoft.WindowsDesktop.App]
```

The policy module also requires a Keyfactor Command license key for the current release with a policy module license.

Important: If you’re upgrading from a previous version of the Keyfactor CA Policy Module, refer to the *Keyfactor Command Upgrade Overview* for important upgrade instructions and a required upgrade script. Newer versions of Keyfactor CA Policy Module **cannot** be installed over the top of existing Keyfactor CA Policy Module installations to complete an upgrade.

4.5.2 Preparing for the Keyfactor CA Policy Module

The preparation steps necessary for the Keyfactor CA Policy Module vary depending on the policy handler(s) you intend to use.

Important: If you’re upgrading from a previous version of the Keyfactor CA Policy Module, refer to the *Keyfactor Command Upgrade Overview* for important upgrade instructions and a required upgrade script. Newer versions of Keyfactor CA Policy Module **cannot** be installed over the top of existing Keyfactor CA Policy Module installations to complete an upgrade.

The policy handlers have the following preparation requirements:

RFC 2818 Policy Handler

During the configuration of the RFC 2818 Policy Handler, you will need to define the list of Microsoft certificate templates that will automatically be assigned a DNS SAN matching the certificate's CN when a certificate enrollment request reaches the CA. These templates are configured by selecting them from a list. You will need to have this list of templates ready.

SAN Attribute Policy Handler

During the configuration of the SAN Attribute Policy Handler, you will need to define the list of Microsoft certificate templates that will allow certificate enrollment requests via CSR to submit SANs outside of the CSR for inclusion in the final certificate, replacing any SANs originally in the CSR. These templates are configured by selecting them from a list. You will need to have this list of templates ready.

vSCEP™ Policy Handler

During the configuration of the vSCEP™ Policy Handler, you will need to enter the URL to the vSCEP service on your Keyfactor Command server and the username and password of a service account that the policy handler will use to make requests to the vSCEP API on the Keyfactor Command server. The user you enter here needs to be a member of the group you configure for *Allowed Users/Groups* on the vSCEP Service tab in the Keyfactor Command configuration wizard (see [Install the Keyfactor Command Components on the Keyfactor Command Server\(s\) on page 2780](#)). The service account needs to be created in Active Directory prior to installation of the Keyfactor CA Policy Module software, and the person installing the Keyfactor CA Policy Module software needs to know the service account domain, username and password.

Whitelist Policy Handler

During the configuration of the SAN Attribute Policy Handler, you will need to define the list of Microsoft certificate templates that will be gated by the handler and the list of machines that will be allowed to use these templates. Any templates you include will be available for enrollment only from machines you include in the allowed list. The purpose of this handler is to force all enrollments to be made from the Keyfactor Command server(s), so the list of machines should include your Keyfactor Command server(s). The templates for this policy handler are configured by typing in their certificate *template name* (short name), so you will need an exact list of the template names.

In addition, you will need to have your Keyfactor product license available for upload into the policy module once installed to activate it.

4.5.3 Installing the Keyfactor CA Policy Module Handlers

These steps only need to be completed if your Keyfactor Command license includes the Keyfactor CA Policy Module and you plan to use this feature and one or more of its policy handlers. Review the policy handlers to determine if one or more of them meets a need in your environment.

Important: For a CA Clustered solution, if the Keyfactor CA Policy Module is installed on a node then configured, then failed over to another node, this will corrupt the check point key. The module must be installed on BOTH nodes, configured on one node, then failed over to the other node.

The available policy handlers are:

RFC 2818 Policy Handler

Automate inclusion of a DNS SAN matching the CN of the requested certificate in certificate enrollments for a defined set of CA templates.

SAN Attribute Policy Handler

Allow the addition of SANs not included in the CSR when making a CSR enrollment request. The added SANs will overwrite any existing SANs in the CSR. This functionality is the same as that seen with the Microsoft default policy module for the CA as a whole when the CA EDITF_ATTRIBUTESUBJECTALTNAME2 flag is set except the SAN Attribute Policy Handler provides the ability to control SAN addition on a template-by-template basis without the need to enable the Microsoft CA EDITF_ATTRIBUTESUBJECTALTNAME2 flag.

Important: By default, Microsoft CAs do not support the addition of SANs not included in the CSR when making a request using a CSR enrollment method. To enable your CA to support requesting certificates with additional SANs, you must either install and configure the Keyfactor Command SAN Attribute Policy Handler on the CA(s) or enable the Microsoft CA EDITF_ATTRIBUTESUBJECTALTNAME2 flag. There are security risks inherent in enabling either of these options on your CA. Keyfactor recommends that you do not enable these options unless it is an absolute requirement. With the SAN Attribute Policy Handler, you can limit the risk by limiting the exposure to just selected templates. Keyfactor further recommends that you:

- Use the SAN Attribute Policy Handler only with templates that require CA manager approval so that a manager will be required to review the request and the added SANs before the certificate is issued.
- Use the SAN Attribute Policy Handler in conjunction with the Whitelist Policy Handler to limit requests for the selected templates to being initiated only by the Keyfactor Command server(s).
- Configure server level monitoring with a product such as Microsoft's System Center Operations Manager (SCOM) to provide alerts for any changes relating to the CA(s) configured with the SAN Attribute Policy Handler so that, for example, changes to the templates configured to support SAN addition do not go unnoticed.

vSCEPTM Policy Handler

Allow secure control of on-device key generation during certificate enrollment for iOS and Mac devices.

Whitelist Policy Handler

Enforce that certificate requests for a given template or templates can only be initiated from a given computer or set of computers.

Note: The following Windows update affects how certificate requests are built when sent to a Microsoft CA and may cause enrollments done outside Keyfactor Command against a Microsoft CA configured with the Whitelist Policy Handler to fail.

<https://support.microsoft.com/en-us/topic/kb5014754-certificate-based-authentication-changes-on-windows-domain-controllers-ad2c23b0-15d8-4340-a468-4d4f3b188f16>

The processing order of the handlers currently available in the Keyfactor CA Policy Module, when used together on the same machine, is significant for some handlers and not others. Specifically, the processing order is not significant for the vSCEP™ Policy Handler and Machine Whitelist Policy handler. These handlers may be placed anywhere within the list of handlers. However, the processing order does matter for the SAN Attribute Policy Handler and the RFC 2818 Policy Handler. When these two handlers are used together, the SAN Attribute Policy Handler must be placed on the list above the RFC 2818 Policy Handler to allow the SAN Attribute Policy Handler to be processed before the RFC 2818 Policy Handler. This is because the SAN Attribute Policy Handler removes any existing SANs on the enrollment request and replaces them with those specified in the request outside of the CSR—such as those entered in the optional SAN section on the CSR page of the Keyfactor Command Management Portal. This includes any SANs added by the RFC 2818 Policy Handler.

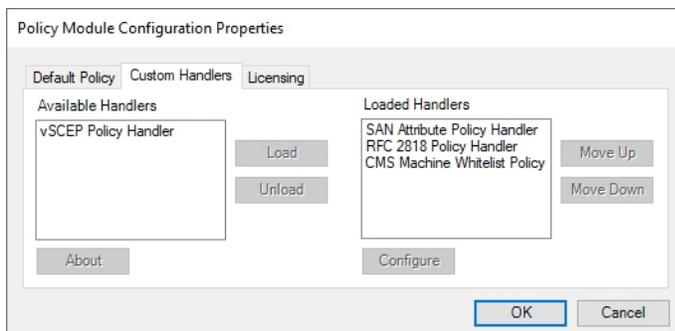

Figure 541: Keyfactor CA Policy Module Policy Module Handler Ordering

When the Keyfactor CA Policy Module is used, the policy module listed on the Default Policy tab of the Policy Module Configuration Properties dialog is run first when a request reaches the CA. This default policy might be the standard Windows default, as shown [Figure 542: Default Policy Module](#), or it might be another non-built-in policy module, such as the Microsoft FIM CM Policy Module. After the default policy module runs, the Loaded Handlers on the Custom Handlers tab of the Policy Module Configuration Properties dialog are run in the order listed (top to bottom). After all the handlers have been run, the result (approved, denied, or marked as pending) is returned to the CA for processing.

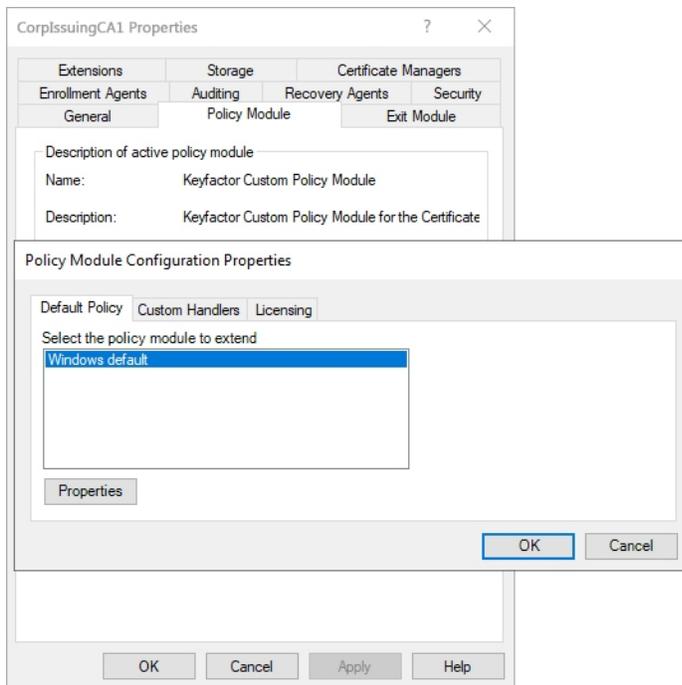

Figure 542: Default Policy Module

Tip: Once the installation is complete, the configuration options for the policy handlers can be found in the registry on the CA in the following paths (where CA_LOGICAL_NAME is the logical name of the local CA):

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\services\CertSvc\Configuration\CA_
LOGICAL_NAME\PolicyModules\CMS_Custom.Policy\PolicyHandlers\RFC2818.PolicyHandler
```

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\services\CertSvc\Configuration\CA_
LOGICAL_NAME\PolicyModules\CMS_
Custom.Policy\PolicyHandlers\SANAttribute.PolicyHandler
```

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\services\CertSvc\Configuration\CA_
LOGICAL_NAME\PolicyModules\CMS_Custom.Policy\PolicyHandlers\vSCEP.PolicyHandler
```

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\services\CertSvc\Configuration\CA_
LOGICAL_NAME\PolicyModules\CMS_
Custom.Policy\PolicyHandlers\CMSWhitelist.PolicyHandler
```

Important: These registry keys should not be modified without advice from Keyfactor support.

4.5.3.1 Install the Keyfactor RFC 2818 Policy Handler

To begin the RFC 2818 Policy Handler installation, execute the KeyfactorCAModuleInstaller.msi file from the Keyfactor installation media and install as follows.

1. On the first installation page, click **Next** to begin the setup wizard.

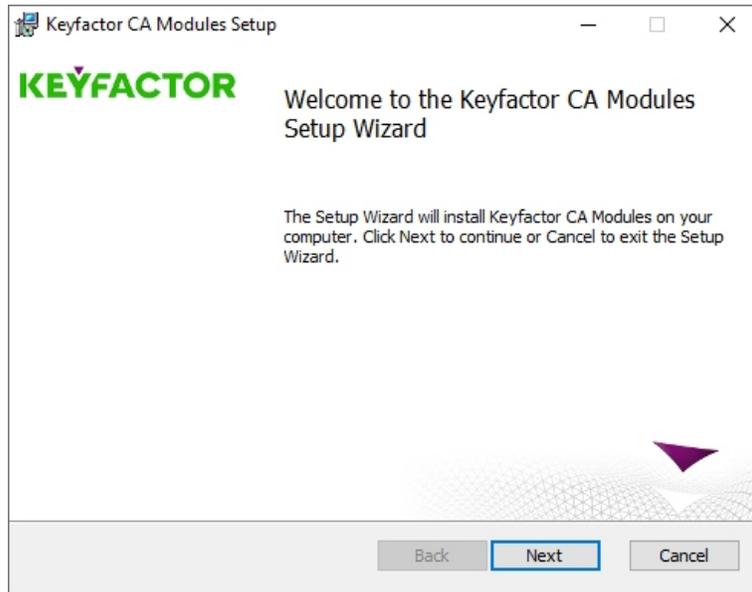

Figure 543: Install RFC 2818 Policy Handler: Begin Setup Wizard

2. On the next page, read and accept the license agreement and click **Next**.
3. On the next page, select the components to install. For the RFC 2818 Policy Handler, deselect all the components except the RFC 2818 Policy Handler component. If desired, you can highlight Keyfactor Custom Policy Module and click **Browse** to select an alternate installation location for the files. The default installation location is:

C:\Program Files\Keyfactor\Keyfactor CA Modules

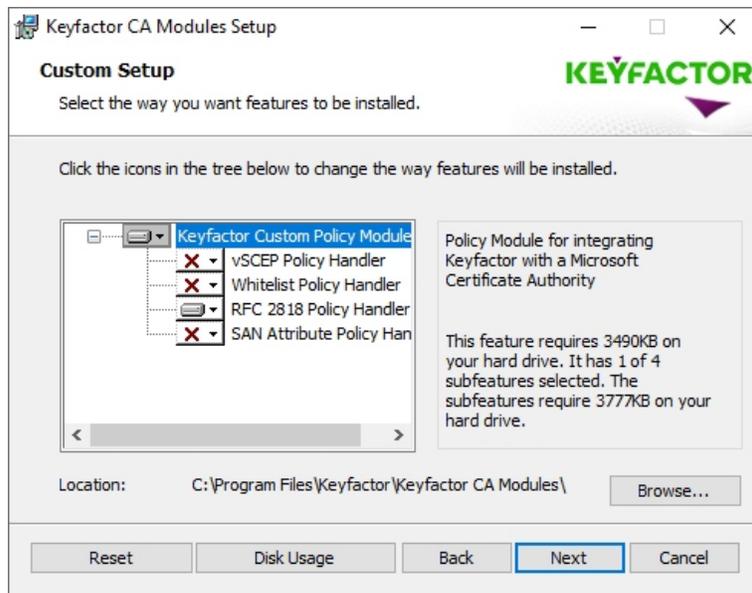

Figure 544: Install RFC 2818 Policy Handler: Select Components

4. On the next screen, click **Install**.
5. On the final installation wizard page, leave the *Launch the CA MMC snap-in now* box selected and click **Finish**. The Microsoft Certification Authority management tool should start automatically. This can take several seconds.
6. In the Certification Authority management tool, right-click the CA name at the top of the tree and choose **Properties**.
7. In the Properties dialog for the CA on the CA Policy Module tab, click **Select**, highlight the **Keyfactor Custom Policy Module** in the Set Active Policy Module dialog and click **OK**.

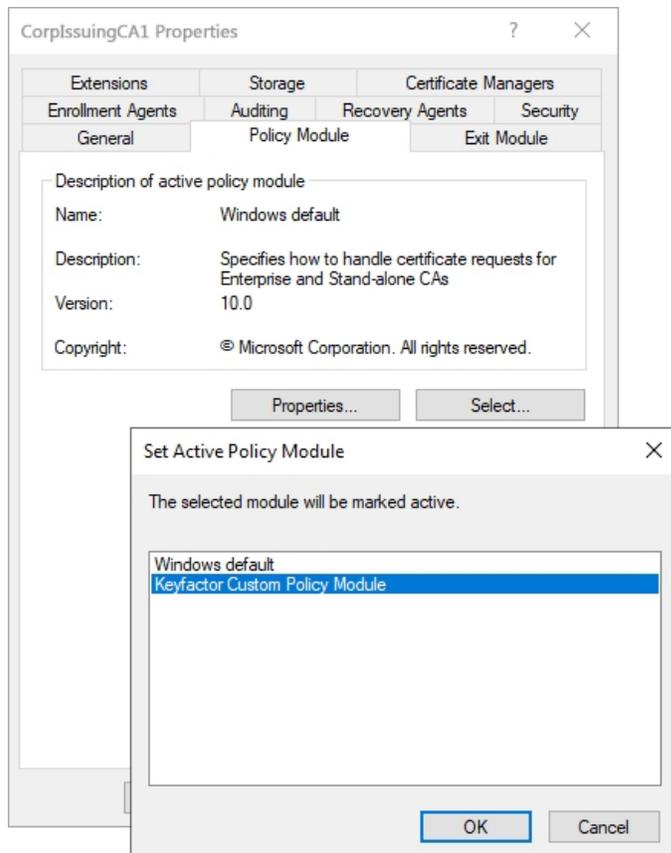

Figure 545: Enable the Keyfactor CA Policy Module

8. In the Properties dialog for the CA on the CA Policy Module tab, click **Properties**.
9. On the Licensing tab of the Policy Module Configuration Properties page, click **Upload License** and browse to locate the license file provided to you by Keyfactor. This file should have the extension CMSLICENSE.

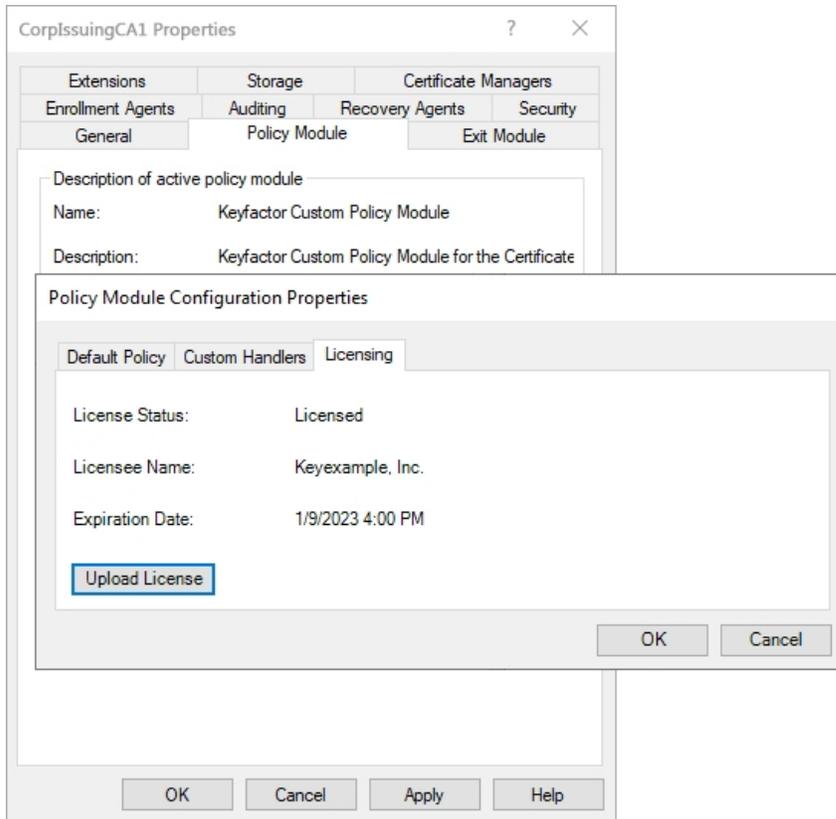

Figure 546: Upload the Keyfactor CA Policy Module License

10. On the Custom Handlers tab of the Policy Module Configuration Properties page, highlight the **RFC 2818 Policy Handler** under Loaded Handlers, click **Load** to move it over to the loaded handlers, and click **OK**.

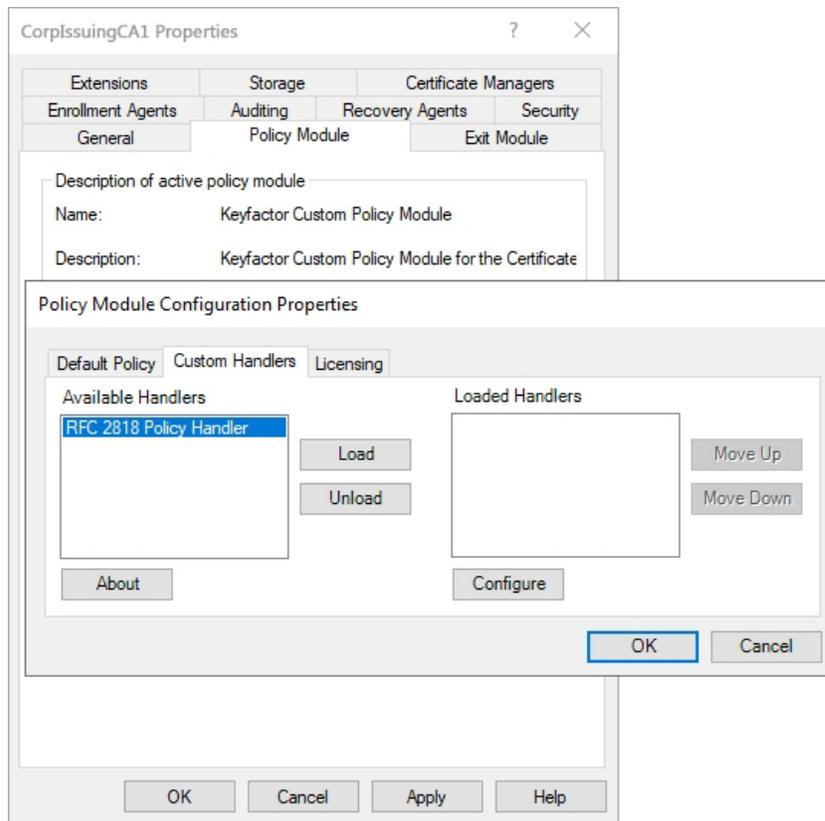

Figure 547: Enable the RFC 2818 Policy Handler

11. On the Custom Handlers tab of the Policy Module Configuration Properties page, highlight the RFC 2818 Policy Handler under Loaded Handlers and click **Configure**.
12. On RFC 2818 Policy Handler configuration dialog, select the templates that should be under management by the RFC 2818 policy handler and click **Add**. Certificate enrollments from any source made using the templates selected here on the configured CA will automatically be assigned a DNS SAN matching the certificate's CN.

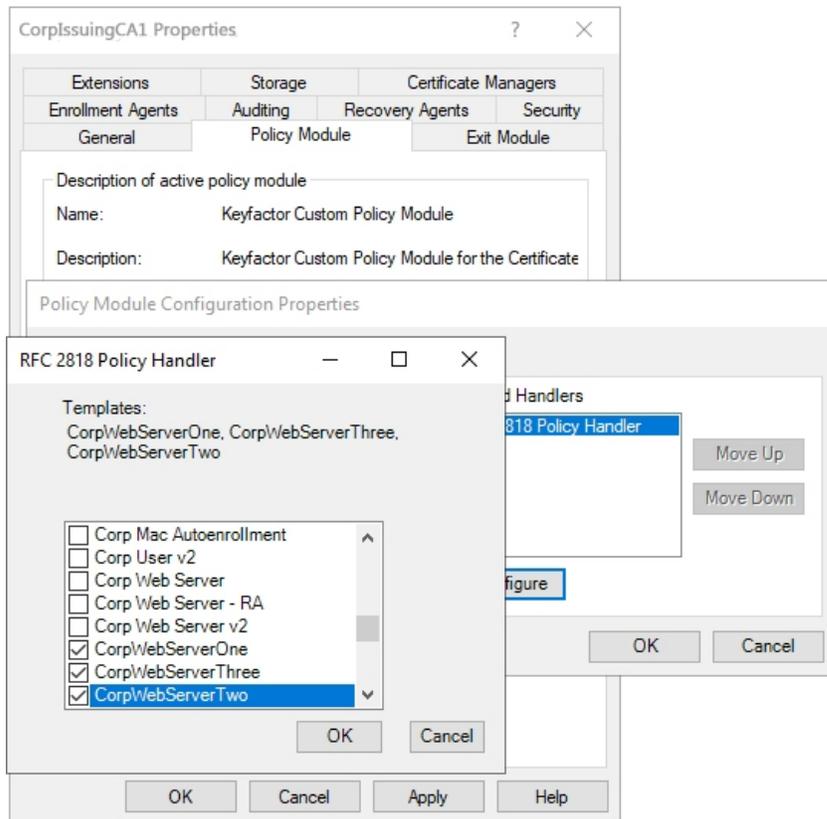

Figure 548: Add Templates for Management with the RFC 2818 Policy Handler

13. Click **OK** as many times as needed to close the configuration dialogs and save the configuration. You will be prompted to restart the CA services.

4.5.3.2 Install the Keyfactor SAN Attribute Policy Handler

To begin the SAN Attribute Policy Handler installation, execute the KeyfactorCAModuleInstaller.msi file from the Keyfactor installation media and install as follows.

1. On the first installation page, click **Next** to begin the setup wizard.

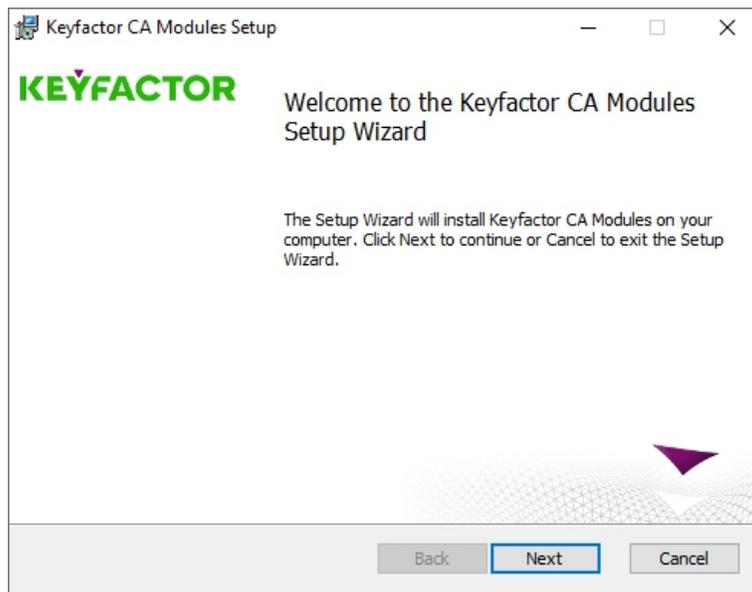

Figure 549: Install SAN Attribute Policy Handler: Begin Setup Wizard

2. On the next page, read and accept the license agreement and click **Next**.
3. On the next page, select the components to install. For the SAN Attribute Policy Handler, deselect all the components except the SAN Attribute Policy Handler component. If desired, you can highlight Keyfactor Custom Policy Module and click **Browse** to select an alternate installation location for the files. The default installation location is:

C:\Program Files\Keyfactor\Keyfactor CA Modules

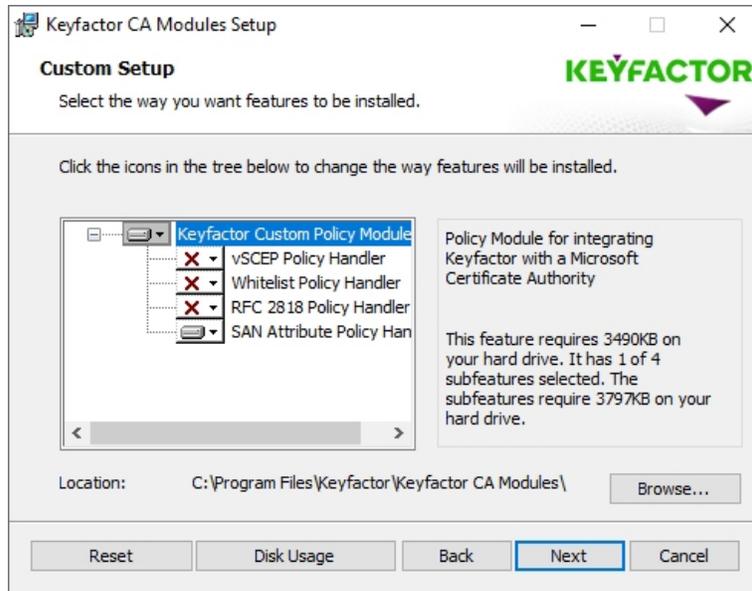

Figure 550: Install SAN Attribute Policy Handler: Select Components

4. On the next screen, click **Install**.
5. On the final installation wizard page, leave the *Launch the CA MMC snap-in now* box selected and click **Finish**. The Microsoft Certification Authority management tool should start automatically. This can take several seconds.
6. In the Certification Authority management tool, right-click the CA name at the top of the tree and choose **Properties**.
7. In the Properties dialog for the CA on the CA Policy Module tab, click **Select**, highlight the **Keyfactor Custom Policy Module** in the Set Active Policy Module dialog and click **OK**.

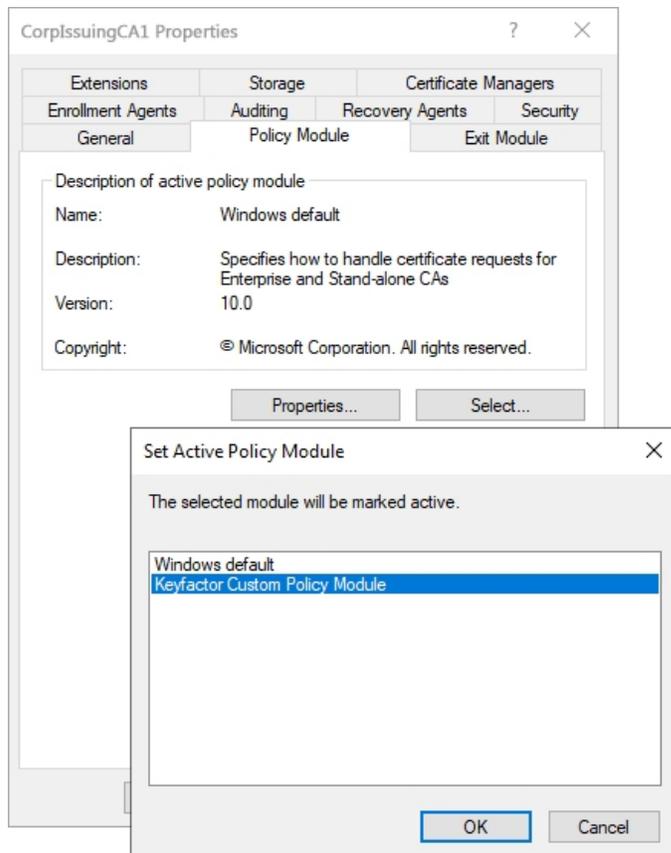

Figure 551: Enable the Keyfactor CA Policy Module

8. In the Properties dialog for the CA on the CA Policy Module tab, click **Properties**.
9. On the Licensing tab of the Policy Module Configuration Properties page, click **Upload License** and browse to locate the license file provided to you by Keyfactor. This file should have the extension CMSLICENSE.

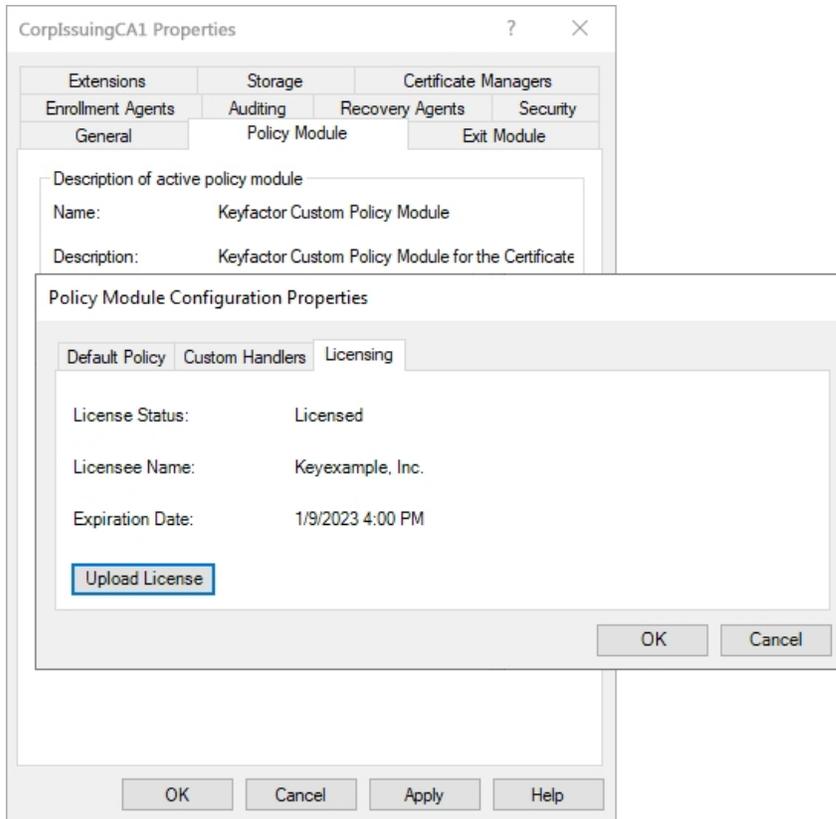

Figure 552: Upload the Keyfactor CA Policy Module License

10. On the Custom Handlers tab of the Policy Module Configuration Properties page, highlight the **SAN Attribute Policy Handler** under Loaded Handlers, click **Load** to move it over to the loaded handlers, and click **OK**.

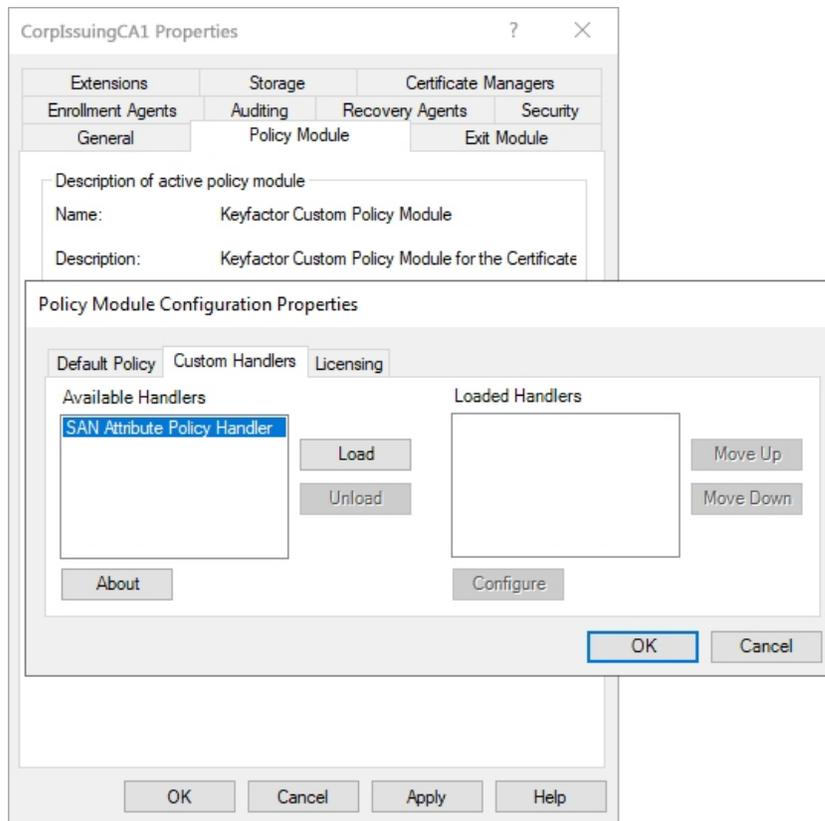

Figure 553: Enable the SAN Attribute Policy Handler

11. On the Custom Handlers tab of the Policy Module Configuration Properties page, highlight the SAN Attribute Policy Handler under Loaded Handlers and click **Configure**.
12. On SAN Attribute Policy Handler configuration dialog, select the templates that should be under management by the SAN Attribute policy handler and click **Add**. Certificate enrollments from any source made using the templates selected here on the configured CA and a CSR enrollment method will allow the addition of SANs not included in the CSR and control the SAN addition functionality on a template-by-template basis without the need to enable the Microsoft CA EDITF_ATTRIBUTESUBJECTALTNAME2 flag.

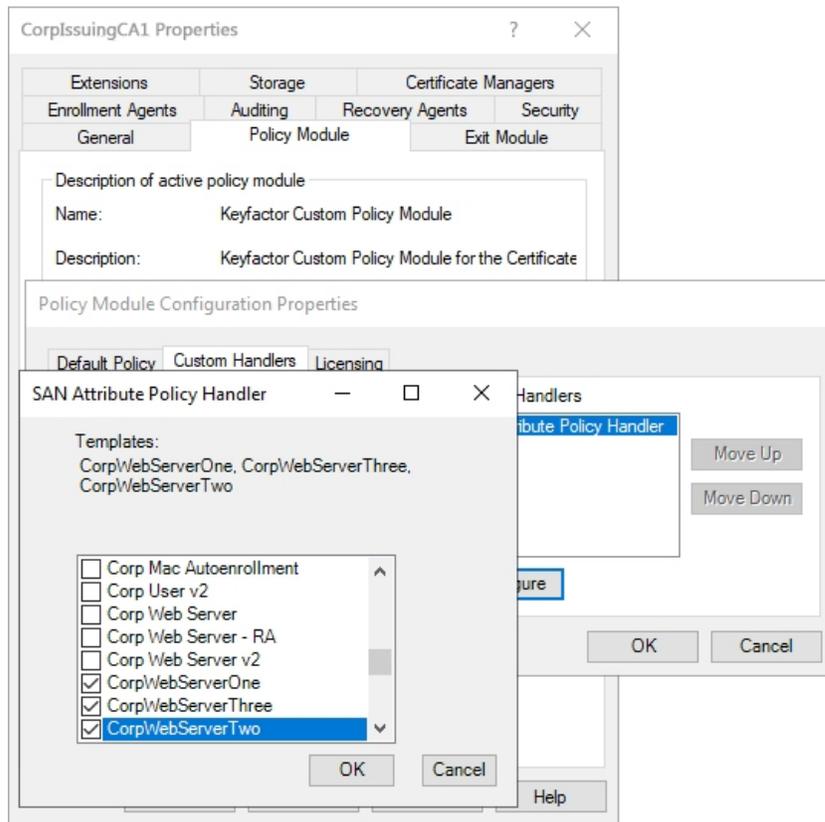

Figure 554: Add Templates for Management with the SAN Attribute Policy Handler

13. Click **OK** as many times as needed to close the configuration dialogs and save the configuration. You will be prompted to restart the CA services.

4.5.3.3 Install the Keyfactor Whitelist Policy Handler

To begin the Whitelist Policy Handler installation, execute the KeyfactorCAModuleInstaller.msi file from the Keyfactor installation media and install as follows.

Note: The following Windows update affects how certificate requests are built when sent to a Microsoft CA and may cause enrollments done outside Keyfactor Command against a Microsoft CA configured with the Whitelist Policy Handler to fail.

<https://support.microsoft.com/en-us/topic/kb5014754-certificate-based-authentication-changes-on-windows-domain-controllers-ad2c23b0-15d8-4340-a468-4d4f3b188f16>

1. On the first installation page, click **Next** to begin the setup wizard.

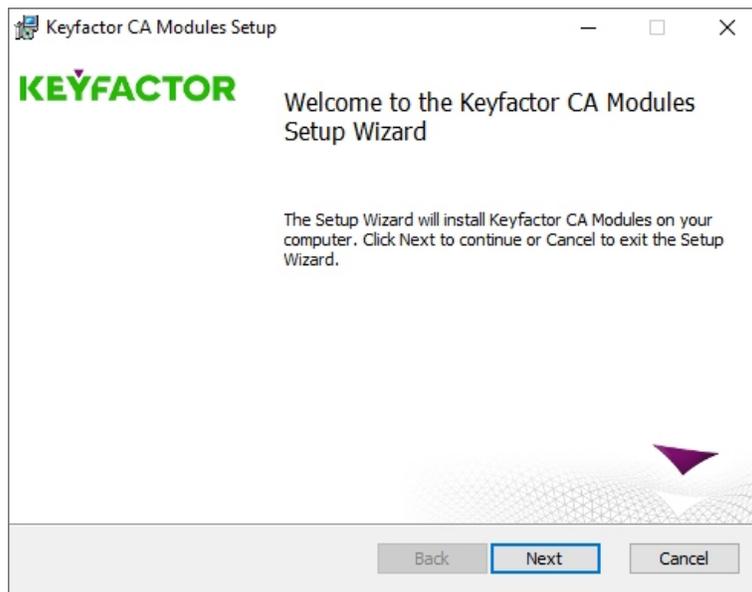

Figure 555: Install Whitelist Policy Handler: Begin Setup Wizard

2. On the next page, read and accept the license agreement and click **Next**.
3. On the next page, select the components to install. For the Whitelist Policy Handler, deselect all the components except the Whitelist Policy Handler component. If desired, you can highlight Keyfactor Custom Policy Module and click **Browse** to select an alternate installation location for the files. The default installation location is:

C:\Program Files\Keyfactor\Keyfactor CA Modules

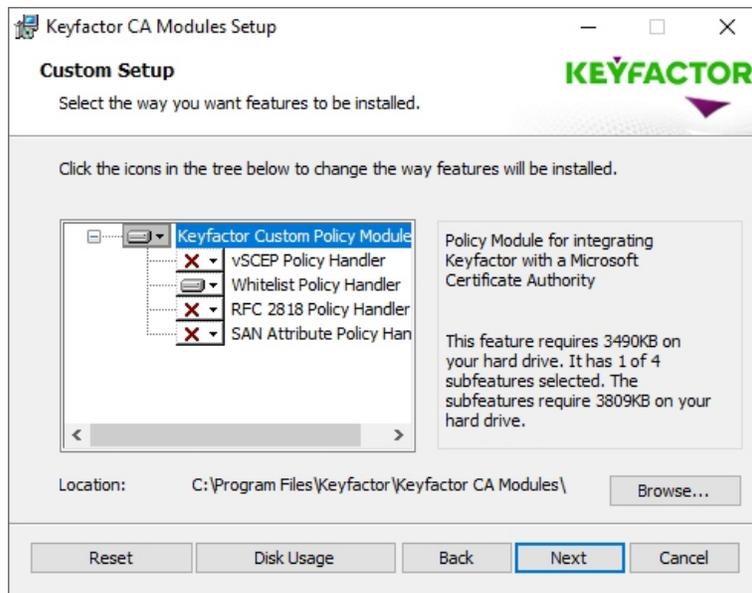

Figure 556: Install Whitelist Policy Handler: Select Components

4. On the next screen, click **Install**.
5. On the final installation wizard page, leave the *Launch the CA MMC snap-in now* box selected and click **Finish**. The Microsoft Certification Authority management tool should start automatically. This can take several seconds.
6. In the Certification Authority management tool, right-click the CA name at the top of the tree and choose **Properties**.
7. In the Properties dialog for the CA on the CA Policy Module tab, click **Select**, highlight the **Keyfactor Custom Policy Module** in the Set Active Policy Module dialog and click **OK**.

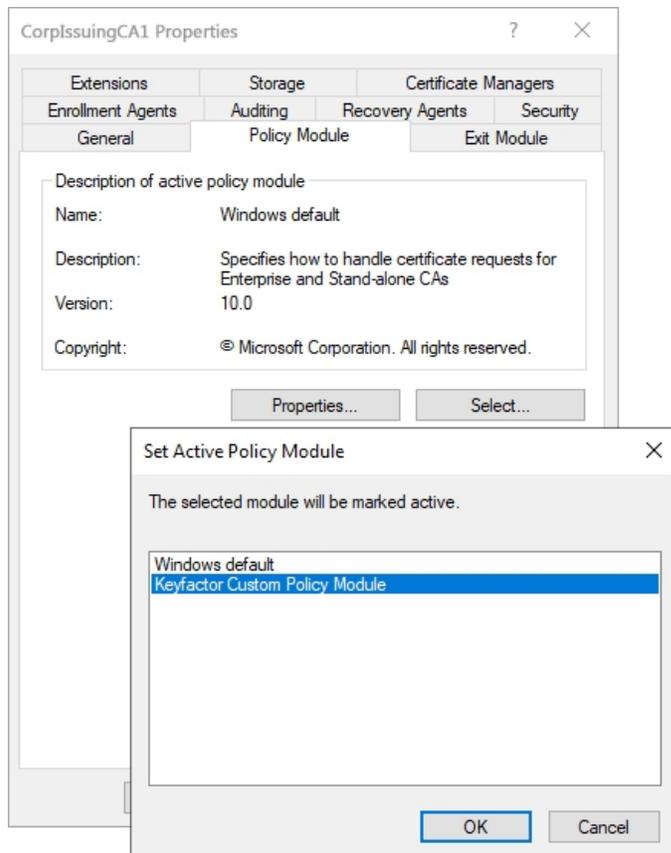

Figure 557: Enable the Keyfactor CA Policy Module

8. In the Properties dialog for the CA on the CA Policy Module tab, click **Properties**.
9. On the Licensing tab of the Policy Module Configuration Properties page, click **Upload License** and browse to locate the license file provided to you by Keyfactor. This file should have the extension CMSLICENSE.

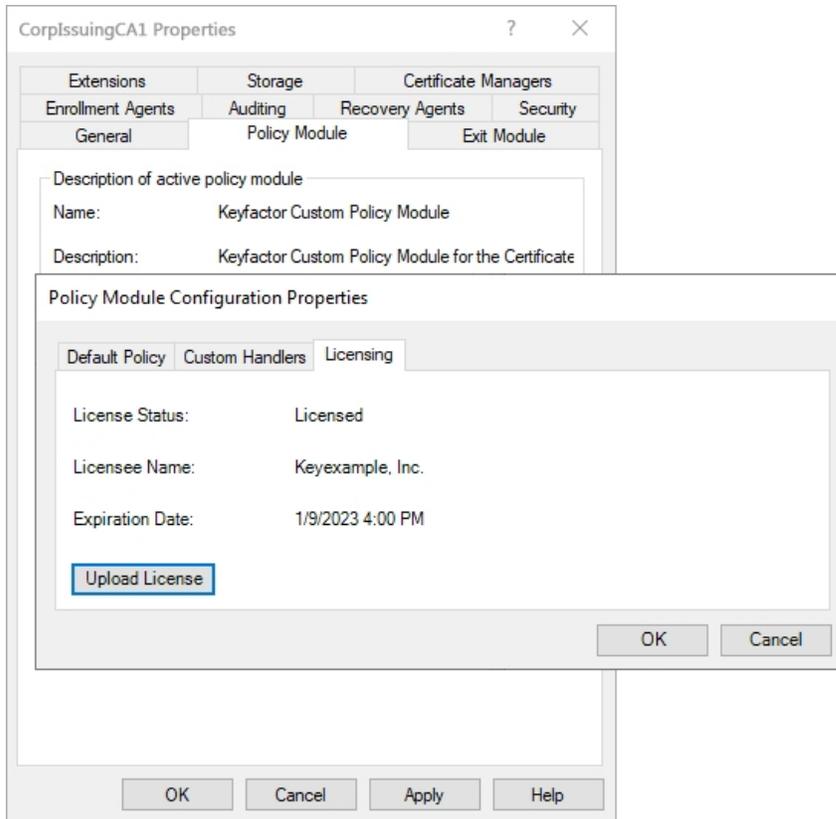

Figure 558: Upload the Keyfactor CA Policy Module License

10. On the Custom Handlers tab of the Policy Module Configuration Properties page, highlight the **CMS Machine Whitelist Policy** on the list of available handlers, click **Load** to move it over to the loaded handlers, and click **OK**.

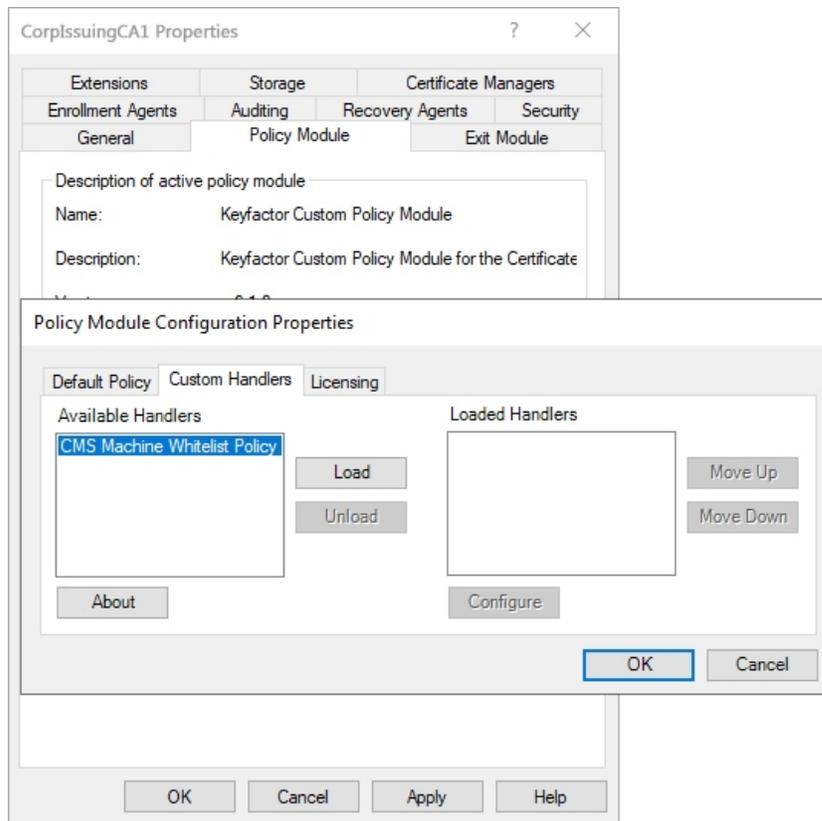

Figure 559: Enable the Whitelist Policy Handler

11. On the Custom Handlers tab of the Policy Module Configuration Properties page, highlight CMS Machine Whitelist Policy under Loaded Handlers and click **Configure**.
12. On the Template tab of the Policy Module Configuration dialog, enter the certificate *template names* (short names), not the template display names, one at a time, of the certificate template(s) you want to manage with the whitelist policy handler and click **Add**. In many cases, the template name is the same as the template display name with the spaces removed. Any templates entered here will be available for enrollment only from machines listed on the Machine Names tab.

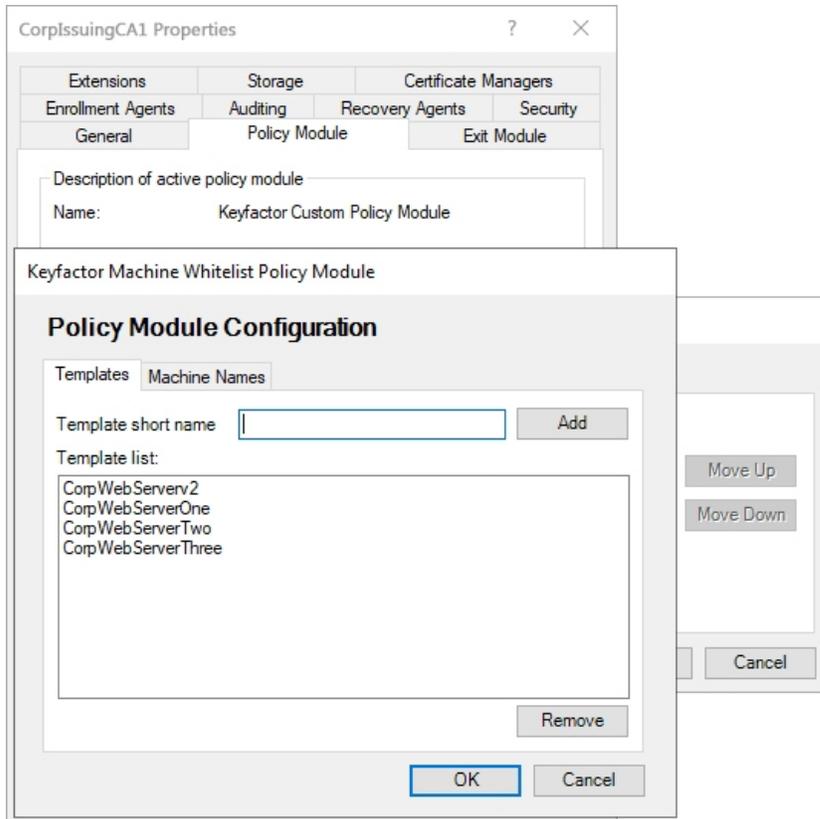

Figure 560: Add Templates for Management with the Whitelist Policy Handler

13. On the Machine Names tab of the Policy Module Configuration dialog, enter the machine names (FQDNs), one at a time, of the machines that you want to manage with the whitelist policy handler and click **Add**. Any machines entered here will be allowed to enroll for the templates listed on the Templates tab.

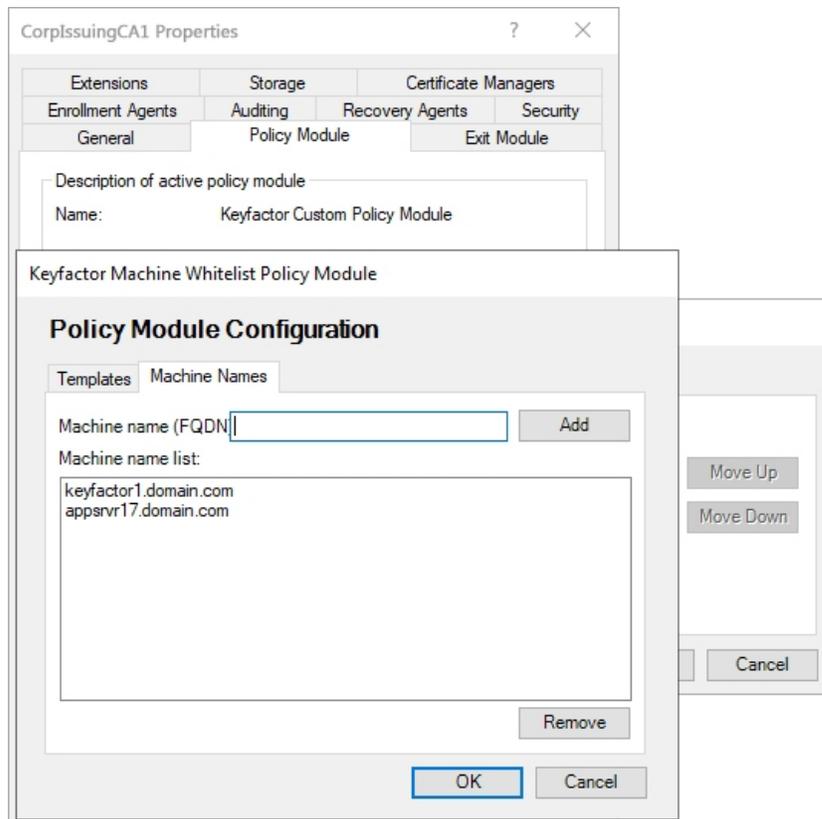

Figure 561: Add Machines for Management with the Whitelist Policy Handler

14. Click **OK** as many times as needed to close the configuration dialogs and save the configuration. You will be prompted to restart the CA services.

4.5.4 Configure Logging for the Keyfactor CA Policy Module

The Keyfactor CA Policy Module provides extensive logging for visibility and troubleshooting. By default, Keyfactor CA Policy Module places its log files in the C:\Keyfactor\logs directory, generates logs at the *Info* logging level and stores the primary logs for two days before deleting them.

To configure logging:

1. On the policy module server where you wish to adjust logging, open a text editor (e.g. Notepad) using the “Run as administrator” option.
2. In the text editor, browse to open the Nlog.config file for the Keyfactor CA Policy Module The file is located in the installation directory for the product, which is the following by default:

C:\Program Files\Keyfactor\Keyfactor CA Modules\NLog.config

3. Your Nlog.config file may have a slightly different layout than shown here, but it will contain the five fields highlighted in [Figure 562: Keyfactor CA Policy Module NLog.config File](#). The fields you may wish to edit are:

- `fileName="C:\Keyfactor\Logs\Keyfactor_CA_Log.txt"`

The path and file name of the active policy module log file, referencing the logDirectory variable.

Important: If you choose to change the path for storage of the log files, you will need to create the new directory (e.g. D:\KeyfactorLogs) and grant the service account under which the Active Directory Certificate Services service is running full control permissions on this directory.

- `archiveFileName="C:\Keyfactor\Logs\Keyfactor_CA_Log_Archive_{#}.txt"`

The path and file name of previous days' orchestrator log files, referencing the logDirectory variable. The orchestrator rotates log files daily and names the previous files using this naming convention.

- `maxArchiveFiles="2"`

The number of archive files to retain before deletion.

- `name="*" minlevel="Info" writeTo="logfile"`

The level of log detail that should be generated and output to the log file. The default *Info* level logs error and some informational data but at a minimal level to avoid generating large log files. For troubleshooting, it may be desirable to set the logging level to *Debug* or *Trace*. Available log levels (in order of increasing verbosity) are:

- OFF—No logging
- FATAL—Log severe errors that cause early termination
- ERROR—Log severe errors and other runtime errors or unexpected conditions that may not cause early termination
- WARN—Log errors and use of deprecated APIs, poor use of APIs, *almost* errors, and other runtime situations that are undesirable or unexpected but not necessarily *wrong*
- INFO—Log all of the above plus runtime events (startup/shutdown)
- DEBUG—Log all of the above plus detailed information on the flow through the system
- TRACE—Maximum log information—this option can generate VERY large log files

```

<targets>
  <target name="buffered wrapper" xsi:type="BufferingWrapper" slidingTimeout="true" bufferSize="500" flushTimeout="500">
    <target xsi:type="File" name="logfile" fileName="C:\Keyfactor\logs\Keyfactor_CA_Log.txt" layout="${longdate} ${logger} [${level}] - ${message}"
      archiveFileName="C:\Keyfactor\logs\Keyfactor_CA_Log_Archive_{#}.txt" archiveEvery="Day" archiveNumbering="Rolling" maxArchiveFiles="2"/>
  </target>
  <target xsi:type="OutputDebugString" name="String" layout="${longdate} ${logger}::${message}"/>
  <target xsi:type="Debugger" name="debugger" layout="${longdate} ${logger}::${message}"/>
  <target xsi:type="Console" name="console" layout="${logger} ${message}"/>
  <target xsi:type="EventLog" name="eventLog" source="Keyfactor CA Modules"
    eventId="${event-properties:item=eventID}" category="${event-properties:item=categoryID}" layout="${event-properties:item=message}" />
</targets>
<rules>
  <!-- Don't write events to the log file (log file should contain different, more verbose, logging) -->
  <logger name="*-EVENT" minlevel="Info" writeTo="eventLog" final="true" />
  <logger name="*" minlevel="Info" writeTo="logfile" />
</rules>

```

Figure 562: Keyfactor CA Policy Module NLog.config File

4.5.5 Add Non-Keyfactor SCEP Servers to the Ignore List

This step only needs to be completed if you installed the Keyfactor CA Policy Module with the vSCEP™ Policy Handler.

If your CA for that issues certificates based on SCEP challenges is used by multiple SCEP servers, you will need to add SCEP servers not used for Keyfactor Command vSCEP API requests to the ignore list on the CA running the vSCEP™ Policy Handler. This will allow the vSCEP™ Policy Handler to ignore requests (passing them through to the CA) from the listed SCEP servers. Without this feature, SCEP challenges from non-Keyfactor Command servers would be denied because no data exists against which to verify the certificate details.

The vSCEP™ Policy Handler reads the ignore list in the registry string value **CCMBlacklist**. This field contains a semicolon-delimited list of SCEP server host names from which all certificate requests should be ignored by the Keyfactor CA Policy Module and passed through to the CA. The **CCMBlacklist** setting can be found in the following registry location:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Certified Security Solutions\vSCEP\Configuration
```

The **CCMBlacklist** registry value does not exist by default. Use the Registry Editor (regedit) to create the **CCMBlacklist** value as a DWORD and populate it with the SCEP server FQDNs for any SCEP servers whose requests should bypass the vSCEP™ Policy Handler.

4.6 Appendices

- [Appendix - Troubleshooting Logi Log Files below](#)
- [Appendix - Logi Load Balancing: Keyfactor Command Configuration Wizard Setup on page 2872](#)
- [Appendix - Configuration Wizard Errors in the Logs on page 2874](#)

4.6.1 Appendix - Troubleshooting Logi Log Files

When troubleshooting Logi, the first thing to try is setting the *Debug Embedded Reports* application setting to **True** (see [Application Settings: Console Tab on page 602](#) in the *Keyfactor Command Reference Guide*). This allows the reports to output errors with debug level information if they generate

errors. If this does not generate the information necessary to resolve the problem, it can sometimes be helpful to modify the Keyfactor Analysis web.config file to allow IIS to show the actual error the application is experiencing at a lower level. To configure this:

1. Browse to the *Logi* directory under the installed directory for your Keyfactor Command implementation. By default, this is:

C:\Program Files\Keyfactor\Keyfactor Platform\Logi

2. Using a text editor opened with the “Run as administrator” option, open the web.config file for editing.
3. Find the `<customErrors mode="RemoteOnly"/>` section and change this to `<customErrors mode="On"/>`.
4. Look for the debug output in the *Logi\rdDownload* directory under the installed directory for your Keyfactor Command implementation. By default, this is:

C:\Program Files\Keyfactor\Keyfactor Platform\Logi\rdDownload

Tip: If you do not find debug output when running a report manually in the Management Portal, try scheduling a report for delivery via email or saving to disk using the Report Manager. Debugging operates differently for these two modes of running a report.

Note: When the portal experiences a 500 error, Logi logs will not be written to the usual output directory.

```
<system.web>
<!-- DYNAMIC DEBUG COMPILATION
      Set compilation debug="true" to insert debugging symbols (.pdb information)
      into the compiled page. Because this creates a larger file that executes
      more slowly, you should set this value to true only when debugging and to
      false at all other times. For more information, refer to the documentation about
      debugging ASP.NET files.
-->
<compilation defaultLanguage="vb" debug="true" />

<!-- CUSTOM ERROR MESSAGES
      Set customErrors mode="On" or "RemoteOnly" to enable custom error messages, "Off" to disable.
      Add <error> tags for each of the errors you want to handle.
-->
<customErrors mode="RemoteOnly" />
<!-- AUTHENTICATION
      This section sets the authentication policies of the application. Possible modes are "Windows",
      "Forms", "Passport" and "None"
-->

<authentication mode="Windows" />
```

Figure 563: Logi web.config

4.6.2 Appendix – Logi Load Balancing: Keyfactor Command Configuration Wizard Setup

In order for the Keyfactor Command Management Portal Dashboard and Reports to load when using a load balancer, the Keyfactor Command Configuration Wizard should have the following configuration on each of the application servers:

- On the Keyfactor Command Portal Tab, the Host Name must be the Load Balanced URL.

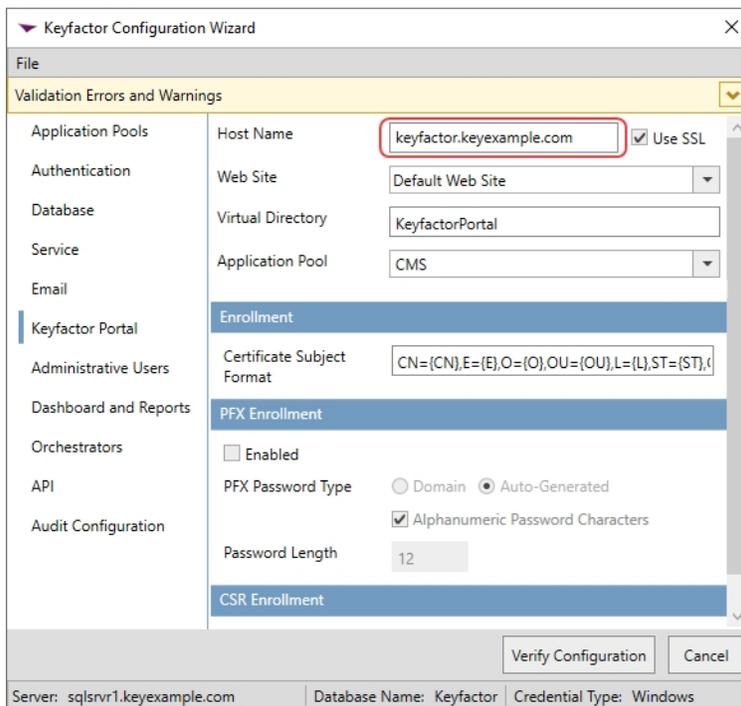

Figure 564: Logi Configuration Settings—Keyfactor Command Portal Tab

- Dashboard and Reports Tab:
 - The Host Name must be the Load Balanced URL. This is the host name that the Management Portal server uses to connect to the Logi Analytics Platform, and it therefore needs to be the name used on the internal side of the network.

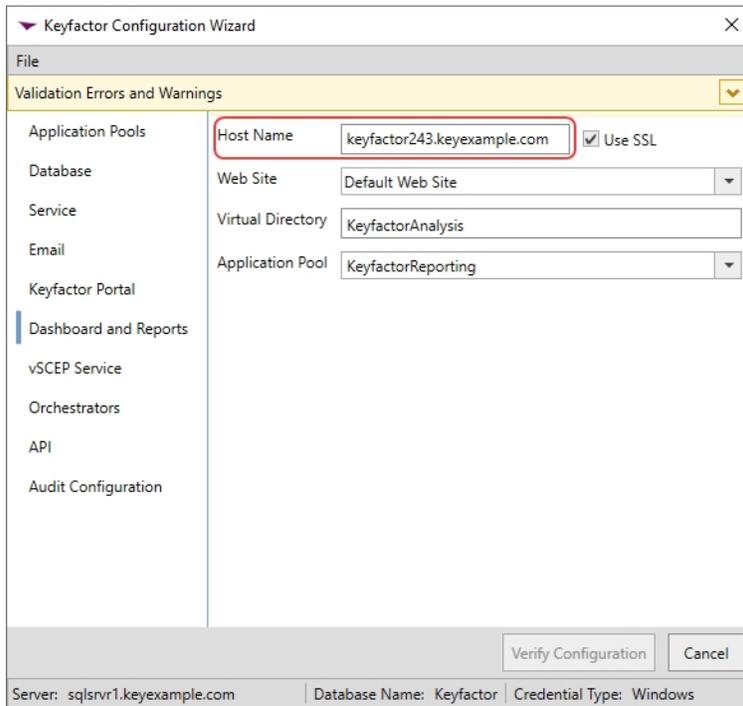

Figure 565: Logi Configuration Settings—Keyfactor Command Dashboards and Reports Tab

Tip: All IP Addresses that could be used internally to connect to the Logi application must be in the Dashboard and Reports configuration section in the configuration wizard. This includes the application host IPs and the load balancer IPs. It is also recommended that the host file is modified to map the load balancer URL to the local IP address.

- Load Balancer

On the load balancer, a new rewrite rule needs to be made that changes the outbound URL from the application servers. Logi sends the `HostName.domain.com/KeyfactorAnalysis` URL back to the browser instead of the `LoadBalancer.URL.com/KeyfactorAnalysis` URL that the browser needs to complete the Logi authorization. In short, an Outbound rewrite rule needs to be created on the Load Balancer that does the following: `HostName_URL/KeyfactorAnalysis` needs to be converted to `LoadBalancer_URL/keyfactorAnalysis`

- Load Balancer - Session Affinity

There are two load balancing scenarios based on user session management: Sticky session (recommended) and Non-Sticky session. In the Sticky session scenario, each user is assigned to a server by the load balancer and all the requests sent by this user are answered by the same server, for as long as the user's session persist. This is the recommended approach and does not require you to centralize the `rdDataCache` folder of the application. We strongly recommend using Sticky session instead. You can learn more about Load Balancing with Info applications on:

<https://devnet.logianalytics.com/hc/en-us/articles/4419707733783-Load-Balancing-Configuration>

4.6.3 Appendix - Configuration Wizard Errors in the Logs

If an incoming web request runs before the configuration is fully completed, you may encounter the following errors in the Management Portal log file after upgrading. These errors are not something to be worried about. They just indicate that the web request was still looking at an old version of the database prior to it being completely upgraded.

```
2021-11-15 12:41:36.5155 Keyfactor.EF.KeyfactorExecutionStrategy [Error] - SqlException with number 207 occurred, not attempting to retry the connection.
```

```
2021-11-15 12:41:36.5780 Keyfactor.EF.KeyfactorExecutionStrategy [Error] - Invalid column name 'Immutable'.
```

```
Invalid column name 'SubscriberTerms'.
```

```
2021-11-15 12:41:36.6249 ASP.global_asax [Error] - An uncaught application error occurred: An error occurred while executing the command definition. See the inner exception for details.
```

```
2021-11-15 12:41:37.3281 ASP.global_asax [Error] - An uncaught application error occurred: An item with the same key has already been added.
```

```
at System.ThrowHelper.ThrowArgumentException(ExceptionResource resource)
```

5.0 Installing Orchestrators

Keyfactor offers several orchestrators (a.k.a. agents) that may be used to interact with and enhance the functionality of the Keyfactor Command Server.

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

This guide covers installation of the following orchestrators:

- Keyfactor Universal Orchestrator
The Keyfactor Universal Orchestrator runs on Windows Servers, Linux servers, and in Linux containers. It can be used to:
 - Run SSL discovery and monitoring tasks.
 - Manage synchronization of certificate authorities in remote forests (installations on Windows only).
 - Collect logs from the orchestrator for central review (full server installations only).
 - Run custom jobs to provide certificate management capabilities on a variety of platforms and devices.
 - Run custom jobs to execute tasks outside the standard list of certificate management functions. This powerful feature can execute just about any job that requires processing on the orchestrator and submitting data back to Keyfactor Command.

As of this release, the following functions, some of which were part of the Keyfactor Windows Orchestrator, are now included among the custom extensions supported for the Keyfactor Universal Orchestrator:

- Interact with Amazon Web Services (AWS) resources for certificate management.
- Interact with Citrix NetScaler devices for certificate management.
- Interact with F5 devices for certificate management.
- Interact with Windows servers (a.k.a. IIS certificate stores), create new bindings for IIS web sites and manage certificates in both the Web Hosting certificate store and the Personal certificate store.
- Remote Java keystore certificate management.
- Remote PEM store certificate management.
- Remote PKCS12 store certificate management.

These custom extensions and more are publicly available at:

<https://keyfactor.github.io/integrations-catalog/content/orchestrator>

The final release of the Keyfactor Windows Orchestrator was version 8.7. This version of the Keyfactor Windows Orchestrator is not compatible with Keyfactor Command version 11.0. Customers should migrate to the Keyfactor Universal Orchestrator with custom extensions as needed.

- **Keyfactor Bash Orchestrator**
The Keyfactor Bash Orchestrator runs on Linux servers and is used to perform discovery and management of SSH public keys, including installation of new keys and automated removal of unauthorized keys.
- **Keyfactor Java Agent**
The Keyfactor Java Agent runs on Windows or Linux servers and is used to perform discovery of Java keystores and PEM certificate stores, to inventory discovered stores, and to push certificates out to stores as needed. In addition, the Keyfactor Java Agent can be extended to create custom certificate store jobs.

Important: The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

For more information, see [Installing Custom-Built Extensions on page 2940](#).

Keyfactor also offers a variety of tools to allow users to develop custom orchestrators and extensions, including:

- **Keyfactor AnyAgent Framework**
The AnyAgent capability of the Keyfactor Universal Orchestrator and Java Agent allows management of certificates regardless of source or location by allowing customers to implement custom agent functionality.
- **Keyfactor Integration SDK**
The Keyfactor Integration SDK (software development kit) includes a variety of tools for building a custom orchestrator, including the Keyfactor Native Agent, which is a reference implementation intended for customers wanting to include Keyfactor Command certificate store management functionality in embedded or other platforms.
- **Keyfactor Orchestrator NuGet Package**
The Keyfactor Orchestrator NuGet package is designed to allow customers to build custom extensions for the Keyfactor Universal Orchestrator.
- **Keyfactor GitHub Site**
Keyfactor offers several publicly available integrations and plugins for the Keyfactor platform in the Keyfactor GitHub. Find all the latest developer tools and resources to integrate the Keyfactor platform with your PKI, Cloud, and DevOps infrastructure.

<https://keyfactor.github.io/>

These tools for developing custom orchestrators and extensions are not documented in this guide. For more information about these and other custom orchestrator solutions, contact your Keyfactor representative.

Important: The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

For more information, see [Installing Custom-Built Extensions on page 2940](#).

5.1 Orchestrator Job Overview

Keyfactor orchestrators can be used to perform a wide variety of jobs. Out of the box, orchestrators can manage certificate stores, manage SSH keys, perform SSL scanning, fetch system logs, and synchronize certificates from CAs in remote forests. Orchestrator jobs fall into these broad types:

- Certificate Store Jobs

This type of job includes the built-in jobs for managing certificate stores, based on the type(s) of certificate stores supported by the orchestrator, and custom-built certificate store jobs that can be added with an extension (see [Installing Custom-Built Extensions on page 2940](#)) or script (see [Configuring Script-Based Certificate Store Jobs on page 2946](#)).

Certificate store jobs (built-in or custom-built), are managed in Keyfactor Command with certificate store types. If you're adding a custom-built certificate store job, you'll need to add a user-defined certificate store type to go with it (see [Certificate Store Types on page 700](#) and [Certificate Store Types on page 1531](#)).

- Custom Jobs

This type of job is intended to implement just about anything else you need an orchestrator to do other than manage certificate stores. The built-in fetch logs job is an example of a custom job.

Custom jobs are managed in Keyfactor Command with custom job types. If you're adding a custom job, you'll need to add a custom job type to go with it (see [Custom Job Types on page 1594](#)).

Custom jobs are supported only by the Keyfactor Universal Orchestrator.

- Other Jobs

This type of job includes the built-in jobs for SSL scanning and certificate synchronization from remote CAs.

Prescripts and Postscripts

All of the job types supported by the Keyfactor Universal Orchestrator—including the built-in jobs—support executing a prescript and/or postscript as part of the job. A prescript might be used to fetch credentials from a privilege access management (PAM) solution to pass in to the username and password parameters for a certificate store. A postscript might be used to restart the web service (e.g.

Apache) after performing a management job to replace the certificate in the certificate store for the web server. Prescripts and postscripts for all types of jobs are configured similarly to the description provided for installing custom-built extensions (see [Installing Custom-Built Extensions on page 2940](#)).

Note: The prescript and postscript functionality of the Keyfactor Universal Orchestrator has been replaced by other functionality in Keyfactor Command such as that provided by Keyfactor Command workflows (see [Workflow Definitions on page 230](#)). As a result, prescript and postscript functionality has been deprecated and will be removed from a future release.

Orchestrator Job Flow

An orchestrator job begins when an orchestrator queries Keyfactor Command to ask for jobs and the Keyfactor Command orchestrator API returns a list of the jobs the orchestrator needs to run. The flow continues as shown in the following chart.

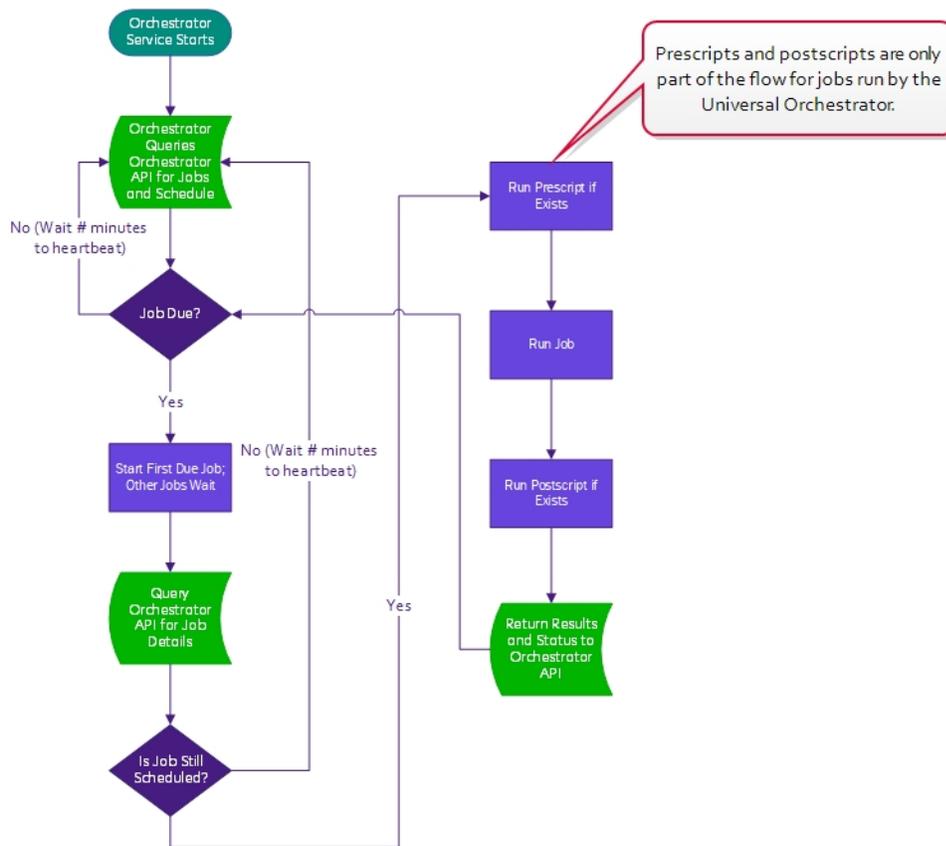

Figure 566: Orchestrator Job Flow

5.2 Universal Orchestrator

The Keyfactor Universal Orchestrator is designed to run jobs at the request of the Keyfactor Command server. Jobs primarily perform certificate management tasks, but other types of operations are also supported. The orchestrator operates as a .NET Core based service on a Windows server, Linux server, or in a Linux container and communicates with a Keyfactor Command server to receive job tasks and report job results. Along with the job results, data can be returned to the Keyfactor Command server and stored in the Keyfactor Command SQL database. Extensions are hosted by the orchestrator and implement the jobs to be executed.

The orchestrator includes these built-in extensions:

- Discover and monitor certificates at TLS 1.3 endpoints either within the local network or across the internet using any of the 5 ciphersuites mentioned in appendix B.4 of RFC 8446. Certificates from the results of SSL discovery and monitoring are imported into Keyfactor Command for viewing, reporting and alerting purposes. Scanning using server name indication (SNI) is supported.
- Retrieve logs generated on the orchestrator via the Keyfactor Command Management Portal. This task returns up to 2 MB of log data from the end of the orchestrator log file to be viewed in the Management Portal. This feature is supported only on full server installations.
- Manage certificates from remote Microsoft Certificate Authorities (CAs) using the Management Portal. Certificates from remote CAs can be imported into Keyfactor Command for viewing, reporting and alerting purposes. This feature is supported only on Windows installations.

If the remote CA is domain-joined to a domain in the remote forest, the Universal Orchestrator may be installed on the CA itself or on a separate server joined to a domain in the same forest (generally a server in the same domain as the CA). Multiple CAs in the same remote forest can be managed with a single Universal Orchestrator server. However, if the remote CA is not domain-joined, the Universal Orchestrator must be installed on the remote CA server.

Note: The Universal Orchestrator does not support certificate enrollment for remote CAs. If you need this capability, you will need to use the *Explicit Credentials* option in the Management Portal CA configuration (see [Adding or Modifying a CA Record on page 354](#)).

In addition, two types of custom extensions are supported:

- Manage and deliver certificates to certificate stores on various platforms and devices using custom certificate store types and orchestrator jobs in the Keyfactor Command Management Portal. Custom extensions may be developed by Keyfactor or end users. Keyfactor offers several publicly available custom extensions for the Universal Orchestrator in the Keyfactor GitHub:

<https://keyfactor.github.io/integrations-catalog/content/orchestrator>

With the custom extensions available from the Keyfactor GitHub, you can manage Windows certificate stores (IIS), JKS stores, PEM stores, F5 devices, Citrix NetScaler devices, AWS resources and more (see [Installing Custom-Built Extensions on page 2940](#)).

For more information about custom extensions, contact your Keyfactor representative.

- Run custom jobs on the orchestrator that fall outside the standard certificate management tasks. With custom jobs, you can perform operations locally on the orchestrator—or initiate them remotely across the network—and then report results back to Keyfactor Command along with data collected from the jobs, if any.

5.2.1 Preparing for the Universal Orchestrator

This section describes the steps that need to be taken prior to a Keyfactor Universal Orchestrator installation to install the prerequisites, create the required supporting components, and gather the necessary information to complete the Universal Orchestrator installation and configuration process.

5.2.1.1 System Requirements

The Keyfactor Universal Orchestrator is supported on the following operating systems:

- Windows Server 2019 or Windows Server 2022
- Oracle Linux 7 or higher
- Red Hat Enterprise 7 or higher
- Ubuntu 16 or higher

Note: Older versions of the Universal Orchestrator will work with newer versions of Keyfactor Command, but not the other way around (see the [Compatibility Matrix](#)). The current version of the Universal Orchestrator requires Keyfactor Command version 10.0 or greater.

Important: Microsoft support for .NET Runtime version 3.1 was deprecated at the end of 2022. Instructions for upgrading to version 6.0 are included in the [tip](#), below.

Windows Server Application Requirements

The Universal Orchestrator has the following requirements on Windows.

- The orchestrator requires the Microsoft .NET Runtime version 6.0 (x64). Version 6.0 is available for download from Microsoft:

<https://dotnet.microsoft.com/download/dotnet/6.0/runtime>

You need only the .NET Runtime (x64), not the ASP.NET Core Runtime or ASP.NET Core Hosting Bundle. At the above link, this would be the **Download x64** option under the *Run console apps* heading.

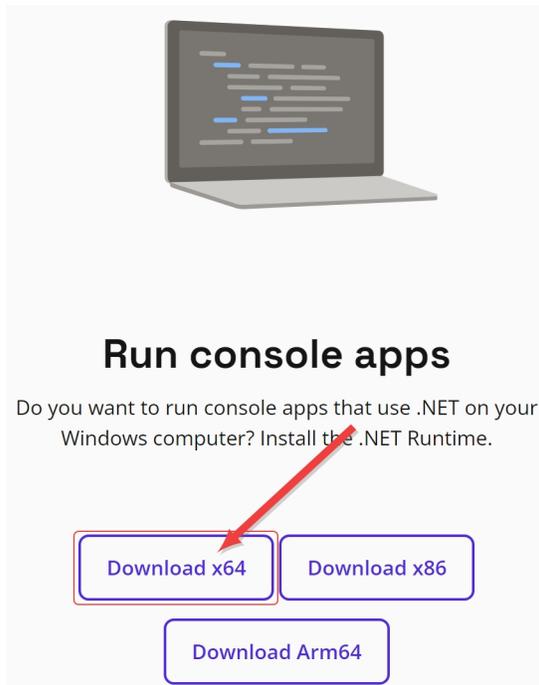

Figure 567: Select the Download x64 Option Under Run Console Apps

You can use the following PowerShell command to check the .NET core version(s) installed on a server (if any):

```
dotnet --list-runtimes
```

Output from this command will look something like this if you have the correct 6.0 x64 version of the .NET Runtime installed (notice the path is in C:\Program Files, not C:\Program Files (x86), indicating this is the x64 version):

```
Microsoft.NETCore.App 6.0.11 [C:\Program Files\dotnet\shared\Microsoft.NETCore.App]
```

- If you intend to use the orchestrator to manage certificates in remote Windows machine certificate stores (servers other than the server on which the orchestrator is installed) using the IIS Certificate Store Manager extension or Java Keystores, PKCS12 files, PEM files, DER files, or IBM Key Database files on Windows servers with the Remote File Certificate Store Management extension (see [Installing Custom-Built Extensions on page 2940](#)), make sure that TCP port 5985 or 5986 is open between the orchestrator and the remote servers (see [Configure Windows Targets for Remote Management on page 2935](#)).
- If you intend to use the orchestrator to manage certificates from remote Microsoft CAs (CAs outside the forest in which Keyfactor Command is installed or forests in a two-way trust with this forest), the orchestrator requires the Microsoft Visual C++ 2019 (or later) redistributable for x64. This is available for download from Microsoft:

https://aka.ms/vs/16/release/vc_redist.x64.exe

The Microsoft Visual C++ Redistributable appears as an application in the Windows Apps & features.

Linux Server Application Requirements

The following applications are required in order to install the Universal Orchestrator on Linux servers.

Microsoft .NET 6.0 Runtime

The orchestrator requires the Microsoft .NET Runtime version 6.0 (x64). Information about this is available from Microsoft:

<https://docs.microsoft.com/en-us/dotnet/core/install/linux>

You need only the .NET Runtime (x64), not the ASP.NET Core Runtime, but it won't hurt anything to install both the .NET and ASP.NET Core runtimes as suggested in the Microsoft documentation for installing .NET on Linux.

For the most part, it can be installed via the OS package manager. The method to complete this varies depending on the Linux operating system. For example, for Ubuntu 20.04, the following commands will install the correct version of .NET:

```
wget https://packages.microsoft.com/config/ubuntu/20.04/packages-microsoft-prod.deb
sudo dpkg -i packages-microsoft-prod.deb
sudo apt-get update
sudo apt-get install apt-transport-https
sudo apt-get install dotnet-runtime-6.0
```

You can use the following command to check the .NET version installed on a server (if any):

```
dotnet --list-runtimes
```

Output from this command will look something like this if you have the correct 6.0 version of the .NET Runtime installed:

```
Microsoft.NETCore.App 6.0.6 [/usr/share/dotnet/shared/Microsoft.NETCore.App]
```

jq

The orchestrator can only be installed on a Linux server that has jq installed. You can use the following command to check the jq version of a server:

```
jq --version
```

systemd

The orchestrator requires a Linux server that uses the systemd service manager. You can use the following command to test whether a system is running systemd:

```
ps -p 1
```

bash

The orchestrator can only be installed on a Linux server that is running bash version 4.3 or higher. You can use the following command to check the bash version of a server:

```
bash --version
```

curl

The orchestrator can only be installed on a Linux server that has curl installed. You can use the following command to check the curl version of a server:

```
curl --version
```

Linux Container Application Requirements

The following applications are required in order to install the Universal Orchestrator in Linux containers.

Containerization Solution

The orchestrator needs a containerization solution in which to run. Keyfactor has tested with Docker and Kubernetes.

Tip: If you have an existing installation of the Universal Orchestrator using the older Microsoft .NET Runtime version 3.1, you do not need to reinstall the orchestrator to upgrade the .NET version.

To update your existing Universal Orchestrator to the latest .NET version:

1. On the Universal Orchestrator machine, browse to locate the Orchestrator.runtimeconfig.json file in your installation directory. By default, this is:

```
Windows: C:\Program Files\Keyfactor\Keyfactor  
Orchestrator\Orchestrator.runtimeconfig.json  
Linux: /opt/keyfactor/orchestrator/Orchestrator.runtimeconfig.json
```

2. Using a text editor, open the Orchestrator.runtimeconfig.json file for editing and add the following property to the runtimeOptions section:

```
"rollForward": "LatestMajor"
```

Being sure to add a comma at the end of the previous row, resulting in a final file that looks something like:

```
{
  "runtimeOptions": {
    "tfm": "netcoreapp3.1",
    "framework": {
      "name": "Microsoft.NETCore.App",
      "version": "3.1.0"
    },
    "rollForward": "LatestMajor"
  }
}
```

3. Save the `Orchestrator.runtimeconfig.json` file.
4. Uninstall the Microsoft .NET Runtime version 3.1 (x64) and install the 6.0 version.
5. Restart the Universal Orchestrator service (see [Start the Universal Orchestrator Service on page 2953](#)).

5.2.1.2 Create Service Accounts for the Universal Orchestrator

The Keyfactor Universal Orchestrator makes use of up to two service accounts to allow it to communicate with the Keyfactor Command server. These two service accounts work together to transfer information from the Universal Orchestrator to the Keyfactor Command server. The two service accounts can be thought of as players on two sides of a fence, with the service account that the Universal Orchestrator runs as lobbing information over the fence to the service account that communicates with the Keyfactor Command server side to catch and hand to the Keyfactor Command server. Below, these are referred to as the Universal Orchestrator service account and the Keyfactor Command connect service account.

The service accounts need to be created prior to installation of the Universal Orchestrator software (except as noted below for installations on Linux), and the person installing the Universal Orchestrator software needs to know the domain (if applicable), username and password of each service account.

Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

Universal Orchestrator Service Account

Your choice of service account may vary depending on the operating system on which you are installing the orchestrator:

Universal Orchestrator on a Windows Server

When the Universal Orchestrator is installed on Windows, you may use either the built-in Network Service account or a custom service account as the Universal Orchestrator service account. Keyfactor recommends using the default of Network Service unless you have a need to use a custom service account. If you choose to use a custom service account, it may be a standard Active Directory service account, an Active Directory group managed service account (gMSA), or a local machine account. Of the custom service account choices, an Active Directory account is more typically used unless the machine is not domain-joined. If you use an Active Directory service account, it needs to be a service account in the forest in which the Universal Orchestrator is installed. This is not necessarily the same forest as the forest in which the Keyfactor Command server is installed. The Universal Orchestrator on Windows has several possible roles, and the choice of service account may vary depending on these roles:

SSL Management

If your Universal Orchestrator SSL discovery and monitoring, you may choose to run the orchestrator as the built-in Network Service account or as a custom service account.

CA Management

If your Universal Orchestrator will be providing certificate synchronization from a remote CA, the Universal Orchestrator service account needs to be able to read the CA(s) in the forest in which the Universal Orchestrator is installed to retrieve certificates and templates from them. When the Universal Orchestrator is used in this configuration, this is typically a forest other than the forest in which the Keyfactor Command server is installed. For domain-joined CAs, you would typically use an Active Directory service account in the remote forest (the forest where the Universal Orchestrator is installed). For a non-domain-joined CA, you may use a local account created on the CA as the Universal Orchestrator service account instead of a domain account.

Custom Extensions

Keyfactor offers several publicly available custom extensions for the Universal Orchestrator in the Keyfactor GitHub. Many of these will operate correctly with a Universal Orchestrator service account running as Network Service, but some may require a custom account. Check the specific documentation for each custom extension for more information:

<https://keyfactor.github.io/integrations-catalog/content/orchestrator>

The Keyfactor Orchestrator Service on the server on which the Universal Orchestrator is installed runs as the Universal Orchestrator service account. This service account requires local “Log on as a service” permissions; this permission is granted automatically during installation.

Universal Orchestrator on a Linux Server

For the purposes of this documentation, it is assumed that Linux machines will be non-domain joined and will use a local account to run the Universal Orchestrator.

For Linux systems, Keyfactor recommends running the service as an account other than root. The default Universal Orchestrator service account of *keyfactor-orchestrator* will be created automatically during the install if the *force* option is used. If you prefer not to use the *force* option, you may create a local service account before running the installation script.

Universal Orchestrator in a Linux Container

This service account is not relevant for the orchestrator run in a container, since the container build is self-contained.

Keyfactor Command Connect Service Account

For the Keyfactor Command connect service account, the service account you use depends on the identity provider you're using:

- If you're using Active Directory as an identity provider, a standard Active Directory service account in the primary Keyfactor Command server forest is used. Group managed service accounts are not supported in this role.

Tip: If the Universal Orchestrator is installed on Windows in the same forest as the Keyfactor Command server, the same Active Directory service account may be used as both the Universal Orchestrator service account and the Keyfactor Command connect service account, if desired.

- If you're using an identity provider other than Active Directory, a client (not user) in the identity provider is used. The client should be configured with a secret and have *Client authentication* and *Service account roles* enabled (see [Service Accounts on page 2730](#)). The user installing the orchestrator will need the client ID and secret.

Universal-Orchestrator OpenID Connect

Clients are applications and services that can request authentication of a user.

- Settings
- Keys
- Credentials**
- Roles
- Client scopes
- Service accounts roles
- Sessions
- Advanced

The screenshot shows the 'Client Secret' configuration page. At the top, there is a 'Client Authenticator' dropdown menu currently set to 'Client Id and Secret'. Below this is a dark blue 'Save' button. The 'Client secret' field is shown as a series of dots, with a 'Regenerate' button to its right. A red callout box with the text 'Copy your Client Secret.' points to a copy icon (two overlapping documents) located next to the 'Client secret' field.

Figure 568: Client Secret for Orchestrator Client in Keyfactor Identity Provider

This service account appears in the Management Portal Orchestrator Management grid as the Identity for the Universal Orchestrator.

Permissions

The user installing the orchestrator must have the SeBackupPrivilege and SeRestorePrivilege rights on the Keyfactor Universal Orchestrator server. Normally, administrators are granted these permissions by default, but you should confirm the permissions prior to starting the install. These permissions can be set through Group Policy or Local Security Policy, and can be found under *Local Policies\User Rights Assignment* as *Back up files and directories* and *Restore files and directories*.

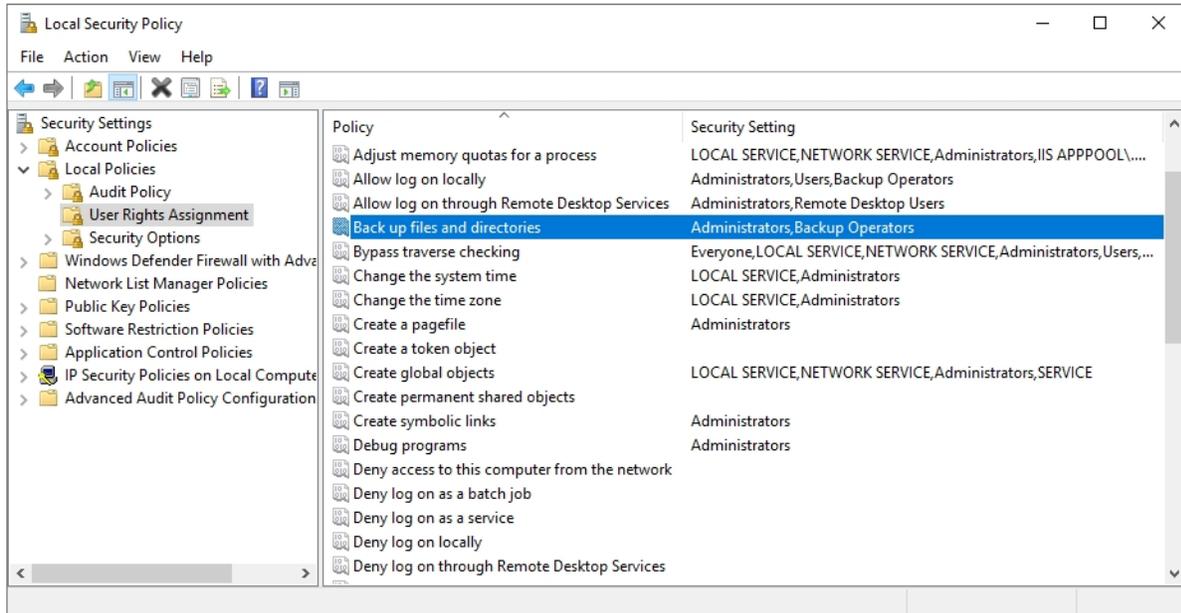

Figure 569: Local Security Policy

For more information on this from Microsoft, see:

<https://docs.microsoft.com/en-us/windows/win32/api/userenv/nf-userenv-load-userprofilea#remarks>

5.2.1.3 Configure Certificate Root Trust for the Universal Orchestrator

Keyfactor recommends using HTTPS to secure the channel between each Keyfactor Universal Orchestrator and the Keyfactor Command server(s). This requires an SSL certificate configured in IIS on the Keyfactor Command server(s). This certificate can either be a publicly-rooted certificate (e.g. from DigiCert, Entrust, etc.), or one issued from a private certificate authority (CA). If your Keyfactor Command server is using a publicly rooted certificate, the orchestrator server may already trust the certificate root for this certificate. However, if you have opted to use an internally-generated certificate, your orchestrator server may not trust this certificate. In order to use HTTPS for communications between the orchestrator and the Keyfactor Command server with a certificate generated from a private CA, you may need to import the certificate chain for the certificate into either the local machine certificate store on the orchestrator server on Windows or the root certificate store on Linux.

Note: The CRL(s) for the Keyfactor Command certificate need to be available to the orchestrator (see [Troubleshooting on page 3003](#)).

Installations on Windows Servers

If the public key infrastructure (PKI) that issued the certificate has only a root CA, the root certificate from this CA must be installed in the Trusted Root Certification Authorities store under Local Computer on the orchestrator server. If the PKI that issued the certificate has both a root and issuing CA, the root certificate must be installed in the Trusted Root Certification Authorities store under Local Computer on the orchestrator server and the issuing CA certificate must be installed in the Intermediate Certification Authorities store under Local Computer on the orchestrator server.

Installations on Linux Servers and in Linux Containers

The location of the OpenSSL trusted root store varies depending on your Linux implementation. The root certificate must be installed in the appropriate location for the operating system before beginning the installation.

5.2.1.4 Grant the Orchestrator Service Account Permissions on the CAs

This step only needs to be completed if you plan to use the Keyfactor Universal Orchestrator for remote Microsoft CA synchronization.

In order for the Universal Orchestrator to be able to synchronize certificates from the remote Microsoft CA(s) to the Keyfactor Command database, the Universal Orchestrator service account—the identity under which the orchestrator in the remote forest runs—must have permissions to read the CA database(s) in the remote forest.

In the management console for each CA that the orchestrator will interact with, open the properties for the CA and grant the service account that the orchestrator runs as (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)) read permissions before continuing.

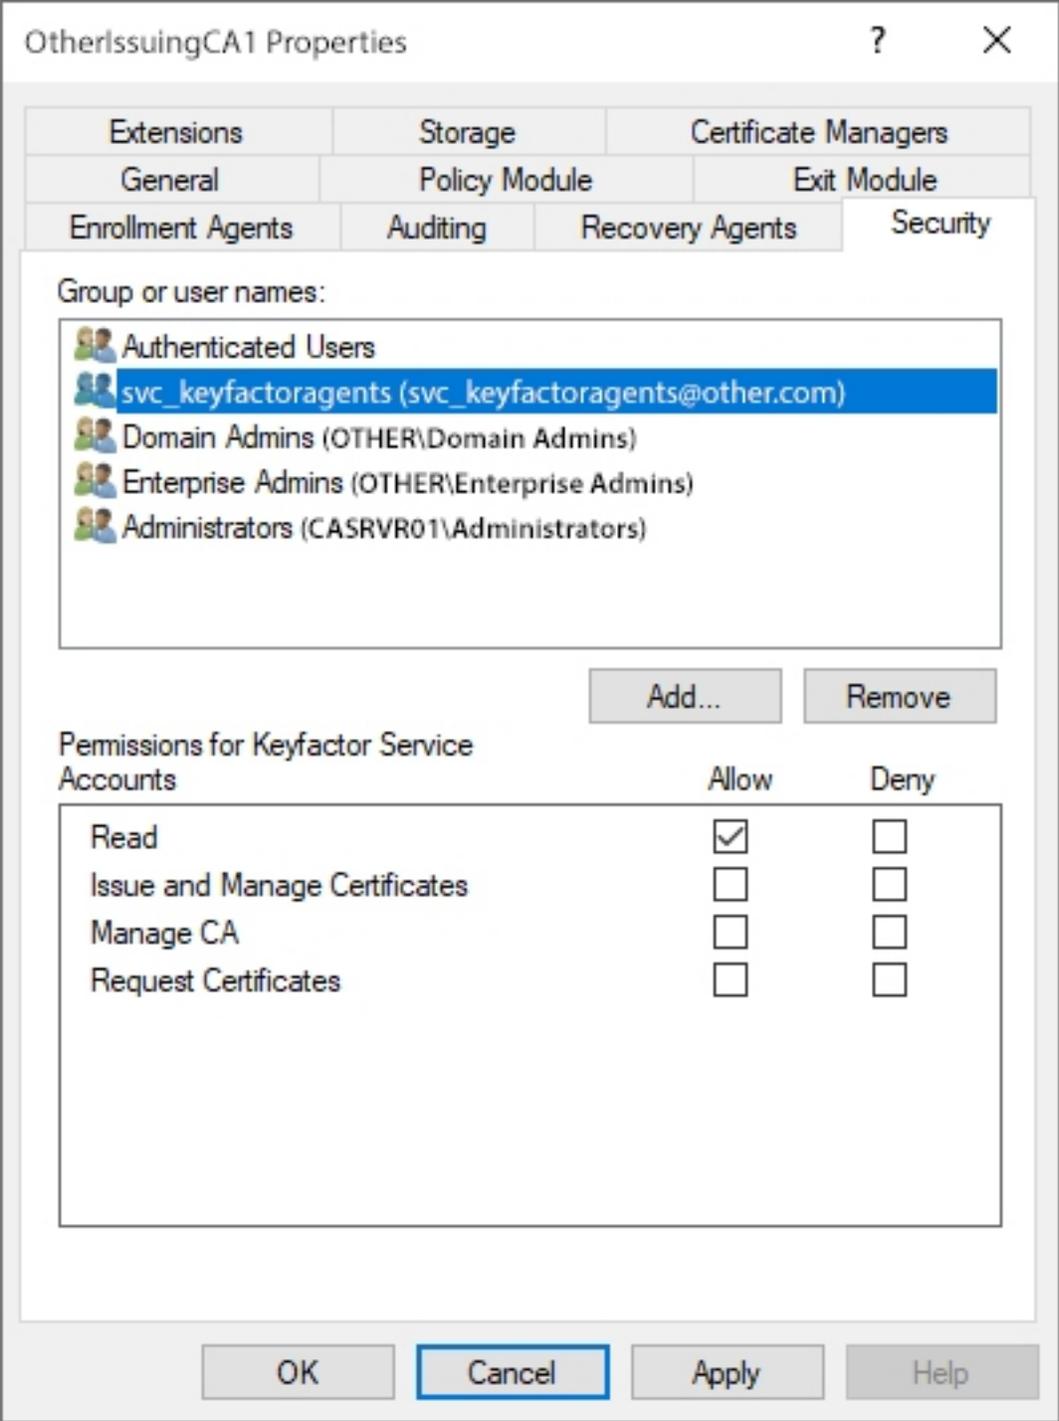

Figure 570: CA Permissions

5.2.1.5 Acquire a Certificate for Client Certificate Authentication (Optional)

The Keyfactor Universal Orchestrator supports client certificate authentication to allow you to authenticate via client certificates from individual orchestrator machines to either a centralized proxy, such as a network load balancer, which would in turn authenticate to the Keyfactor Command server using either a username and password or client ID and secret that was stored securely on the proxy or another client certificate, or directly using IIS on the Keyfactor Command to manage the certificate authentication and Active Directory to manage the mapping of client certificates to service accounts. The proxy approach allows orchestrator credentials to be assigned and managed outside the Active Directory forest in which Keyfactor Command is installed. The web proxy's job is to confirm the validity of the certificate and to provide Active Directory or an identity provider other than Active Directory credentials known to Keyfactor Command (if configured in this manner). Typically the proxy would be configured to accept all certificates issued from a given PKI implementation—even a PKI that is unknown to the Keyfactor Command Active Directory forest—thus delegating orchestrator access control to that PKI. For more information, see:

- [Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication via a Reverse Proxy: Citrix ADC on page 3023](#)
- [Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication with Certificates Stored in Active Directory on page 3035](#)

Important: The Universal Orchestrator supports automated client certificate renewal using an extension point interface on the orchestrator that can be implemented by the end-user. The custom extension will generate a CSR with private key and submit the CSR to Keyfactor Command for enrollment. Keyfactor Command will return the certificate to the orchestrator, which will pair it with its private key and use that certificate for authentication. See [Register a Client Certificate Renewal Extension on page 2961](#) for more information.

Note: Client certificate authentication is not supported when using the Universal Orchestrator installed in a Linux container (see [Install the Universal Orchestrator in a Linux Container on page 2922](#)).

There are several situations in which using certificate authentication for the Universal Orchestrator may be helpful, including:

- Scale—To allow orchestrator numbers to scale (e.g. the IoT case) where it isn't practical to have a unique Active Directory account for each orchestrator.
- Untrusted Environments—To support environments (e.g. a “hostile” network) where policy doesn't allow the password for an Active Directory account to be stored on the orchestrator.

The certificate that the Universal Orchestrator uses for authentication needs:

- An extended key usage (EKU) of Client Authentication

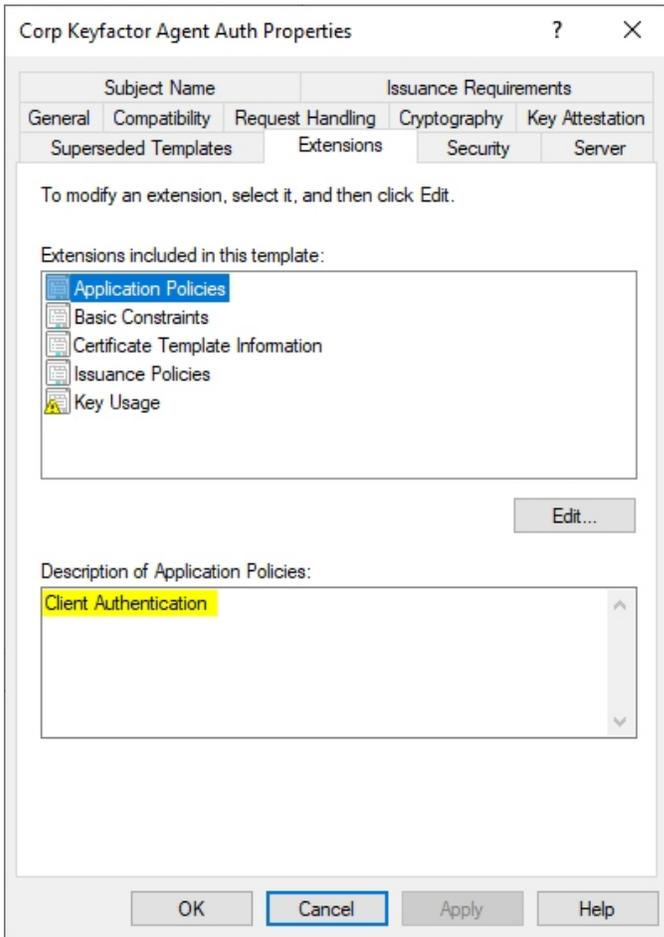

Figure 571: Microsoft Certificate Template Application Policies for Client Authentication Certificate

- A key usage that includes Digital Signature

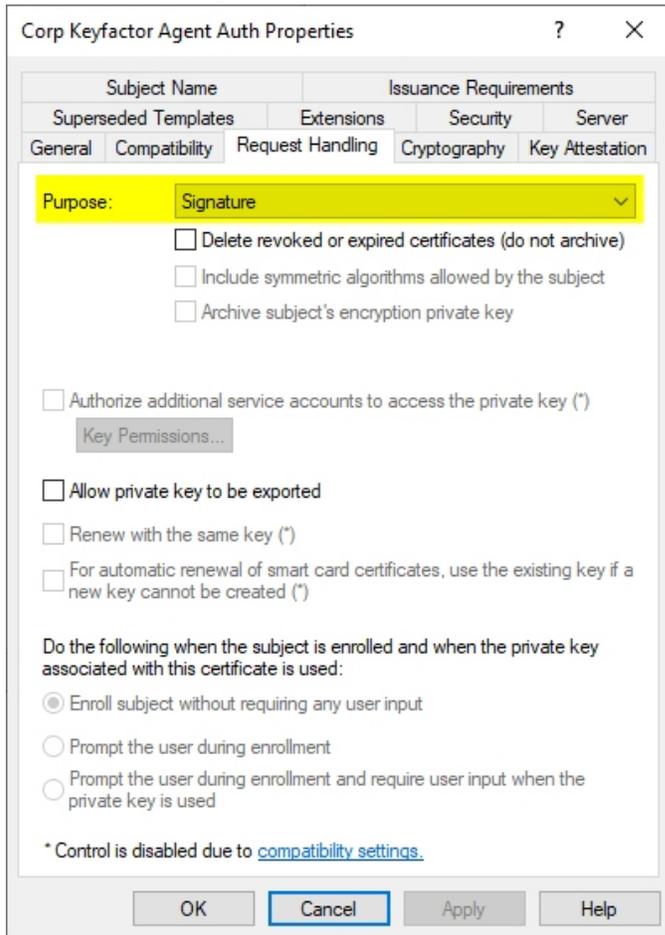

Figure 572: Microsoft Certificate Template Request Handling for Client Authentication Certificate

On Windows servers, the certificate may be referenced either as a PKCS12 file stored in the file system or may be placed either in the local machine's personal store (*My*), or, if you opt to run the Universal Orchestrator service as a domain service account rather than the default of *Network Service*, in the personal store of the Universal Orchestrator service account user. If you opt to place the certificate in the local machine store, you need to grant the service account under which the Universal Orchestrator service will run (including *Network Service* if you will use this option) read permissions to the private key of the certificate. If you opt to place the certificate in the personal store of the Universal Orchestrator service account user, it also needs to be placed in the personal store of the user running the installation for the duration of the installation to allow it to be read during initial configuration. It may be removed from the installing user's store after installation is complete.

On Linux servers, the certificate is referenced as a PKCS12 file stored in the file system.

Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

To acquire a certificate for use by the Universal Orchestrator using a Microsoft CA, first create a template using the appropriate configurations as described above and make it available for enrollment on the CA from which you will request the certificate. The simplest way to acquire a certificate as a PKCS12 file for either Linux or Windows use is with PFX enrollment in Keyfactor Command. There are multiple ways to acquire a certificate and place it in the machine store on the Windows server where the Universal Orchestrator will be installed, including:

- Enroll through the Microsoft certificates MMC.
- Generate a CSR through the Microsoft certificates MMC and take the CSR to Keyfactor Command to issue a certificate using the CSR enrollment option in the Keyfactor Command Management Portal. You will need to return to the Microsoft certificates MMC to marry the certificate with the private key.
- Enroll for a certificate through Keyfactor Command using the PFX enrollment method and deploy it to the certificate store using an already installed Universal Orchestrator managing the store as an IIS store.
- Enroll using the command-line `certreq` command with a `request.inf` file on the Universal Orchestrator server.

Several of the above methods can also be used if you opt to enroll into the Universal Orchestrator service account user's personal store, though this option requires a few extra steps.

To enroll for a certificate using the certificates MMC into the local machine store:

1. On the Universal Orchestrator machine, do one of following:
 - Using the GUI:
 - a. Open an empty instance of the Microsoft Management Console (MMC).
 - b. Choose **File->Add/Remove Snap-in...**
 - c. In the *Available snap-ins* column, highlight **Certificates** and click **Add**.
 - d. In the Certificates snap-in popup, choose the radio button for Computer account, click **Next**, accept the default of Local computer, and click **Finish**.
 - e. Click **OK** to close the Add or Remove Snap-ins dialog.
 - Using the command line:
 - a. Open a command prompt using the "Run as administrator" option.
 - b. Within the command prompt type the following to open the certificates MMC:
`certlm.msc`

2. Drill down to the Personal folder under **Certificates** for the Local Computer, right-click, and choose **All Tasks->Request New Certificate...**
3. Follow the certificate enrollment wizard, selecting the template you created or identified for use for this purpose, and providing any required information.
4. When the enrollment completes, locate the certificate in the Personal store (you may need to refresh), highlight it, and choose **All Tasks->Manage Private Keys...**
5. In the Permissions for private keys dialog, click **Add**, add the Universal Orchestrator service account—the account under which the Universal Orchestrator is running (created as per [Create Service Accounts for the Universal Orchestrator on page 2884](#))—and grant that service account **Read** but not **Full control** permissions. Click **OK** to save.

5.2.1.6 Upgrading the Universal Orchestrator

There are two possible paths for upgrading from an earlier implementation of the Keyfactor Universal Orchestrator to a newer implementation:

- If your newer orchestrator will be installed in the same path as the older orchestrator, you may install the newer orchestrator over the older orchestrator using the *-Force* (Windows) or *--force* (Linux) option to overwrite the existing implementation.
- You may uninstall the older implementation using the provided uninstall script (uninstall.ps1 on Windows or uninstall.sh on Linux) and install the newer version using the standard installation steps (see [Install the Universal Orchestrator on Windows on page 2898](#) or [Install the Universal Orchestrator on a Linux Server on page 2912](#)).

If you have an existing instance of the Keyfactor Windows Orchestrator and wish to migrate to the Keyfactor Universal Orchestrator, you may either install the two orchestrators side-by-side and then uninstall the Keyfactor Windows Orchestrator or uninstall the Keyfactor Windows Orchestrator and then install the Keyfactor Universal Orchestrator.

Important: Before following any of these upgrade paths, be sure to save off a copy of any custom extensions for the Keyfactor Universal Orchestrator (found in C:\Program Files\Keyfactor\Keyfactor Orchestrator\extensions by default) or plugins for the Keyfactor Windows Orchestrator (found in C:\Program Files\Keyfactor\Keyfactor Windows Orchestrator\plugins by default).

Keyfactor's suggested upgrade process is:

1. Review your installed orchestrator and gather this information:
 - Is this a Windows Orchestrator or a Universal Orchestrator?
There are a number of ways to tell the difference. For example, the default install directory for the Universal Orchestrator is *Keyfactor Orchestrator* which the default install directory for the Windows Orchestrator is *Keyfactor Windows Orchestrator*. The Universal Orchestrator has several subdirectories, including an *extensions* directory. The Keyfactor Windows Orchestrator has only one subdirectory—*plugins*—by default.

- What user account is being used to run the orchestrator service?

To check this, you can open the Windows Services tool (`services.msc`), look for the *Keyfactor Orchestrator Service*, and check the account that's configured as the *Log On As*.

- If this installation is on Windows, is the user account being used to run the orchestrator service a group managed service account (gMSA)?
- What type of authentication is being used to make the connection to Keyfactor Command?

To check this, you can open the `appsettings.json` configuration file, which is found in the following location by default:

Windows: `C:\Program Files\Keyfactor\Keyfactor Orchestrator\configuration\appsettings.json`

Linux: `/opt/keyfactor/orchestrator/configuration/appsettings.json`

If you're using client certificate authentication, the `CertPath` and `AuthCertThumbprint` fields will be populated. If you're using token authentication, the `BearerTokenUrl` and `ClientId` fields will be populated. If none of the aforementioned fields are populated, you're using Basic authentication.

- What user account, client ID, or other authentication information is being used to make the connection to Keyfactor Command?

Check in Keyfactor Command for the Identity that the orchestrator indicates on the Orchestrator Management page.

- What secret information (user password, client secret, etc.) is used to make the connection to Keyfactor Command?

This information cannot be retrieved from your existing installation. It is stored in an encrypted state.

- What plugins (Windows Orchestrator) or extensions (Universal Orchestrator) are you using?

The plugins for the Keyfactor Windows Orchestrator are found in `C:\Program Files\Keyfactor\Keyfactor Windows Orchestrator\plugins` by default. The extensions for the Keyfactor Universal Orchestrator are found in `C:\Program Files\Keyfactor\Keyfactor Orchestrator\extensions` by default.

2. If you're using plugins or extensions:

- a. Before beginning the upgrade, save off a copy of any existing plugins or extensions in use.
- b. If you're using plugins or extensions from the Keyfactor Git Hub, check for the latest version:

<https://keyfactor.github.io/integrations-catalog/content/orchestrator>

Plugins for the Keyfactor Windows Orchestrator are not compatible with the Keyfactor Universal Orchestrator, so check for extensions that replace your plugins.

- c. Review the documentation of each extension you will be using to determine if there are any changes needed to the certificate store type definition in Keyfactor Command. Only the following fields in a certificate store type that's in use may be edited:

- Name
- Short Name
- Supported Job Types
- Entry Parameters

If changes to any other fields of the certificate store type are needed, you will need to create a new certificate store type.

- d. Create new certificate store types or edit existing certificate store types as needed (see the previous step). If you're creating a new certificate store type to replace an existing one, it cannot have the same Short Name as an existing certificate store type. This means that you will most likely be using a non-standard Short Name for your extension (e.g. CitrixAdc2) and will need to modify the extension configuration to point it to the correct certificate store type. To do this, in the directory for your extension (the version that you will later copy into the upgraded orchestrator's directory), locate the manifest.json file and open it for editing. Change the existing capability to map to your new certificate store type(s). For example, CitrixAdc becomes CitrixAdc2:

```
{
  "extensions": {
    "Keyfactor.Orchestrators.Extensions.IOrchestratorJobExtension": {
      "CertStores.CitrixAdc2.Inventory": {
        "assemblypath": "Keyfactor.Extensions.Orchestrator.CitricAdc.dll",
        "TypeFullName": "Keyfactor.Extensions.Orchestrator.CitricAdc.Inventory"
      },
      "CertStores.CitrixAdc2.Management": {
        "assemblypath": "Keyfactor.Extensions.Orchestrator.CitricAdc.dll",
        "TypeFullName": "Keyfactor.Extensions.Orchestrator.CitricAdc.Management"
      }
    }
  }
}
```

3. Install the new Universal Orchestrator, either uninstalling the previous version or installing over the previous version using the `-force` option, following the standard installation steps (see [Install the Universal Orchestrator on Windows on the next page](#), [Install the Universal Orchestrator on a Linux Server on page 2912](#), or [Install the Universal Orchestrator in a Linux Container on page 2922](#)) and referencing the information you gathered in step 1. If you're installing in a container, you'll need to stage your selected extensions as part of the install.
4. If you're using extensions and didn't install in a container, copy your extensions into the extensions directory of the new orchestrator (see [Installing Custom-Built Extensions on page 2940](#)).

Restart the orchestrator service to pick up the extension changes.

5. In the Keyfactor Command Management Portal, review the orchestrator, confirm that the capabilities are as expected, and approve the orchestrator.
6. If you're using extensions and added a new certificate store type, you will need to recreate your certificate store. The certificate store type associated with a certificate store cannot be edited. Review your current certificate stores and recreate them with the new certificate store type, and then delete the versions with the old certificate store type.
7. Confirm that your certificate stores and/or SSL scanning are functioning as expected.

5.2.2 Install the Universal Orchestrator on Windows

To install the Keyfactor Universal Orchestrator on Windows, copy the zip file containing installation files to a temporary working directory on the Windows server and unzip it.

Note: In some instances, downloading a compressed file on Windows can cause the file to be marked as *blocked*. If you unzip a blocked file and proceed with the installation, the installation may fail with an error about missing files or dependencies (e.g. “Could not load file or assembly [filename] or one of its dependencies...”). Before beginning the installation, check the zip file *before* unzipping it to confirm that it is not blocked and unblock it if it is blocked.

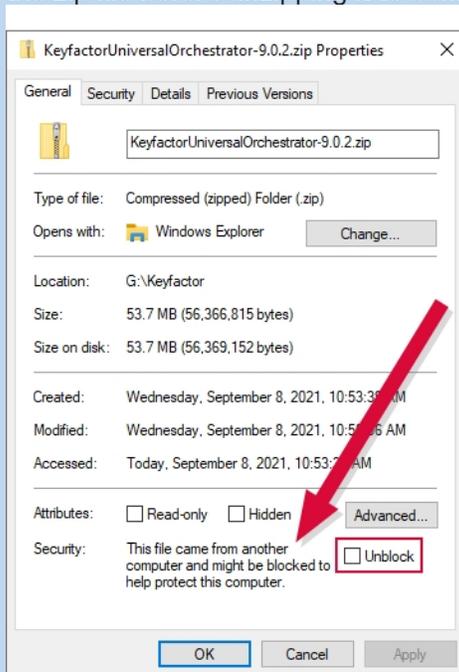

Figure 573: Installation Files Blocked after Download

To begin the installation:

1. On the Windows machine on which you wish to install the orchestrator, open a PowerShell window using the “Run as Administrator” option and change to change to *InstallationScripts* subdirectory under the temporary directory where you placed the installation files.
2. In the PowerShell window, select from the following commands to run based on the identity provider you’re using for Keyfactor Command, the desired orchestrator service accounts, and the desired install experience to prepare for the install.

In these examples, *credKeyfactor* is used for the Keyfactor Command connect service account that the orchestrator uses to connect to Keyfactor Command and *credService* is used for the Universal Orchestrator service account that the service runs as. Usernames should be given in DOMAIN\username format for Active Directory domain accounts or hostname\username format for local user accounts.

- If you’re using Active Directory as an identity provider, will be running the service as an Active Directory domain or local account rather than Network Service, and do not want to provide the usernames and passwords in the command, run the following commands to populate a variable with the user credentials for the Keyfactor Command connect service account (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)) and populate a variable with the user credentials for the Universal Orchestrator service account:

```
$credKeyfactor = Get-Credential  
$credService = Get-Credential
```

Enter the appropriate username and password when prompted.

- Active Directory as the identity provider, running the service as Network Service, and not providing the username and password for the Keyfactor Command connect service account in the command:

```
$credKeyfactor = Get-Credential
```

- Active Directory as the identity provider, running the service as Network Service, and providing the username and password for the Keyfactor Command connect service account in the command:

```
$keyfactorUser = "DOMAIN\mykeyfactorconnectusername"  
$keyfactorPassword = "MySecurePassword"  
$secKeyfactorPassword = ConvertTo-SecureString $keyfactorPassword -AsPlainText  
-Force  
$credKeyfactor = New-Object System.Management.Automation.PSCredential  
($keyfactorUser, $secKeyfactorPassword)
```

- Active Directory as the identity provider, running the service as a domain or local account, and providing the username and password for the Keyfactor Command connect service account and the service account the orchestrator runs as in the command:

```

$serviceUser = "DOMAIN\myserviceusername"
$keyfactorUser = "DOMAIN\mykeyfactorconnectusername"
$keyfactorPassword = "MyFirstSecurePassword"
$servicePassword = "MySecondSecurePassword"
$secKeyfactorPassword = ConvertTo-SecureString $keyfactorPassword -AsPlainText
-Force
$secServicePassword = ConvertTo-SecureString $servicePassword -AsPlainText -
Force
$credKeyfactor = New-Object System.Management.Automation.PSCredential
($keyfactorUser, $secKeyfactorPassword)
$credService = New-Object System.Management.Automation.PSCredential
($serviceUser, $secServicePassword)

```

- Active Directory as the identity provider, running the service as a group managed service account (gMSA), and providing the username and password for the Keyfactor Command connect service account in the command:

```

$serviceUser = "DOMAIN\myGMSAserviceusername$"
$keyfactorUser = "DOMAIN\mykeyfactorconnectusername"
$keyfactorPassword = "MySecurePassword"
$secKeyfactorPassword = ConvertTo-SecureString $keyfactorPassword -AsPlainText
-Force
$credKeyfactor = New-Object System.Management.Automation.PSCredential
($keyfactorUser, $secKeyfactorPassword)
$credService = New-Object System.Management.Automation.PSCredential
($serviceUser, (New-Object System.Security.SecureString))

```

Note: Group managed service accounts are not supported for use in making the connection to Keyfactor Command.

- An identity provider other than Active Directory and running the service as Network Service:

```
none
```

- An identity provider other than Active Directory, running the service as a domain or local account, and not providing the username and password for the service account the orchestrator runs as in the command:

```
$credService = Get-Credential
```

- An identity provider other than Active Directory, running the service as a domain or local account, and providing the username and password for the service account the orchestrator runs as in the command:

```
$serviceUser = "DOMAIN\myserviceusername"  
$servicePassword = "MySecondSecurePassword"  
$secServicePassword = ConvertTo-SecureString $servicePassword -AsPlainText -  
Force  
$credService = New-Object System.Management.Automation.PSCredential  
($serviceUser, $secServicePassword)
```

Tip: In some cases, you may be using the same service account for both the Universal Orchestrator service account role and the Keyfactor Command connect service account role. If this is the case, you may use a single variable for both passwords in the next step.

3. In the PowerShell window, run the install.ps1 script using the following syntax to begin the installation:

-URL (Required)

This is the URL to the Agent Services endpoint on the Keyfactor Command server running the Keyfactor Command Agent Services role. If you installed all the Keyfactor Command server roles together, this is the URL for your Keyfactor Command server with /KeyfactorAgents after the server's IP or FQDN (e.g. <https://keyfactor.keyexample.com/KeyfactorAgents>). If you choose to use SSL to connect to the Keyfactor Command server, you'll need to enter a URL that contains a hostname that is found in the SSL certificate.

This parameter sets the local orchestrator application setting *AgentsServerUri* to the specified value.

This parameter is **required**.

Note: If you've opted to use client certificate authentication for the orchestrator, the value you use for the **URL** will vary depending on the method you select to implement client certificate authentication. You may choose to route client certificate authentication through a proxy (see [Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication via a Reverse Proxy: Citrix ADC on page 3023](#)), in which case you would use the proxy server name here (whatever name you're using to route traffic through the proxy). You may choose to publish client certificates to Active Directory and access the Keyfactor Command server directly (see [Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication with Certificates Stored in Active Directory on page 3035](#)), in which case you would use the Keyfactor Command server name here.

Tip: If your Keyfactor Command server was configured with an alternate virtual directory for the Keyfactor Command Agents Services endpoint, you will need to enter that in the URL rather than /KeyfactorAgents.

Client Authentication Parameters (Required)

The Keyfactor Universal Orchestrator supports authenticating to the Keyfactor Command server using Basic authentication, token authentication, or client certificate authentication. The method you choose depends in part on the identity provider in use for the Keyfactor Command the orchestrator will be communicating with. If you're using Active Directory as an identity provider, you may choose Basic authentication or client certificate authentication. If you're using an identity provider other than Active Directory, you may choose token authentication or client certificate authentication.

When you configure the orchestrator with Basic authentication (*WebCredential*), you provide a username and password as a *PSCredential* object. With token authentication (*BearerTokenUrl*), you provide a client ID and secret that allows the orchestrator to acquire a bearer token. With client certificate authentication (either *ClientCertificateThumbprint* or *ClientCertificate* and *ClientCertificatePassword*), the orchestrator uses a client certificate to authenticate to either a proxy or IIS on the Keyfactor Command server. You cannot configure multiple types of authentication together.

One of the following authentication methods is **required**:

- Basic Authentication: *WebCredential*
- Token Authentication: *BearerTokenUrl*, *ClientId*, *ClientSecret*, and *TokenLifetime*
- Client Certificate Authentication: *ClientCertificate* and *ClientCertificatePassword*
- Client Certificate Authentication: *ClientCertificateThumbprint*

Important: Choosing a client certificate authentication method for the orchestrator may require additional configuration on your Keyfactor Command server. For more information, see [Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication with Certificates Stored in Active Directory on page 3035](#), [Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication via a Reverse Proxy: Citrix ADC on page 3023](#), and [Install the Keyfactor Command Components on the Keyfactor Command Server\(s\) on page 2780](#).

Tip: For information about rotating passwords and client authentication certificates, see [Change Service Account Passwords on page 2954](#).

-*WebCredential* (Basic Authentication)

This is the credential object of the Keyfactor Command connect service account that the orchestrator uses to communicate with Keyfactor Command that you created as per [Create Service Accounts for the Universal Orchestrator on page 2884](#). It is provided as a *PSCredential* object.

This parameter is **required** if Basic authentication will be used.

This parameter cannot be used in conjunction with the *BearerTokenURL*, *ClientCertificateThumbprint*, *ClientCertificate*, or *ClientCertificatePassword* parameter.

-BearerTokenURL (Token Authentication)

Specifying this parameter causes the installation to be done using token authentication for the connection to Keyfactor Command.

This parameter **requires** that *TokenLifetime*, *ClientId*, and *ClientSecret* also be specified.

This parameter is **required** if token authentication will be used.

This parameter cannot be used in conjunction with the *WebCredential*, *ClientCertificateThumbprint*, *ClientCertificate*, or *ClientCertificatePassword* parameter.

-ClientId (Token Authentication)

This parameter is used to specify the ID of the identity provider client that should be used to authenticate the session when *BearerTokenUrl* authentication is used (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)).

This parameter **requires** that *TokenLifetime* and *ClientSecret* also be specified.

This parameter is only supported if the *BearerTokenUrl* parameter is specified.

-ClientSecret (Token Authentication)

This parameter is used to specify the secret of the identity provider client that should be used to authenticate the session when *BearerTokenUrl* authentication is used.

This parameter **requires** that *TokenLifetime* and *ClientId* also be specified.

This parameter is only supported if the *BearerTokenUrl* parameter is specified.

-TokenLifetime (Token Authentication)

The number of seconds for which the bearer token is valid. The *TokenLifetime* should be set to the same value as the Keyfactor Command *Cookie Expiration* (see [Authentication Tab on page 2787](#)). For example, if the Keyfactor Command *CookieExpiration* is 5 minutes, the *TokenLifetime* should be 300 seconds.

The *Cookie Expiration* value determines the length of time the authentication cookie is considered valid. After half of the setting's duration, Keyfactor Command will attempt to use a refresh token to update the cookie. If this fails, the orchestrator's session will be terminated.

This parameter **requires** that *ClientId* and *ClientSecret* also be specified.

This parameter is only supported if the *BearerTokenUrl* parameter is specified.

-ClientCertificate (Client Certificate Authentication)

The path and file name on the orchestrator of a PKCS12 file containing the client authentication certificate used to authenticate to Keyfactor Command created as per [Acquire a Certificate for Client Certificate Authentication \(Optional\) on page 2891](#). The certificate must have a Client Authentication EKU.

The account under which the Universal Orchestrator service will run (see [-ServiceCredential on page 2907](#)) needs read and write permissions on the PKCS12 file you specify with this parameter.

This parameter **requires** that *ClientCertificatePassword* also be specified.

You may specify either the thumbprint of the certificate with the *ClientCertificateThumbprint* parameter or specify a path and password to a PKCS12 file containing the certificate on the orchestrator using *ClientCertificate* and *ClientCertificatePassword*. You do not need to specify both a thumbprint and a PKCS12 file; if you do, the certificate stores will take precedence.

Specifying this parameter sets the local orchestrator application setting *CertPath* to the specified value.

This parameter cannot be used in conjunction with the *BearerTokenURL* or *WebCredential* parameter.

-ClientCertificatePassword (Client Certificate Authentication)

The password for the PKCS12 file specified with the *ClientCertificate* parameter.

Specifying this parameter **requires** that *ClientCertificate* also be specified.

This parameter cannot be used in conjunction with the *BearerTokenURL* or *WebCredential* parameter.

-ClientCertificateThumbprint (Client Certificate Authentication)

The thumbprint of the client authentication certificate used to authenticate to Keyfactor Command created as per [Acquire a Certificate for Client Certificate Authentication \(Optional\) on page 2891](#). The certificate must have a Client Authentication EKU, have a private key readable by the account under which the Universal Orchestrator service will run (see [-ServiceCredential on page 2907](#)), and be located in either the orchestrator local machine's personal certificate store (*My*) or the Universal Orchestrator service account user's (see [-ServiceCredential on page 2907](#)) personal certificate store. If the certificate is stored in the local machine's store, the Universal Orchestrator service account user must be granted permissions to read the private key of the certificate (see the final steps under [Acquire a Certificate for Client Certificate Authentication \(Optional\) on page 2891](#)).

You may specify either the thumbprint of the certificate with the *ClientCertificateThumbprint* parameter or specify a path and password to a PKCS12 file containing the certificate on the orchestrator using *ClientCertificate* and *ClientCertificatePassword*. You do not need to specify both a thumbprint and a PKCS12 file; if you do, the certificate stores will take precedence.

Specifying this parameter sets the local orchestrator application setting *AuthCertThumbprint* to the specified value.

This parameter cannot be used in conjunction with the *BearerTokenURL* or *WebCredential* parameter.

-Audience

This parameter is used to specify an audience value to be included in token requests delivered to the identity provider when using an identity provider other than Active Directory.

-Capabilities

This parameter is used to specify the capabilities the orchestrator will support if a capability set other than the default set is desired. Supported options are:

- all
All the capabilities supported by the orchestrator will be enabled and reported to Keyfactor Command.
- none
The orchestrator will be installed with no capabilities and will not be registered with Keyfactor Command. This is primarily used for implementations that will support only custom capabilities (see [Installing Custom-Built Extensions on page 2940](#) and [Configuring Script-Based Certificate Store Jobs on page 2946](#)).
- ssl
Only the SSL discovery and monitoring capability will be enabled and reported to Keyfactor Command.

If the *InPlace* parameter is specified, this parameter must be set to *all*.

If this parameter is not specified, the default set of capabilities for the orchestrator will be used. For the Universal Orchestrator, the default capability set is *IIS*, *CA* and *LOG* (log fetching).

One installation of the orchestrator can be enabled with multiple capabilities to perform more than one function, but there are best practices for locating orchestrators that should be considered. For example, Keyfactor recommends against performing the SSL discovery and monitoring function using an orchestrator installed on the main Keyfactor Command server due to the resource requirements of this function and against using the same orchestrator for the SSL function and other functions, again due to the resource requirements. The CA management

function is typically used on remote servers and not collocated with other orchestrator functions.

-Destination

This parameter specifies a location in which to install the orchestrator that is other than the default. The default installation location is:

```
C:\Program Files\Keyfactor\Keyfactor Orchestrator
```

This parameter cannot be used in conjunction with the *InPlace* parameter.

-Force

Specifying this parameter causes the installation to warn and continue on certain potential problems, including:

- A service with either the default service name or the service name specified with the *ServiceSuffix* parameter already exists. The service will be overwritten if *Force* is specified.
- Either the default installation location or the location specified with the *Location* parameter is not empty. The install will occur to the specified or default location anyway and files may be overwritten if *Force* is specified.

If this parameter is not specified and any of these problems are encountered, the installation will terminate prematurely.

-InPlace

This parameter is used to indicate that the installation should occur in the current directory where the install files are located and no files should be copied to another location on the machine.

This parameter cannot be used in conjunction with the *Destination* parameter. This parameter is only supported if the *Capabilities* parameter is set to *all*.

-NoRevocationCheck

This parameter is used to indicate that the revocation status (CRL) of the SSL certificate on the Keyfactor Command server should not be checked when connecting to Keyfactor Command.

Specifying this parameter sets the local orchestrator application setting *Check-ServerCertificateRevocation* to false. The default for this parameter is *true* (CRL checking will be done).

-NoService

This parameter is used to indicate that no Windows service should be created. The orchestrator will be installed but will need to be started manually or added as a service at a later time.

This parameter cannot be used in conjunction with the *ServiceSuffix* or *ServiceCredential* parameter.

-OrchestratorName

Specifying this parameter allows you to override the name the orchestrator would by default use to register itself in Keyfactor Command.

Specifying this parameter sets the local orchestrator application setting *OrchestratorName* to the specified value.

By default, the orchestrator uses the value of the `COMPUTERNAME` environment variable for the orchestrator's name.

-ServiceCredential

This is the credential object of the Universal Orchestrator service account the orchestrator service will run as (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)). It is provided as a `PSCredential` object.

This parameter cannot be used in conjunction with the *NoService* parameter.

If this parameter is not specified, the built-in Network Service account will be used.

-ServiceSuffix

This parameter is used to add a suffix to the root service name of *KeyfactorOrchestrator* (e.g. *Instance1* for a resulting service name of *KeyfactorOrchestrator-Instance1*). This is used primarily for implementations where the orchestrator will be installed multiple times on the same server.

This parameter cannot be used in conjunction with the *NoService* parameter.

If this parameter is not specified, the default service name of *KeyfactorOrchestrator-Default* will be used—with a display name of *Keyfactor Orchestrator Service (Default)*.

-Scope

This parameter is used to specify one or more scopes that should be included in token requests delivered to the identity provider when using an identity provider other than Active Directory. Multiple scopes should be separated by spaces.

-Source

Specify this parameter to point to a directory containing the installation files other than the directory in which the install.ps1 file is found. This parameter is used primarily if a copy of the install.ps1 file is made in an alternate directory, updated with some customizations, and then used for installation without being copied back to the directory where the remaining installation files are located.

Installation example with expected output using Basic authentication and Network Service to run the local service:

```
$keyfactorUser = "KEYEXAMPLE\svc_kyforch1"
$keyfactorPassword = "MySecurePassword123!"
$secKeyfactorPassword = ConvertTo-SecureString $keyfactorPassword -AsPlainText -Force
$credKeyfactor = New-Object System.Management.Automation.PSCredential ($keyfactorUser, $secKey-
factorPassword)

.\install.ps1 -URL https://keyfactor.keyexample.com/KeyfactorAgents -WebCredential $credKeyfactor
-OrchestratorName websrvr42.keyexample.com -Capabilities all

Copying files
Setting configuration data
Installing Windows Service
Granting necessary file permissions to NT AUTHORITY\NETWORK SERVICE for configuration file
Starting service KeyfactorOrchestrator-Default
```

Installation example with expected output using Basic authentication and a standard Active Directory service account to run the local service:

```
$serviceUser = "KEYEXAMPLE\svc_kyforch1"
$keyfactorUser = "KEYEXAMPLE\svc_kyforch2"
$servicePassword = "MyFirstSecurePassword123!"
$keyfactorPassword = "MySecondSecurePassword456#"
$secServicePassword = ConvertTo-SecureString $servicePassword -AsPlainText -Force
$secKeyfactorPassword = ConvertTo-SecureString $keyfactorPassword -AsPlainText -Force
$credService = New-Object System.Management.Automation.PSCredential ($serviceUser, $secSer-
vicePassword)
$credKeyfactor = New-Object System.Management.Automation.PSCredential ($keyfactorUser,
$secKeyfactorPassword)

.\install.ps1 -URL https://keyfactor.keyexample.com/KeyfactorAgents -WebCredential $credKeyfactor
-ServiceCredential $credService -OrchestratorName websrvr42-IIS.keyexample.com -Capabilities all

Copying files
```

```
Setting configuration data
Installing Windows Service
Granting necessary file permissions to KEYEXAMPLE\svc_kyforch1 for configuration file
Granting Log on as a Service permission to KEYEXAMPLE\svc_kyforch1
Starting service KeyfactorOrchestrator-Default
```

Installation example with expected output using Basic authentication and an Active Directory gMSA to run the local service:

```
$serviceUser = "KEYEXAMPLE\GMSA_kyforch$"
$keyfactorUser = "KEYEXAMPLE\svc_kyforch"
$keyfactorPassword = "MySecurePassword123!"
$secKeyfactorPassword = ConvertTo-SecureString $keyfactorPassword -AsPlainText -Force
$credService = New-Object System.Management.Automation.PSCredential ($serviceUser,(New-Object
System.Security.SecureString))
$credKeyfactor = New-Object System.Management.Automation.PSCredential ($keyfactorUser, $secKey-
factorPassword)

.\install.ps1 -URL https://keyfactor.keyexample.com/KeyfactorAgents -WebCredential $credKeyfactor
-ServiceCredential $credService -OrchestratorName webservr42-IIS.keyexample.com -Capabilities all

Copying files
Setting configuration data
Installing Windows Service
Granting necessary file permissions to KEYEXAMPLE\GMSA_kyforch$ for configuration file
Granting Log on as a Service permission to KEYEXAMPLE\GMSA_kyforch$
Starting service KeyfactorOrchestrator-Default
```

Important: Prior to using a gMSA in the installation, you need to have installed the account on the Universal Orchestrator server using the *Install-ADServiceAccount* PowerShell command. For example:

```
Install-ADServiceAccount -Identity GMSA_kyforch$
```

This requires the *Active Directory module for Windows PowerShell*, which is installed as a feature as part of the *Remote Server Administrator Tools*.

Installation example with expected output using token authentication and Network Service to run the local service:

```
.\install.ps1 -URL https://keyfactor.keyexample.com/KeyfactorAgents -BearerTokenUrl https://appsr-
vr18.keyexample.com:1443/realms/Keyfactor/protocol/openid-connect/token -TokenLifetime 300 -
```

```
ClientId Universal-Orchestrator -ClientSecret m1aE6RErW5cezSPmv0PJcFdFp152HFqK -OrchestratorName
websrvr42-U0.keyexample.com -Capabilities all
```

```
Copying files
Setting configuration data
Installing Windows Service
Granting necessary file permissions to NT AUTHORITY\NETWORK SERVICE for configuration file
Starting service KeyfactorOrchestrator-Default
```

Installation example with expected output using token authentication and a local account on the machine to run the local service:

```
$serviceUser = "websrvr42\kyforch"
$servicePassword = "MySecurePassword123!"
$secServicePassword = ConvertTo-SecureString $servicePassword -AsPlainText -Force
$credService = New-Object System.Management.Automation.PSCredential ($serviceUser, $secServicePassword)

.\install.ps1 -URL https://keyfactor.keyexample.com/KeyfactorAgents -BearerTokenUrl https://appsrvr18.keyexample.com:1443/realms/Keyfactor/protocol/openid-connect/token -TokenLifetime 300 -
ClientId Universal-Orchestrator -ClientSecret m1aE6RErW5cezSPmv0PJcFdFp152HFqK -ServiceCredential
$credService -OrchestratorName websrvr42-U0.keyexample.com -Capabilities all
```

```
Copying files
Setting configuration data
Installing Windows Service
Granting necessary file permissions to websrvr42\kyforch for configuration file
Granting Log on as a Service permission to websrvr42\kyforch
Starting service KeyfactorOrchestrator-Default
```

Installation example with expected output using client certificate authentication with the certificate stored in the local machine store:

```
$serviceUser = "KEYEXAMPLE\svc_kyforch"
$servicePassword = "MySecurePassword123!"
$secServicePassword = ConvertTo-SecureString $servicePassword -AsPlainText -Force
$credService = New-Object System.Management.Automation.PSCredential ($serviceUser, $secServicePassword)

.\install.ps1 -URL https://keyfactor.keyexample.com/KeyfactorAgents -ClientCertificateThumbprint
29b21df7403b4afe6daf44762e5c47fb73c07ce7 -ServiceCredential $credService -OrchestratorName
websrvr42-IIS.keyexample.com -Capabilities all
```

```
Copying files
Setting configuration data
Installing Windows Service
Granting necessary file permissions to KEYEXAMPLE\svc_kyforch for configuration file
Granting Log on as a Service permission to KEYEXAMPLE\svc_kyforch
Starting service KeyfactorOrchestrator-Default
```

Tip: The client certificate authentication example shown here references a certificate stored in the local machine store. Because of this, the service account that will run the Universal Orchestrator service needs to be granted permissions to read the private key of the certificate before the installation is run. If the certificate had been acquired into the Universal Orchestrator service account user's personal store rather than the local machine store, the step of granting private key read permissions would not have been necessary.

Installation example with expected output using client certificate authentication with the certificate stored as a file:

```
.\install.ps1 -URL https://keyfactor.keyexample.com/KeyfactorAgents -ClientCertificate
C:\Certs\kyforch.pfx -ClientCertificatePassword MySecurePassword123! -OrchestratorName websrvr42-
IIS.keyexample.com -Capabilities all
```

```
Copying files
Setting configuration data
Installing Windows Service
Granting necessary file permissions to KEYEXAMPLE\svc_kyforch for configuration file
Granting Log on as a Service permission to KEYEXAMPLE\svc_kyforch
Starting service KeyfactorOrchestrator-Default
```

Tip: The client certificate authentication example shown here does not use the `-ServiceCredential` parameter. This will cause the Universal Orchestrator service to run as Network Service. If you prefer to run the service as a domain service account, you will need to include the `-ServiceCredential` parameter and specify the `PSCredential` value for the service credentials appropriately, as shown in the previous examples. Network Service will need to be granted read and write permissions on the PFX file before the script is executed.

4. Review the output from the installation to confirm that no errors have occurred.

The script creates a directory, `C:\Program Files\Keyfactor\Keyfactor Orchestrator` by default, and places the orchestrator files in this directory. Log files are found in `C:\Program Files\Keyfactor\Keyfactor Orchestrator\logs` by default, though this is configurable (see [Configure Logging for the Universal Orchestrator on page 2950](#)).

The orchestrator service, by default given a display name of *Keyfactor Orchestrator Service (Default)*, should be automatically started at the conclusion of the install and configured to restart on reboot unless you have selected the *NoService* parameter.

Tip: Once the installation of the orchestrator is complete, you need to use the Keyfactor Command Management Portal to approve the orchestrator and configure certificate stores or SSL jobs:

- [Approving or Disapproving Orchestrators on page 500](#)
- [Certificate Store Operations on page 413](#)
- [SSL Discovery on page 453](#)

If you've opted to enable remote CA management for the orchestrator, further configuration is needed (see [Configure the Universal Orchestrator for Remote CA Management on page 2938](#)).

5.2.3 Install the Universal Orchestrator on a Linux Server

To install the Keyfactor Universal Orchestrator on a Linux server, copy the zip file containing installation files to a temporary working directory on the Linux server and unzip it.

To begin the installation:

1. On the Linux machine on which you wish to install the orchestrator, in a command shell change to *InstallationScripts* subdirectory under the temporary directory where you placed the installation files.
2. Use the `chmod` command to make the `install.sh` script file executable. The file ships in a non-executable state to avoid accidental execution. For example:

```
sudo chmod +x install.sh
```

3. In the command shell, run the `install.sh` script as root using the following parameters to begin the installation:

--url (Required)

This is the URL to the Agent Services endpoint on the Keyfactor Command server running the Keyfactor Command Agent Services role, which is installed as part of the Keyfactor Command Services role. If you installed all the Keyfactor Command server roles together, this is the URL for your Keyfactor Command server with `/KeyfactorAgents` after the server's IP or FQDN (e.g. `https://keyfactor.keyexample.com/KeyfactorAgents`). If you choose to use SSL to connect to the Keyfactor Command server, you'll need to enter a URL that contains a hostname that is found in the SSL certificate.

This parameter sets the local orchestrator application setting *AgentsServerUri* to the specified value.

This parameter is **required**.

Tip: If your Keyfactor Command server was configured with an alternate virtual directory for the Keyfactor Command Agents Services endpoint, you will need to enter that in the URL rather than /KeyfactorAgents.

Client Authentication Parameters (Required)

The Keyfactor Universal Orchestrator supports authenticating to the Keyfactor Command server using Basic authentication, token authentication, or client certificate authentication. The method you choose depends in part on the identity provider in use for the Keyfactor Command the orchestrator will be communicating with. If you're using Active Directory as an identity provider, you may choose Basic authentication or client certificate authentication. If you're using an identity provider other than Active Directory, you may choose token authentication or client certificate authentication.

When you configure the orchestrator with Basic authentication (*username* and *password*), you provide a username and password. With token authentication (*bearer-token-url*, *client_id*, and *client_secret*), you provide a client ID and secret that allows the orchestrator to acquire a bearer token. With client certificate authentication (*client-auth-certificate* and *client-auth-certificate-password*), the orchestrator uses a client certificate to authenticate to either a proxy or IIS on the Keyfactor Command server. You cannot configure multiple types of authentication together.

One of the following authentication methods is **required**:

- Basic Authentication: *username* and *password*
- Token Authentication: *bearer-token-url*, *client_id*, *client_secret*, and *token_lifetime*
- Client Certificate Authentication: *client-auth-certificate* and *client-auth-certificate-password*

Important: Choosing to use client certificate authentication for the orchestrator may require additional configuration on your Keyfactor Command server. For more information, see [Install the Keyfactor Command Components on the Keyfactor Command Server \(s\) on page 2780](#) in the *Keyfactor Command Server Installation Guide* and [Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication with Certificates Stored in Active Directory on page 3035](#), [Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication via a Reverse Proxy: Citrix ADC on page 3023](#).

Tip: For information about rotating passwords and client authentication certificates, see [Change Service Account Passwords on page 2954](#).

--username (Basic Authentication)

This is the Keyfactor Command connect service account that the orchestrator uses to communicate with Keyfactor Command that you created as per [Create Service Accounts for the Universal Orchestrator on page 2884](#). It may be entered either as username@domain (e.g. svc_kyforch@keyexample.com) or DOMAIN\username (e.g. KEYEXAMPLE\svc_kyforch).

This parameter is **required** if Basic authentication will be used.

This parameter cannot be used in conjunction with the *bearer-token-url* or *client-auth-certificate* and *client-auth-certificate-password* parameters.

--password (Basic Authentication)

This is the password for the Keyfactor Command connect service account that the orchestrator uses to communicate with Keyfactor Command specified with the *username* parameter.

 **Important:** The password for the Keyfactor Command connect service account is stored in clear text in the orchestratorsecrets.json file in the configuration directory under the installation directory for the orchestrator. By default, this file is granted read/write permissions for the Universal Orchestrator service account running the service on the Linux machine (*keyfactor-orchestrator* by default) and no permissions for any other users. Access to this file should be strictly controlled. If you prefer to avoid the use of a password in a file, consider using client certificate authentication.

This parameter is **required** if the *username* parameter is specified.

This parameter cannot be used in conjunction with the *bearer-token-url* or *client-auth-certificate* and *client-auth-certificate-password* parameters.

 **Important:** Your password may be preserved in command history and may be visible on the process listing when providing a password using this parameter. See the *--secret-file-path* and *--secret-std-in* parameters for alternatives.

--bearer-token-url (Token Authentication)

Specifying this parameter causes the installation to be done using token authentication for the connection to Keyfactor Command. Set this to the URL of the token endpoint for your identity provider. For example:

```
https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/token
```

For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see [Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716](#)).

This parameter **requires** that *token-lifetime*, *client-id*, and *client-secret* also be specified.

This parameter is **required** if token authentication will be used.

This parameter cannot be used in conjunction with the *username* and *password* or *client-auth-certificate* and *client-auth-certificate-password* parameters.

--client-id (Token Authentication)

This parameter is used to specify the ID of the identity provider client that should be used to authenticate the session when *bearer-token-url* authentication is used (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)).

This parameter **requires** that *token-lifetime* and *client-secret* also be specified.

This parameter is only supported if the *bearer-token-url* parameter is specified.

--client-secret (Token Authentication)

This parameter is used to specify the secret of the Keyfactor Identity Provider client that should be used to authenticate the session when *bearer-token-url* authentication is used.

 **Important:** The client secret for the Keyfactor Command connect service account is stored in clear text in the `orchestratorsecrets.json` file in the configuration directory under the installation directory for the orchestrator. By default, this file is granted read/write permissions for the Universal Orchestrator service account running the service on the Linux machine (*keyfactor-orchestrator* by default) and no permissions for any other users. Access to this file should be strictly controlled. If you prefer to avoid the use of a password in a file, consider using client certificate authentication.

This parameter **requires** that *token-lifetime* and *client-id* also be specified.

This parameter is only supported if the *bearer-token-url* parameter is specified.

 **Important:** Your secret may be preserved in command history and may be visible on the process listing when providing a secret using this parameter. See the `--secret-file-path` and `--secret-std-in` parameters for alternatives.

--token-lifetime (Token Authentication)

The number of seconds for which the bearer token is valid. The *token-lifetime* should be set to the same value as the Keyfactor Command *CookieExpiration*. For example, if the Keyfactor Command *CookieExpiration* is 5 minutes, the *token-lifetime* should be 300 seconds.

The *Cookie Expiration* value determines the length of time the authentication cookie is considered valid. After half of the setting's duration, Keyfactor Command will attempt to use a refresh token to update the cookie. If this fails, the orchestrator's session will be terminated.

This parameter **requires** that *client-id* and *client-secret* also be specified.

This parameter is only supported if the *bearer-token-url* parameter is specified.

--client-auth-certificate (Client Certificate Authentication)

The path and file name on the orchestrator of a PKCS12 file containing the client authentication certificate used to authenticate to Keyfactor Command created as per [Acquire a Certificate for Client Certificate Authentication \(Optional\) on page 2891](#). The certificate must have a Client Authentication EKU.

The account under which the Universal Orchestrator service will run (see [--service-user on page 2920](#)) needs read and write permissions on the PKCS12 file you specify with this parameter.

This parameter **requires** that *client-auth-certificate-password* also be specified.

Specifying this parameter sets the local orchestrator application setting *CertPath* to the specified value.

This parameter cannot be used in conjunction with the *bearer-token-url* or *username* and *password* parameters.

--client-auth-certificate-password (Client Certificate Authentication)

The password for the PKCS12 file specified with the *client-auth-certificate* parameter.

Specifying this parameter **requires** that *client-auth-certificate* also be specified.

This parameter cannot be used in conjunction with the *bearer-token-url* or *username* parameters.

Important: Your password may be preserved in command history and may be visible on the process listing when providing a password using this parameter. See the *--secret-file-path* and *--secret-std-in* parameters for alternatives.

--secret-file-path (All Authentication Types)

This parameter specifies a path and filename to provide a plain text secret for the Keyfactor Command connect service account that the orchestrator uses to communicate with Keyfactor Command. For example:

```
sudo ./install.sh --secret-file-path /opt/apps/my_secret_file [other parameters here]
```

This parameter can be used with the *username*, *client-auth-certificate*, or *client-id* parameter to provide the authentication secret from a file rather than the command line to avoid storing it in command history.

This parameter cannot be used in conjunction with the *password*, *client_secret*, or *client-auth-certificate-password* parameter.

Tip: Be sure to delete your secret file at the conclusion of the installation.

--secret-std-in (All Authentication Types)

This parameter allows you to provide a plain text secret via standard in for the Keyfactor Command connect service account that the orchestrator uses to communicate with Keyfactor Command. For example:

```
echo "MySuperSecretPassword" | sudo ./install.sh --secret-std-in [other parameters here]
```

This parameter can be used with the *username*, *client-auth-certificate*, or *client-id* parameter to provide the authentication secret from a file rather than the command line to avoid storing it in command history.

This parameter cannot be used in conjunction with the *password*, *client_secret*, or *client-auth-certificate-password* parameter.

--audience

This parameter is used to specify an audience value to be included in token requests delivered to the identity provider when using an identity provider other than Active Directory.

--capabilities

This parameter is used to specify the capabilities the orchestrator will support if a capability set other than the default set is desired. Supported options are:

- all

All the capabilities supported by the orchestrator will be enabled and reported to Keyfactor Command.

- none

The orchestrator will be installed with no capabilities and will not be registered with Keyfactor Command. This is primarily used for implementations that will support only custom capabilities (see [Installing Custom-Built Extensions on page 2940](#) and [Configuring Script-Based Certificate Store Jobs on page 2946](#)).

- ssl

Only the SSL discovery and monitoring capability will be enabled and reported to Keyfactor Command.

If the *in-place* parameter is specified, this parameter must be set to *all*.

If this parameter is not specified, the default set of capabilities for the orchestrator will be used. For the Linux orchestrator, the default capability set is *LOG* (log fetching).

Important: The Linux orchestrator does not support the CA (remote CA management) or IIS (Windows server certificate store) capabilities due to the Windows-specific nature of the authentication requirements for these methods.

--destination

This parameter specifies a location in which to install the orchestrator that is other than the default. The default installation location is:

```
/opt/keyfactor/orchestrator
```

This parameter cannot be used in conjunction with the *in-place* parameter.

--force, -f

Specifying this parameter causes the installation to warn and continue on certain potential problems, including:

- The local Universal Orchestrator service account does not exist. The default user will be created if *force* is specified.
- The local application settings (appsettings.json) file does not exist. A new one will be created if *force* is specified.
- A service with either the default service name or the service name specified with the *service-suffix* parameter already exists. The service will be overwritten if *force* is specified.
- Either the default installation location or the location specified with the *location* para-

meter is not empty. The install will occur to the specified or default location anyway and files may be overwritten if *force* is specified.

If this parameter is not specified and any of these problems are encountered, the installation will terminate prematurely. See also the *what-if* parameter.

--in-place

This parameter is used to indicate that the installation should occur in the current directory where the install files are located and no files should be copied to another location on the machine.

This parameter cannot be used in conjunction with the *destination* parameter. This parameter is only supported if the *capabilities* parameter is set to *all*.

--no-revocation-check

This parameter is used to indicate that the revocation status (CRL) of the SSL certificate on the Keyfactor Command server should not be checked when connecting to Keyfactor Command.

Specifying this parameter sets the local orchestrator application setting *Check-ServerCertificateRevocation* to false. The default for this parameter is *true* (CRL checking will be done).

--no-service

This parameter is used to indicate that no service should be created and added to the server's service control manager. The orchestrator will be installed but will need to be started manually or added to the server's service control manager manually.

This parameter cannot be used in conjunction with the *service-suffix* or *service-user* parameter.

--orchestrator-name

Specifying this parameter allows you to override the name the orchestrator would by default use to register itself in Keyfactor Command.

Specifying this parameter sets the local orchestrator application setting *OrchestratorName* to the specified value.

By default, the orchestrator uses the results from a hostname lookup for the orchestrator's name.

--service-suffix

This parameter is used to add a suffix to the root service name of *keyfactor-orchestrator* (e.g. *instance1* for a resulting service name of *keyfactor-orchestrator-instance1*). This is used primarily for implementations where the orchestrator will be installed multiple times on the same

server.

This parameter cannot be used in conjunction with the *no-service* parameter.

If this parameter is not specified, the default service name of *keyfactor-orchestrator-default* will be used.

--service-user

This is the local Linux Universal Orchestrator service account that the service will run as (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)). It should be entered as just the user name. Entry of a password for this service account is not required. You may either create this account prior to running the installation script (or use an existing account) or use the *force* parameter to generate the account automatically during the installation process.

This parameter cannot be used in conjunction with the *no-service* parameter.

If this parameter is not specified, the default service account name of *keyfactor-orchestrator* will be used.

--scope

This parameter is used to specify one or more scopes that should be included in token requests delivered to the identity provider when using an identity provider other than Active Directory. Multiple scopes should be separated by spaces.

--source

Specify this parameter to point to a directory containing the installation files other than the directory in which the *install.sh* file is found. This parameter is used primarily if a copy of the *install.sh* file is made in an alternate directory, updated with some customizations, and then used for installation without being copied back to the directory where the remaining installation files are located.

--verbose, -v

Specify this parameter to output verbose installation messages.

--what-if

This parameter is used to test the installation command without actually installing in order to see any errors that might arise and correct them before installing.

Installation example with expected output using Basic authentication (the password for the *svc_kyforch* service account is saved in *my_password_file*):

```
vi my_password_file
```

```
sudo ./install.sh --url https://keyfactor.keyexample.com/KeyfactorAgents --username svc_
kyforch@keyexample.com --secret-file-path my_password_file --orchestrator-name appsvr16-
ssl.keyexample.com --capabilities all --force
```

```
Creating user keyfactor-orchestrator
Copying files from /tmp/KeyfactorOrchestrator to /opt/keyfactor/orchestrator
Saving app settings
Setting file permissions
Installing systemd service keyfactor-orchestrator-default
Created symlink /etc/systemd/system/multi-user.target.wants/keyfactor-orchestrator-default.ser-
vice → /etc/systemd/system/keyfactor-orchestrator-default.service.
Starting systemd service keyfactor-orchestrator-default
```

Installation example with expected output using token authentication (the secret for the client is provided at standard in):

```
echo "WcHlAhYku6wmD0a6rj0XC1rkz0Jw9sGh" | sudo ./install.sh --url https://key-
factor.keyexample.com/KeyfactorAgents --bearer-token-url https://appsvr-
vr18.keyexample.com:1443/realms/Keyfactor/protocol/openid-connect/token --token-lifetime 300 --
client-id Universal-Orchestrator --secret-std-in --orchestrator-name appsvr16-ssl.keyexample.com
--capabilities all --force
```

```
Creating user keyfactor-orchestrator
Copying files from /tmp/KeyfactorOrchestrator to /opt/keyfactor/orchestrator
Setting file permissions and saving app settings
Installing systemd service keyfactor-orchestrator-default
Created symlink /etc/systemd/system/multi-user.target.wants/keyfactor-orchestrator-default.ser-
vice → /etc/systemd/system/keyfactor-orchestrator-default.service.
Starting systemd service keyfactor-orchestrator-default
```

Installation example with expected output using client certificate authentication (the password for the client certificate is saved in cert_password_file):

```
vi cert_password_file

sudo ./install.sh --url https://keyfactor.keyexample.com/KeyfactorAgents --client-auth-cert-
ificate /opt/certs/kyforch.p12 --secret-file-path cert_password_file --orchestrator-name
appsvr16-ssl.keyexample.com --capabilities all --force

Creating user keyfactor-orchestrator
Copying files from /tmp/KeyfactorOrchestrator to /opt/keyfactor/orchestrator
Saving app settings
Setting file permissions
```

```
Installing systemd service keyfactor-orchestrator-default
Created symlink /etc/systemd/system/multi-user.target.wants/keyfactor-orchestrator-default.service → /etc/systemd/system/keyfactor-orchestrator-default.service.
Starting systemd service keyfactor-orchestrator-default
```

4. Review the output from the installation to confirm that no errors have occurred.

The script creates a directory, `/opt/keyfactor/orchestrator` by default, and places the orchestrator files in this directory. Log files are found in `/opt/keyfactor/orchestrator/logs` by default, though this is configurable (see [Configure Logging for the Universal Orchestrator on page 2950](#)).

The orchestrator service, by default named `keyfactor-orchestrator-default.service`, should be automatically started at the conclusion of the install and configured to restart on reboot unless you have selected the `no-service` parameter.

Tip: Once the installation of the orchestrator is complete, you need to use the Keyfactor CommandManagement Portal to approve the orchestrator and configure certificate stores or SSL jobs:

- [Approving or Disapproving Orchestrators on page 500](#)
- [Certificate Store Operations on page 413](#)
- [SSL Discovery on page 453](#)

5.2.4 Install the Universal Orchestrator in a Linux Container

When the Keyfactor Universal Orchestrator runs in a Linux container, it is typically installed in a containerization solution that sits on top of a Linux server or set of servers. There are a wide variety of containerization solutions for multiple operating systems. This document covers deploying the container to either Docker or Kubernetes on Linux.

The artifactory for the Universal Orchestrator images can be found here:

```
keyfactor.jfrog.io/con-develop-us-engineering/command/
```

Check with your Keyfactor Customer Success Manager for credentials.

Two different images are available, depending on the functionality you are looking for:

- `universal-orchestrator`
This image has no built-in functionality and is designed to be used with custom extensions.
- `universal-orchestrator-ssl`
This image provides the SSL capability to provide support for SSL discovery and monitoring.

Docker

If you plan to use Docker, you may find it helpful to first run the Universal Orchestrator in the foreground so that it will output log messages to assist in troubleshooting.

Tip: If your Docker implementation hasn't been configured to inject your DNS server(s) into running containers, you may wish to do this so that the Universal Orchestrator will be able to do name resolution. To do this, on the Linux server(s) where you are running Docker, create or update the `/etc/docker/daemon.json` file, and add an entry similar to the following:

```
{"dns": ["DNS_IP_Address_1", "DNS_IP_Address_2"] }
```

To install the Universal Orchestrator in a Linux container and start the container using compose:

1. Create a directory from which you will run the Docker container (e.g. `/opt/kyf_uo`).
2. Select a Universal Orchestrator image, and from your Docker host, retrieve the Universal Orchestrator image from the artifactory with commands similar to the following (using credentials provided to you by Keyfactor; the password is saved in `my_password.txt`):

```
cat my_password.txt | docker login keyfactor.jfrog.io --username username --password-stdin
```

```
docker pull keyfactor.jfrog.io/con-develop-us-engineering/command/universal-orchestrator-ssl:11.0
```

Important: Remove the `my_password.txt` file when complete.

3. Create a Docker compose file (`compose.yaml`) in the directory for your Docker container similar to the following, using the inputs as per [Table 854: Linux Container Parameters](#), referencing the artifactory you pulled, selecting the appropriate authentication mechanism for your environment, and any additional volume mounts (see [Custom Extensions on page 2925](#)). The fields highlighted in red below indicate fields that need to be edited or that you may wish to edit.

Important: When editing the file, be sure to preserve the indenting exactly as found. YAML requires a very specific file layout to function. If the indenting (multiples of two spaces) or layout is incorrect, you will receive an error when trying to install.

```
services:
  universal-orchestrator:
    image: keyfactor.jfrog.io/con-develop-us-engineering/command/universal-orchestrator-ssl:11.0
    container_name: universal_orchestrator_1
    environment:
```

```

COMMAND_AGENTS_URL: https://keyfactor.keyexample.com/KeyfactorAgents
ORCHESTRATOR_NAME: appsrvr19-U0-1

# Uncomment the next two lines to use Active Directory
#USERNAME: KEYEXAMPLE\svc_kyforch
#PASSWORD: MySuperSecretPassword

# Uncomment the next two lines to use OAuth
#BEARER_TOKEN_URL: https://appsrvr18.keyexample.com:1443/realms/Keyfactor/protocol/openid-
connect/token
#TOKEN_LIFETIME: 300
#CLIENTID: Universal-Orchestrator
#CLIENT_SECRET: Client-Secret-from-Keyfactor-IdP
volumes:
- /etc/ssl/certs:/etc/ssl/certs:ro

```

Important: The password or secret for the Keyfactor Command connect service account is stored in clear text in this compose file. Access to this file should be strictly controlled.

4. Set the permissions on the `compose.yaml` file such that the file is owned by root and readable only by root (this assumes your Docker daemon is running as root, which is typical). For example:

```
sudo chown root:root compose.yaml
```

```
sudo chmod 400 compose.yaml
```

Tip: If you need to make edits to the compose file, you will need to make the file writable again. For example:

```
sudo chmod 600 compose.yaml
```

5. Execute the following command to install and run the container in the foreground:

```
sudo docker compose up
```

Press CTRL-C to stop it if it's running in the foreground. You can instead run it in the background by adding the `-d` flag like so, but it can sometimes be helpful to run it in the foreground initially so that you can easily review the log output live:

```
sudo docker compose up -d
```

Tip: To stop and start the container again after installation is complete, use the following commands:

```
sudo docker compose stop
```

```
sudo docker compose start
```

Or:

```
sudo docker compose restart
```

If you need to delete the container and try the install again, use this command:

```
sudo docker compose down
```

To review logs generated from the container, identify the container ID or name with this command:

```
sudo docker container ls
```

Then use the following command to output the current log (with the optional `--follow` to make output continuous):

```
sudo docker container logs [--follow] [container ID or name]
```

Custom Extensions

To use custom extensions with the orchestrators (see [Installing Custom-Built Extensions on page 2940](#)), you can either build them into a custom-built orchestrator image or reference them as external volume mounts. The latter works well for quick testing in a development environment, but you'll probably want to use a custom-built orchestrator image for a production deployment.

To run the orchestrator referencing an extension as an external volume mount:

1. Create a directory on your Linux server to host the extension(s) you wish to use and copy each extension you wish to use into this directory. For example:

```
/opt/kyf_uo/exts/f5-ext
```

```
/opt/kyf_uo/exts/citrix-ext
```

Make note of whether the extension documentation indicates whether the files in the extension need to exist within a subdirectory or whether they should be placed in the root of the directory you're creating (e.g. f5-ext).

2. Follow the instructions above, but modify the volumes section of your docker compose file to include the extension(s). For example (where /app/extensions is the path within the image where the extensions will live):

```
[See beginning above]
volumes:
  - /etc/ssl/certs:/etc/ssl/certs:ro
  - /opt/kyf_uo/exts/f5-ext:/app/extensions/f5-ext
  - /opt/kyf_uo/exts/citrix-ext:/app/extensions/citrix-ext
```

To create a custom build of the orchestrator referencing extensions:

1. Create a directory on your Linux server to host the extension(s) you wish to use and copy each extension you wish to use into this directory. This should be a subdirectory of the directory in which you will build your custom orchestrator image. For example:

```
/opt/kyf_uo/exts/f5-ext
```

```
/opt/kyf_uo/exts/citrix-ext
```

Make note of whether the extension documentation indicates whether the files in the extension need to exist within a subdirectory or whether they should be placed in the root of the directory you're creating (e.g. f5-ext).

2. In the directory above the extension directory (e.g. /opt/kyf_uo), create a file called *Dockerfile* and open it for editing. The entries in this file will vary depending on the extension(s) you wish to include in your build. Check the documentation for the specific extension for more information. The following example includes two extensions:

```
FROM keyfactor.jfrog.io/con-develop-us-engineering/command/universal-orchestrator:11.0
WORKDIR "/app/extensions/f5-ext"
COPY ./ext/f5-ext/ ./
WORKDIR "/app/extensions/citrix-ext"
COPY ./ext/citrix-ext/ ./
WORKDIR "/app"
```

This build script sets the source for the artifactory and then changes directories within the image to the f5-ext directory. It copies the contents of the ext/f5-ext subdirectory under the current working directory on the host to the current directory in the image. It then repeats this change directory and copy for the Citrix Netscaler extension. Finally, it changes directory back

to the /app directory within the image before leaving the build. This last step is important to be sure the image will later function as expected.

3. Build your custom image by executing the following command from the directory in which your *Dockerfile* is located (where `custom-uo-image` is the name you give to your image):

```
docker build -t custom-uo-image .
```

4. Create your compose file as above, but referencing your custom image like so:

```
services:
  universal-orchestrator:
    image: custom-uo-image
    container_name: universal_orchestrator_f5_ns
[see remainder above]
```

5. Complete the install as above.

Kubernetes

To install the Universal Orchestrator in a Linux container and start the container using Kubernetes:

1. Create a directory from which you will run the container (e.g. /opt/kyf_uo).
2. Create a secret in Kubernetes for the credentials that the orchestrator(s) will use to authenticate to Keyfactor Command (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)). For example, for Active Directory authentication:

```
echo -n 'keyexample\svc_kyforch' > ./username
```

```
echo -n 'MySuperSecretPassword' > ./password
```

```
kubectl create secret generic uo-credentials --from-file=./username --from-file=./password
```

For authentication with an identity provider other than Active Directory:

```
echo -n 'Universal-Orchestrator' > ./clientid
```

```
echo -n 'Client-Secret-from-Keyfactor-IdP' > ./clientsecret
```

```
kubectl create secret generic uo-credentials --from-file=./clientid --from-file=./clientsecret
```

Important: The password or secret for the Keyfactor Command connect service account is stored in clear text in the “password” or “clientsecret” file. Be sure to delete it after the Kubernetes secret has been created.

3. Create a secret in Kubernetes for the credentials you will use to authenticate to the Keyfactor artifactory. For example:

```
kubect1 create secret docker-registry keyregcred --docker-server=keyfactor.jfrog.io
--docker-username=MyUsername --docker-password=MySuperSecretPassword --docker-
email=my.email@my-domain.com
```

4. On your Kubernetes server, create a configmap containing CA root certificates, including the chain certificates for the SSL certificate on the Keyfactor Command server (see [Configure Certificate Root Trust for the Universal Orchestrator on page 2888](#)). For example:

```
kubect1 create configmap ca-roots --from-file=/etc/ssl/certs/ca-certificates.crt
```

Note: The standard path to the trusted root store will vary depending on your Linux implementation.

5. Create a Kubernetes deployment file (e.g. `uo_ssl.yaml`) in the directory for your Kubernetes container similar to the following, using the inputs as per [Table 854: Linux Container Parameters](#), referencing the artifactory for the image you wish to install, selecting the appropriate authentication mechanism for your environment, and any additional volume mounts. The fields highlighted in red below indicate fields that need to be edited or that you may wish to edit.

Important: When editing the file, be sure to preserve the indenting exactly as found. YAML requires a very specific file layout to function. If the indenting (multiples of two spaces) or layout is incorrect, you will receive an error when trying to install.

```
apiVersion: apps/v1
kind: StatefulSet
metadata:
  # Give the pod a unique name if you plan to deploy more than one orchestrator to the same Kuber-
  netes server or cluster
  name: keyfactor-uo-1
  labels:
    app.kubernetes.io/name: keyfactor-universal-orchestrator
    app.kubernetes.io/instance: ssl-1
    app.kubernetes.io/version: "11.0"
spec:
```

```

# The universal orchestrator should not have replicas; instead use many different deployments

      subPath: ca-certificates.crt
  volumes:
    - configMap:
        items:
          - key: ca-certificates.crt
            path: ca-certificates.crt
        name: ca-roots
      name: root-ca
    # Uncomment the next block if adding extensions
    #- name: command-pv-claim
    # emptyDir: {}
  imagePullSecrets:
    - name: keyregcred

```

6. Set the permissions on the deployment file such that the file is owned by root and readable only by root (this assumes your Kubernetes implementation is running as root, which is typical). For example:

```
sudo chown root:root uo_ssl.yaml
```

```
sudo chmod 400 uo_ssl.yaml
```

Tip: If you need to make edits to the compose file, you will need to make the file writable again. For example:

```
sudo chmod 600 uo_ssl.yaml
```

7. Execute the following command to install and run the container:

```
kubectl apply -f uo_ssl.yaml
```

Tip: To review logs generated from the container, identify the pod name with this command:

```
kubectl get pods
```

Then use the following command to output the current log:

```
kubectl logs [pod name] --follow
```

The optional follow parameter will continuously output the logs as they are generated until interrupted.

If you need to delete the container and try the install again, use this command:

```
kubectl delete -f uo_ssl.yaml
```

Table 854: Linux Container Parameters

Parameter	Description
AppSettings__Check-ServerCertificateRevocation	A Boolean that indicates whether the revocation status (CRL) of the SSL certificate on the Keyfactor Command server should be checked when connecting to Keyfactor Command (true) or not (false). The default is <i>true</i> (CRL checking will be done).
AUDIENCE	This parameter is used to specify an audience value to be included in token requests delivered to the identity provider when using an identity provider other than Active Directory.
BEARER_TOKEN_URL	Required* . The URL of the token endpoint for your identity provider. For example: <pre>https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/token</pre> For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see Configuring Keyfactor Identity Provider and Collecting Data for the Keyfactor Command Installation on page 2716). This parameter is required if you're using an identity provider other than Active Directory.

Parameter	Description
CLIENTID	<p>Required*. For implementations using an identity provider other than Active Directory, the ID of the identity provider client that should be used to authenticate the session (see Create Service Accounts for the Universal Orchestrator on page 2884).</p> <p>This parameter is required if you're using an identity provider other than Active Directory.</p>
CLIENT_SECRET	<p>Required*. For implementations using an identity provider other than Active Directory, the secret of the identity provider client that should be used to authenticate the session.</p> <p>This parameter is required if you're using an identity provider other than Active Directory.</p>
COMMAND_AGENTS_URL	<p>Required. The URL of the Orchestrators API on the Keyfactor Command server. For example:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAgents</pre>
LOG_LEVEL	<p>The logging level for the orchestrator. The default value is <i>Info</i>. Possible values are the same as those described in Configure Logging for the Universal Orchestrator on page 2950.</p>
ORCHESTRATOR_NAME	<p>The name the orchestrator uses to register itself with Keyfactor Command. By default, the container hostname is used, which is not ideal as this will create a new orchestrator entry with every container start. Although this parameter is not strictly required, Keyfactor strongly recommends using it.</p> <p>If you choose to uninstall and reinstall the orchestrator (using compose down), it is important to use the same orchestrator name for subsequent implementations so that Keyfactor Command will recognize the orchestrator when it is started again using compose up.</p>
PASSWORD	<p>Required*. The password for the Keyfactor Command Connect Service Account if you're using Active Directory as an identity provider (see USERNAME).</p> <p>This parameter is required if you're using Active Directory as an identity provider.</p>
SCOPE	<p>This parameter is used to specify one or more scopes that should be included in token requests delivered to the identity provider when using an identity provider other than Active Directory. Multiple scopes should be separated by spaces.</p>

Parameter	Description
TOKEN_LIFETIME	<p>For implementations using an identity provider other than Active Directory, the number of seconds for which the bearer token is valid. This should be set to the same value as the Keyfactor Command <i>Cookie Expiration</i>. For example, if the Keyfactor Command <i>Cookie Expiration</i> is 5 minutes, the <i>TOKEN_LIFETIME</i> should be 300 seconds. The default value is 60.</p> <p>The <i>Cookie Expiration</i> value determines the length of time the authentication cookie is considered valid. After half of the setting's duration, Keyfactor Command will attempt to use a refresh token to update the cookie. If this fails, the orchestrator's session will be terminated.</p>
USERNAME	<p>Required*. The username for service account used to connect to the Keyfactor Command server (see PASSWORD). This is the Keyfactor Command Connect Service Account described in Create Service Accounts for the Universal Orchestrator on page 2884 if you're using Active Directory as an identity provider. The orchestrator uses Basic Authentication to authenticate to Keyfactor Command.</p> <p>This parameter is required if you're using Active Directory as an identity provider.</p>

Note: The Keyfactor Universal Orchestrator running in a container does not support client certificate authentication.

Tip: Once the installation of the orchestrator is complete, you need to use the Keyfactor CommandManagement Portal to approve the orchestrator and configure certificate stores or SSL jobs:

- [Approving or Disapproving Orchestrators on page 500](#)
- [Certificate Store Operations on page 413](#)
- [SSL Discovery on page 453](#)

5.2.5 Optional Configuration

Once the installation is complete, the Keyfactor Universal Orchestrator should be running and ready to communicate with the Keyfactor Command server. The initial installation allows the orchestrator to register itself with Keyfactor Command and run jobs of the capability types configured during installation (after being approved in the Keyfactor Command Management Portal) unless you selected the NoService parameter.

This section details some post-install configuration steps that may need to be completed for some capabilities and some optional settings.

Important: Synchronization for the remote CA functionality of the orchestrator will not begin until you complete the configuration by making the appropriate configuration changes in the Keyfactor Command Management Portal. See [Orchestrator Management on page 496](#) in the *Keyfactor Command Reference Guide* for instructions on approving the orchestrator in the Keyfactor Command Management Portal on the *Orchestrators->Management* page and [Adding or Modifying a CA Record on page 354](#) in the *Keyfactor Command Reference Guide* for instructions on configuring certificate and template synchronization for remote CAs on the *Locations->Certificate Authorities* page.

5.2.5.1 Configure Windows Targets for Remote Management

This step only needs to be completed if you plan to use one of the custom-built extensions for the Keyfactor Universal Orchestrator to manage certificate stores on Windows machines that relies on PowerShell remoting and WinRM. Keyfactor offers many custom-built extensions for the Universal Orchestrator on GitHub:

<https://keyfactor.github.io/integrations-catalog/content/orchestrator>

Packages that rely on PowerShell remoting and WinRM for store management on Windows include:

- [IIS Certificate Store Manager](#)
- [Remote File Certificate Store Management](#) (Java Keystores, PKCS12 files, PEM files, DER files, IBM Key Database files)

Permissions

On each target machine where you wish to manage certificate stores with the Universal Orchestrator, you need to grant the Active Directory or local service account the orchestrator is using to authenticate to the server sufficient permissions to read the directories where the certificate stores are located (for the Remote File extension) or local machine certificate store (for the IIS extension) and, if you plan to deploy certificates to it using Keyfactor Command and bind certificates to IIS, write to the directories (Remote File) and local machine store (IIS) and appropriate permissions to bind certificates in IIS. For the Remote File extension, granting read/write permissions on the given directories may be sufficient. For IIS, the Universal Orchestrator service account needs to be added to the local administrators group on each target machine.

PowerShell Remoting

The orchestrator uses PowerShell remoting to deliver certificates to targets and bind certificates to IIS web sites. This includes certificates delivered directly from the PFX enrollment option of the Keyfactor Command Management Portal or Keyfactor API to targets. If you wish to use any of these features, you will need to make sure that each target machine on which you want to use one of these features is running at least PowerShell version 3 and that PowerShell remoting has been enabled.

To check the PowerShell version on a given machine, open a PowerShell window, run the following command, and check the output CLRVersion:

```
$PSVersionTable
```

PowerShell version 3 is available for download from Microsoft.

To enable PowerShell remoting:

1. On the target machine, open a PowerShell window using the “Run as administrator” option.
2. On the target machine, run the following command to enable PowerShell remoting:

```
Enable-PSRemoting
```

Respond Yes to all the question prompts (or A for all).

3. On the target machine it may be necessary to run the following command to enable execution of unsigned local PowerShell scripts for some operating systems (e.g. Windows Server 2008 R2):

```
Set-ExecutionPolicy RemoteSigned
```

4. To test the PowerShell remoting, on the Universal Orchestrator server, open a PowerShell window and run the following command (where TARGET_MACHINE is the FQDN of the target machine you wish to manage with the orchestrator):

```
Enter-PSSession -ComputerName TARGET_MACHINE
```

Use the actual hostname of the target machine rather than a DNS alias (either A or CNAME records) when running this test. This is necessary because PowerShell remoting relies on Kerberos authentication, which requires that the target machine has a service principal name (SPN) in the HTTP/ format assigned to the target’s machine account. This will be present by default (as part of the HOST/ format record) as long as the HTTP/ format SPN has not been manually assigned elsewhere. Using an alias gets into complexities of setting up appropriate SPNs and assuring that there are not duplicate SPNs in the environment.

You should be connected to the target machine and be able to execute PowerShell commands on the target machine.

WinRM and Firewall Port Considerations

When you add a certificate store in Keyfactor Command using an extension from Keyfactor’s GitHub that relies on WinRM, you are given the option to choose whether to secure the channel to the target hosting the certificate store with SSL. If you select True, Microsoft Windows Remote Management (WinRM) on the target needs to be running on HTTPS and to have been configured with a certificate for WinRM. If you select False, WinRM on the target needs to be running on HTTP. By default, WinRM HTTP uses port 5985 and WinRM HTTPS uses port 5986. WinRM HTTPS is not enabled out-of-the box.

Make sure that any firewalls between the Universal Orchestrator, Keyfactor Command, and the remote target allow communications over port TCP 5985 or 5986, depending on your SSL selection,

or the alternate port you've configured for WinRM on the target if you're not using the default WinRM port(s).

You can use the Test-WSMan and Test-netConnection PowerShell cmdlets on the Universal Orchestrator to validate that communication can occur between the Universal Orchestrator and the remote target in the manner you are intending to configure it (SSL or not SSL). For example, for SSL using the default port (where `websrvr38.keyexample.com` is your remote target):

```
Test-netConnection -ComputerName "websrvr38.keyexample.com" port 5986
```

Output from this command should look something like this if the connection completes successfully:

```
ComputerName      : websrvr38.keyexample.com
RemoteAddress     : 192.168.216.38
RemotePort        : 5986
InterfaceAlias    : Ethernet0
SourceAddress     : 192.168.216.42
TcpTestSucceeded : True
```

And:

```
Test-WSMan -ComputerName websrvr38.keyexample.com -UseSSL
```

Output from this command should look something like this if the connection completes successfully:

```
wsmid              : http://schemas.dmtf.org/wbem/wsman/identity/1/wsmanidentity.xsd
ProtocolVersion    : http://schemas.dmtf.org/wbem/wsman/1/wsman.xsd
ProductVendor      : Microsoft Corporation
ProductVersion     : OS: 0.0.0 SP: 0.0 Stack: 3.0
```

On the remote target, you can use the following WinRM command to check the configuration of WinRM, whether it has been configured to support HTTPS, whether it has a certificate configured for HTTPS, and the ports in use:

```
winrm enumerate winrm/config/listener
```

Output from this command should look something like this if both HTTP and HTTPS are configured for WinRM (notice the port for HTTPS and the certificate thumbprint indicating a certificate has been configured for WinRM on HTTPS):

```
Listener
  Address = *
```

```
Transport = HTTP
Port = 5985
Hostname
Enabled = true
URLPrefix = wsman
CertificateThumbprint
ListeningOn = 192.168.216.42, 127.0.0.1, ::1, fe80::21e1:ab7e:9c35:5550%3
```

```
Listener
Address = *
Transport = HTTPS
Port = 5986
Hostname = webservr42.keyexample.com
Enabled = true
URLPrefix = wsman
CertificateThumbprint = 79ee047d673da83cea87ba779761b0ec2b9217f8
ListeningOn = 192.168.216.42, 127.0.0.1, ::1, fe80::21e1:ab7e:9c35:5550%3
```

For troubleshooting help, see [Remote Management Helpful Tools on page 3020](#). For more information about configuring WinRM for HTTPS, see:

<https://learn.microsoft.com/en-us/troubleshoot/windows-client/system-management-components/configure-winrm-for-https>

5.2.5.2 Configure the Universal Orchestrator for Remote CA Management

If you've opted to enable the remote CA management functionality for the Keyfactor Universal Orchestrator, further configuration is needed on the orchestrator to configure the CA(s) that the orchestrator will manage.

To configure CAs for the orchestrator:

1. On the orchestrator, open a text editor (e.g. Notepad) using the "Run as administrator" option.
2. In the text editor, browse to open the *extensionoptions.json* file for the Universal Orchestrator. The file is located in the configuration directory within the install directory, which is the following directory by default:

```
C:\Program Files\Keyfactor\Keyfactor Orchestrator\configuration
```

3. In the *extensionoptions.json* file, locate the CertificateAuthority section.

```

{
  "CertificateAuthority": {
    "BatchSize": 10000,
    "CacheHours": 3,
    "RecordCountLimit": 5000,
    "MaxErrorCount": 5,
    "AdditionalCertificateAuthoritiesAllowed": false,
    "CertificateAuthorities": [
      {
        "Forest": "keyother.com",
        "Hostname": "corpca01.keyother.com",
        "LogicalName": "KeyIssuing01"
      },
      {
        "Forest": "keyother.com",
        "Hostname": "corpca02.keyother.com",
        "LogicalName": "KeyIssuing02"
      }
    ]
  }
},

```

Figure 574: CA Configuration Settings

4. Either set the *AdditionalCertificateAuthoritiesAllowed* value to **true** or populate the *CertificateAuthorities* section with your CA information (see [Table 855: Remote CA Configuration Parameters](#)).
5. Save the file.
6. Restart the orchestrator service (see [Start the Universal Orchestrator Service on page 2953](#)).

Table 855: Remote CA Configuration Parameters

Parameter	Description
BatchSize	<p>An integer that specifies the number of certificate cache records to read from the Keyfactor Command in each data retrieval batch. The default is 10,000.</p> <div style="border: 1px solid #c6e0b4; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: Certificate cache information from Keyfactor Command is retrieved from and stored on the orchestrator to allow the orchestrator to calculate which records represent changes and return only those to Keyfactor Command on requests from Keyfactor Command for CA synchronization.</p> </div>
CacheHours	<p>An integer that specifies the number of hours for which to cache certificate information from Keyfactor Command on the orchestrator before clearing it. The default is 3.</p>
RecordCountLimit	<p>An integer that specifies the number of records to read from the CA(s) in each synchronization batch. The default is 5,000.</p>
MaxErrorCount	<p>An integer that specifies the number of times an attempt</p>

Parameter	Description								
	should be made to read records from the CA before the synchronization job ends with a failure. The default is 5.								
AdditionalCertificateAuthoritiesAllowed	A Boolean that sets whether any CAs available to the orchestrator (to which the orchestrator has network access and sufficient permissions) should be considered as managed (<i>True</i>) or whether only those CAs specifically listed in the <i>CertificateAuthorities</i> parameter should be considered as managed (<i>False</i>). If you set this value to <i>True</i> , you do not need to populate the <i>CertificateAuthorities</i> value.								
CertificateAuthorities	An array of the certificate authorities that should be considered managed by the orchestrator. The certificate authority information includes: <table border="1" data-bbox="743 793 1404 1108"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Forest</td> <td>The name of the Active Directory forest in which the CA resides.</td> </tr> <tr> <td>Hostname</td> <td>The fully qualified domain name of the CA.</td> </tr> <tr> <td>LogicalName</td> <td>The logical name of the CA.</td> </tr> </tbody> </table>	Parameter	Description	Forest	The name of the Active Directory forest in which the CA resides.	Hostname	The fully qualified domain name of the CA.	LogicalName	The logical name of the CA.
Parameter	Description								
Forest	The name of the Active Directory forest in which the CA resides.								
Hostname	The fully qualified domain name of the CA.								
LogicalName	The logical name of the CA.								

5.2.5.3 Installing Custom-Built Extensions

Keyfactor offers many custom-built extensions for the Keyfactor Universal Orchestrator on GitHub:

<https://keyfactor.github.io/integrations-catalog/content/orchestrator>

Some packages that may be of special interest to long-term users of Keyfactor Command are:

- [AWS Certificate Store Manager](#)
- [Citrix NetScaler Certificate Store Manager](#)
- [F5 Certificate Store Manager](#)
- [IIS Certificate Store Manager](#)
- [Remote File Certificate Store Management](#) (Java Keystores, PKCS12 files, PEM files, DER files, IBM Key Database files)

Tip: Unlike the Keyfactor Java Agent, which must be installed directly on each machine holding Java keystores to be managed, the Keyfactor Universal Orchestrator with the Remote File extension is a centralized orchestrator, which is installed on just a single machine (or handful of machines) and then reaches out via remote management to each machine holding Java Keystores to be managed. For Java keystores on Windows servers, it uses PowerShell remoting and WinRM, typically over HTTPS, for this (see [Configure Windows Targets for Remote Management on page 2935](#)). For Java keystores on Linux servers, it uses either SCP or SFTP (configurable on a per-orchestrator basis and can be configured to try both). Large-scale deployment of Java keystore management (or any of the other formats supported by this extension) involves enabling PowerShell remoting and WinRM with HTTPS on Windows targets (and a local login user if the servers aren't domain joined) or enabling SCP or SFTP and creating a login user for the orchestrator on Linux targets.

Note: For information about installing PAM extensions for the Universal Orchestrator, see [Installing Custom PAM Provider Extensions on page 743](#).

To find a package on GitHub:

1. Visit one of the links above to find your desired package, and click either **Github Repository** or **View source on GitHub** to go to the package page on GitHub.

IIS Orchestrator

The IIS Orchestrator treats the certificates bound (actively in use) on a Microsoft Internet Information Server (IIS) as a Keyfactor certificate store. Inventory and Management functions are supported. The orchestrator replaces the IIS orchestrator that ships with Keyfactor Command (which did not support binding.)

[Github Repository](#)

Figure 575: View Packages as Part of a List

Remote File

Universal Orchestrator

The Remote File Orchestrator allows for the remote management of file-based certificate stores. Discovery, Inventory, and Management functions are supported. The orchestrator performs operations by first converting the certificate store into a BouncyCastle PKCS12Store.

[View source on GitHub](#)

Figure 576: View Packages on Individual Pages

2. On the GitHub page, on the right-hand side, click the link for the **Latest** version.

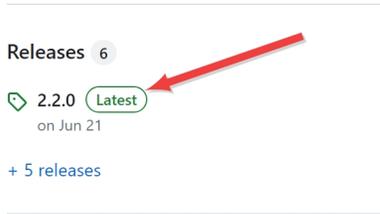

Figure 577: Find the Latest Version of the Package

3. On the GitHub version page in the Assets section, click the package name to download the zip file.

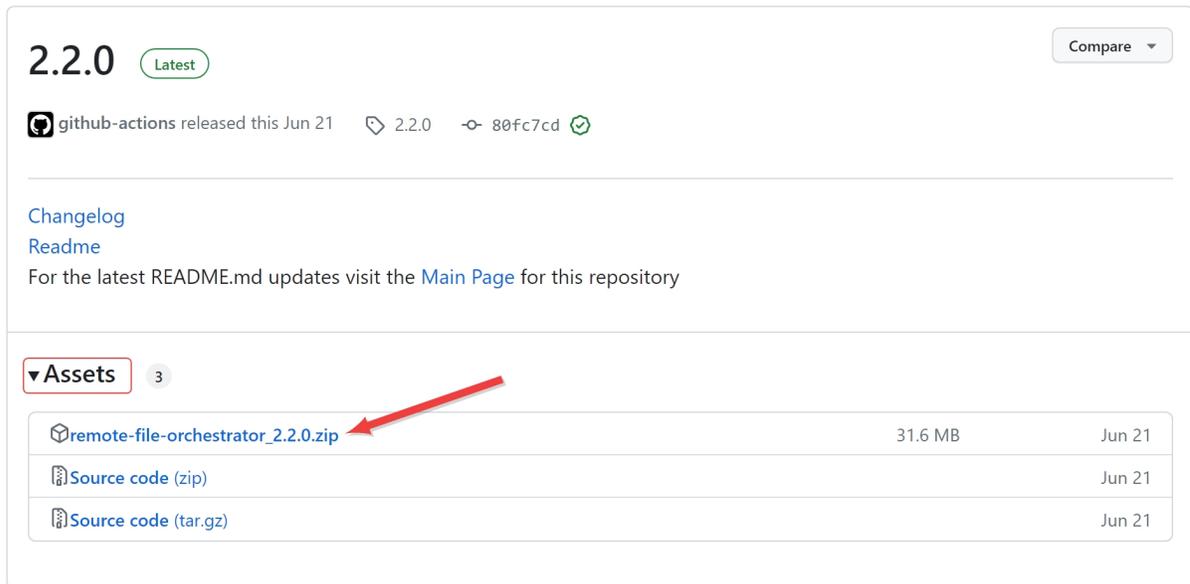

Figure 578: Download the Package Zip File

4. On the main extension GitHub page, review the documentation for the specific extension. Here you will find supported platforms, prerequisites, and extension-specific installation and configuration instructions. The below instructions only cover where to place the extension files on the orchestrator and building custom manifest.json files (changes to which aren't needed for extensions from GitHub unless you are customizing something), but not the details for creation of custom certificate store types for the extension or any other customization specific to a given extension.

Custom-built extensions can also be generated by end users using the Universal Orchestrator NuGet package. Custom-built extensions for certificate store jobs and custom jobs are both installed in the same way.

Once you have your custom-built extension ready, install it as follows:

1. In the Keyfactor Command Management Portal or using the Keyfactor API, add a certificate store type or custom job type for your custom-built extension, if applicable. See [Adding or](#)

[Editing a Certificate Store Type on page 701](#) or [POST Custom Job Types on page 1600](#)

2. On the Universal Orchestrator server, locate the extensions directory within the install directory. By default, this is:

Windows: C:\Program Files\Keyfactor\Keyfactor Orchestrator\extensions

Linux: /opt/keyfactor/orchestrator/extensions

3. Under the extensions directory, create a new directory with an appropriate name for your custom-built extension (e.g. MyExtension). This name is for reference only and does not need to match any names used elsewhere.
4. Place the DLL(s) created for your custom-built extension along with any other supporting files needed for the extension in the new directory.
5. In the directory for your custom-built extension, create a file called manifest.json if one has not been provided with the extension. The manifest.json file must be placed in the same directory as the DLL(s) for your extension.
6. Using a text editor, edit the manifest.json file if needed and configure it appropriately for your application.

Tip: This step is generally not needed for extensions downloaded from GitHub unless you have opted to make customizations or not use the suggested short name when creating the certificate store type.

Some things to keep in mind are:

- The opening and closing lines of the file must match those shown in red here:

```
{
  "extensions": {
    "Keyfactor.Orchestrators.Extensions.IOrchestratorJobExtension":
  {
    "Custom.MyJob": {
      "assemblypath": "Keyfactor.Orchestrators.MyJob.dll",
      "TypeFullName": "Keyfactor.Orchestrators.MyJob.MyJobExtension"
    }
  }
}
}
```

- Each customized section of the file starts with either a custom job reference (e.g. Custom.MyJob) or a certificate store reference (e.g. CertStores.MyStore.Inventory).

Custom jobs (beginning *Custom*) correspond to custom job types created with the Keyfactor API `POST /JobTypes/Custom` method. For example, a custom job type with a *JobTypeName* of *MyJob* would appear in the file as *Custom.MyJob*.

Certificate store jobs (beginning *CertStores*) correspond to certificate store types created with the Keyfactor API `POST /CertificateStoreType` method (see [POST Certificate Store Types on page 1552](#)) or in the Keyfactor Command Management Portal (see [Adding or Editing a Certificate Store Type on page 701](#)). For example, a certificate store type with a *Capability* of *MyStore* configured to do inventory, management and discovery, would have three separate sections in the file as *CertStores.MyStore.Inventory*, *CertStores.MyStore.Management*, and *CertStores.MyStore.Discovery*. An inventory section is required.

- The *assemblypath* referenced in each section points to the DLL in the extensions directory that corresponds to that job function. A single manifest file may include many different capabilities if the extension performs more than one type of job (e.g. inventory and management of certificates), such as is shown in the below example.
- The *TypeFullName* referenced in each section corresponds to the name of the type that resides inside of the DLL listed for the assembly path. A single manifest file may include many different capabilities if the extension performs more than one type of job (e.g. inventory and management of certificates), such as is shown in the below example.
- Each section may optionally have a *PreScript* reference, which points to a script file on the orchestrator machine that will run before the main job for the section executes.
 - For orchestrators installed on Windows, these will be PowerShell scripts. No special configuration is needed other than entry of a path to the PowerShell script in the *PreScript* field. The script may be placed anywhere on the orchestrator machine. The orchestrator will need read permissions to the script.
 - For orchestrators installed on Linux, these will be Bash scripts. In order to use a Bash script with the orchestrator, you must first register the Bash script driver in the `appsettings.json` file. This file is found in the *configuration* directory. Edit the file and add the following below the existing `AppSettings` configuration section in the file (before the final closing bracket):

```
"extensions": {
  "Keyfactor.Orchestrators.ScriptDrivers.IScriptDriver": {
    "RegisteredScriptDriver": {
      "assemblypath": "Keyfactor.Orchestrators.BashDriver.dll",
      "TypeFullName": "Keyfactor.Orchestrators.ScriptDrivers.BashDriver"
    }
  }
}
```

After the Bash script driver is registered, you may enter a path to the Bash script in the orchestrator manifest.json file *PreScript* section. The script may be placed

anywhere on the orchestrator machine. The orchestrator will need read permissions to the script.

 **Tip:** If your script fails, this will cause the entire job to fail. You can use this to your advantage if you'd like to fail the job under certain conditions by doing a *Write-Error* on Windows or *exit <error code>* on Linux.

For more information about calling scripts from the orchestrator, contact your Keyfactor representative.

 **Note:** The prescript and postscript functionality of the Keyfactor Universal Orchestrator has been replaced by other functionality in Keyfactor Command such as that provided by Keyfactor Command workflows (see [Workflow Definitions on page 230](#)). As a result, prescript and postscript functionality has been deprecated and will be removed from a future release.

- Each section may optionally have a *PostScript* reference, which points to a script file on the orchestrator machine that will run after the main job for the section executes. See the notes for script use under *PreScript*.
- User-defined certificate store jobs support up to four job types—Inventory, Management, Discovery, and Reenrollment. Each one of these job types should have a separate section in the file.

```
{
  "extensions": {
    "Keyfactor.Orchestrators.Extensions.IOrchestratorJobExtension": {
      "CertStores.MyStore.Inventory": {
        "assemblypath": "Keyfactor.Orchestrators.MyStore.dll",
        "TypeFullName": "Keyfactor.Orchestrators.MyStore.MyStoreInventoryJobExtension"
      },
      "CertStores.MyStore.Management": {
        "assemblypath": "Keyfactor.Orchestrators.MyStore.dll",
        "TypeFullName": "Keyfactor.Orches-
trators.MyStore.MyStoreManagementJobExtension",
        "PreScript": "C:\\Program Files\\Keyfactor\\Keyfactor
Orchestrator\\extensions\\MyStoreManagementPreScript.ps1",
        "PostScript": "C:\\Program Files\\Keyfactor\\Keyfactor Orches-
trator\\extensions\\MyStoreManagementPostScript.ps1"
      },
      "CertStores.MyStore.Discovery": {
        "assemblypath": "Keyfactor.Orchestrators.MyStore.dll",
        "TypeFullName": "Keyfactor.Orchestrators.MyStore.MyStoreDiscoveryJobExtension"
      }
    }
  }
}
```

```
    }  
  }  
}
```

7. Restart the Universal Orchestrator service (see [Start the Universal Orchestrator Service on page 2953](#)).
8. In the Keyfactor Command Management Portal, re-approve the orchestrator. The orchestrator will update to a status of new (if it had been approved previously) upon receiving updated capabilities. See [Orchestrator Management on page 496](#) for information on approving orchestrators.

Contact your Keyfactor representative for more information about custom-built solutions or to obtain access to the NuGet packages required for development of Universal Orchestrator extensions.

5.2.5.4 Configuring Script-Based Certificate Store Jobs

The Keyfactor Universal Orchestrator supports the option to implement custom-built certificate store jobs using one or more scripts (PowerShell or Bash) rather than a full extension (see [Installing Custom-Built Extensions on page 2940](#)). To implement custom-built certificate store jobs in this way, you need to create your scripts that will execute the certificate store actions (e.g. inventory, add certificates, remove certificates) and a manifest.json file to reference the jobs and install them on the orchestrator. Optionally, each certificate store action script can call a prescript and/or a postscript to perform actions before or after the main action.

Note: The scripting method of running custom-built certificate store jobs cannot be used to run other types of custom jobs. These are supported only with the use of a custom extension (see [Installing Custom-Built Extensions on page 2940](#)). However, both certificate store jobs and custom jobs support the use of prescripts and postscripts (see [Orchestrator Job Overview on page 2877](#)).

To configure a set of custom-built certificate store scripts:

1. On the Universal Orchestrator server, locate the scripts directory within the install directory. By default, this is:

Windows: C:\Program Files\Keyfactor\Keyfactor Orchestrator\Scripts

Linux: /opt/keyfactor/orchestrator/Scripts

2. Under the scripts directory, create a new directory with an appropriate name for your custom-built certificate store job set (e.g. MyStore). This name matches the name of the job referenced in the manifest.json file.

3. Place the scripts created for your custom-built certificate store job set in the new directory. Supported script file names are:
 - Add (e.g. Add.ps1 or Add.sh)
A management job to add a certificate to the certificate store.
 - Create (e.g. Create.ps1 or Create.sh)
A management job to create the certificate store if it does not already exist.
 - Discovery (e.g. Discovery.ps1 or Discovery.sh)
A discovery job.
 - Inventory (e.g. Inventory.ps1 or Inventory.sh)
An inventory job.
 - Reenrollment (e.g. Reenrollment.ps1 or Reenrollment.sh)
A reenrollment job.
 - Remove (e.g. Remove.ps1 or Remove.sh)
A management job to remove a certificate from the certificate store.
4. In order to use a Bash script with orchestrators installed on Linux, you must first register the Bash script driver in the appsettings.json file. This file is found in the configuration directory. Edit the file and add the following below the existing AppSettings configuration section in the file (before the final closing bracket):

```
"extensions": {  
  "Keyfactor.Orchestrators.ScriptDrivers.IScriptDriver": {  
    "RegisteredScriptDriver": {  
      "assemblypath": "Keyfactor.Orchestrators.BashDriver.dll",  
      "TypeFullName": "Keyfactor.Orchestrators.ScriptDrivers.BashDriver"  
    }  
  }  
}
```

5. On the Universal Orchestrator server, locate the JobExtensionDrivers directory within the extensions directory under the install directory. By default, this is:

Windows: C:\Program Files\Keyfactor\Keyfactor Orchestrator\extensions\JobExtensionDrivers

Linux: /opt/keyfactor/orchestrator/extensions/JobExtensionDrivers
6. In the JobExtensionDrivers directory, create a file called manifest.json or open the existing one. There should be only one manifest.json file no matter how many script directories you create.
7. Using a text editor, edit the manifest.json file and configure it appropriately for your custom-built certificate store job set. Some things to keep in mind are:

- The opening and closing lines of the file must match those shown in red here:

```
{
  "extensions": {
    "Keyfactor.Orchestrators.Extensions.IOrchestratorJobExtension":
  {
    "CertStores.MyStore.Inventory": {
      "assemblypath": "Keyfactor.Orchestrators.JobExtensionDrivers.dll",
      "TypeFullName": "Keyfactor.Orches-
trators.JobExtensionDrivers.InventoryJobExtensionDriver"
    }
  }
}
```

- Each customized section of the file starts with a certificate store reference (e.g. `CertStores.MyStore.Inventory`). Certificate stores jobs (beginning `CertStores`) correspond to certificate store types created with the Keyfactor API `POST /CertificateStoreType` method (see [POST Certificate Store Types on page 1552](#)) or in the Keyfactor Command Management Portal (see [Adding or Editing a Certificate Store Type on page 701](#)). For example, a custom certificate store type with a *Capability* of `MyStore` configured to do inventory, management and discovery, would have three separate sections in the file as `CertStores.MyStore.Inventory`, `CertStores.MyStore.Management`, and `CertStores.MyStore.Discovery`. The capability reference (e.g. `MyStore`) must also match the name you give to the directory where you place your scripts. An inventory section is required.
- The `assemblypath` referenced in each section points to the DLL in the extensions directory of the Job Extensions Driver extension. This built-in extension is used to run custom-built certificate store jobs as scripts. This value will be the same for all entries in the file.
- The `TypeFullName` referenced in each section corresponds to the name of the type that resides inside of the DLL listed for the assembly path—the Job Extensions Driver extension in this case. This value will be the same for all entries in the file.
- Each section may optionally have a `PreScript` reference, which points to an additional script file on the orchestrator machine that will run before the main job for the section executes.

Tip: If either your PreScript or PostScript fails, this will cause the entire job to fail. You can use this to your advantage if you'd like to fail the job under certain conditions by doing a `Write-Error` on Windows or `exit <error code>` on Linux.

Note: The prescript and postscript functionality of the Keyfactor Universal Orchestrator has been replaced by other functionality in Keyfactor Command such as that provided by Keyfactor Command workflows (see [Workflow Definitions on page 230](#)). As a result, prescript and postscript functionality has been deprecated and will be removed from a future release.

- Each section may optionally have a *PostScript* reference, which points to an additional script file on the orchestrator machine that will run after the main job for the section executes.
- Custom-built certificate store jobs support up to four job types—Inventory, Management, Discovery, and Reenrollment. Each one of these job types should have a separate section in the file.

```
{
  "extensions": {
    "Keyfactor.Orchestrators.Extensions.IOrchestratorJobExtension": {
      "CertStores.MyStore.Inventory": {
        "assemblypath": "Keyfactor.Orchestrators.JobExtensionDrivers.dll",
        "TypeFullName": "Keyfactor.Orchestrators.JobExtensionDrivers.InventoryJobExtensionDriver"
      },
      "CertStores.MyStore.Management": {
        "assemblypath": "Keyfactor.Orchestrators.JobExtensionDrivers.dll",
        "TypeFullName": "Keyfactor.Orchestrators.JobExtensionDrivers.InventoryJobExtensionDriver"
        "PreScript": "C:\\Program Files\\Keyfactor\\Keyfactor Orchestrator\\scripts\\MyStore\\MyStoreManagementPreScript.ps1",
        "PostScript": "C:\\Program Files\\Keyfactor\\Keyfactor Orchestrator\\scripts\\MyStore\\MyStoreManagementPostScript.ps1"
      },
      "CertStores.MyStore.Discovery": {
        "assemblypath": "Keyfactor.Orchestrators.JobExtensionDrivers.dll",
        "TypeFullName": "Keyfactor.Orchestrators.JobExtensionDrivers.InventoryJobExtensionDriver"
      },
      "CertStores.MyStore.Reenrollment": {
        "assemblypath": "Keyfactor.Orchestrators.JobExtensionDrivers.dll",
        "TypeFullName": "Keyfactor.Orchestrators.JobExtensionDrivers.InventoryJobExtensionDriver"
      }
    }
  }
}
```

- Restart the Universal Orchestrator service (see [Start the Universal Orchestrator Service on page 2953](#)).
- In the Keyfactor Command Management Portal, re-approve the orchestrator. The orchestrator will update to a status of new (if it had been approved previously) upon receiving updated capabilities. See [Orchestrator Management on page 496](#) for information on approving orchestrators.

Contact your Keyfactor representative for more information about custom solutions or for assistance creating custom scripts.

5.2.5.5 Configure Logging for the Universal Orchestrator

Keyfactor Universal Orchestrator provides extensive logging for visibility and troubleshooting. For more information about troubleshooting, see [Troubleshooting on page 3003](#).

By default, the Keyfactor Universal Orchestrator places its log files in the logs directory under the installed directory, generates logs at the INFO logging level and stores logs for two days before deleting them. If you wish to change these defaults, follow the directions below for your installation type.

Windows Installations

- On the Windows server where you wish to adjust logging, open a text editor (e.g. Notepad) using the “Run as administrator” option.
- In the text editor, browse to open the Nlog.config file for the Universal Orchestrator. The file is located in the configuration directory within the install directory, which is the following directory by default:

C:\Program Files\Keyfactor\Keyfactor Orchestrator\configuration

- Your Nlog.config file may have a slightly different layout than shown here, but it will contain the five fields highlighted in [Figure 579: Universal Orchestrator on Windows NLog.config File](#). The fields you may wish to edit are:

- `variable name="logDirectory" value="logs/"`

The path to the log file location.

Important: If you choose to change the path for storage of the log files, you will need to create the new directory (e.g. D:\KeyfactorLogs) and grant the Universal Orchestrator service account under which the Keyfactor Orchestrator Service is running full control permissions on this directory.

- `fileName="${logDirectory}/Log.txt"`

The path and file name of the active orchestrator log file, referencing the logDirectory variable.

- `archiveFileName="${logDirectory}/Log_Archive_{#}.txt"`

The path and file name of previous days' orchestrator log files, referencing the logDirectory variable. The orchestrator rotates log files daily and names the previous files using this naming convention.

- `maxArchiveFiles="2"`

The number of archive files to retain before deletion.

- `name="*" minlevel="Info" writeTo="logfile"`

The level of log detail that should be generated and output to the log file. The default INFO level logs error and some informational data but at a minimal level to avoid generating large log files. For troubleshooting, it may be desirable to set the logging level to DEBUG or TRACE. Available log levels (in order of increasing verbosity) are:

- OFF—No logging
- FATAL—Log severe errors that cause early termination
- ERROR—Log severe errors and other runtime errors or unexpected conditions that may not cause early termination
- WARN—Log errors and use of deprecated APIs, poor use of APIs, “almost” errors, and other runtime situations that are undesirable or unexpected but not necessarily “wrong”
- INFO—Log all of the above plus runtime events (startup/shutdown)
- DEBUG—Log all of the above plus detailed information on the flow through the system
- TRACE—Maximum log information—this option can generate VERY large log files

```

{variable name="logDirectory" value="logs"/>
<targets>
  <target name="buffered_wrapper" xsi:type="BufferingWrapper" slidingTimeout="true" bufferSize="500" flushTimeout="500">
    <target xsi:type="File" name="logfile" fileName="{logDirectory}/Log.txt" layout="{longdate} {logger} [{level}] - {message}"
      archiveFileName="{logDirectory}/Log_Archive_{#}.txt" archiveEvery="Day" archiveNumbering="Rolling" maxArchiveFiles="2" archiveAboveSize="2147483648"/>
  </target>
  <target xsi:type="OutputDebugString" name="String" layout="{longdate} {logger}::{message}"/>
  <target xsi:type="Debugger" name="debugger" layout="{longdate} {logger}::{message}"/>
  <target xsi:type="Console" name="console" layout="{logger} {message}"/>
  <target xsi:type="EventLog" name="eventLog" source="Keyfactor Orchestrator"
    eventId="{event-properties:item=eventID}" category="{event-properties:item=categoryID}" layout="{event-properties:item=message}" />
</targets>
<rules>
  <logger name="*-EVENT" minlevel="Info" writeTo="eventLog" final="true" />
  <logger name="*" minlevel="Info" writeTo="console" />
  <logger name="*" minlevel="Info" writeTo="logfile" >
    <filters>
      <when condition="contains('{logger}', 'Quartz') and level <= LogLevel.Warn" action="IgnoreFinal" />
      <when condition="starts-with('{logger}', 'Microsoft.Hosting.Lifetime') and level >= LogLevel.Info" action="LogFinal" />
      <when condition="starts-with('{logger}', 'Microsoft.Azure.SignalR') and level >= LogLevel.Debug" action="LogFinal" />
      <when condition="starts-with('{logger}', 'Microsoft.AspNetCore')" action="Ignore" />
      <when condition="starts-with('{logger}', 'Microsoft') and level <= LogLevel.Warn" action="Ignore" />
    </filters>
  </logger>
</rules>

```

Figure 579: Universal Orchestrator on Windows NLog.config File

Linux Installations

1. On the orchestrator machine where you wish to adjust logging, open a command shell and change to the directory in which the orchestrator is installed. By default this is /opt/keyfactor/orchestrator.
2. In the command shell in the directory in which the orchestrator is installed, change to the configuration directory.
3. Using a text editor, open the nlog.config file in the configuration directory. Your nlog.config file may have a slightly different layout than shown here, but it will contain the five fields highlighted in the below figure. The fields you may wish to edit are:

- `variable name="logDirectory" value="logs/"`

The path to the log file location.

Important: If you choose to change the path for storage of the log files, you will need to create the new directory (e.g. /opt/kyflogs) and grant the Universal Orchestrator service account under which the keyfactororchestrator-default service is running full control permissions on this directory.

- `fileName="{logDirectory}/Log.txt"`

The path and file name of the active orchestrator log file, referencing the logDirectory variable.

- `archiveFileName="{logDirectory}/Log_Archive_{#}.txt"`

The path and file name of previous days' orchestrator log files, referencing the logDirectory variable. The orchestrator rotates log files daily and names the previous files using this naming convention.

- maxArchiveFiles="2"

The number of archive files to retain before deletion.

- name="*" minlevel="Info" writeTo="logfile"

The level of log detail that should be generated and output to the log file. The default INFO level logs error and some informational data but at a minimal level to avoid generating large log files. For troubleshooting, it may be desirable to set the logging level to DEBUG or TRACE. Available log levels (in order of increasing verbosity) are:

- OFF—No logging
- FATAL—Log severe errors that cause early termination
- ERROR—Log severe errors and other runtime errors or unexpected conditions that may not cause early termination
- WARN—Log errors and use of deprecated APIs, poor use of APIs, “almost” errors, and other runtime situations that are undesirable or unexpected but not necessarily “wrong”
- INFO—Log all of the above plus runtime events (startup/shutdown)
- DEBUG—Log all of the above plus detailed information on the flow through the system
- TRACE—Maximum log information—this option can generate VERY large log files

```

<variable name="logDirectory" value="logs"/>
<targets>

    <when condition="starts-with('${logger}', 'Microsoft.Hosting.Lifetime') and level >= LogLevel.Info" action="LogFinal" />
    <when condition="starts-with('${logger}', 'Microsoft.Azure.SignalR') and level >= LogLevel.Debug" action="LogFinal" />
    <when condition="starts-with('${logger}', 'Microsoft.AspNetCore') action="Ignore" />
    <when condition="starts-with('${logger}', 'Microsoft') and level <= LogLevel.Warn" action="Ignore" />
  </filters>
</logger>
</rules>

```

Figure 580: Universal Orchestrator on Linux NLog.config File

5.2.5.6 Start the Universal Orchestrator Service

The Keyfactor Universal Orchestrator service runs on the orchestrator server and controls orchestrator communications with the Keyfactor Command server. During the configuration process you set the service account under which the orchestrator service will run. The service should start automatically at the conclusion of the installation. To check to see if it's running and start it if necessary, follow the directions below for your installation type.

Windows Installations

The service on Windows is added with a display name of Keyfactor Orchestrator Service (Default) by default.

1. On the Universal Orchestrator server, open the Services MMC.
2. In the Services MMC confirm that the Keyfactor Orchestrator Service is set to a Startup Type of Automatic (if desired). If the service is not running, click the green arrow to start it.

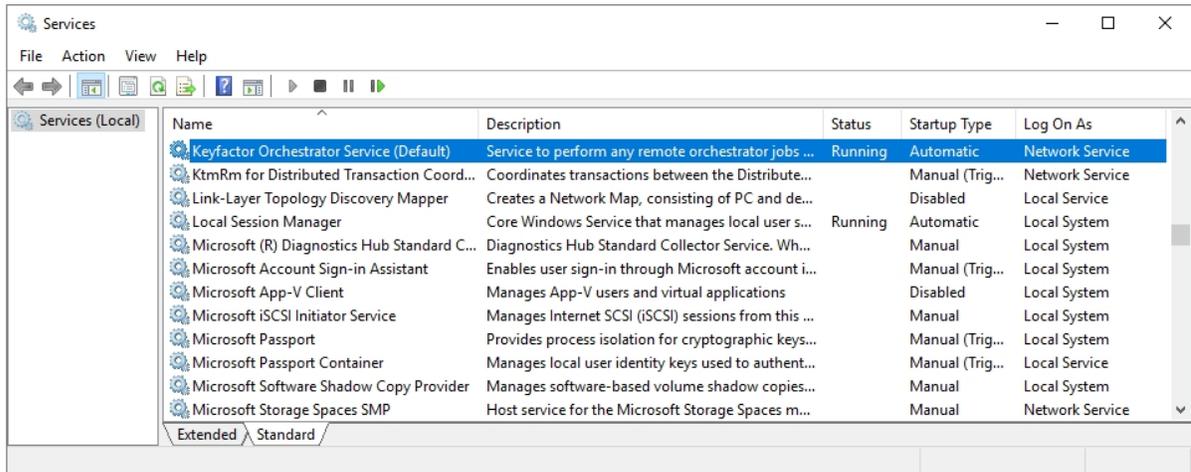

Figure 581: Universal Orchestrator Service

Note: Your service will have a name other than (*Default*) following *Keyfactor Orchestrator Service* if you opted to use the *ServiceSuffix* installation parameter.

Linux Installations

The service on Linux is added as `keyfactor-orchestrator-default` by default, so when referencing it in startup commands, it should be referenced by this name, including case. For example:

```
systemctl start [stop] [restart] [status] keyfactor-orchestrator-default.service
```

Note: Your service will have a name other than *default* following *keyfactor-orchestrator-* if you opted to use the *service-suffix* installation parameter.

5.2.5.7 Change Service Account Passwords

The process for changing the passwords for the service accounts used by the Keyfactor Universal Orchestrator varies for the different service accounts (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)) and based on the type of authentication used for the service account used to connect to Keyfactor Command.

Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

Universal Orchestrator Service Account

The password for the service account that's used to run the Universal Orchestrator service on the orchestrator server can be changed through standard operating system methods.

On a Linux server, this would be, for example, the command line `passwd` command executed for the service account running the orchestrator service (by default `keyfactor-orchestrator`). So, this command on a Linux server might be:

```
sudo passwd keyfactor-orchestrator
```

On a Windows server, if you've opted to run the Universal Orchestrator service as a custom service account rather than *Network Service*, the password would need to be changed in Active Directory or the local user store and in the Services MMC.

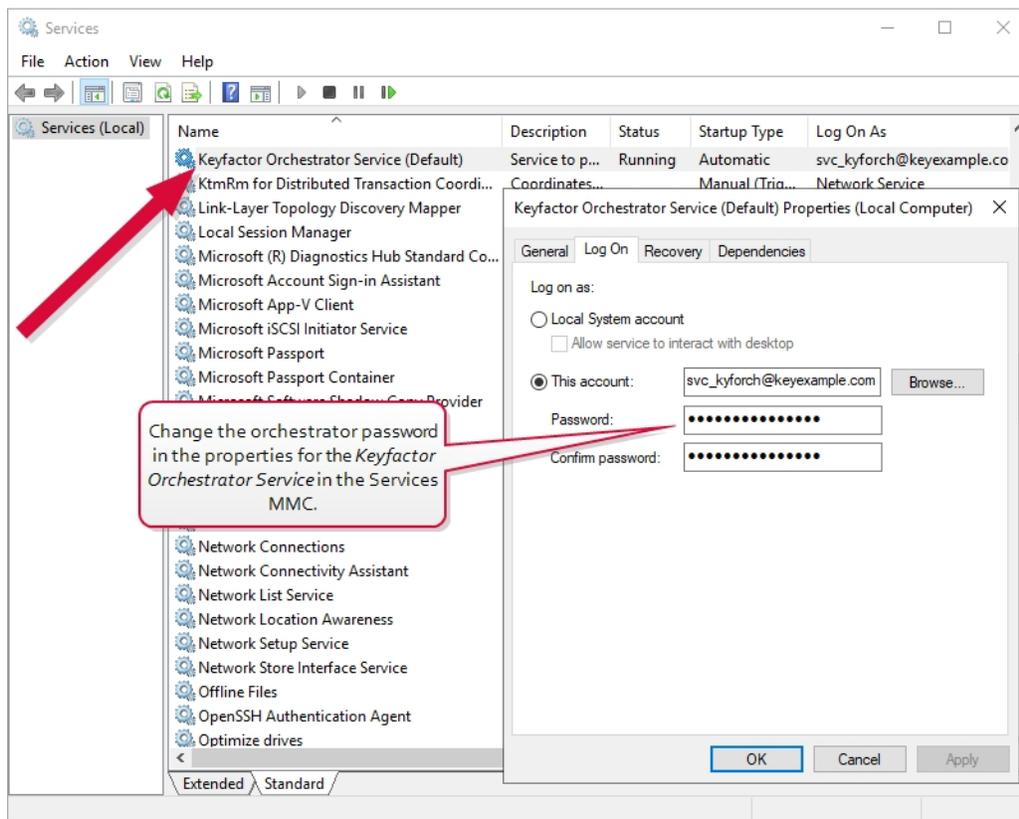

Figure 582: Change Service Account Password in Services MMC

Keyfactor Command Connect Service Account with Basic Authentication

For both Windows and Linux servers, the password change for the service account that's used to make the connection to Keyfactor Command when Basic authentication is used follows this process:

1. Change the password for the service account in Active Directory.
2. On the Windows or Linux server, open a command window. For Windows, this should be a PowerShell window open using the "Run as Administrator" option. Change to the directory in which the orchestrator is installed and locate the change_secrets script. By default, this is:

```
Windows: C:\Program Files\Keyfactor\Keyfactor Orchestrator\change_secrets.ps1
Linux: /opt/keyfactor/orchestrator/change_secrets.sh
```

3. For Linux only, use the chmod command to make the change_secrets.sh script file executable. The file ships in a non-executable state to avoid accidental execution. For example:

```
sudo chmod +x change_secrets.sh
```

4. For Windows only, in the PowerShell window, run the following command to populate a variable with the password for the service account:

```
$credKeyfactor = Get-Credential
```

Enter the appropriate username and password when prompted (the service account that the orchestrator uses to connect to Keyfactor Command). Usernames should be given in DOMAIN\username format.

Or, to avoid being prompted for credentials:

```
$keyfactorUser = "DOMAIN\mykeyfactorconnectusername"
$keyfactorPassword = "MySecurePassword"
$secKeyfactorPassword = ConvertTo-SecureString $keyfactorPassword -AsPlainText -
Force
$credKeyfactor = New-Object System.Management.Automation.PSCredential
($keyfactorUser, $secKeyfactorPassword)
```

5. Run the password change script on the Universal Orchestrator server using the following parameters:

`-WebCredential (Windows)`

This is the credential object of the service account that the orchestrator uses to communicate with Keyfactor Command that you created as per [Create Service Accounts for the Universal Orchestrator on page 2884](#). It is provided as a PSCredential object.

For Basic authentication password change operations, this parameter is **required**.

This parameter cannot be used in conjunction with the *ClientSecret* or *ClientAuthPassword* parameter.

`--username` (Linux)

The service account that the orchestrator uses to communicate with Keyfactor Command created as per [Create Service Accounts for the Universal Orchestrator on page 2884](#). It may be entered either as `username@domain` (e.g. `svc_kyforch@keyexample.com`) or `DOMAIN\username` (e.g. `KEYEXAMPLE\svc_kyforch`).

For Basic authentication password change operations, this parameter is **required**.

This parameter cannot be used in conjunction with the *client-secret* or *client-auth-password* parameter.

`--password` (Linux)

The password for the service account that the orchestrator uses to communicate with Keyfactor Command specified with the *username* parameter.

 **Important:** The password for the service account the orchestrator uses to communicate with Keyfactor Command is stored in clear text in the `orchestratorsecrets.json` file in the configuration directory under the installation directory for the orchestrator. By default, this file is granted read/write permissions for the orchestrator service account running the service on the Linux machine (*keyfactor-orchestrator* by default) and no permissions for any other users. Access to this file should be strictly controlled.

This parameter is **required** if the *username* parameter is specified.

 **Tip:** If you prefer to avoid providing the password at the command line (and storing it in command history), use an input file instead as follows:

- a. Create a file that contains just your password. For example:

```
vi my_password_file
```

- b. When using the password parameter, reference the file. For example:

```
--password $(cat my_password_file)
```

- c. Delete the password file after the install is complete. For example:

```
rm my_password_file
```

`-SecretsPath` (Windows) or `--secrets-path` (Linux)

The full path and file name of the or the `orchestratorsecrets.json` file that stores the secret information. This file is found in the configuration directory under the installation directory for

the Universal Orchestrator, which is by default:

```
Windows: C:\Program Files\Keyfactor\Keyfactor
Orchestrator\configuration\orchestratorsecrets.json
Linux: /opt/keyfactor/orchestrator/configuration/orchestratorsecrets.json
```

The location and file name for this file cannot be changed from the default. The parameter is provided to allow for installations in non-standard locations or multiple locations on the same server.

This parameter is **required**.

Windows example using basic authentication:

```
$keyfactorUser = "KEYXAMPLE\svc_kyforch"
$keyfactorPassword = "MySecurePassword123!"
$secKeyfactorPassword = ConvertTo-SecureString $keyfactorPassword -AsPlainText -Force
$credKeyfactor = New-Object System.Management.Automation.PSCredential ($keyfactorUser, $secKey-
factorPassword)

.\change_secrets.ps1 -WebCredential $credKeyfactor -SecretsPath "C:\Program Files\Keyfactor\Keyfactor
Orchestrator\configuration\orchestratorsecrets.json"

Saved secrets to 'C:\Program Files\Keyfactor\Keyfactor Orches-
trator\configuration\orchestratorsecrets.json'
Restarting service KeyfactorOrchestrator-Default
```

Linux example using basic authentication:

```
vi password_file_new

sudo ./change_secrets.sh --username svc_kyforch@keyexample.com --password $(cat password_file_new) --
secrets-path /opt/keyfactor/orchestrator/configuration/orchestratorsecrets.json

Saving secrets to '/opt/keyfactor/orchestrator/configuration/orchestratorsecrets.json'
Restarting service keyfactor-orchestrator-default
```

Keyfactor Command Connect Service Account with Token Authentication

For both Windows and Linux servers, the secret change for the client that's used to make the connection to Keyfactor Command when token authentication is used follows this process:

1. Change the secret for the client in your identity provider (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)).

2. On the Windows or Linux server, open a command window. For Windows, this should be a PowerShell window open using the “Run as Administrator” option. Change to the directory in which the orchestrator is installed and locate the `change_secrets` script. By default, this is:

```
Windows: C:\Program Files\Keyfactor\Keyfactor Orchestrator\change_secrets.ps1
Linux: /opt/keyfactor/orchestrator/change_secrets.sh
```

3. For Linux only, use the `chmod` command to make the `change_secrets.sh` script file executable. The file ships in a non-executable state to avoid accidental execution. For example:

```
sudo chmod +x change_secrets.sh
```

4. Run the password change script on the Universal Orchestrator server using the following parameters:

`-ClientSecret` (Windows)

This is the secret of the identity provider client used to authenticate the session with Keyfactor Command (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)).

For token authentication password change operations, this parameter is **required**.

This parameter cannot be used in conjunction with the *WebCredential* or *ClientAuthPassword* parameter.

`--client-secret` (Linux)

This is the secret of the identity provider client used to authenticate the session with Keyfactor Command (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)).

For token authentication password change operations, this parameter is **required**.

This parameter cannot be used in conjunction with the *username* and *password* or *client-auth-password* parameters.

Tip: If you prefer to avoid providing the secret at the command line (and storing it in command history), use an input file instead as follows:

- a. Create a file that contains just your password. For example:

```
vi my_secret_file
```

- b. When using the password parameter, reference the file. For example:

```
--client-secret $(cat my_secret_file)
```

c. Delete the password file after the install is complete. For example:

```
rm my_secret_file
```

`-SecretsPath` (Windows) or `--secrets-path` (Linux)

The full path and file name of the or the `orchestratorsecrets.json` file that stores the secret information. This file is found in the configuration directory under the installation directory for the Universal Orchestrator, which is by default:

```
Windows: C:\Program Files\Keyfactor\Keyfactor
Orchestrator\configuration\orchestratorsecrets.json
Linux: /opt/keyfactor/orchestrator/configuration/orchestratorsecrets.json
```

The location and file name for this file cannot be changed from the default. The parameter is provided to allow for installations in non-standard locations or multiple locations on the same server.

This parameter is **required**.

Windows example using token authentication:

```
.\change_secrets.ps1 -ClientSecret "aLru2IvZYJh0kFmHa36xs2xTLSp4ya" -SecretsPath "C:\Program
Files\Keyfactor\Keyfactor Orchestrator\configuration\orchestratorsecrets.json"
```

```
Saved secrets to 'C:\Program Files\Keyfactor\Keyfactor Orches-
trator\configuration\orchestratorsecrets.json'
Restarting service KeyfactorOrchestrator-Default
```

Linux example using token authentication:

```
vi my_new_secret

sudo change_secrets.sh --client-secret $(cat my_new_secret) --secrets-path /opt/key-
factor/orchestrator/configuration/orchestratorsecrets.json

Saving secrets to '/opt/keyfactor/orchestrator/configuration/orchestratorsecrets.json'
Restarting service keyfactor-orchestrator-default

rm my_new_secret
```

Universal Orchestrator Running in a Container

When you're running the Universal Orchestrator in a container, the method for password changes is different and applies only to the Keyfactor Command connect service account. In this scenario, the

approach is to tear down the container and stand up a new one. As long as the new container connects to Keyfactor Command with the same set of capabilities, the same service account username, and the same orchestrator name (either the container hostname or the ORCHESTRATOR_NAME parameter), the orchestrator will continue to operate seamlessly and will not need re-approval.

To change the Keyfactor Command connect service account password for a container:

1. Change the service account's Active Directory password or change the secret for the client in your identity provider (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)).
2. Use an appropriate command to tear down the current orchestrator container (being sure you know its configuration). For example:

```
docker compose [-f myconfig.yaml] down
```

Or:

```
kubectl delete -f myconfig.yaml]
```

3. Stand up a new container referencing the same set of capabilities, the same service account username, and the same orchestrator name (either the container hostname or the ORCHESTRATOR_NAME parameter) if you want the orchestrator to continue seamlessly without requiring re-approval (see [Install the Universal Orchestrator in a Linux Container on page 2922](#)).

5.2.5.8 Register a Client Certificate Renewal Extension

The Keyfactor Universal Orchestrator supports automated renewal of the certificate used for client certificate authentication. It does this using a custom extension point interface on the orchestrator that can be implemented by the end user. When the client certificate used for authentication by the orchestrator is approaching expiration (within 180 days of expiration by default), the extension generates a CSR with a private key and submits the CSR to Keyfactor Command for enrollment. When Keyfactor Command returns the certificate to the orchestrator, it is paired with the private key and installed for use as the client certificate for authentication. The extension both supplies the information for the CSR and holds a dictionary of client parameters (see [Build a Client Certificate Renewal Extension on page 2967](#)).

To register a client authentication certificate renewal extension:

1. Create the extension DLL (see [Build a Client Certificate Renewal Extension on page 2967](#)).
2. On the Universal Orchestrator server, locate the extensions folder under the install directory for the orchestrator. By default, this is:

```
Windows: C:\Program Files\Keyfactor\Keyfactor Orchestrator\extensions  
Linux: /opt/keyfactor/orchestrator/extensions
```

3. Under the extensions directory, create a new directory for your extension (e.g. CertRotation).
4. Place your DLL in the new CertRotation directory.
5. Create a manifest.json file in the CertRotation directory with the following contents:

```
{
  "extensions": {
    "Keyfactor.Orchestrators.Extensions.IOrchestratorRegistrationUpdater": {
      "RegisteredRegistrationUpdater": {
        "assemblypath": "RegistrationUpdater.dll",
        "TypeFullName": "Custom.Registration.Updaters.CustomRegistrationUpdater",
        "config": {
          "DnsSan": "orchestrator_name.keyexample.com",
          "Subject": "CN=Client Certificate Authentication",
          "DataCenter": "WestCoast",
          "ForceRenewal": "False"
        }
      }
    }
  }
}
```

Only the values shown in red above should be modified from what is shown in this example:

- The *assemblypath* is the name of your DLL.
- The example `Custom.Registration.Updaters` portion of the *TypeFullName* must match the *namespace* in your code. The example `CustomRegistrationUpdater` portion of the *TypeFullName* must match the *class* in your code.
- The config section is only needed if you wish to pass configuration values such as a standard DNS SAN or certificate subject into the extension. Those shown here are examples that match the sample code (see [Build a Client Certificate Renewal Extension on page 2967](#)).

The certificate renewal process occurs as follows:

1. When each registration or session renewal of the orchestrator service occurs, the orchestrator, in conjunction with underlying Keyfactor Command functionality, checks the expiration date of the client authentication certificate and compares that with the defined client certificate warning period (180 days) and expiry period (30 days) in Keyfactor Command to determine whether a new certificate is needed.

Note: If the certificate is in the warning period, operations will continue while a new certificate is requested. If the certificate is in the expiry period or already expired, the orchestrator will not be allowed to register a new session when the existing session expires or

the orchestrator service is restarted.

Orchestrator log messages indicating that a certificate is in the warning period look similar to the following:

```
2021-09-17 12:45:59.7927 Keyfactor.Orchestrators.JobEngine.SessionClient [Warn] - Remote CMS call 'https://keyfactor.keyexample.com/KeyfactorAgents/Session/Register' returned: Agent certificate is approaching expiration and should be renewed. (A0100007)
```

Orchestrator log messages indicating that a certificate is in the expiry period look similar to the following:

```
2021-09-09 17:27:37.5367 Keyfactor.Orchestrators.JobEngine.SessionClient [Error] - Remote CMS call 'https://keyfactor.keyexample.com/KeyfactorAgents/Session/Register' returned: Agent certificate is approaching expiration and must be renewed. (A0100008)
2021-09-09 17:27:37.5642 Keyfactor.Orchestrators.JobEngine.SessionJobExecutor [Error] - Error in SessionManager: Unable to register session.
    at Keyfactor.Orchestrators.JobEngine.SessionClient.RegisterAsync(IEnumerable`1 capabilities, CancellationTokens cancellationTokens)
    at Keyfactor.Orchestrators.JobEngine.SessionJobExecutor.Execute(IJobExecutionContext context)

Error: A0100008
Agent certificate is approaching expiration and must be renewed.
    at Keyfactor.Orchestrators.JobEngine.SessionClient.RegisterAsync(IEnumerable`1 capabilities, CancellationTokens cancellationTokens)
```

Tip: The length of the warning period and expiry period are defined in Keyfactor Command and are not user-configurable values. Contact support@keyfactor.com if you need to modify these values.

Tip: The orchestrator can be forced into the warning or expiry state before it reaches these based on certificate lifetime using the *POST /Agent-s/SetAuthCertificateReenrollment* method in the Keyfactor API or the *Request Renewal* button on the Orchestrator Management page of the Keyfactor Command Management Portal. A status of *Request (1)* is the equivalent of the warning period and a status of *Require (2)* is the equivalent of the expiry period.

- When either the warning period or expiry period is identified, the Keyfactor Universal Orchestrator will pass a value of *true* to the *GetCSRInfo* method (*newOrchestratorCertRequestedByPlatform* in the sample extension—see [Build a Client Certificate Renewal Extension on page 2967](#)). The extension generates a private key and a CSR using CSR

information (e.g. subject, key size) provided or generated by the extension (depending on the extension design), returns the CSR to the orchestrator, which submits it to Keyfactor Command for certificate enrollment.

If the certificate is within the warning period but not within the expiry period, orchestrator activity will be allowed to continue as usual. If the certificate is within the expiry period, a new session will not be granted when the orchestrator requests a new session and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate. If the certificate has expired, the certificate rotation cannot take place since the orchestrator cannot authenticate to Keyfactor Command to complete the rotation.

Tip: If a certificate has expired or some other certificate problem is causing the orchestrator not to be able to acquire a session, the orchestrator can be reset using either the Reset button on the Orchestrator Management page in the Keyfactor Command Management Portal or the `POST /Agents/{id}/Reset` method in the Keyfactor API. This removes the certificate history and allows the orchestrator to register for a session with the certificate currently configured in the `appsettings.json` file under the configuration directory. You will need to re-approve the orchestrator if you reset it.

3. In Keyfactor Command, a certificate is issued based on:

- The `OrchestratorConstants.CertificateAttributes.CERTIFICATE_AUTHORITY` and `OrchestratorConstants.CertificateAttributes.CERTIFICATE_TEMPLATE` values defined in the custom registration handler enroll function.
- If no values are supplied in the custom registration handler enroll function, the certificate authority and template defined by the *Certificate Authority For Submitted CSRs* and *Template For Submitted CSRs* application settings in the Keyfactor Command Management Portal.

SAVE UNDO ALL

Figure 583: Application Settings for Client Certificate Renewal

- Once the certificate is issued, it is returned to the orchestrator and married with the private key. If certificate authentication is configured using a certificate stored in the local computer or Universal Orchestrator service account user's personal store (Windows only), the orchestrator updates the *appsettings.json* file with the thumbprint of the new certificate. The thumbprint is stored in the *AuthCertThumbprint* value in the *appsettings.json* file (see [Change Service Account Passwords on page 2954](#)). If certificate authentication is configured using a PKCS12 file stored in the file system, a PKCS12 file is generated and replaces the original PKCS12 file. The randomly generated password for the PKCS12 file is updated in the *orchestratorsecrets.json* file.

Note: If certificate authentication is configured using a certificate stored in the local computer personal store on Windows, when the new certificate is generated, it will be placed in the service account user's personal store, not the local computer personal store. This is true if the service is running as a domain account and if the service is running as the default *Network Service*.

5. With the orchestrator's next session registration or heartbeat, it will begin using the new certificate.

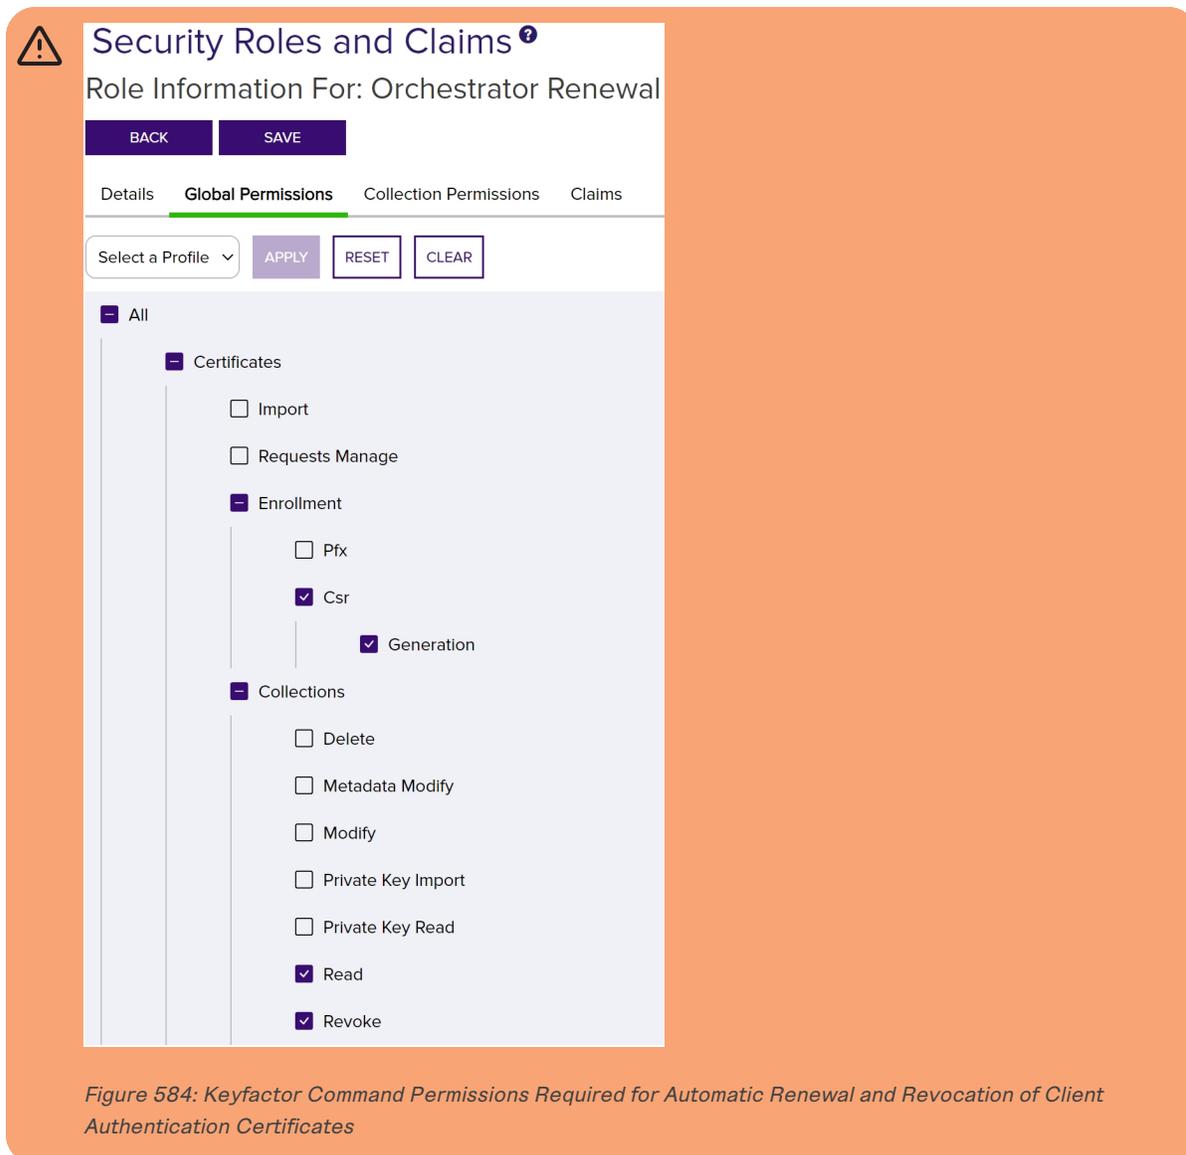

Tip: If you manually configured the orchestrator to renew the certificate using the *POST /Agents/SetAuthCertificateReenrollment* method in the Keyfactor API or the *Request Renewal* button on the Orchestrator Management page, that flag will be cleared when the orchestrator successfully registers for a session or completes a heartbeat using the new certificate.

Once a new session is established with the new certificate, the stored legacy thumbprint for the replaced certificate will be removed from the database. This occurs whether or not you opt to automatically revoke the old certificate and occurs before the certificate revocation takes place. The legacy thumbprint is not cleared on a heartbeat with the new certificate.

6. If you've opted to enable the *Revoke old Client Auth Certificate* application setting (see [Figure 583: Application Settings for Client Certificate Renewal](#)) in Keyfactor Command, the previous certificate for the orchestrator will be revoked automatically by Keyfactor Command once the orchestrator has made a successful registered for a new session with the new certificate.

Important: The service account under which the Universal Orchestrator is operating must have permissions to enroll for certificates from the CA and have at least the *Enroll CSR* role permission for *Certificate Enrollment* and the *Read* role permission for *Certificates* in Keyfactor Command. If you've opted to enable automated revocation of the old certificate, the service account must also have permissions to revoke certificates on the CA and have at least the *Revoke* role permission for *Certificates* in Keyfactor Command.

Build a Client Certificate Renewal Extension

The functionality to renew the certificate used by the Keyfactor Universal Orchestrator for authentication is available via an extension point interface provided by Keyfactor. To implement a custom extension, you will need to obtain the `Keyfactor.Orchestrators.IOrchestratorRegistrationUpdater` nuget package from Keyfactor. Contact your Client Success Manager or support@keyfactor.com for assistance with that.

To build a client certificate renewal extension:

1. Create a project for the extension in your favorite integrated development environment (e.g. Visual Studio).

2. Import the *Keyfactor.Orchestrators.IOrchestratorRegistrationUpdater* nuget package into the project.
3. Consult the sample code to help you design your extension. A sample extension for the client authentication registration updater interface is provided on the Keyfactor GitHub:

<https://keyfactor.github.io/>

4. Build an assembly file (DLL file) containing the extension.
5. Follow the instructions for registering the extension (see [Register a Client Certificate Renewal Extension on page 2961](#)).

5.3 Java Agent

The Keyfactor Java Agent allows organizations to run discovery jobs to locate Java keystores on Windows and Linux systems and PEM certificate stores on Linux systems, inventory the certificates found in them, and push new certificates out to them.

The system requirements for the Java Agent on Windows are:

- 64-bit versions of Windows 8.1, Windows 10, and Windows Server 2019
- 64-bit versions of Oracle Java or OpenJDK 8, 11 or 13
- The WiX Toolset (<http://wixtoolset.org/>) for users wishing to build an MSI

Note: The path to the WiX executables needs to be added to the System PATH (e.g. C:\Program Files (x86)\WiX Toolset v3.11\bin) to support this.

The system requirements for the Java Agent on Linux are:

- Red Hat 6 or greater, CentOS 6 or greater, or Ubuntu 14 or greater
- 64-bit versions of Oracle Java or OpenJDK 8, 11 or 13
- JSVC on SysV style (init.d) systems

Important: The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

For more information, see [Installing Custom-Built Extensions on page 2940](#).

5.3.1 Preparing for the Java Agent

This section describes the steps that need to be taken prior to a Java Agent installation to install the prerequisites, create the required supporting components, and gather the necessary information to

complete the Java Agent installation and configuration process.

5.3.1.1 Create Service Accounts for the Java Agent

The Java Agent makes use of up to two service accounts to allow it to communicate with the Keyfactor Command server. These two service accounts work together to transfer information from the Java Agent to the Keyfactor Command server. The two service accounts can be thought of as players on two sides of a fence, with the service account for the Java Agent lobbing information over the fence to the service account on the Keyfactor Command server side to catch and hand to the Keyfactor Command server:

- Java Agent Side
On the Java Agent side of the fence, you may use either a local account or an Active Directory service account.

Windows

For domain-joined Windows machines, an Active Directory service account is typically used. For non-domain-joined Windows machines, you may use a local account created on the Windows machine as the service account instead of a domain account.

The service account under which the Keyfactor Java Agent service runs on Windows must be granted permissions to “Log on as a service” through local security policy. This step is generally done automatically as part of the installation scripts, but may need to be completed by hand in certain environments or on certain operating systems. The service account needs sufficient permissions to allow it to discover and inventory Java keystores and PEM certificate stores as applicable (read permissions on the appropriate files and directories) and update the stores if desired (write permissions on the files and directories in which the files are stored).

Important: During the installation process, you enter the Java agent service identity username and password interactively in a PowerShell window to configure the service account. PowerShell will not support the following characters in the service account password when used in this interface:

" \$

If you need to support these characters in the password, you can re-enter the username and password in the Services MMC after receiving an error in the PowerShell interface.

Linux

For the purposes of this documentation it is assumed that Linux machines will be non-domain joined and will use a local account to run the Java Agent.

For Linux systems, Keyfactor recommends running the service as an account other than root.

- Keyfactor Command Server Side
On the Keyfactor Command server side of the fence, an Active Directory service account in the primary Keyfactor Command server forest is used. This can be the same service account used

for other Keyfactor Command server services. This service account appears in the Management Portal Orchestrator Management grid as the *Identity* for the Java Agent.

If the Java Agent is installed on a domain-joined machine in the same forest as the Keyfactor Command server, the same Active Directory service account may be used on both sides of the fence.

The service accounts need to be created prior to installation of the Java Agent software, and the person installing the Java Agent software needs to know the domain, username and password of each service account.

Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

5.3.1.2 Create a Group for Java Agent Auto-Registration (Optional)

Keyfactor Command can use an Active Directory group to support auto-registration of Java Agents. Auto-registration is an optional feature that allows you to define the conditions under which a Java Agent can automatically be approved for operation with the Keyfactor Command server without administrator input, if desired. This is useful in environments hosting a large number of agents. There are six Java Agent auto-registration roles that share the same AD group:

Java Keystore Discovery

Auto-register the Java Agent to allow it to run discovery tasks to locate Java keystores.

Java Keystore Inventory Reporting

Auto-register the Java Agent to allow it to inventory certificates in Java keystores.

Java Keystore Management

Auto-register the Java Agent to allow it to manage (add/remove) certificates in Java keystores.

PEM Cert Store Management Jobs

Auto-register the Java Agent to allow it to manage (add/remove) certificates in PEM certificate stores.

PEM Server Configuration Directive Parser

Auto-register the Java Agent to allow it to run discovery tasks to locate PEM certificate stores.

PEM Server Inventory

Auto-register the Java Agent to allow it to inventory certificates in PEM certificate stores.

The same Active Directory group must be used for all roles. All auto-registration settings must be populated if any are to be used even if all features are not planned for use. For example, if you plan to use PEM but not Java keystore functionality, you still need to populate the Java keystore auto-registration settings to enable auto-registration for the Java Agent to function correctly.

Note: If all your agents will be connecting to Keyfactor Command as the same service account, you can directly add that user in the auto-registration configuration and skip using a group, if desired.

Although you can choose to enable auto-registration without user validation, allowing any agent to register regardless of the user account under which the agent is running, user validation with either an Active Directory group or a specific Active Directory user is the more secure option.

5.3.1.3 Configure Certificate Root Trust for the Java Agent

Keyfactor recommends using HTTPS to secure the channel between each Java Agent and the Keyfactor Command server(s). This requires an SSL certificate configured in IIS on the Keyfactor Command server(s). This certificate can either be a publicly-rooted certificate (e.g. from Symantec, Entrust, etc.), or one issued from a private certificate authority (CA). If your Keyfactor Command server is using a publicly rooted certificate, the Java Agent machine may already trust the certificate root for this certificate. However, if you have opted to use an internally-generated certificate, your Java Agent server may not trust this certificate. In order to use HTTPS for communications between the Java Agent and the Keyfactor Command server with a certificate generated from a private CA, you will need to import the certificate chain for the certificate into a Java CA certificate store on the Java Agent server. This can be done automatically as part of the installation process. You will need to have the root certificate available as a PEM-encoded format file when you run the installation script.

5.3.1.4 Create Environment Variables for the Java Agent on Windows

The Keyfactor Java Agent determines the location of the current installed Java version on Windows by checking the Windows system environment variables Path and JAVA_HOME. Depending on how your version of Java was installed, these environment variables may or may not be set.

To check and set the environment variables for the Java Agent install:

1. Identify your Java base directory (e.g. C:\Program Files\Java\jdk-13.0.2). This directory typically contains the versioning and release files. Copy this path to a text file for easy access.
2. Identify the location of the Java virtual machine library (e.g. C:\Program Files\Java\jdk-13.0.2\bin\server\jvm.dll), and copy the path to the text file created in the previous step.

3. Identify the location of the main Java executable (e.g. C:\Program Files\Java\jdk-13.0.2\bin\java.exe), and copy the path to the text file.
4. As a user with local administrator permissions, use the search function to search for *environment* and select the option to edit the *system environment variables* from the search results.

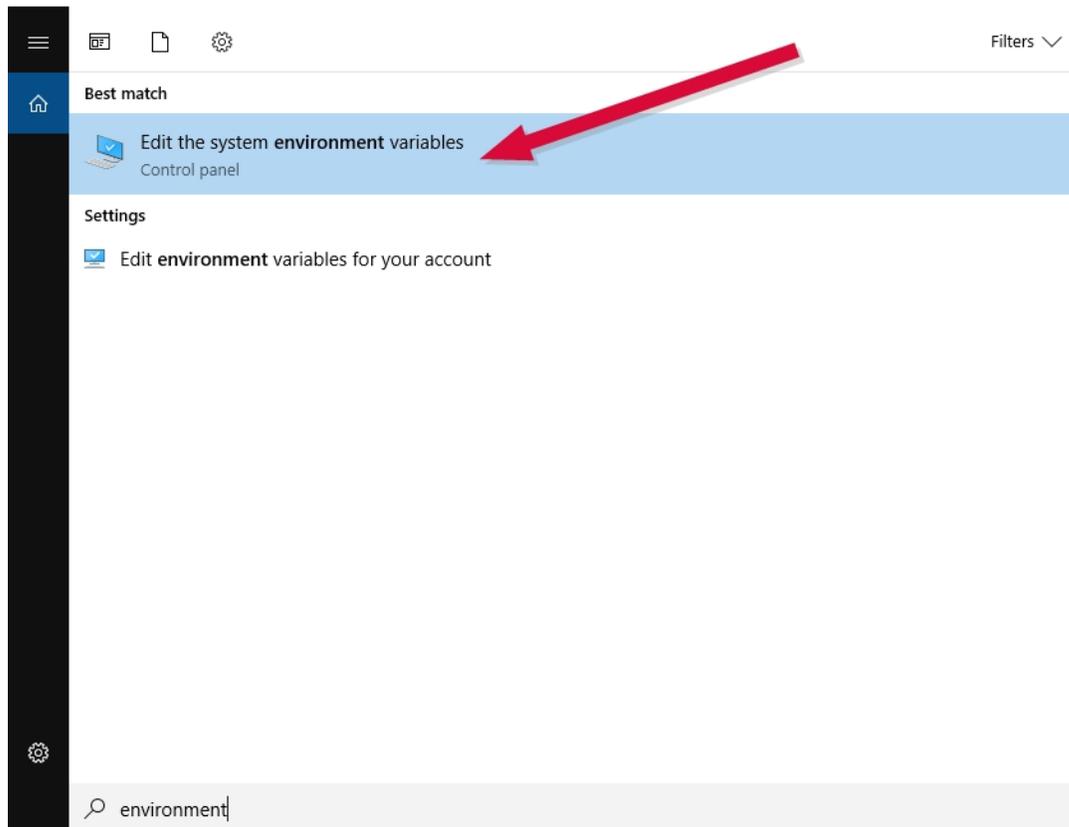

Figure 585: Search for System Environment Variables

5. In the System Properties dialog on the Advanced tab, click *Environment Variables*.
6. In the Environment Variables dialog in the *System variables* section at the bottom, scroll down to locate the *Path* variable, highlight it and click **Edit**.

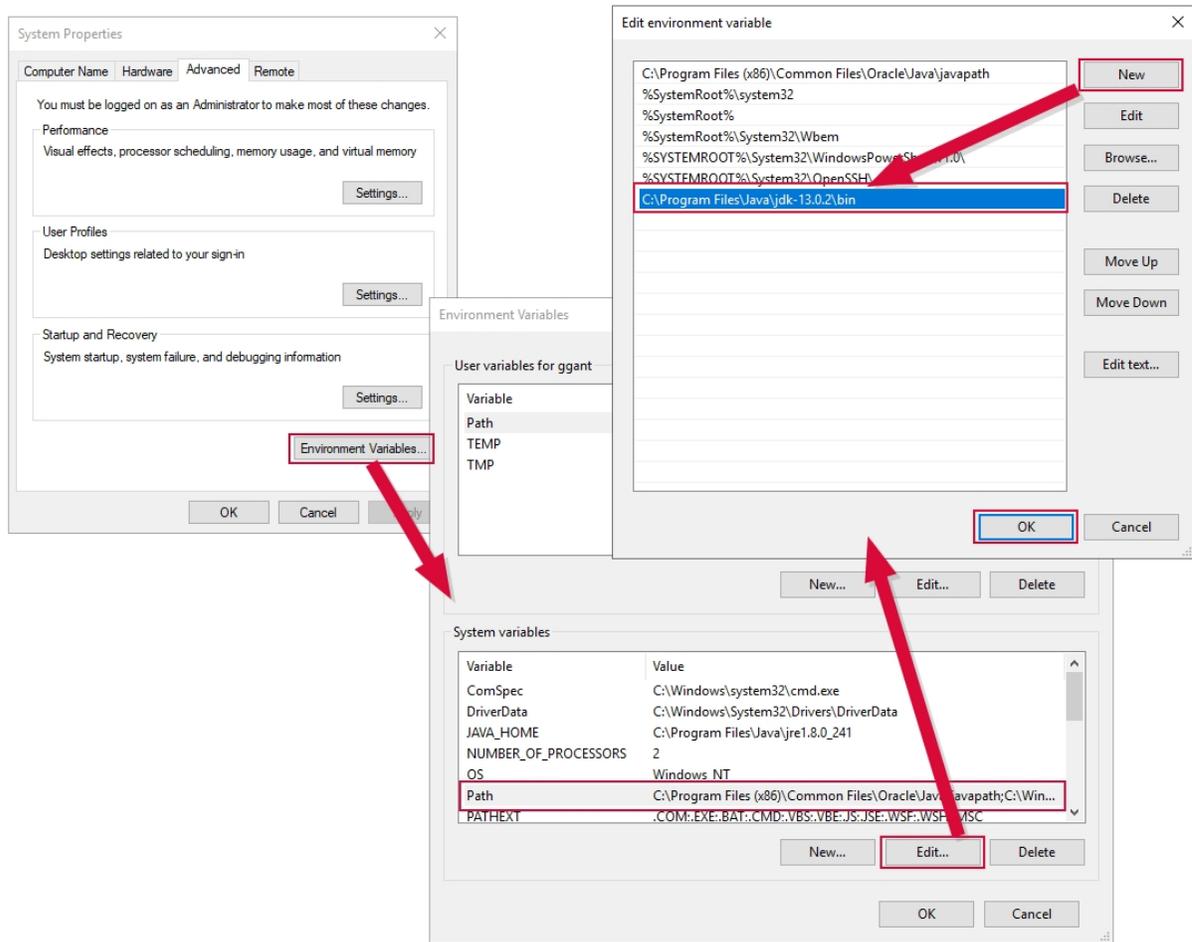

Figure 586: Edit the System Path Environment Variable to Add the Path to Java

7. In the Edit Environment Variable dialog, click **New**. On the newly added line, paste the path to the main Java executable (e.g. C:\Program Files\Java\jdk-13.0.2\bin) that you saved earlier (do not include the java.exe part) and click **OK**.
8. If it doesn't exist already among the *System variables*, create the JAVA_HOME environment variable—click **New** below the *System variables* box and, in the New System Variable dialog, type **JAVA_HOME** in the *Variable name* field and paste the path to the Java base directory in the *Variable value* field. If the field exists already but with a value that is not correct for the version of Java you wish to use, click **Edit** and update the *Variable value* field with the appropriate Java base directory.

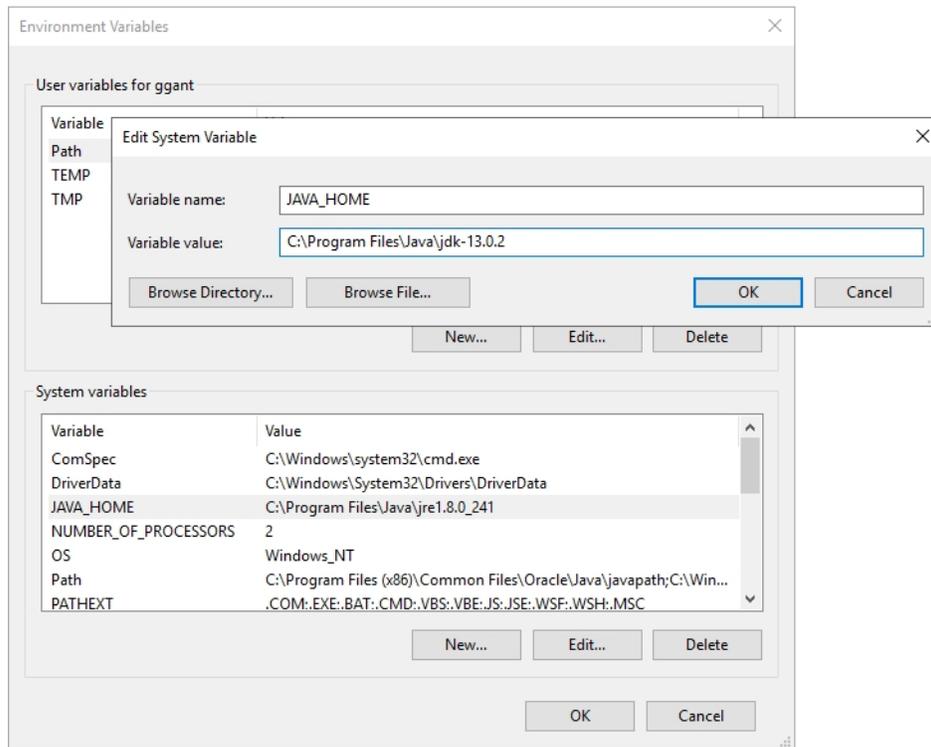

Figure 587: Add JAVA_HOME System Environment Variable

Important: When you run the `install.ps1` script, you may be prompted to input the absolute path to the Java Virtual Machine library. From the text file in which you saved paths, take the path to the Java Virtual Machine library (e.g. `C:\Program Files\Java\jdk-13.0.2\bin\server-jvm.dll`) and input that string to complete the install.

5.3.2 Install the Java Agent on Windows

The Keyfactor Java Agent installation script offers the option to install the Java agent directly or use the installation script to build an msi package that you can then use to install the Java agent on multiple machines.

Note: If you have a previously installed version of the Keyfactor Java Agent on this server, you need to uninstall it (see [Uninstall the Java Agent on page 2990](#)) before installing a new version.

To begin the Java agent installation on Windows, unzip the installation files and place them in a temporary working directory.

1. On the Windows machine on which you wish to install the Java agent or build the package, open a PowerShell window using the “Run as administrator” option and change to the temporary

directory where you placed the installation files.

2. In the PowerShell window, run the cms-java-agent-installer.bat file to begin the installation. You will be prompted to answer several questions:

Username the Java Agent will connect as

This is the service account on the Keyfactor Command server side of the fence you created as per [Create Service Accounts for the Java Agent on page 2969](#). It should be entered in the format DOMAIN\username.

Password for the account that the Java Agent will connect as

This is the password for the service account on the Keyfactor Command server side of the fence.

Hostname or address for the Keyfactor Command Agents server

This is the FQDN or IP address of the Keyfactor Command server running the Keyfactor Command Agent Services role, which is installed as part of the Keyfactor Command Services role. If you installed all the Keyfactor Command server roles together, this is the FQDN or IP address of your Keyfactor Command server.

If you choose to use SSL to connect to the Keyfactor Command server, you'll need to enter a hostname at this prompt that is found in the SSL certificate.

If you're using a non-standard port for IIS on your Keyfactor Command server, enter that here as part of your hostname or IP address (e.g. keyfactor.keyexample.com:444).

Virtual directory for the Keyfactor Command Agents service URL

Press Enter to accept the default of KeyfactorAgents. Only enter an alternate virtual directory if your Keyfactor Command server was configured with an alternate virtual directory for the Keyfactor Command Agents service.

Connect to Keyfactor using SSL?

Press Enter to accept the default of Yes or enter No. The following instructions assume that you answered Yes.

To connect to Keyfactor Command, the Java Agent needs to trust the SSL certificate presented by the Keyfactor Command Agents server

If your Keyfactor Command server is using a publicly rooted certificate, the server most likely already trusts the certificate issuer, and you can press Enter here.

If the certificate on the Keyfactor Command server was internally generated, you will need to enter the full path and file name pointing to a file on the local server containing the PEM-encoded root certificate for the certificate authority chain that issued the certificate (see [Configure Certificate Root Trust for the Java Agent on page 2971](#)).

The root certificate will be saved in a Java keystore file called `trust.jks` located in the Java agent's install directory (`C:\Program Files\Keyfactor\Keyfactor Java Agent` by default). The default keystore password is *changeit*. Please contact Keyfactor technical support for assistance in changing the default password, if desired.

This question will not appear if you answered no to the question about using SSL.

Verify Keyfactor Command connectivity?

Press Enter to accept the default of “Yes”. The Java agent will attempt to connect to the Keyfactor Command server using the credentials provided to confirm that the server name, agents URL, root trust, and provided credentials are valid. Enter “No” to skip this validation if you don't have connectivity to the Keyfactor Command server at the time of installation.

Tip: If the installer terminates after this question without an error or with an error writing the `trust.jks` file, it can be an indication that the path to the root certificate you provided in the previous question was incorrect in some way (e.g. the path is not valid, the root certificate doesn't match the certificate on the Keyfactor Command server, etc.)

Please specify the installation format

The options at this prompt are “local” or “msi”. If you press enter to accept “local”, the Java agent will be installed locally. If you enter “msi”, the batch file will generate an msi after all the questions have been answered. You can use this to install the Java agent on other Windows systems with the installation questions already answered. The subsequent questions differ depending on the answer given to this question. The following instructions include both **local** and **msi** questions. You will not see all of these questions.

If you select “msi”, the Java agent will not be installed locally.

Path to the desired directory for installation (**Local**)

Press Enter to accept the default installation directory of `C:\Program Files\Keyfactor\Keyfactor Java Agent` or enter an alternate path if desired. This question does not appear when generating an msi.

Local user account the agent should run as \ User account on the target machine that the agent should run as (**Local****MSI**)

Press Enter to accept the default of the local SYSTEM account for local installs (this is not an option when generating an msi) or enter a specific user account—the service account for the

Java agent side of the fence you created as per [Create Service Accounts for the Java Agent on page 2969](#). Domain user accounts should be entered in the format DOMAIN\username. You do not need to enter the password for this user at this time. The username is entered at this time to allow permissions to be configured appropriately.

Hostname the agent will connect to Keyfactor as (Local)

Press Enter to accept the default of the local machine's hostname as determined by a reverse DNS lookup or, failing that, the value of the local environment variable for the computer name. If desired, you can enter an alternative value to use as the hostname. This is the identifier for the server on which you are installing the Java agent. This identifier can be in the form of a hostname or FQDN, but you can use another unique identifier, if desired. This identifier appears in the Keyfactor Command Management Portal on the orchestrators page. This question does not appear when generating an msi.

Tip: When installing from an msi, you can specify a custom hostname by using the AGENTNAME parameter. In order to use this option, you must install the msi from the command line. For example:

```
msiexec /i C:\temp\cms-java-agent.msi AGENTNAME=jvagnt38.keyexample.com
```

Note: If the agent machine has a non-private address, you will most likely need to use this option.

Directory where the agent logs should be placed (Local)

Press Enter to accept the default log directory of C:\CMS\logs or enter an alternate path if desired. This question does not appear when generating an msi.

Number of log files that should be kept (Local\MSI)

Press Enter to accept the default of 7 log files or enter an alternate number if desired. Older files are automatically deleted once more files than this have been generated.

Maximum size of each log file (Local\MSI)

Press Enter to accept the default log file size of 3 MB or enter an alternate value if desired.

Register AnyAgent components with the Keyfactor Java Agent? (Local)

Press Enter to accept the default value and begin the installation. If you would like to install one or more Any Agent implementations, enter yes. In this case, you'll be presented with a list of custom certificate store types for which to provide an implementation. After choosing each one, you'll need to enter the path to the .jar file that implements the certificate store type. That .jar file will be copied to the installation directory, under the libs folder. You'll need to manually copy any other dependent .jar files to that location as well. Note that this option is only available when

the Java agent is installed locally. This question does not appear when generating an msi.

3. After answering the AnyAgent components question, the installation begins. Review the output to be sure that no errors have occurred and then press any key to return to the PowerShell prompt.

```
Welcome to the Keyfactor Java Agent Installer.
This installer will collect all information necessary to configure the Java Agent for use with your Keyfactor Command instance. You will be given the option to apply this configuration to the local machine, or to use the configuration data to construct a Linux RPM package or Windows MSI installer for distribution within your environment.
Please enter the following information:

Username the Java Agent will connect as (format "DOMAIN\user"):
KEYEXAMPLE\svc_keyfjava
Password for the account that the Java Agent will connect as:
Re-enter password:
Hostname or address for the Keyfactor Command Agents server (e.g. "server1.corp.local" or "192.168.0.100"):
keyfactor.keyexample.com
Virtual directory for the Keyfactor Command Agents service URL (default: KeyfactorAgents):
Connect to Keyfactor using SSL? (default: Yes):
To connect to Keyfactor Command, the Java Agent needs to trust the SSL certificate presented by the Keyfactor Command Agents server.
Please enter a local path to a CA certificate that can be used to trust the SSL certificate that will be presented.
You can find this certificate by navigating to the Keyfactor Command Management Portal in a secure browser session and viewing the server certificate chain.
c:\temp\CorpRoot.cer
Verify Keyfactor Command connectivity? (default: Yes):
Verifying connection...
Please specify the installation format. Enter "local" or "msi". (default: "local"):
Path to the desired directory for installation. Directory must not already exist. (default: C:\Program Files\Keyfactor\Keyfactor Java Agent ):
Local user account the agent should run as (default : SYSTEM):
Hostname the agent will connect to Keyfactor as:
jvagn54.keyexample.com
Directory where the agent logs should be placed (default: C:\CMS\logs\):
NOTE: Logging configuration, including additional options, can be adjusted through the "log4j2.xml" file within the agent "config" directory.
Number of log files that should be kept (default: 7):
Maximum size of each log file (default: "3 MB"):
Register AnyAgent components with the Keyfactor Java Agent? (Default: No):
Building Java Agent installer...
Encrypting credentials
Generating config files
Copying files
Option to be replaced: $javaOptionsArray += "-Dcms.agentMachine=jvagn54.keyexample.com"
Creating SSL certificate trust store
Install completed
You can use the scripts included in the installation to set up the Java agent as a service on your platform. Additional configuration may be necessary for the service to run automatically on machine startup.
```

Figure 588: Keyfactor Java Agent Local Installation on Windows

4. In the PowerShell window, change to the install directory within the directory in which you installed the Java agent. If you installed in the default install directory, this path is:

C:\Program Files\Keyfactor\Keyfactor Java Agent\install

5. In the PowerShell window, run the install.ps1 PowerShell script. Unless you selected SYSTEM as the user the agent should run as, you will be prompted to enter the username (DOMAIN\username format) and password of the account that will run the Keyfactor Java Agent service on the local machine. This is the service account for the Java agent side of the fence you created as per [Create Service Accounts for the Java Agent on page 2969](#). Press Enter without entering any data to run the service under the local system credentials.

Note: The install.ps1 may fail with an error similar to the following on older versions of Windows:

Method invocation failed because [System.Object[]] doesn't contain a method named 'Replace'.

If this occurs, you need to manually grant the service account under which the Keyfactor Java Agent service will run the local "Log on as a service" permission and then run the install.ps1 script again.

Tip: If you choose the “msi” option rather than the “local” option, the MSI file will be generated in the directory in which you executed the batch file.

5.3.3 Install the Java Agent on Linux

The Java Agent installation script offers the option to install the Java Agent directly or use the installation script to build an RPM package that you can then use to install the Java Agent on multiple machines.

Note: If you have a previously installed version of the Keyfactor Java Agent on this server, you need to uninstall it (see [Uninstall the Java Agent on page 2990](#)) before installing a new version.

To begin the Java Agent installation on Linux, unzip the installation files and place them in a temporary working directory.

1. On the Linux machine on which you wish to install the Java Agent or build the package, at a command shell change to the temporary directory where you placed the installation files.
2. Use the `chmod` command to make the `cms-java-agent-Installer.sh` script executable. The file ships in a non-executable state to avoid accidental execution. For example:

```
sudo chmod +x cms-java-agent-installer.sh
```

3. In the command shell, run the `cms-java-agent-Installer.sh` script *as root* to begin the installation. You will be prompted to answer several questions:

Username the Java Agent will connect as

This is the service account on the Keyfactor Command server side of the fence you created as per [Create Service Accounts for the Java Agent on page 2969](#). It should be entered in the format `DOMAIN\username`.

Password for the account that the Java Agent will connect as

This is the password for the service account on the Keyfactor Command server side of the fence.

Hostname or address for the Keyfactor Command Agents server

This is the FQDN or IP address of the Keyfactor Command server running the Keyfactor Command Agent Services role, which is installed as part of the Keyfactor Command Services role. If you installed all the Keyfactor Command server roles together, this is the FQDN or IP address of your Keyfactor Command server.

If you choose to use SSL to connect to the Keyfactor Command server, you'll need to enter a hostname at this prompt that is found in the SSL certificate.

If you're using a non-standard port for IIS on your Keyfactor Command server, enter that here as part of your hostname or IP address (e.g. keyfactor.keyexample.com:444).

Virtual directory for the Keyfactor Command Agents service URL

Press Enter to accept the default of KeyfactorAgents. Only enter an alternate virtual directory if your Keyfactor Command server was configured with an alternate virtual directory for the Keyfactor Command Agents service.

Connect to Keyfactor using SSL?

Press Enter to accept the default of Yes or enter No. The following instructions assume that you answered Yes.

To connect to Keyfactor Command, the Java Agent needs to trust the SSL certificate presented by the Keyfactor Command Agents server...

If your Keyfactor Command server is using a publicly rooted certificate, the server most likely already trusts the certificate issuer, and you can press Enter here.

If the certificate on the Keyfactor Command server was internally generated, you will need to enter the full path and file name pointing to a file on the local server containing the PEM-encoded root certificate for the certificate authority chain that issued the certificate (see [Configure Certificate Root Trust for the Java Agent on page 2971](#)).

The root certificate will be saved in a Java keystore file called trust.jks located in the Java Agent's install directory (/opt/keyfactor-java-agent by default). The default keystore password is *changeit*. Please contact Keyfactor technical support for assistance in changing the default password, if desired.

This question will not appear if you answered no to the question about using SSL.

Verify Keyfactor Command connectivity?

Press Enter to accept the default of "Yes". The Java Agent will attempt to connect to the Keyfactor Command server using the credentials provided to confirm that the server name, agents URL, root trust, and provided credentials are valid. Enter "No" to skip this validation if you don't have connectivity to the Keyfactor Command server at the time of installation.

Tip: If the installer terminates after this question without an error or with an error writing the trust.jks file, it can be an indication that the path to the root certificate you provided in the previous question was incorrect in some way (e.g. the path is not valid, the root certificate doesn't match the certificate on the Keyfactor Command server, etc.)

Please specify the installation format

The options at this prompt are “local” or “rpm”. If you press enter to accept “local”, the Java Agent will be installed locally. If you enter “rpm”, the script will generate an rpm after all of the questions have been answered. You can use this to install the Java Agent on other Linux systems with the installation questions already answered. The subsequent questions differ depending on the answer given to this question. The following instructions include both **local** and **rpm** questions. You will not see all of these questions.

If you select “rpm”, the Java agent will not be installed locally.

Path to the desired directory for installation (**Local**)

Press Enter to accept the default installation directory of /opt/keyfactor-java-agent or enter an alternate path if desired. This question does not appear when generating an rpm.

Local user account the agent should run as \ User account on the target machine that the agent should run as (**Local****RPM**)

This is the service account for the Java Agent side of the fence you created as per [Create Service Accounts for the Java Agent on page 2969](#). It should be entered as just the user name. Entry of the password for this service account is not required. The username is entered at this time to allow permissions to be configured appropriately.

Hostname the agent will connect to Keyfactor as (**Local**)

Press Enter to accept the default of the local machine’s hostname as determined by a reverse DNS lookup or, failing that, the value of the local environment variable for the computer name. If desired, you can enter an alternative value to use as the hostname. This is the identifier for the server on which you are installing the Java agent. This identifier can be in the form of a host-name or FQDN, but you can use another unique identifier, if desired. This identifier appears in the Keyfactor Command Management Portal on the orchestrators page. This question does not appear when generating an rpm.

Full path to the desired buildroot directory for RPM package staging. Directory must not exist. (**RPM**)

Press Enter to accept the default path of /temp under the current directory or enter an alternate path if desired. This is a temporary location the build process will use while the package is being created. This is not the directory where the final RPM file will be placed. This question does not appear when installing locally.

Note: Ensure the path does not contain spaces. Any space in the java agent path causes issues when building an rpm.

Tip: The RPM file will be generated in a subdirectory (rpmbuild/RPMS) of the home directory of the user running the cms-java-agent-Installer.sh script. If you run the script as root, this will be root's home directory, so you may choose to run the script as a non-root user if you plan to create an RPM.

Path the RPM will install to on the target machine (RPM)

Press Enter to accept the default installation directory of /opt/keyfactor-java-agent or enter an alternate path if desired. This question does not appear when installing locally.

Architecture of the RPM target machine (RPM)

Press Enter to accept the default as determined by the machine on which the RPM is being generated or enter an alternate architecture if desired. A separate RPM needs to be generated with each required machine architecture. This question does not appear when installing locally.

Directory where the agent logs should be placed (Local\RPM)

Press Enter to accept the default log directory of /opt/cms-java-agent/logs or enter an alternate path if desired.

Number of log files that should be kept (Local\RPM)

Press Enter to accept the default of 7 log files or enter an alternate number if desired. Older files are automatically deleted once more files than this have been generated.

Maximum size of each log file (Local\RPM)

Press Enter to accept the default log file size of 3 MB or enter an alternate value if desired.

Register AnyAgent components with the Keyfactor Java Agent? (Local)

Press Enter to accept the default value and begin the installation. If you would like to install one or more Any Agent implementations, enter yes. In this case, you'll be presented with a list of custom certificate store types for which to provide an implementation. After choosing each one, you'll need to enter the path to the .jar file that implements the certificate store type. That .jar file will be copied to the installation directory, under the libs folder. You'll need to manually copy any other dependent .jar files to that location as well. Enter "Done" when you've finished listing agent implementations. Note that this option is only available when the JavaAgent is installed locally.

4. After answering the log file size question, the installation begins. Review the output to be sure that no errors have occurred.

```

Welcome to the Keyfactor Java Agent Installer.
This installer will collect all information necessary to configure the Java Agent for use with your Keyfactor Command instance. You will be given the option to apply this configuration to the local machine, or to use the configuration data to construct a Linux RPM package or Windows MSI installer for distribution within your environment.
Please enter the following information:

Username the Java Agent will connect as (format "DOMAIN\user"):
KEYEXAMPLE\svc_kyfjava
Password for the account that the Java Agent will connect as:
Re-enter password:
Hostname or address for the Keyfactor Command Agents server (e.g. "server1.corp.local" or "192.168.0.100"):
keyfactor.keyexample.com
Virtual directory for the Keyfactor Command Agents service URL (default: KeyfactorAgents):

Connect to Keyfactor using SSL? (default: Yes):

To connect to Keyfactor Command, the Java Agent needs to trust the SSL certificate presented by the Keyfactor Command Agents server.
Please enter a local path to a CA certificate that can be used to trust the SSL certificate that will be presented.
You can find this certificate by navigating to the Keyfactor Command Management Portal in a secure browser session and viewing the server certificate chain.
/tmp/CorpRoot.crt
Verify Keyfactor Command connectivity? (default: Yes):

Verifying connection...

Please specify the installation format. Enter "local" or "rpm". (default: "local"):

Path to the desired directory for installation. Directory must not already exist. (default: /opt/keyfactor-java-agent ):

Local user account the agent should run as:
kyfuser

Hostname the agent will connect to Keyfactor as:
jvagt162.keyexample.com
Directory where the agent logs should be placed (default: /opt/keyfactor-java-agent/logs/):

NOTE: Logging configuration, including additional options, can be adjusted through the "logj2.xml" file within the agent "config" directory.
Number of log files that should be kept (default: 7):

Maximum size of each log file (default: "3 MB"):

Register AnyAgent components with the Keyfactor Java Agent? (Default: No):

Building Java Agent installer...
Encrypting credentials
Generating config files
Copying files
Creating SSL certificate trust store
Install completed
You can use the scripts included in the installation to set up the Java agent as a service on your platform. Additional configuration may be necessary for the service to run automatically on machine startup.

```

Figure 589: Keyfactor Java Agent Local Installation on Linux

5. Keyfactor provides scripts that can be used to configure the Keyfactor Java Agent to start automatically. These can be used on systems using startups based on SysV style (init.d) or systemd. Other startup systems will need to be configured manually. If your machine has neither of these startup systems, you will not be able to use these scripts to configure the Keyfactor Java Agent to start automatically. The appropriate startup script to use depends on whether you are doing a local install or installing from a previously generated RPM file.

Local Install

- a. In the command shell, change to the directory in which you installed the Java Agent. The default install directory is:

```
/opt/keyfactor-java-agent
```

- b. Select the appropriate installation script for your startup system. The two available scripts for local installs are:

```
install-init-service.sh
install-systemd-service.sh
```

Tip: The scripts with `-with-configured-hostname` in their names (e.g. `install-systemd-service-with-configured-hostname.sh`) are for use with installations from RPM packages and should not be used for local installs.

- c. Use the `chmod` command to make the desired script executable. The file ships in a non-executable state to avoid accidental execution. For example:

```
sudo chmod +x install-systemd-service.sh
```

- d. Run the appropriate shell script as root. This will add the `keyfactor-java-agent` as a service, which you can then stop and start using the standard service stop and start commands. For example:

```
service keyfactor-java-agent restart
systemctl restart keyfactor-java-agent.service
```

Install from RPM

- a. Locate the RPM file on the machine on which it was generated and copy it to the machine on which you wish to install the Java agent.

Tip: The RPM file is generated in a subdirectory (`rpmbuild/RPMS`) of the home directory of the user running the `cms-java-agent-Installer.sh` script. If you run the script as root, this will be root's home directory.

- b. Execute the RPM as root. For example:

```
sudo rpm -ivh keyfactor-java-agent-8.6.0-1.i686.rpm
```

- c. In the command shell, change to the directory in which you installed the Java Agent. The default install directory is:

```
/opt/cms-java-agent
```

- d. There are four possible installation scripts for installation from RPM packages:

```
install-init-service.sh
install-init-service-with-configured-hostname.sh
install-systemd-service.sh
install-systemd-service-with-configured-hostname.sh
```

Select the appropriate installation script type for your startup system (init or systemd). The versions of the scripts that contain a reference to *with-configured-hostname* in the file name allow you to enter a custom agent name (see [Hostname the agent will connect to](#))

[Keyfactor as \(Local\) on page 2981](#)). The versions without this reference will use the system hostname as the agent name.

- e. Use the `chmod` command to make the desired script executable. The file ships in a non-executable state to avoid accidental execution. For example:

```
sudo chmod +x install-systemd-service-with-configured-hostname.sh
```

- f. Run the appropriate shell script as root. You will be prompted to answer questions specific to the machine on which the Java agent is being installed—the hostname or other identifier for the machine (see [Hostname the agent will connect to Keyfactor as \(Local\) on page 2981](#)) if you used a *with-configured-hostname* script and the username and password for the service account that will connect the agent to Keyfactor Command (see [Username the Java Agent will connect as on page 2979](#)).
- g. Change the ownership on the file containing the startup credentials to the local user that the agent will run as. This file is found in the `config` directory under the installed directory and is called `install.creds`. For example:

```
sudo chown kyfuser /opt/cms-java-agent/config/install.creds
```

- h. The install shell script adds the `keyfactor-java-agent` as a service, which you can then stop and start using the standard service stop and start commands. You may need to restart the service after changing the ownership on the credentials file. For example:

```
service keyfactor-java-agent restart
systemctl restart keyfactor-java-agent.service
```

Tip: If desired, you can pass the responses to the questions the installer asks in from a file. For example, for a full install (not working from an RPM file you previously created), create a file that contains values something like this:

```
KEYEXAMPLE\svc_kyfjava
MyVerySecurePassword
MyVerySecurePassword <- The installer requires entry of the password twice
keyfactor.keyexample.com
KeyfactorAgents
Yes
/tmp/CorpRoot.crt
Yes
local
/opt/keyfactor-java-agent
kyfuser
jvagnt162.keyexample.com
```

```
/opt/keyfactor-java-agent/logs  
7  
"3 MB"  
No
```

Note that the values needed in your input file will vary depending on how you answer some of the questions. For example, the first Yes shown above will go in response to the question of whether to use SSL for the connection to Keyfactor Command. If you answer No here, you will not receive the question about needing a root certificate, and so the path to a root certificate shown after this will not correctly match the next question. The script will fail.

Place the file in the same directory as the install script. Then, execute the install script like this:

```
sudo ./cms-java-agent-installer.sh < myinputfile.txt
```

5.3.4 Optional Configuration

Once the installation scripts are complete, the Java Agent should be running and ready to communicate with the Keyfactor Command server.

Important: Java Agent tasks will not run until you complete the Java Agent configuration by making the appropriate configuration changes in the Keyfactor Command Management Portal. See [Orchestrators on page 481](#) in the *Keyfactor Command Reference Guide* for instructions on approving the Java Agent in the Keyfactor Command Management Portal on the *Orchestrators->Auto-Registration* and *Orchestrators->Management* pages, and on configuring certificate stores on the *Certificate Management->Certificate Stores* page (see [Adding or Modifying a Certificate Store on page 413](#) and [Certificate Store Discovery on page 437](#)).

5.3.4.1 Configure Logging for the Java Agent

By default, the Java Agent places its log files in the C:\CMS\logs directory on Windows and the /opt/keyfactor-java-agent/logs directory on Linux, generates logs at the *Info* logging level and stores seven 3 MB logs before deleting them (how long this will be will depend on the logging level and the volume of usage the Java Agent is receiving).

If you wish to change these defaults after the installation is complete on Windows:

1. On the Java Agent machine where you wish to adjust logging, open a text editor (e.g. Notepad) using the "Run as administrator" option.

2. In the text editor, browse to open the log4j2.xml file in the config directory under the directory in which you installed the Java Agent. By default, the file is located in the following directory:

```
C:\Program Files\Keyfactor\Keyfactor Java Agent\config
```

3. Your log4j2.xml file may have a slightly different layout than shown here, but it will contain the four fields highlighted in the below figure. The fields you may wish to edit are:

```
fileName="C:\CMS\logs\CMS-Java.txt"
```

The path and file name of the active Java Agent log file.

Important: If you choose to change the path for storage of the log files, you will need to create the new directory (e.g. D:\KeyfactorLogs) and grant the service account under which the Keyfactor Java Agent service is running full control permissions on this directory.

```
size="3 MB"
```

The maximum file size of each log file. After a log file reaches the maximum size, it is rotated to an archive file name and a new log file is generated.

```
max="7"
```

The number of archive files to retain before deletion.

```
level="info"
```

The level of log detail that should be generated. The default info level logs error and some informational data but at a minimal level to avoid generating large log files. For troubleshooting, it may be desirable to set the logging level to debug or trace. Available log levels (in order of increasing verbosity) are:

- OFF – No logging
- FATAL – Log severe errors that cause early termination
- ERROR – Log severe errors and other runtime errors or unexpected conditions that may not cause early termination
- WARN – Log errors and use of deprecated APIs, poor use of APIs, almost errors, and other runtime situations that are undesirable or unexpected but not necessarily wrong
- INFO – Log all of the above plus runtime events (startup/shutdown)
- DEBUG – Log all of the above plus detailed information on the flow through the system
- TRACE – Maximum log information—this option can generate VERY large log files

```

<RollingFile name="logfile" fileName="C:\CMS\logs\CMS-Java.txt" filePattern="CMS-Java-%i.txt">
  <PatternLayout pattern="%d{yyyy-MM-dd HH:mm:ss.SSS} [%t] %-5level %logger{36} - %msg%n" />
  <MarkerFilter marker="EVENT" onMatch="DENY" onMismatch="NEUTRAL" />
  <SizeBasedTriggeringPolicy size="3 MB"/>
  <DefaultRolloverStrategy max="7"/>
</RollingFile>
Section of file removed in graphic for simplicity.
<Loggers>
  <Root level="info">
    <AppenderRef ref="console" />
    <AppenderRef ref="logfile" />
  </Root>
</Loggers>

```

Figure 590: Configure Logging for Keyfactor Java Agent on Windows

If you wish to change these defaults after the installation is complete on Linux:

1. On the Java Agent machine where you wish to adjust logging, open a command shell and change to the directory in which the Java Agent is installed. By default this is /opt/keyfactor-java-agent.
2. In the command shell in the directory in which the Java Agent is installed, change to the config directory.
3. Using a text editor, open the log4j2.xml file in the config directory. Your log4j2.xml file may have a slightly different layout than shown here, but it will contain the four fields highlighted in the below figure. The fields you may wish to edit are:

```
fileName="/opt/keyfactor-java-agent/logs/CMS-Java.txt"
```

The path and file name of the active Java Agent log file.

Important: If you choose to change the path for storage of the log files, you will need to create the new directory (e.g. /opt/javalogs) and grant the service account under which the Keyfactor Java Agent service is running full control permissions on this directory.

```
size="3 MB"
```

The maximum file size of each log file. After a log file reaches the maximum size, it is rotated to an archive file name and a new log file is generated.

```
max="7"
```

The number of archive files to retain before deletion.

```
level="info"
```

The level of log detail that should be generated. The default INFO level logs error and some informational data but at a minimal level to avoid generating large log files. For troubleshooting, it may be desirable to set the logging level to DEBUG or TRACE. Available log levels (in order of increasing verbosity) are:

- OFF – No logging
- FATAL – Log severe errors that cause early termination
- ERROR – Log severe errors and other runtime errors or unexpected conditions that may not cause early termination
- WARN – Log errors and use of deprecated APIs, poor use of APIs, almost errors, and other runtime situations that are undesirable or unexpected but not necessarily wrong
- INFO – Log all of the above plus runtime events (startup/shutdown)
- DEBUG – Log all of the above plus detailed information on the flow through the system
- TRACE – Maximum log information—this option can generate VERY large log files

```
<RollingFile name="logfile" fileName="/opt/cms-java-agent/logs/CMS-Java.txt" filePattern="CMS-Java-%i.txt">
  <PatternLayout pattern="%d{yyyy-MM-dd HH:mm:ss.SSS} [%t] %-5level %logger{36} - %msg%n" />
  <MarkerFilter marker="EVENT" onMatch="DENY" onMismatch="NEUTRAL" />
  <SizeBasedTriggeringPolicy size="3 MB"/>
  <DefaultRolloverStrategy max="7"/>
</RollingFile>
Section of file removed in graphic for simplicity.
<Root level="info">
  <AppenderRef ref="console" />
  <AppenderRef ref="logfile" />
</Root>
```

Figure 591: Configure Logging for Keyfactor Java Agent on Linux

5.3.4.2 Start the Keyfactor Java Agent Service

The Keyfactor Java Agent service runs on the Java Agent machine and controls discovery, inventory and certificate store update tasks. During the Java Agent configuration process you set the service account under which the Keyfactor Java Agent service will run. The service should start automatically at the conclusion of the installation scripts.

To check to see if the Keyfactor Java Agent service is running and start it if necessary on Windows:

1. On a Windows Java Agent server, open the Services MMC.
2. In the Services MMC confirm that the Keyfactor Java Agent service is set to a Startup Type of Automatic (if desired). If the service is not running, click the green arrow to start it.

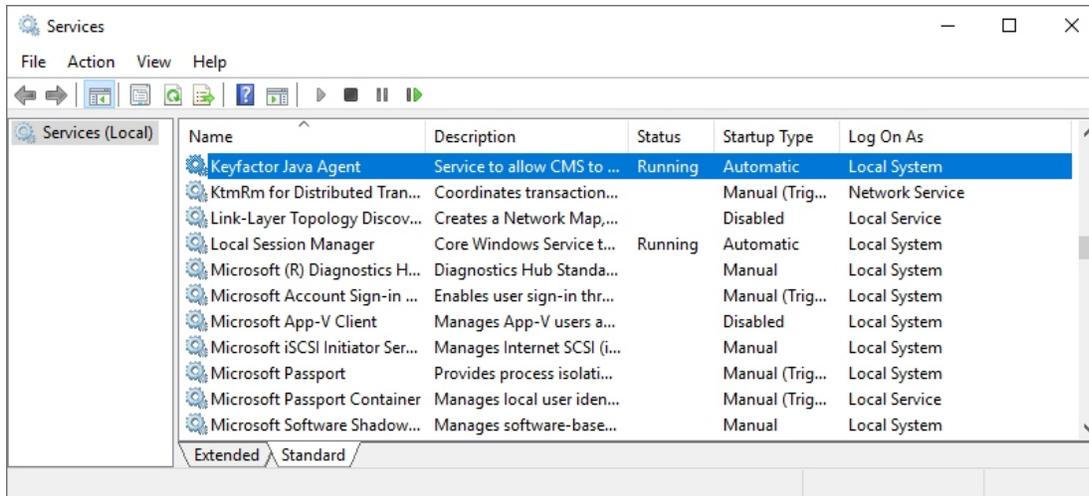

Figure 592: Keyfactor Java Agent Service on Windows

Service startup and shutdown procedures vary by Linux implementation and version depending on the startup system. The service on Linux is added as `keyfactor-java-agent`, so when referencing it in startup commands, it should be referenced by this name, including case. For example:

```
service keyfactor-java-agent start [stop] [restart]
systemctl start [stop] [restart] [status] keyfactor-java-agent.service
```

Once you have finished the Java keystore and PEM certificate store inventory configuration using the Keyfactor Command Management Portal and have imported certificates from the stores, you can use the Certificate Search feature in the Keyfactor Command Management Portal to review the certificate store certificates. See [Certificate Search and Collections on page 19](#) in the *Keyfactor Command Reference Guide* for information on using the Certificate Search feature.

5.3.4.3 Uninstall the Java Agent

To uninstall the Java Agent on Linux.

1. On the Linux machine on which the Java Agent is installed, run the command to stop the service.

```
sudo systemctl stop keyfactor-java-agent.service
```

2. Run the command to remove the service

```
sudo systemctl disable keyfactor-java-agent.service
```

3. After steps 1 & 2 are executed, it is safe to manually remove the Java Agent folder (default location is `/opt/keyfactor-java-agent/`).

5.4 Bash Orchestrator

SSH supports a wide variety of authentication mechanisms. Often, enterprises fall back to simple username and password at least some of the time due to the complexities of key management for key-based authentication. Without key management, SSH keys tend to multiply, and you can quickly lose track of who has access to what where. The Keyfactor Bash Orchestrator is designed to allow organizations to inventory and manage secure shell (SSH) keys across the enterprise.

Important: SSH Key Management licensing is required to use any of the functionality outlined in the Keyfactor Bash Orchestrator documentation. Contact support@keyfactor.com for assistance with obtaining the proper licenses.

The orchestrator runs on Linux servers and can be operated in two possible modes:

- The orchestrator is used in *inventory only* mode to perform discovery of SSH public keys and associated Linux user accounts across multiple configured targets. When used in *inventory and publish policy* mode, the orchestrator:
 - Scans the `authorized_keys` files of all current users on each configured server.

Note: OpenSSH maintains a file for each user that contains the public keys authorized to connect via SSH. By default, this file is named `authorized_keys`. In this document, we refer to this file as *authorized_keys*, however in your environment, this file may have a different name. The file name used in a given environment is defined in the `AuthorizedKeysFile` setting in the OpenSSH `sshd_config` file.

- Aggregates all public key data per Linux user logon.
- Reports aggregate key and logon data back to Keyfactor Command.

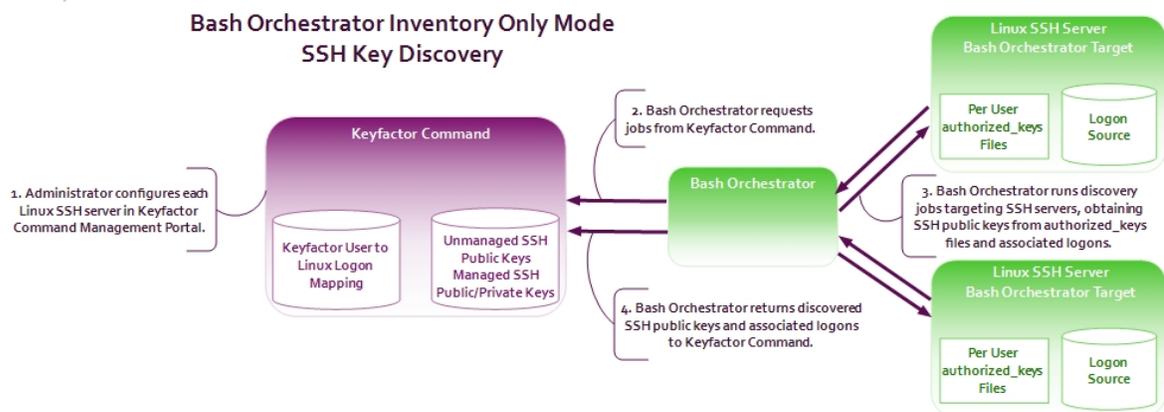

Figure 593: SSH Key Discovery Flow

- When operated in *inventory and publish policy* mode, the orchestrator can be used to add SSH public keys and Linux user accounts on targets and remove rogue keys that appear without authorization. [Figure 594: SSH User Key Management Flow](#) shows the flow from a user

requesting a new key pair to the public key being placed on a target server to allow the user to connect to the server via SSH. The flow is similar for requesting a key pair for a service, though the request is made by an administrator through a different interface in the Keyfactor Command Management Portal. When used in *inventory and publish policy* mode, policies are published to the orchestrator from the Keyfactor Command server following this flow:

- The Keyfactor Command server determines what content needs to go into the authorized_keys files for each logon on each target server. Content includes keys and associated comments aggregated from all servers where that key was found. For example, if a given public key exists on three different servers for the same user but in the original authorized_keys files the key is associated with a different comment on each server, when Keyfactor Command publishes the key down to the servers, it will be published with an aggregated comment string (all three comments together in each authorized_keys file).
- Aggregate logon and key information pushed down to each orchestrator target.
- Orchestrator determines where to place key information, builds the file, and overwrites the existing file with the new one. The process is done in this way to enforce policy and prevent rogue keys from being placed in authorized_keys files.
- Orchestrator informs Keyfactor Command of the success or failure of each machine logon combination.

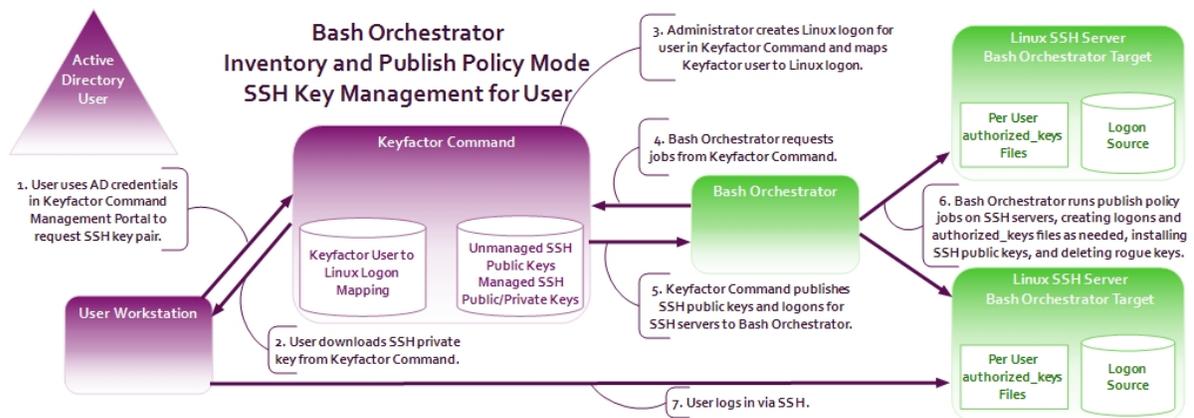

Figure 594: SSH User Key Management Flow

5.4.1 Preparing for the Keyfactor Bash Orchestrator

This section describes the steps that need to be taken prior to a Keyfactor Bash Orchestrator installation to install the prerequisites, create the required supporting components, and gather the necessary information to complete the orchestrator installation and configuration process.

5.4.1.1 System Requirements

The Keyfactor Bash Orchestrator is supported on the following operating systems:

- Oracle Linux 7 or higher
- Red Hat Enterprise 7 or higher
- Ubuntu 16 or higher

The minimum specs are:

- 2GB RAM
- 1 2GHz Processor
- 20GB disk space

Note: As more servers are added to be orchestrated by the orchestrator, increasing those specs will improve performance.

The following applications are required:

systemd

The orchestrator requires a Linux server that uses the systemd service manager. You can use the following command to test whether a system is running systemd:

```
ps -p 1
```

bash

The orchestrator can only be installed on a Linux server that is running bash version 4.3 or higher. You can use the following command to check the bash version of a server:

```
bash --version
```

For systems running an older version of bash, you may be able to successfully operate these as control targets (see [Install Remote Control Targets on page 3000](#)).

Note: The default version of bash on Red Hat Enterprise 7 is 4.2. If you're using this platform and your bash version has not already been updated, this will need to be done.

curl

The orchestrator can only be installed on a Linux server that has curl installed. You can use the following command to check the curl version of a server:

```
curl --version
```

This is a requirement for orchestrators only; curl does not need to be installed on control targets (see [Install Remote Control Targets on page 3000](#)).

5.4.1.2 Create a Service Account for the Keyfactor Bash Orchestrator

The Keyfactor Bash Orchestrator uses a service account in the Active Directory domain where the Keyfactor Command server resides to allow it to communicate with Keyfactor Command. This can be the same service account used for other Keyfactor Command server services. This service account appears in the Management Portal as the *Identity* on the Orchestrator Management grid for the Keyfactor Bash Orchestrator.

The service account needs to be created prior to installation of the Keyfactor Bash Orchestrator software, and the person installing the Keyfactor Bash Orchestrator software needs to know the domain, username and password of the service account.

Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

During installation of the orchestrator, a local Linux user account is created automatically as an identity under which the orchestrator service will operate. This allows the orchestrator to run as a non-root user. On servers on which you install the orchestrator directly, the following Linux user account is created:

```
keyfactor-bash
```

On servers configured as remote control targets, the following Linux user account is created:

```
keyfactor-bash-orchestrator-svc
```

These users are granted access to read `authorized_keys` files for inventory purposes and to update `authorized_keys` files when the orchestrator is operating in *inventory and publish policy* mode using `sudo`. On install, modifications are made to the `sudo` configuration with the addition of a file in the `/etc/sudoer.d` directory granting the orchestrator user select `sudo` rights. The commands the service account user may be granted the right to use via `sudo` include:

```
adduser, awk, cat, chmod, chown, flock, gpasswd, ls, mkdir, restorecon, rm, sed, tee, test, touch, usermod
```

5.4.1.3 Create a Group for Auto-Registration (Optional)

Keyfactor Command can use an Active Directory group to support auto-registration of Keyfactor Bash Orchestrator. Auto-registration is an optional feature that allows you to define the conditions under which a Keyfactor Bash Orchestrator can automatically be approved for operation with the Keyfactor Command server without administrator input, if desired. This is useful in environments hosting a large number of orchestrators or if you wish to automatically add orchestrators to server

groups and add them as servers in the Management Portal as you install them. The auto-registration role used by the Keyfactor Bash Orchestrator is called *Secure Shell Management*.

Add the service account or service accounts under which the orchestrators will communicate with Keyfactor Command to this group.

Note: If all your orchestrators will be connecting to Keyfactor Command as the same service account, you can directly add that user in the auto-registration configuration and skip using a group, if desired.

Although you can choose to enable auto-registration without user validation, allowing any orchestrator to register regardless of the user account under which the orchestrator is running, user validation with either an Active Directory group or a specific Active Directory user is the more secure option.

5.4.1.4 Certificate Root Trust for the Keyfactor Bash Orchestrator

Keyfactor recommends using HTTPS to secure the channel between each Keyfactor Bash Orchestrator and the Keyfactor Command server(s). This requires an SSL certificate configured in IIS on the Keyfactor Command server(s). This certificate can either be a publicly-rooted certificate (e.g. from Symantec, Entrust, etc.), or one issued from a private certificate authority (CA). If your Keyfactor Command server is using a publicly rooted certificate, the orchestrator machine may already trust the certificate root for this certificate. However, if you have opted to use an internally-generated certificate, your orchestrator server may not trust this certificate. In order to use HTTPS for communications between the orchestrator and the Keyfactor Command server with a certificate generated from a private CA, you will need to import the certificate chain for the certificate into the orchestrator's root certificate store. This can be done automatically as part of the installation process. You will need to have the root certificate available as a PEM-encoded format file when you run the installation script.

5.4.2 Install the Keyfactor Bash Orchestrator

To begin the Keyfactor Bash Orchestrator installation, place the installation files in a temporary working directory on the Linux server and:

1. On the Linux machine on which you wish to install the main orchestrator, in a command shell change to the temporary directory where you placed the installation files.
2. Use the `chmod` command to make the following script files executable. The files ship in a non-executable state to avoid accidental execution.
 - [yourpath]/heartbeat.sh
 - [yourpath]/static-analysis.sh
 - [yourpath]/syncjob.sh
 - [yourpath]/Service/keyfactor-bash-orchestrator.sh
 - [yourpath]/Service/systemd/configure-systemd.sh

- [yourpath]/Service/systemd/stop.sh
- [yourpath]/Installation/install.sh
- [yourpath]/Installation/remoteinstall.sh
- [yourpath]/Installation/uninstall.sh

For example, this command will add the executable flag to every file with a .sh extension in the /tmp/BashOrchestrator directory and all its sub-directories:

```
sudo find /tmp/BashOrchestrator -type f -iname "*.sh" -exec chmod +x {} \;
```

3. In the command shell, run the Installation/install.sh script as root using the following syntax to begin the installation:

-n, --username <service account name>

This is the service account that the orchestrator uses to communicate with Keyfactor Command that you created as per [Create a Service Account for the Keyfactor Bash Orchestrator on page 2994](#). It should be entered in the format username@domain (e.g. svc_sshorch@keyexample.com). This parameter is required.

-u, --url <Keyfactor Command agents URL>

This is the URL to the Agent Services endpoint on the Keyfactor Command server running the Keyfactor Command Agent Services role, which is installed as part of the Keyfactor Command Services role. If you installed all the Keyfactor Command server roles together, this is the URL for your Keyfactor Command server with /KeyfactorAgents after the server's IP or FQDN (e.g. https://keyfactor.keyexample.com/KeyfactorAgents). If you choose to use SSL to connect to the Keyfactor Command server, you'll need to enter a URL that contains a hostname that is found in the SSL certificate. This parameter is required.

Tip: If your Keyfactor Command server was configured with an alternate virtual directory for the Keyfactor Command Agents Services endpoint, you will need to enter that in the URL rather than /KeyfactorAgents.

-p, --password <your-secure-password>

This is the password for the orchestrator service account. If you leave this parameter out, you will be prompted to enter this password.

-s, --ssl

Specifying this parameter causes the orchestrator to use SSL for communications with Keyfactor Command. Leave out this parameter if you prefer not to use SSL. This parameter does not take any arguments.

-t, --trusted-root </path/root-filename>

If your Keyfactor Command server is using a publicly rooted certificate, you do not need to use this option. If the certificate on the Keyfactor Command server was internally generated, you will need to use this option to specify the full path and file name of the file containing the root certificate for the certificate authority that issued the certificate (e.g. -t /tmp/myroot.crt). See [Certificate Root Trust for the Keyfactor Bash Orchestrator on page 2995](#).

-i, --server-group-id <GUID of existing SSH server group>

If desired, you may specify this parameter to automatically add the server to an existing server group in Keyfactor Command. The server group must be specified by group ID (e.g. -i 74a9afcc-087d-423a-a331-06686427fdd9). You can find a server group's ID by editing the server group record in the Keyfactor Command Management Portal. This function is only supported if you have enabled auto-registration for SSH (see [Create a Service Account for the Keyfactor Bash Orchestrator on page 2994](#)).

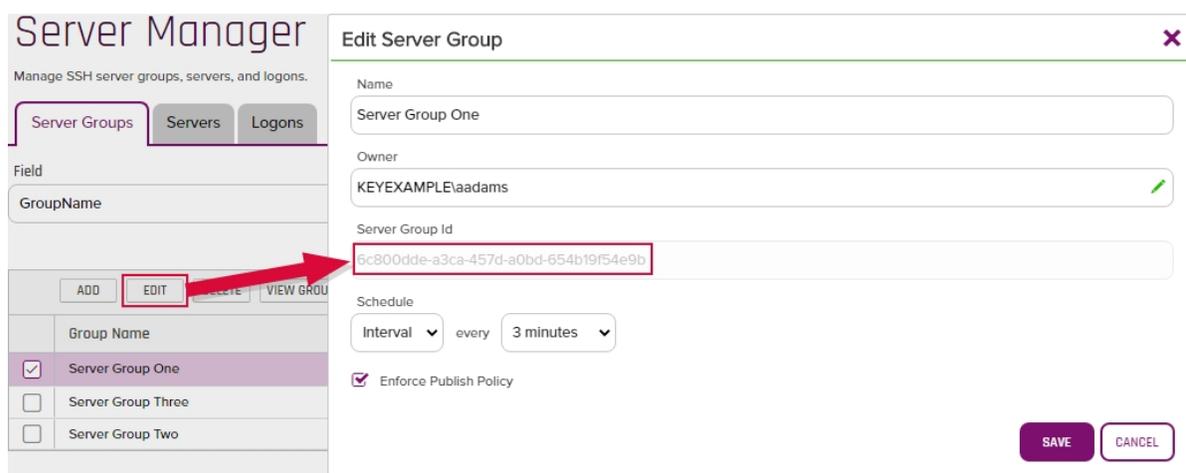

Figure 595: Find the Server Group ID

-c, --client-machine-name <client name>

Specifying this parameter allows you to override the client name the orchestrator would by default use to register itself in Keyfactor Command. By default, the orchestrator uses the results from a hostname lookup for the server's name. See the example output below where the name passed into Keyfactor Command (appsvr80-SSH.ubuntu.keyexample.com) differs from the name used in the SSH key comment for the local Linux user (appsvr80.keyexample.com).

-d, --use-sssd

This is required. You must explicitly specify whether or not you want to enable the orchestrator to use SSSD for user lookups.

- To enable SSSD set either:

```
-d true
```

```
--use-sssd true
```

- To disable SSSD set either:

```
-d false
```

```
--use-sssd false
```

When enabled, the orchestrator will check both the local user store and the SSSD user store (e.g. Active Directory) on requests to create logons and distribute key information, allowing keys to be managed both for local users and for domain users. When enabled, user logon must be created in Keyfactor Command with the username as it appears in SSSD (see [SSH-SSSD Case Sensitivity Flag on page 791](#) and [Adding Logons on page 585](#)).

If you're using SSSD, you must be using SSSD on any remote servers the orchestrator will manage. Additionally, the *LogonHomeDirectories* setting is expected to be consistent on all remote servers.

Domain users can be managed with or without preexisting home directories.

-l, --logon-home-directories </homedirectoryroot>

Specifying this parameter allows you to set the base path for home directories of SSH users. This is referenced both when new logons are created, as requested through Keyfactor Command, and when doing discovery for existing logons and keys. If you don't specify a value, the default of */home* is used.

The value set for the Keyfactor Bash Orchestrator *login-home-directories* needs to match the value set for the path in the *override_homedir* or *fallback_homedir* SSSD configuration. For example, if *fallback_homedir* = */home/my/dir/path/%u@%d*, *login-home-directories* needs to be set to */home/my/dir/path*. All SSSD logons to be discovered by or created with the Keyfactor Bash Orchestrator must have a home directory in this directory, not a subdirectory of this directory. For example, given the previously referenced directory, the path */home/my/dir/path/myusername@keyexample.com* would be valid but */home/my/dir/path/anotherdirlevel/myusername@keyexample.com* would not be valid. Home directories are created automatically when logons are created.

Important: Any remotely controlled targets (see [Install Remote Control Targets on page 3000](#)) of a server using SSSD logons with the Keyfactor Bash Orchestrator must also be configured for SSSD logons and must have the same configuration value for *fallback_homedir* or *override_homedir*.

The output from the command should look similar to the following, given the example command shown.

```
sudo ./install.sh -u https://keyfactor.keyexample.com/KeyfactorAgents -n svc_
sshorch@keyexample.com -s -t /tmp/MyRoot.crt -i 74a9afcc-087d-423a-a331-06686427fdd9 -c
appsrvr80-SSH.ubuntu.keyexample.com -d false

```

4. Review the output from the installation to confirm that no errors have occurred.

The script creates a directory, `/opt/keyfactor-bash-orchestrator`, and places the orchestrator files in this directory. Log files are found in `/opt/keyfactor-bash-orchestrator/logs`, though this is configurable (see [Configure Logging for the Keyfactor Bash Orchestrator on page 3002](#)).

The orchestrator service, named `keyfactor-bash-orchestrator.service`, should be automatically started at the conclusion of the install and configured to restart on reboot.

Tip: Once the installation of the orchestrator and any targets for it to control is complete, you need to use the Keyfactor Command Management Portal to approve the orchestrator (if you don't have auto-registration for Keyfactor Bash Orchestrators enabled) and configure SSH server groups and servers as per [Server Manager on page 560](#) in the *Keyfactor Command Reference Guide*. SSH server records are automatically created for the main bash orchestrator if you enable auto-registration for bash orchestrators and use the `-i` switch when registering the bash orchestrator. They are not automatically created for remote targets.

5.4.3 Install Remote Control Targets

After you complete the installation of at least one Keyfactor Bash Orchestrator, you can configure other Linux servers in the environment as control targets for this orchestrator. This is done by running a script on the target servers that installs the SSH public key matching the orchestrator's private key on the target server, along with making a few configuration changes. This allows the orchestrator service on the orchestrator (the local Linux user `keyfactor-bash`) to communicate with the targets using secured SSH.

Important: Any remotely controlled targets of a server using SSSD logons with the Keyfactor Bash Orchestrator must also be configured for SSSD logons and must have the same configuration value for `fallback_homedir` or `override_homedir`.

To configure orchestrator targets:

1. On the orchestrator machine, locate the `remoteinstall.sh` script in the `/opt/keyfactor-bash-orchestrator` directory. Do not use the `remoteinstall-template.sh` script found in the source material under Installation. This script has not been modified to contain the specific public key of your orchestrator.

Tip: A copy of the configured `remoteinstall.sh` script may also be found in the directory from which you executed the installation of the Keyfactor Bash Orchestrator.

2. Copy the customized `remoteinstall.sh` script to the orchestrator target that you wish to configure and place it in a temporary working directory.
3. On the Linux machine you wish to control with the orchestrator, in a command shell change to the temporary directory where you placed the `remoteinstall.sh` script.
4. Use the `chmod` command to make the script file executable. The file ships in a non-executable state to avoid accidental execution. For example:

```
sudo ./chmod +x remoteinstall.sh
```
5. In the command shell, run the `remoteinstall.sh` script as root with no parameters. There is no output from the command when it completes successfully.

```
sudo ./remoteinstall.sh
```

The script creates a directory, `/opt/keyfactor-bach-orchestrator-client`, and places the public key of the orchestrator Linux service account user in an `authorized_keys` file within it. It also creates a local service account user (see [Create a Service Account for the Keyfactor Bash Orchestrator on page 2994](#)) and grants this user ownership on this file to allow the orchestrator server service account to perform tasks on the target.

Log messages are written to the standard Linux `syslog`. The location of these will vary depending on the system OS.

Tip: Once the installation of the orchestrator and any targets for it to control is complete, you need to use the Keyfactor Command Management Portal to approve the orchestrator (if you don't have auto-registration for Keyfactor Bash Orchestrators enabled) and configure SSH server groups and servers as per [Server Manager on page 560](#) in the *Keyfactor Command Reference Guide*. SSH server records are not automatically created for remote targets, even if you enable auto-registration for bash orchestrators and use the `-i` switch when registering the bash orchestrator that will control your targets.

5.4.4 Optional Configuration

Once the installation is complete, the Keyfactor Bash Orchestrator should be running and ready to communicate with the Keyfactor Command server. The initial installation allows the orchestrator to scan itself to do discovery of SSH keys and then management of SSH keys if the server is configured for management in Keyfactor Command. At this point, you may wish to configure one or more orchestrator target servers for the orchestrator to additionally control (see [Install Remote Control Targets on the previous page](#)).

Important: Orchestrator tasks will not run until you complete the orchestrator configuration by making the appropriate configuration changes in the Keyfactor Command Management Portal. See [Orchestrators on page 481](#) in the *Keyfactor Command Reference Guide* for instructions on approving the orchestrator in the Keyfactor Command Management Portal on the *Orchestrators->Management* pages and on configuring SSH server groups and servers

on the *SSH->Server Managers* page (see [Server Manager on page 560](#) in the *Keyfactor Command Reference Guide*).

5.4.4.1 Configure Logging for the Keyfactor Bash Orchestrator

By default, the Keyfactor Bash Orchestrator places its log files in the `/opt/keyfactor-bash-orchestrator/logs` directory, generates logs at non-debug level, rotates the logs when they reach 50 MB, and retains 10 archive logs before deletion.

If you wish to change these defaults after the installation is complete:

1. On the orchestrator machine where you wish to adjust logging, open a command shell and change to the directory in which the orchestrator is installed. By default this is `/opt/keyfactor-bash-orchestrator`.
2. In the command shell in the directory in which the orchestrator is installed, change to the Configuration directory.
3. Using a text editor, open the `orchestrator_config` file in the Configuration directory. Your `orchestrator_config` file may have a slightly different layout than shown here, but it will contain the three fields highlighted in the below figure. The fields you may wish to edit are:

- `logFile=/opt/keyfactor-bash-orchestrator/logs/bash-orchestrator-log.txt`

The path and file name of the active orchestrator log file.

Important: If you choose to change the path for storage of the log files, you will need to create the new directory (e.g. `/opt/sshorchlogs`) and grant the Linux service account under which the orchestrator service is running (see [Create a Service Account for the Keyfactor Bash Orchestrator on page 2994](#)) full control permissions on this directory.

- `logFileSize=50000000`
The maximum file size of each log file. After a log file reaches the maximum size, it is rotated to an archive file name and a new log file is generated. The default is 50000000 (50 MB).
- `logFilesToKeep=10`
The number of archive files to retain before deletion.
- `debugLogEnabled=false`
The level of log detail that should be generated. The default of *false* logs error and some informational data but at a minimal level to avoid generating large log files. For troubleshooting, it may be desirable to set the debug level to *true*.

```
logFile=/opt/keyfactor-bash-orchestrator/logs/bash-orchestrator-log.txt
logFileSize=50000000
logFilesToKeep=10
keyfactorAgentServer=https://keyfactor.keyexample.com/KeyfactorAgents
serverGroupId=71804a75-78de-42fb-bb7e-96b123742f0d
debugLogEnabled=false
clientMachineName=appsrvr79.keyexample.com
```

Figure 596: Configure Logging for the Keyfactor Bash Orchestrator

Tip: Log messages for remote control targets are written to the standard Linux syslog. The location of these will vary depending on the system OS. Log messages for the orchestrator's communication with the remote control targets are included in the primary orchestrator log (described above). It can be helpful to look in both places when troubleshooting an issue with a remote control target.

5.4.4.2 Start the Keyfactor Bash Orchestrator Service

The `keyfactor-bash-orchestrator` service runs on the Keyfactor Bash Orchestrator machine and controls SSH public key discovery and management tasks for the orchestrator machine itself and target servers it controls. The service should start automatically at the conclusion of the installation.

The service on Linux is added as `keyfactor-bash-orchestrator`, so when referencing it in startup commands, it should be referenced by this name, including case. For example:

```
systemctl start [stop] [restart] [status] keyfactor-bash-orchestrator.service
```

Once you have finished the SSH server group and server configuration using the Keyfactor Command Management Portal and have completed a scan of the configured servers, you can view discovered keys and logons in the Keyfactor Command Management Portal and then begin using the management features. See [SSH on page 525](#) in the *Keyfactor Command Reference Guide* for information on using the SSH features.

5.5 Troubleshooting

The following error conditions and general troubleshooting tips may be helpful in resolving issues with the Keyfactor orchestrators. Generally speaking, issues are often related to trusts of root and intermediate certificates, firewall challenges, or insufficient permissions for the service account running the orchestrator service.

Validate Management Portal Configuration

Things to check in the Management Portal include:

- Is the last seen time for the orchestrator on the Orchestrator Management page in the Management Portal within the last few minutes (see [Orchestrator Management on page 496](#) in the *Keyfactor Command Reference Guide*)? Most orchestrators send a heartbeat to Keyfactor Command every 5 minutes, so this date should at most be 5 minutes out of date if the

orchestrator is operating correctly.

Tip: Orchestrator control targets for the Keyfactor Bash Orchestrator do not appear on the Orchestrator Management page, so for a remote server that's not operating as expected, this would be the orchestrator that is controlling the target.

Orchestrator Management ⁹

Orchestrators are used to perform tasks directly on computers and communicate information back to Keyfactor. These tasks may include synchronizing certificates and templates from remote configuration tenant CAs or non-domain-joined CAs, reporting inventory of Java Keystores, installing certificates into Java Keystores, and requesting certificates on Macintosh clients.

Field: Comparison: Value:

Figure 597: Orchestrator Management for a Keyfactor Bash Orchestrator

- Has the orchestrator been approved on the Orchestrator Management page in the Management Portal (see [Orchestrator Management on page 496](#) in the *Keyfactor Command Reference Guide*)?
- Is there a sync schedule set to run frequently for the orchestrator (SSH), remote control target (SSH), or certificate store? Sync schedules for certificates stores are automatically disabled if inventory jobs are failing.
- For the Keyfactor Bash Orchestrator:
 - Has the server record for the orchestrator or remote control target been created under SSH Server Manager on the Servers tab in the Management Portal (see [SSH Servers on page 577](#) in the *Keyfactor Command Reference Guide*)?

Server Manager ⁹

Manage SSH server groups, servers, and logons.

Server Groups **Servers** Logons Users

Figure 598: Orchestrator Management for a Keyfactor Bash Orchestrator

- Does the server record for the orchestrator or remote control target in the Management Portal have the correct hostname or IP address? If the name or IP address is incorrect, sync jobs will fail.
- Is the server record for the remote control target in the Management Portal associated with the correct orchestrator? If the control target is associated with the wrong orchestrator, you may be looking at the wrong log files (see [Debug Logging and Error Messages below](#)) for troubleshooting information.

Debug Logging and Error Messages

It is often helpful to enable debug logging on the orchestrator. For information on configuring this, see the specific orchestrator chapters.

Once the logging is set at debug or trace level, it can be helpful to watch the logs live while activity is going on. On Linux, you can do this with *tail* (or a similar tool) to watch the log in real time. For example:

```
tail -f /opt/keyfactor-bash-orchestrator/logs/keyfactorbash-orchestrator-log.txt
```

```
tail -f /opt/keyfactor/orchestrator/logs/Log.txt
```

On Windows, there are also tools with tail-like functionality. Notepad++, for example, has this functionality built in.

Some messages in the KeyfactorUniversal Orchestrator log include a correlation ID that helps to identify log messages that originated from the same request. The correlation ID is a randomly generated GUID that often appears just after the date in the log entry (**BOC4946E-DB3B-4404-8080-79AFF260DE4E** in the following example) and is the same for all log messages for the given request until the request completes.

```

2023-09-15 18:19:00.7389 B0C4946E-DB3B-4404-8080-79AFF260DE4E 230398
```

```
Keyfactor.Orchestrators.JobExecutors.OrchestratorJobExecutor [Debug] - Finished running job extension for job with Id 'b0c4946e-db3b-4404-8080-79aff260de4e'
```

Some messages to look for include:

- This message (or similar—text varies slight from orchestrator to orchestrator) indicates that the orchestrator has not yet been approved in the Keyfactor Command Management Portal:

```
2021-07-29 09:01:28.5957 Keyfactor.Orchestrators.JobEngine.SessionJobExecutor [Info] - Agent has not yet been registered with CMS. Trying again in 30 minutes.
```

After approving the orchestrator in the Management Portal, you can restart the orchestrator service to avoid waiting 30 minutes for the next automated retry.

- Some log message spell out the problem pretty clearly. For example, this message from the Java Agent log:

```
2021-07-29 09:00:02.437 [Scheduler_Worker-1] ERROR com.css_security.cms.JksUtilities - Keystore /opt/apps/myapp.jks loaded as type JKS but the provided password is incorrect
```

In this case, the certificate store configuration in the Management Portal is not using the correct password for the store.

- This series of messages in the Java Agent log indicates that the stored credentials file for the Java Agent is no longer useable:

```
2021-07-01 11:24:59.292 [Scheduler_Worker-1] ERROR com.css_security.cms.apache.http.HttpClientFactory - Given final block not properly padded. Such issues can arise if a bad key is used during decryption.
2021-07-01 11:24:59.313 [Scheduler_Worker-1] ERROR com.css_security.cms.apache.http.HttpClientFactory - Could not decrypt credentials file at config/install.creds
2021-07-01 11:24:59.313 [Scheduler_Worker-1] INFO com.css_security.cms.apache.http.HttpClientFactory - Your machine key may have changed. Reencrypt credentials using local machine key.
2021-07-01 11:24:59.313 [Scheduler_Worker-1] INFO com.css_security.cms.apache.http.HttpClientFactory - Generate new credentials by running included cms-credential-encryptor utility
2021-07-01 11:24:59.313 [Scheduler_Worker-1] INFO com.css_security.cms.apache.http.HttpClientFactory - Try 1. Trying again in 30 seconds
```

The credentials file can be recreated to return the Java Agent to functionality (see Appendix A—Generate New Credentials for the Java Agent).

- This series of messages indicates that the Keyfactor Command server is unreachable:

```
2021-07-29 11:59:02.1003 Keyfactor.Orchestrators.JobEngine.SessionClient [Error] - Unable to heartbeat:
2021-07-29 11:59:02.1003 Keyfactor.Orchestrators.JobEngine.SessionClient [Trace] - Leaving CMSSessionClient.Heartbeat
2021-07-29 11:59:02.1006 Keyfactor.Orchestrators.JobEngine.SessionJobExecutor [Debug] - Heartbeat success: Unreachable
2021-07-29 11:59:02.1006 Keyfactor.Orchestrators.JobEngine.SessionJobExecutor [Warn] - Heartbeat endpoint unreachable. Trying again later
```

This could indicate a network or firewall issue.

- A series of messages similar to this for the Universal Orchestrator can indicate a problem retrieving the CRL for the certificate used to secure the Keyfactor Command server if you've chosen to connect to Keyfactor Command over SSL:

```
2022-09-14 11:15:06.1830 Keyfactor.Orchestrators.JobEngine.SessionJobExecutor [Error] - Error in SessionManager: Unable to register session.
The SSL connection could not be established, see inner exception.
The remote certificate is invalid because of errors in the certificate chain: RevocationStatusUnknown, OfflineRevocation
```

Confirm that the CRLs for the CA that issued the certificate and the remaining CAs in the chain are valid. Confirm that they are available in a location that is accessible to the orchestrator server (e.g. a location other than LDAP if the orchestrator is installed on a server not joined to a domain in the forest where they were issued). If you're using delta CRLs and hosting them on an IIS website using the default CRL suffix as a naming convention (+), be sure to enable double escaping in IIS to allow the orchestrator to retrieve the CRL files containing a plus in the file name.

- Messages that look like errors during SSL scanning are common as attempts are made to connect to TLS endpoints and connections fail or are refused. This is part of the process of testing whether an SSL endpoint is responding and then whether there is a certificate there. Most of these message exist at TRACE level, so monitoring at DEBUG rather than TRACE level will eliminate these messages if they become overwhelming. For example:

```
2022-09-12 10:56:32.3948 EE033BD9-421A-44CA-89BC-10C86949B506 166937 Tls13Probe [Trace] - Endpoint 192.168.216.87:443 returned status 'ExceptionDownloading' with exception 'System.ArgumentException': The specified nonce is not a valid size for this algorithm. (Parameter 'nonce')
2022-09-12 10:56:39.0567 EE033BD9-421A-44CA-89BC-10C86949B506 166937 Tls13Probe [Trace] -
```

```
Endpoint 192.168.216.158:443 returned status 'ConnectionRefused' with exception 'System.Net.Sockets.SocketException': An existing connection was forcibly closed by the remote host.
2022-09-12 10:57:23.4727 EE033BD9-421A-44CA-89BC-10C86949B506 166937 Tls13Probe [Trace] - Connection to 192.168.216.87:443 failed
2022-09-12 10:57:24.3345 EE033BD9-421A-44CA-89BC-10C86949B506 166937 a [Trace] - Endpoint 192.168.216.211:443 returned status 'ExceptionDownloading' with exception 'Keyfactor.Orchestrators.SSL.Pipeline.Exceptions.ConnectionGoneException': Read zero bytes on a blocking read
2022-09-12 10:57:57.9505 EE033BD9-421A-44CA-89BC-10C86949B506 166937 b [Trace] - Endpoint 192.168.216.96:443 returned status 'SslRefused' with exception 'Keyfactor.Orchestrators.SSL.Pipeline.Exceptions.TlsAlertException': Got TLS alert during TLS handshake: Alert level 2, Alert description 70
```

Heartbeat

You should see a heartbeat message similar to the following in the log every 5 minutes:

- Keyfactor Universal Orchestrator on Windows:

```
2023-09-12 11:01:16.4598 Keyfactor.Orchestrators.JobEngine.SessionJobExecutor [Debug] - Existing session found. Heartbeating...
```

- Keyfactor Bash Orchestrator:

```
Tue Aug 11 18:06:02 UTC 2023 [Debug]: Performing orchestrator heartbeat...
```

- Keyfactor Java Agent on Linux:

```
2023-07-30 00:52:11.662 [Scheduler_Worker-1] DEBUG com.css_security.cms.agents.jobs.SessionManager - Existing session found. Heartbeating...
```

This is the orchestrator checking in with the Keyfactor Command server to see if there are any jobs. If this message is missing, it could indicate that the heartbeat service is not running.

If you're running the Keyfactor Bash Orchestrator, you can see the heartbeat service as a separate entity. Execute this command on the orchestrator in the command shell as root:

```
systemctl status keyfactor-bash-orchestrator.service
```

Output from this command should look something like that shown in [Figure 599: Status for the Keyfactor Bash Orchestrator Service](#). If you don't see heartbeat.sh in the output, the heartbeat service is not running.

```

```

Is the heartbeat service present in the output, indicating it is running?

Figure 599: Status for the Keyfactor Bash Orchestrator Service

For other orchestrators, check to see if the orchestrator service as a whole is running (see details in the specific orchestrator chapters). Start the service if it is not running or restart it if it is running and check again for a heartbeat after a few minutes.

Firewall Ports

At a very basic level, the orchestrator needs to be able to communicate with the Keyfactor Command server(s) on either port 80 or port 443 (depending on the configuration option you’ve chosen for this connection—see orchestrator specific chapters).

The ports needed for the Keyfactor Universal Orchestrator depend on the functions enabled for the orchestrator. For example, IIS certificate store management uses remote PowerShell (default TCP 5985 and 5986). For SSL discovery and management, any ports configured for scanning need to be open.

The Keyfactor Bash Orchestrator communicates with any remote control targets on port 22 or the alternative port you have configured for SSH. If you are using a non-standard port for SSH, you need to be sure to configure this on both the Keyfactor Command side (see [Adding SSH Servers on page 577](#) in the *Keyfactor Command Reference Guide*) and in the SSH configuration on the orchestrator and remote control targets (sshd_config).

For more information about the firewall ports needed in a Keyfactor Command environment, see [Firewall Considerations on page 2765](#) in the *Keyfactor Command Server Installation Guide*.

Keyfactor Bash Orchestrator Troubleshooting Tips

The Keyfactor Bash Orchestrator has two possible configurations—local and remote. The troubleshooting steps differ depending on whether the server that’s not operating as expected is running the orchestrator software (a local installation) or is a control target for the orchestrator (a remote installation). In either case, the best place to start with troubleshooting is in the Keyfactor Command Management Portal to confirm things seem correct on this side of the communication and then configure debug logging on the orchestrator and review those logs.

Successful Inventory and Policy Publishing

In this snippet you see a successful inventory showing keys found for the Linux users ginag and svc_greenchicken and a logon found for the Linux user zadams with no key found. You see that the server is configured in *inventory and publish policy mode*, since after performing the inventory the server went through the steps of publishing logons and keys. Details about these are not written to the log.

```

Validate Service Account Logon

During installation of the orchestrator, a local Linux user account should be created automatically as an identity under which the orchestrator service will operate. This allows the orchestrator to run as a non-root user. On servers on which you install the orchestrator directly, the following Linux user account is created:

```
keyfactor-bash
```

On servers configured as remote control targets, the following Linux user account is created:

```
keyfactor-bash-orchestrator-svc
```

You can validate that the user has been created and has the correct configuration by reviewing the `/etc/passwd` file.

In a command shell, output the content of the `/etc/passwd` file to the screen:

```
cat /etc/passwd
```

In the output from this command, look for the entry for the `keyfactor-bash` or `keyfactor-bash-orchestrator-svc` user. It will look similar to one of these:

```
keyfactor-bash:x:978:976:./home/keyfactor-bash:/bin/bash  
keyfactor-bash-orchestrator-svc:x:112:65534:./opt/keyfactor-bash-orchestrator-client:/bin/bash
```

On the remote control target server, you should find an entry in the `sshd_config` file that directs the service account logon over to the install path for the client to find the `authorized_keys` file for the service account user, like so:

```
Match User keyfactor-bash-orchestrator-svc
AuthorizedKeysFile /opt/keyfactor-bash-orchestrator-client/authorized_keys
```

On both the orchestrator and remote control target servers, you should find a file in the `/etc/sudoer.d` directory named for the service name of the orchestrator or remote control target user (`keyfactor-bash` or `keyfactor-bash-orchestrator-svc`) and containing a list of commands the orchestrator is allowed to execute as root. For example:

```
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /bin/ls
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /bin/cat
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /usr/bin/test
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /bin/rm
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /usr/bin/tee
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /bin/touch
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /bin/chmod
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /bin/chown
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /usr/bin/gpasswd
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /usr/sbin/usermod
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /bin/sed
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /usr/bin/flock
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /bin/mkdir
keyfactor-bash appsrvr79.keyexample.com = (root) NOPASSWD: /usr/sbin/adduser
```

Validate Remote Control Target Public Key

The orchestrator connects to the remote control targets it is managing using SSH with a public key pair. On the orchestrator, the key pair is stored in the `.ssh` directory under the directory where the orchestrator is installed. By default, this is:

```
/opt/keyfactor-bash-orchestrator/.ssh
```

Both the private key (`id_rsa`) and public key (`id_rsa.pub`) are found here.

In a command shell, output the content of the public key file to the screen:

```
cat id_rsa.pub
```

On the remote control target, the public key of the key pair is stored in the `authorized_keys` file for the remote control target service account, which is found in the remote control install path. By default, this is:

```
/opt/keyfactor-bach-orchestrator-client
```

In a command shell, output the content of the `authorized_keys` file to the screen:

```
cat authorized_keys
```

Compare the public key string from the remote control target `authorized_keys` file to the public key string from the orchestrator `id_rsa.pub` file. They should match exactly. If they do not match, the remote control target is not using the correct public key, which will cause connection attempts made to it from the orchestrator to fail.

Tip: You should also see in the `.ssh` directory on the orchestrator a file named by hostname (e.g. `appsvr80.keyexample.com`) for each of the remote control targets managed by the orchestrator. These contain a list of known, trusted host key stores. If this file has not been created for your remote control target, connectivity to the target is failing at a very fundamental level (before the stage of a public key mismatch). See [Firewall Ports on page 3010](#).

Keyfactor Bash Orchestrator Log Messages

If the orchestrator is managing more than one server (remote control targets), it can be difficult to interpret the logs, because the orchestrator operates in a multi-threaded manner and log messages for jobs with different servers will be mixed together. Find a message related to the job you're interested in and look for the ID for that job. Then look for all other messages referencing that ID.

Look for error messages in the log. These should appear with the word *Error* in brackets just after the date like so:

```
Tue Aug 11 19:14:33 UTC 2020 [Error]: Error occurred during job with id 'b835bde8-8174-447a-b351-810e582148c0' on server 'appsvr79.keyexample.com': An error occurred attempting to configure the job 'b835bde8-8174-447a-b351-810e582148c0'
```

This particular message doesn't tell you very much except that this job was unable to complete for some reason. If you look at the debug messages that appear immediately before and after the error message, they may provide more information.

This message indicates that the orchestrator was unable to make an SSH connection to the remote control target named in the message:

```
Mon Aug 10 23:36:10 UTC 2020 [Error]: Error occurred during job with id '3f04f552-05fd-4c90-b3b1-edec70878bb' on server 'appsvr80.ubuntu.keyexample.com': Unable to connect to 'appsvr80.ubuntu.keyexample.com' on port '22' via SSH
```

This could happen for a number of reasons. Perhaps the hostname configured for the remote target is incorrect. Perhaps the public key on the remote target is incorrect. It can be helpful in this case to check the Linux `syslog` on the orchestrator for more context on the message. For example, this set of messages from the Linux `syslog` reveals that the public key on the target is invalid in some fashion:

```
Aug 11 13:03:04 appsvr158 keyfactor-bash[29417]: Testing 'keyfactor-bash-orchestrator-svc' on
server 'appsvr80.keyexample.com' via SSH for job with id 'eeabd541-b9d2-46d2-a215-9cb99fed4adc'...
Aug 11 13:03:04 appsvr158 keyfactor-bash-orchestrator.sh[932]: keyfactor-bash-orchestrator-
svc@appsvr80.keyexample.com: Permission denied (publickey).
Aug 11 13:03:30 appsvr158 keyfactor-bash[29486]: Error occurred during job with id 'eeabd541-b9d2-
46d2-a215-9cb99fed4adc' on server 'appsvr80.keyexample.com': Unable to connect to 'appsr-
vr80.keyexample.com' on port '22' via SSH
```

For information on troubleshooting public key issues with remote control targets, see [Validate Remote Control Target Public Key on page 3013](#). For more information on troubleshooting remote control target issues in general, see [Remote Control Target Logs below](#). For information on what successful inventory and publish policy log messages look like, see [Successful Inventory and Policy Publishing on page 3011](#).

Remote Control Target Logs

Unlike on the orchestrator itself, where you can enable debug logging to see a more detailed picture of what's going on when the orchestrator attempt to connect or run a job, on a remote control target, the only logs available are the SSH logs showing attempts by the orchestrator to make a remote connection into the target and then the commands the orchestrator runs from an SSH perspective. These logs are found in the Linux system log where SSH logs are consolidated. The name and location of this will vary by operating system, but it is often found in `/var/log` by default (*auth.log* or *secure* is common). A large number of entries are generated in the log on a successful connection for inventory or inventory and policy publishing, so it can be difficult to interpret the logs.

In these logs you can check to see if the orchestrator is successfully making an SSH connection. If it isn't, you may see some messages that will help determine why it isn't. If it's successfully making the initial connection but then failing further along in the process, this log may also help reveal that. Perhaps one of the commands that the service account needs to run isn't in the expected path, for example.

When the orchestrator first connects to the remote control target, the log entries on the target will look something like:

```
Aug 11 17:36:51 appsvr80 sshd[95543]: Accepted publickey for keyfactor-bash-orchestrator-svc from
10.4.3.158 port 47778 ssh2: RSA SHA256:u5zNB4UEoPNcax5p4fBbkkWaoiWq6AcEkA65XdzUkM4
Aug 11 17:36:51 appsvr80 sshd[95543]: pam_unix(sshd:session): session opened for user keyfactor-
bash-orchestrator-svc by (uid=0)
Aug 11 17:36:51 appsvr80 systemd-logind[656]: New session 13019 of user keyfactor-bash-orches-
trator-svc.
Aug 11 17:36:51 appsvr80 systemd: pam_unix(systemd-user:session): session opened for user
keyfactor-bash-orchestrator-svc by (uid=0)
```

```
Aug 11 17:36:51 appsvr80 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=/opt/keyfactor-bash-orchestrator-client ; USER=root ; COMMAND=/bin/cat /etc/ssh/sshd_config
```

An inventory of an `authorized_keys` file for a user will appear as a series of entries, something like:

```
Aug 11 18:11:28 appsvr164 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=-
=/opt/keyfactor-bash-orchestrator-client ; USER=root ; COMMAND=/bin/test -f /home/j-
smith/.ssh/authorized_keys
Aug 11 18:11:28 appsvr164 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=-
=/opt/keyfactor-bash-orchestrator-client ; USER=root ; COMMAND=/bin/ls -l /home/j-
smith/.ssh/authorized_keys
Aug 11 18:11:28 appsvr164 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=-
=/opt/keyfactor-bash-orchestrator-client ; USER=root ; COMMAND=/bin/cat /home/j-
smith/.ssh/authorized_keys
```

Removal of a rogue key on a remote control target under management (in *inventory and publish policy* mode) will appear as a series of entries where the `authorized_keys` file is removed, recreated and repopulated with any valid keys (none in this case), like:

```
Aug 12 09:01:24 appsvr80 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=/opt/keyfactor-
bash-orchestrator-client ; USER=root ; COMMAND=/usr/bin/test -f /home/jsmith/.ssh/authorized_keys
Aug 12 09:01:24 appsvr80 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=/opt/keyfactor-
bash-orchestrator-client ; USER=root ; COMMAND=/bin/rm /home/jsmith/.ssh/authorized_keys
Aug 12 09:01:25 appsvr80 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=/opt/keyfactor-
bash-orchestrator-client ; USER=root ; COMMAND=/usr/bin/test -f /home/jsmith/.ssh/authorized_keys
Aug 12 09:01:25 appsvr80 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=/opt/keyfactor-
bash-orchestrator-client ; USER=root ; COMMAND=/usr/bin/test -d /home/jsmith/.ssh
Aug 12 09:01:25 appsvr80 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=/opt/keyfactor-
bash-orchestrator-client ; USER=root ; COMMAND=/usr/bin/touch /home/jsmith/.ssh/authorized_keys
Aug 12 09:01:25 appsvr80 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=/opt/keyfactor-
bash-orchestrator-client ; USER=root ; COMMAND=/bin/chmod 640 /home/jsmith/.ssh/authorized_keys
Aug 12 09:01:25 appsvr80 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=/opt/keyfactor-
bash-orchestrator-client ; USER=root ; COMMAND=/bin/chown jsmith: /home/jsmith/.ssh/authorized_keys
Aug 12 09:01:25 appsvr80 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=/opt/keyfactor-
bash-orchestrator-client ; USER=root ; COMMAND=/usr/bin/flock /home/jsmith/.ssh/authorized_keys
echo
Aug 12 09:01:25 appsvr80 sudo: keyfactor-bash-orchestrator-svc : TTY=unknown ; PWD=/opt/keyfactor-
bash-orchestrator-client ; USER=root ; COMMAND=/usr/bin/tee -a /home/jsmith/.ssh/authorized_keys
```

General Errors

Below are some possible errors you might encounter and some suggested troubleshooting tips or solutions.

Unable to connect to the remote server

Here is an example of some very similar errors you might see when trying to connect to a target machine to inventory a certificate store or execute a management or discovery job on a certificate store:

```
Error: Unable to connect to the remote server - No connection could be made because the target machine actively refused it 192.196.12.12:443 (80131500)
```

```
Error: Unable to complete the inventory operation. One or more errors occurred.
An error occurred while sending the request.
Unable to connect to the remote server
A connection attempt failed because the connected party did not properly respond after a period of time, or established connection failed because connected host has failed to respond 192.168.12.12:443 (80131500)
```

```
Error: Unable to connect to the remote server (80131509)
```

```
Error occurred during job with id 'b5e93ae6-df3b-4b36-9640-b41146db6d36' on server 'appsrvr13.keyexample.com': Unable to connect to 'appsrvr13.keyexample.com' on port '22' via SSH
```

Messages of this type are generally the result of the target server being inaccessible. This might happen if the server was turned off or in maintenance mode. Perhaps there is a network problem routing to that server. If the certificate store has never worked in Keyfactor Command, perhaps there is a typo in the server name configuration.

Request Entity Too Large

You may encounter this error when doing an inventory of an IIS certificate store:

```
Error: Response status code does not indicate success: 413 (Request Entity Too Large). (80131500)
```

This is an indication that the certificate store you are inventorying contains more certificates (or more precisely, the certificates add up to a total number of bytes greater) than IIS on the Keyfactor Command server is configured to accept. To resolve this, adjust the values on the IIS server that control the upload limits. For example, the *maxAllowedContentLength*. See [Monitoring Network Scan Jobs with View Scan Details on page 465](#) in the *Keyfactor Command Reference Guide*) on fine tuning SSL monitoring for more information.

IIS Error 403.16

You may receive a 403.16 error while trying to authenticate an orchestrator to Keyfactor Command using certificate authentication. On the face of it, this error indicates that the chain for the certificate you're using to authenticate is not trusted by the Keyfactor Command server. First,

check to be sure that your certificate is trusted by the Keyfactor Command server. But if your certificate is fully trusted and you're still getting this error, what then?

This error can indicate that the trusted root store on the Keyfactor Command server contains a certificate that is not a root certificate (for example, an intermediate certificate is accidentally in the root store). To check this, open the Local Computer certificates MMC on the Keyfactor Command server, drill down to Certificates under the Trusted Root Certificate Authorities and scan for any certificates where the *Issued To* does not match the *Issued By*. Remove any certificates you find like this.

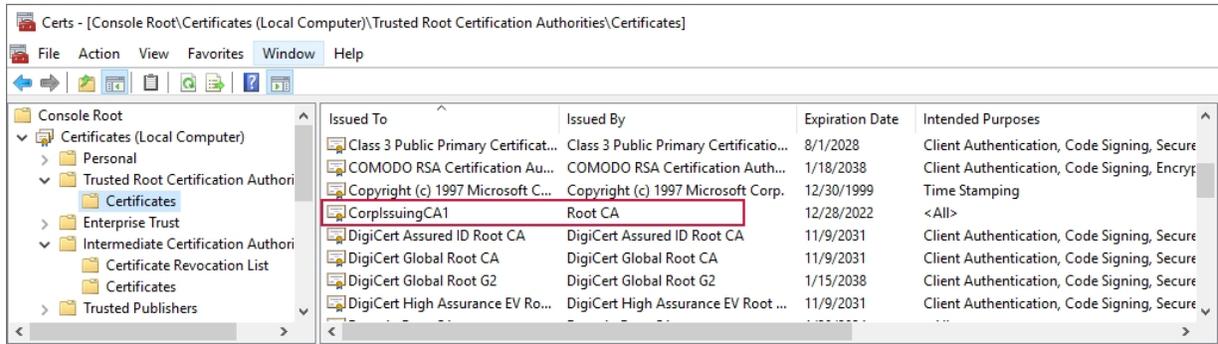

Figure 600: Certificate Incorrectly in the Trusted Root Certificate Store

Error: An attempt was made to load a program with an incorrect format.

If you receive an error similar to the following:

```
Could not load file or assembly 'Keyfactor.CAclient.Microsoft.DCOM, Version=2.1.1.0, Culture=neutral, PublicKeyToken=0ed89d330114ab09'. An attempt was made to load a program with an incorrect format.
```

This may indicate that the Keyfactor Universal Orchestrator was installed without the Microsoft Visual C++ Redistributable x64 required to manage certificates from remote Microsoft CAs (see [System Requirements on page 2880](#)).

Error: The remote certificate is invalid because of errors in the certificate chain

If you receive an error similar to the following (some portions of message removed for clarity):

```
2023-02-15 11:54:27.6600 Keyfactor.Orchestrators.JobEngine.SessionJobExecutor [Error] - Error in SessionManager: Unable to register session.
```

```
The SSL connection could not be established, see inner exception.
```

```
The remote certificate is invalid because of errors in the certificate chain: RevocationStatusUnknown, OfflineRevocation
```

This may indicate that the Keyfactor Universal Orchestrator cannot access the CRL(s) for the SSL certificate used to secure the Keyfactor Command server (see [System Requirements on page 2880](#)).

To check this:

1. Enable at least debug level logging (see [Configure Logging for the Universal Orchestrator on page 2950](#)).
2. Either wait for the orchestrator to attempt to register again, or restart the orchestrator service (see [Start the Universal Orchestrator Service on page 2953](#)) to force an immediate attempt to register.
3. Look in the logs for a log message similar to the following (referencing your Keyfactor Command server name):

```
2023-02-15 12:08:14.6076 Keyfactor.Orchestrators.Core.Http.KeyfactorHttpClient  
[Debug] - Sending request to  
'https://keyfactor.keyexample.com/KeyfactorAgents/Session/Register'
```

4. Visit the referenced URL (`https://keyfactor.keyexample.com/KeyfactorAgents/Session/Register`) in a browser on the orchestrator server. This should give you a response of:

```
The requested resource does not support http method 'GET'.
```

5. In the browser, view details for the certificate (the exact method for this will vary depending on the browser) and check the *CRL Distribution Points* field in the certificate.

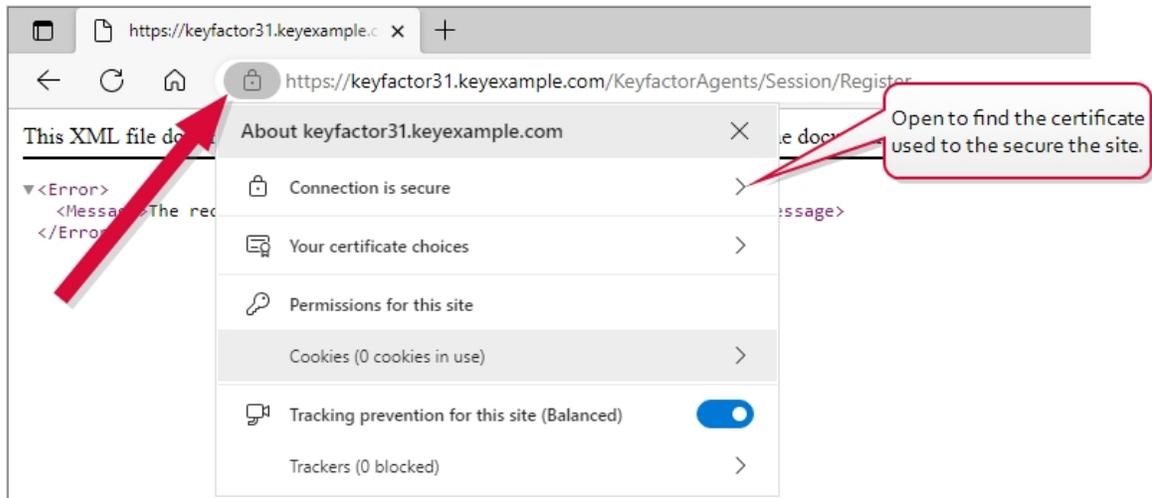

Figure 601: Find the Certificate for the Keyfactor Command Web Site

6. In the same browser on the orchestrator server, attempt to browse to the URL for the CRL (assuming it's a URL).
7. If the CRL downloads without error, then likely CRL access is not the issue. Open the CRL and check the *Next update* date to see if it's in the past (indicating the CRL is out of date).

Note: CRL checks are done on port 80 since the CRL lookup is part of the validation of the server's SSL certificate. This means the CRLs need to be available at an http URL. The CRL file that is retrieved is signed by the CA, so although the network communication is not encrypted when retrieving it, the data that is being validated can't be tampered with (because it is signed).

Tip: The Keyfactor Universal Orchestrator can be installed without checking the CRL of the Keyfactor Command if desired. Use the `-NoRevocationCheck` option for the Windows orchestrator (see [-NoRevocationCheck on page 2906](#)), the `--no-revocation-check` option for the Linux orchestrator (see [--no-revocation-check on page 2919](#)), or the `AppSettings_CheckServerCertificateRevocation` option for the orchestrator in Linux containers (see [Table 854: Linux Container Parameters](#)).

Remote Management Helpful Tools

The following tips are useful for servers being remotely managed using PowerShell remoting and WinRM.

- Test the connection from the orchestrator server to the remotely managed Windows server:

```
Test-netConnection -ComputerName <target> -Port 5986 or Test-netConnection -
ComputerName <target> -Port 5985
```

- Test PS Session from the orchestrator server to the remotely managed server:

```
Enter-PSSession -ComputerName <target>
```

- On the remotely managed server, check what's available:

```
winrm enumerate winrm/config/listener
```

- Enable secure winrm:

```
winrm quickconfig -transport:https
```

- Check the secure winrm port certificate:

```
gci -path cert:\localmachine\my |ft -property thumbprint,subject,NotBefore,NotAfter
```

5.6 Appendices

5.6.1 Appendix - Generate New Credentials for the Java Agent

Under some circumstances, you may find it necessary to generate new credentials for the Java Agent. This can happen, for example, if you make a change to the hostname of the machine on which the Java Agent is running. The credentials file stores the username and password for the service account user that allows the Java Agent to communicate with Keyfactor Command—the identity for the agent (see [Create Service Accounts for the Java Agent on page 2969](#))—encrypted with the hostname to prevent the file from being used on machines other than the machine on which the agent has been installed.

Log messages that indicate a new credentials file is needed look similar to the following:

```
2020-10-02 15:21:43.307 [Scheduler_Worker-1] ERROR com.css_security.cms.apache.http.HttpClientFactory
- Given final block not properly padded. Such issues can arise if a bad key is used during decryption.
2020-10-02 15:21:43.307 [Scheduler_Worker-1] ERROR com.css_security.cms.apache.http.HttpClientFactory
- Could not decrypt credentials file at config\install.creds
2020-10-02 15:21:43.526 [Scheduler_Worker-1] INFO com.css_security.cms.apache.http.HttpClientFactory
- Your machine key may have changed. Reencrypt credentials using local machine key.
```

```
2020-10-02 15:21:43.541 [Scheduler_Worker-1] INFO com.css_security.cms.apache.http.HttpClientFactory
- Generate new credentials by running included cms-credential-encryptor utility
```

To generate a new credentials file on Windows:

1. Open a command prompt using the “Run as administrator” option.
2. Change directories to the directory in which the Java Agent is installed. By default, this is:
`C:\Program Files\Keyfactor\Keyfactor Java Agent`
3. Type the following command to generate a new credentials file in the current directory:
`java -jar CSS.CMS.CredentialEncryptor.jar encode-basic install.creds`
4. Locate the existing credentials file in the config directory under the installed directory. By default, this is:
`C:\Program Files\Keyfactor\Keyfactor Java Agent\config`
5. Delete or name off the existing `install.creds` file in the config directory and copy the new `install.creds` file from the base install directory to the config directory.
6. Restart the Java Agent service (see [Start the Keyfactor Java Agent Service on page 2989](#)).
7. Review the log messages to confirm that credential errors are no longer occurring (see [Configure Logging for the Java Agent on page 2986](#)).

To generate a new credentials file on Linux:

1. Open a command shell.
2. Change directories to the directory in which the Java Agent is installed. By default, this is:
`/opt/keyfactor-java-agent`
3. As a user with rights to write to the current directory (or use `sudo`), type the following command to generate a new credentials file in the current directory:
`java -jar CSS.CMS.CredentialEncryptor.jar encode-basic install.creds`
4. Locate the existing credentials file in the config directory under the installed directory. By default, this is:
`/opt/keyfactor-java-agent/config`
5. Delete or name off the existing `install.creds` file in the config directory and copy the new `install.creds` file from the base install directory to the config directory.
6. Restart the Java Agent service (see [Start the Keyfactor Java Agent Service on page 2989](#)).
7. Review the log messages to confirm that credential errors are no longer occurring (see [Configure Logging for the Java Agent on page 2986](#)).

5.6.2 Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication via a Reverse Proxy: Citrix ADC

The Keyfactor Universal Orchestrator can be configured to support TLS termination at a reverse proxy or network edge device such as a Citrix ADC (a.k.a. NetScaler) or F5. The orchestrator supports using either basic authentication or client certificate authentication between the orchestrator and the Keyfactor Command orchestrator endpoint. When a client certificate is used for the segment between the orchestrator and the reverse proxy, the reverse proxy authenticates the orchestrator with the provided client certificate and then sends the certificate on to Keyfactor Command as an added request header to authenticate the orchestrator to Keyfactor Command with the original certificate. The orchestrator is authenticated and authorized to make the connection to Keyfactor Command in one of two ways:

- A username and password with appropriate permissions within Keyfactor Command are stored on the reverse proxy and presented to Keyfactor Command as part of the request. Basic authentication is used to authenticate the reverse proxy to IIS on the Keyfactor Command server. The same credentials provide authorization for the orchestrator in Keyfactor Command. The original certificate from the orchestrator, provided in a request header, authenticates the orchestrator to the Keyfactor Command orchestrator endpoint.
- A username and password with appropriate permissions within Keyfactor Command are stored in IIS on the Keyfactor Command. In this scenario, a second client certificate residing on the reverse proxy is used to authenticate the reverse proxy to IIS on the Keyfactor Command server. The basic authentication credentials provide authorization for the orchestrator in Keyfactor Command and the original client certificate from the request header provides authentication. The basic authentication credentials are stored locally and do not need to travel over the network. The original certificate from the orchestrator, provided in a request header, authenticates the orchestrator to the Keyfactor Command orchestrator endpoint.

The following instructions cover one method of configuring a Citrix ADC device to support these.

 **Tip:** The following provides instructions for using the Citrix ADC GUI interface to create the appropriate configuration. The same configuration could be accomplished using the command line interface.

Complete the following steps and then configure the orchestrator to enable client certificate authentication as per the installation instructions (see [--client-auth-certificate \(Client Certificate Authentication\) on page 2916](#) or [Install the Universal Orchestrator on Windows on page 2898](#)).

Define Rewrite Actions in Citrix

Create the following two rewrite actions.

 **Tip:** If you're using a second client certificate to authenticate the proxy to Keyfactor Command, you only need to create the first of these actions.

Capture the client certificate from the orchestrator:

1. In the Citrix ADC GUI, browse to *AppExpert > Rewrite > Actions*.
2. On the Rewrite Actions page, click **Add**.
3. On the Create Rewrite Action page, enter a **Name** for the action that will take the certificate received from the orchestrator and convert it to PEM format (e.g. CaptureClientCert).
4. Give the action a *Type* of *INSERT_HTTP_HEADER*.
5. Give the action a *Header Name* (e.g. NS-ClientCert). Be sure to make a note of this header name. You will need it later when you configure certificate authentication for the orchestrator.
6. Enter an *Expression* to convert the client authentication certificate to PEM format:

```
CLIENT.SSL.CLIENT_CERT.TO_PEM
```

7. Enter *Comments* if desired and click **OK** to save the action.

Store basic authentication credentials to authenticate the proxy to IIS on the Keyfactor Command server and provide authorization information:

1. Click **Add** to add another action.
2. On the Create Rewrite Action page, enter a **Name** for the action that will send the basic authentication credentials for the orchestrator to Keyfactor Command (e.g. SendServiceCreds).
3. Give the action a *Type* of *INSERT_HTTP_HEADER*.
4. Give the action a *Header Name* of *Authorization*.
5. Enter an *Expression* to send Base64-encoded basic authentication credentials to the Keyfactor Command server (where *service@keyexample.com* and *MySecurePassword* are the correct service name and password for your environment):

```
"Basic "+("service@keyexample.com"+" ":"MySecurePassword").B64ENCODEM
```

6. Enter *Comments* if desired and click **OK** to save the action.

Define Rewrite Policies in Citrix

Create the following two rewrite policies.

Tip: If you're using a second client certificate to authenticate the proxy to Keyfactor Command, you only need to create the first of these policies.

Put the client certificate from the orchestrator in the header:

1. In the Citrix ADC GUI, browse to *AppExpert > Rewrite > Policies*.
2. On the Rewrite Policies page, click **Add**.

3. On the Create Rewrite Policy page, enter a **Name** for the policy that will confirm that a certificate has been received from the orchestrator and run the action to convert it to PEM format (e.g. NS-GetCert).
4. Give the policy the **Action** you created in the previous section to capture the client authentication certificate (e.g. CaptureClientCert).
5. Define a **Log Action** if desired.
6. Set the **Undefined-Result Action** to *-Global-undefined-result-action-*.
7. Enter an *Expression* to validate that the client authentication certificate has been received from the orchestrator:

```
CLIENT.SSL.CLIENT_CERT.EXISTS
```
8. Enter *Comments* if desired and click **OK** to save the policy.

Send the basic authentication credentials to the Keyfactor Command server:

1. Click **Add** to add another policy.
2. On the Create Rewrite Policy page, enter a **Name** for the policy that will send the basic authentication credentials for the orchestrator to the Keyfactor Command server (e.g. NS-SendCreds).
3. Give the policy the **Action** you created in the previous section to send the basic authentication credentials (e.g. SendServiceCreds).
4. Define a **Log Action** if desired.
5. Set the **Undefined-Result Action** to *-Global-undefined-result-action-*.
6. Enter an *Expression* to confirm that the authorization header does not already exist in the request header:

```
HTTP.REQ.HEADER("Authorization").EXISTS.NOT
```
7. Enter *Comments* if desired and click **OK** to save the policy.

Define a Responder Policy in Citrix

Create the following responder policy.

Validate that the client certificate presented by the orchestrator was issued by the specified issuing CA:

1. In the Citrix ADC GUI, browse to *AppExpert > Responder > Policies*.
2. On the Responder Policies page, click **Add**.

3. On the Create Responder Policy page, enter a **Name** for the policy that will validate that the certificate received from the orchestrator was issued by the correct CA (e.g. NS-Validatelssuer).
4. Select an **Action** of *Reset*.
5. Define a **Log Action** if desired.
6. Do not configure an **AppFlow Action**.
7. Set the **Undefined-Result Action** to *-Global-undefined-result-action-*.
8. Enter an *Expression* to confirm that the certificate received from the orchestrator was issued from the correct issuing CA (where *CorpIssuingCA* is the logical name of your CA):

```
CLIENT.SSL.CLIENT_CERT.ISSUER.CONTAINS("CorpIssuingCA").NOT
```

Tip: Connections from the orchestrator will fail if the client authentication certificate was issued by any CA other than the one configured here. You can use AND logic to add more than one CA. For example:

```
CLIENT.SSL.CLIENT_CERT.ISSUER.CONTAINS("CorpIssuingCA1").NOT &&  
CLIENT.SSL.CLIENT_CERT.ISSUER.CONTAINS("CorpIssuingCA2").NOT
```

With this expression, certificates issued from either one of these CAs would be accepted.

9. Enter *Comments* if desired and click **OK** to save the policy.

Update the Virtual Server in Citrix

Important: Once you modify the virtual server to require certificates for authentication, many other Keyfactor Command transactions will no longer function if they are sharing the same virtual server. Be sure that you are using a separate virtual server for incoming requests to /KeyfactorAgents on the Keyfactor Command server versus other types of requests. The following instructions refer to setting all policies on a single load balancing virtual server, but your configuration may include multiple virtual servers of other types, which may require slight modifications to these instructions.

Modify the configuration for your load balancing virtual server that is used for Keyfactor Command KeyfactorAgent requests as follows.

Configure the Citrix device to authenticate the orchestrator using its client certificate:

1. In the Citrix ADC GUI, browse to *Traffic Management > Load Balancing > Virtual Servers*.
2. On the Virtual Servers page, select your virtual server and click **Edit**.
3. In the SSL Parameters section, click to edit, check the **Client Authentication** box, and set the **Client Certificate** dropdown to **Mandatory**.

Associate the two rewrite policies.

Tip: If you're using a second client certificate to authenticate the proxy to Keyfactor Command, you only need to associate the first of these policies.

Configure the policy to include the certificate in the header:

1. On the Virtual Servers page, under Advanced Settings expand Policies.
2. In the Policies section, click the plus to add a new policy.
3. On the Choose Type page, select **Choose Policy***Rewrite* and **Choose Type***Request* and click **Continue**.
4. On the Choose Type page, click **Add Binding**.
5. On the Policy Binding page, click the **Select Policy** field and on the Rewrite Policies page select the radio button for the rewrite policy you created to capture the client authentication certificate (e.g. NS-GetCert). Click **Select** to save the selection.
6. On the Policy Binding page, set a **Priority** of 110.
7. Set **Goto Expression** to *Next*.
8. Set **Invoke LabelType** to *None*.
9. Click **Bind** to save the binding.

Configure the policy to send the basic authentication credentials to the Keyfactor Command server:

1. On the Choose Type page for Rewrite Request, click **Add Binding**.
2. On the Policy Binding page, click the **Select Policy** field and on the Rewrite Policies page select the radio button for the rewrite policy you created to send the service account credentials to the Keyfactor Command server (e.g. NS-SendCreds). Click **Select** to save the selection.
3. On the Policy Binding page, set a **Priority** of 120.
4. Set **Goto Expression** to *Next*.
5. Set **Invoke LabelType** to *None*.
6. Click **Bind** to save the binding.
7. Click **Close** to return to the virtual server settings page.

Associate the responder policy:

1. On the Virtual Servers page, in the Policies section, click the plus to add a new policy.
2. On the Choose Type page, select **Choose Policy Responder** and **Choose Type Request** and click **Continue**.
3. On the Choose Type page, click **Add Binding**.
4. On the Policy Binding page, click the **Select Policy** field and on the Responder Policies page select the radio button for the responder policy you created to validate the issuer of the client authentication certificate (e.g. NS-ValidatelIssuer). Click **Select** to save the selection.
5. On the Policy Binding page, set a **Priority** of 100.
6. Set **Goto Expression** to *END*.
7. Set **Invoke LabelType** to *None*.
8. Click **Bind** to save the binding.
9. Click **Close** to return to the virtual server settings page.

Configure Keyfactor Command for Client Certificate Authentication

Once you have all the components configured on Citrix, you're ready to configure Keyfactor Command to enable client certificate authentication for the orchestrators. Once you do this, all orchestrators connecting to this instance of Keyfactor Command will be required to provide a certificate to authenticate. If you have some orchestrators deployed that do not support certificate authentication (e.g. Java agents), you will need to design a solution with multiple Keyfactor Command servers to support multiple authentication types. Contact your Keyfactor representative for assistance with this.

To configure Keyfactor Command to require client certificate authentication for orchestrators:

1. On the Keyfactor Command server, open the Keyfactor Configuration Wizard.
2. In the Certificate Authentication section of the Orchestrators tab, check the **Enabled** box.
3. In the **Certificate Authentication HTTP Header** field, enter the *Header Name* you gave to the rewrite action you created to capture the certificate from the orchestrator (e.g. NS-ClientCert). Keyfactor Command uses the certificate supplied in this header to identify the orchestrator attempting to authenticate.
4. In the **Certificate Authentication Username** and **Certificate Authentication Password** fields, enter the credentials for an Active Directory service account for the orchestrator(s).

Tip: The service account entered here does not need to match the service account entered on the Citrix device to authenticate the orchestrator.

5. Click **Verify Configuration** and **Apply Configuration**.

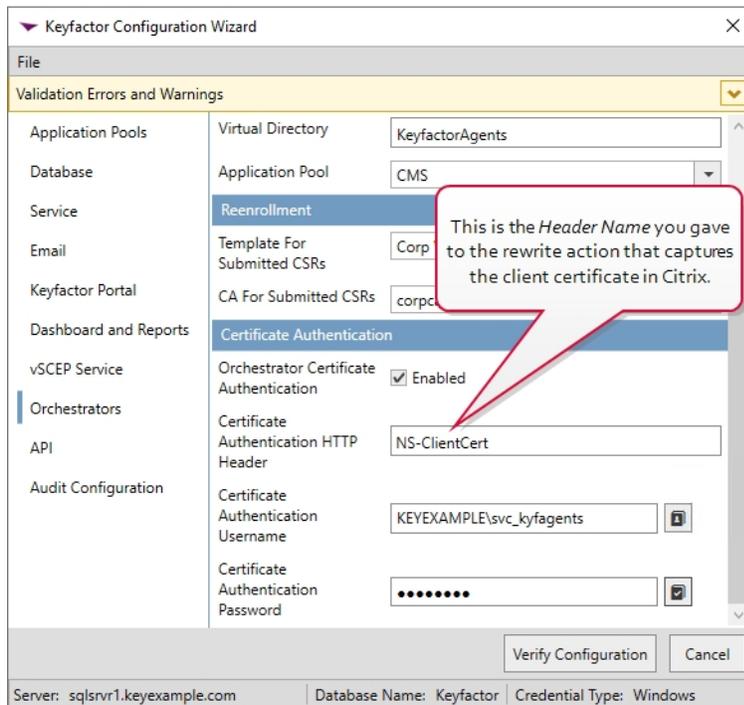

Figure 602: Configure Keyfactor Command for Client Certificate Authentication

Configure IIS to Provide Credentials When a Second Client Certificate is Used to Authenticate the Proxy

If you have opted to configure the Citrix ADC device to use a client certificate to authenticate from the device to the Keyfactor Command server instead of submitting basic authentication credentials from the device, you will need to configure IIS on the Keyfactor Command server to recognize the client certificate for authentication and then use basic authentication credentials on the Keyfactor Command server to provide authorization to Keyfactor Command. In addition, you will need to configure Keyfactor Command to force it to use the client certificate from the orchestrator stored in the header to authenticate the orchestrator, not the client certificate presented by the proxy in the second hop of the transaction.

Install the Required Windows Module

On your Keyfactor Command server, install the following additional module:

- *IIS Client Certificate Mapping Authentication* (rather than *Client Certificate Mapping Authentication*)

 **Tip:** It's fine to install both *IIS Client Certificate Mapping Authentication* and *Client Certificate Mapping Authentication*, but the former is what's needed for this solution.

If you have more than one Keyfactor Command server with separated roles, this only needs to be installed on the server accepting traffic to the /KeyfactorAgents web application.

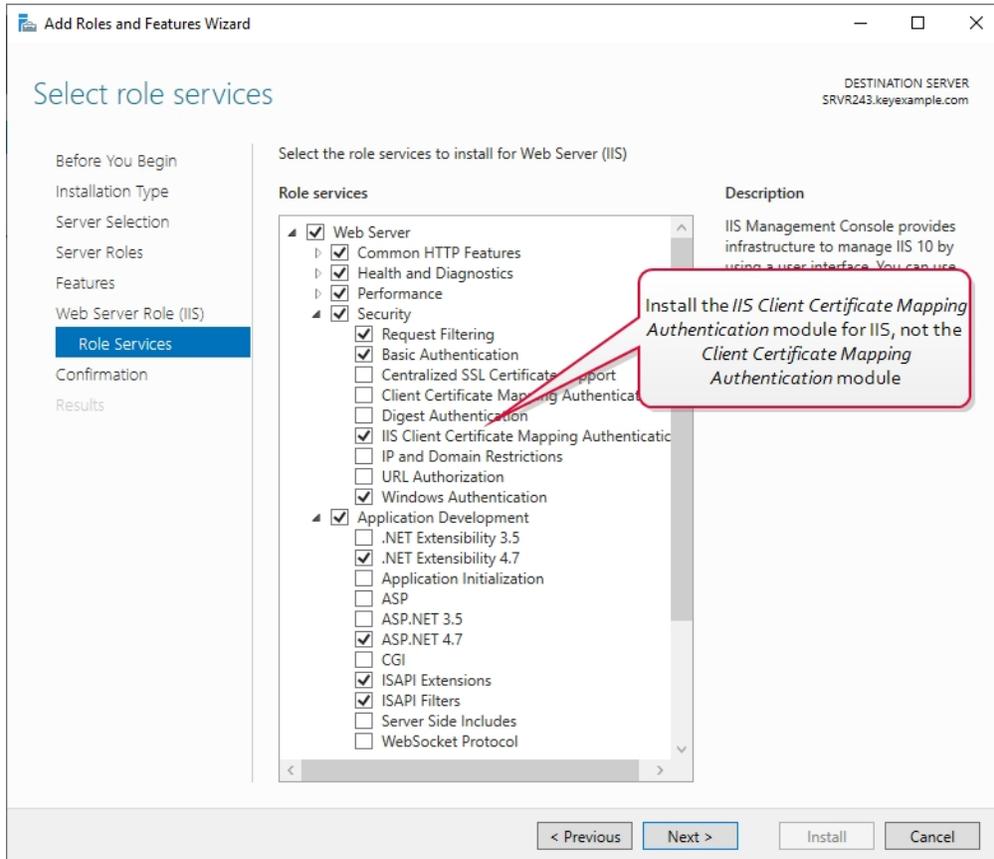

Figure 603: IIS Module for Client Certificate Authentication

The PowerShell command to install the appropriate module is :

```
Add-WindowsFeature Web-Cert-Auth
```

Configure Certificate Authentication and SSL Settings in IIS

Make the following changes in the IIS Management console on the Keyfactor Command server:

1. In the IIS Management console, highlight the server name on the left and open Authentication. Make sure *Anonymous Authentication* is the only enabled method.

Figure 604: Configure only Anonymous Authentication at the Server Level in IIS

- In the IIS Management console, drill down into sites and into the Default Web Site (or other web site if your Keyfactor Command instance has been installed in an alternate web site). Under the Default Web Site, locate the KeyfactorAgents application and open Authentication for this. Disable all the authentication methods shown here.

Figure 605: Disable Authentication Methods at the Application Level in IIS

Tip: If your KeyfactorAgents endpoint is running on a standalone server with no other Keyfactor roles, you should also disable all authentication methods at the Default Web Site level as in step two. If your server holds other Keyfactor roles, leave this in the default configuration with Anonymous being the only authentication method enabled as in step one.

- In the IIS Management console, open SSL Settings for the KeyfactorAgents application. Check the **Require SSL** box and select either **Require** or **Accept** for *Client certificates*.

Important: Only selected **Require** if your are only using orchestrators that support client certificate authentication and plan to configure all of them for certificate authentication.

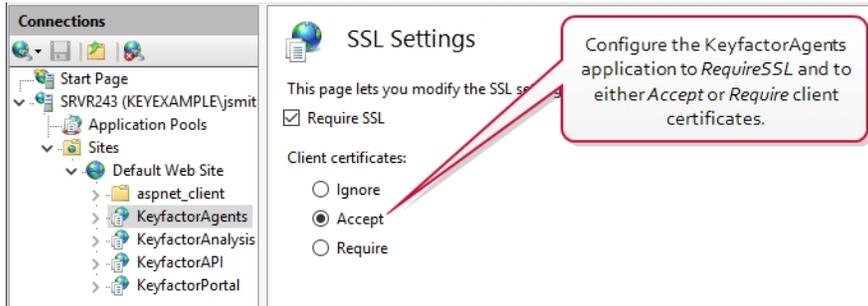

Figure 606: Configure SSL Settings in IIS for Client Certificate Authentication

Tip: If your KeyfactorAgents endpoint is running on a standalone server with no other Keyfactor roles, you may also configure your server to **Require** or **Accept** for *Client certificates* at the Default Web Site level. It is good security practice to check the *Require SSL* box. If your KeyfactorAgents endpoint is running on a server with other Keyfactor roles, you do not need to accept client certificates at this level and should not require them at this level.

Configure Basic Authentication Credentials in IIS

Make the following changes in the IIS Management console on the Keyfactor Command server:

1. In the IIS Management console, drill down to the Default Web Site (or other web site if your Keyfactor Command instance has been installed in an alternate web site). In the Default Web Site, open the Configuration Editor tool.
2. In the Configuration Editor tool at the Default Web Site level, browse to:

system.webServer/security/authentication/iisClientCertificateMappingAuthentication

Important: Don't be tempted to configure this setting only at the application level (KeyfactorAgents) rather than at the Default Web Site level. It will only work if configured at the Default Web Site level and then enabled at the application level.

3. In the configurations for IIS Client Certificate Mapping Authentication, set the *defaultLogoutDomain* to your forest root. Set the *manyToOneCertificateMappingsEnabled* option to *True* and the *oneToOneCertificateMappingEnabled* option to *False*. Click the dots to the right of the *manyToOneMappings* setting to open details for this setting.

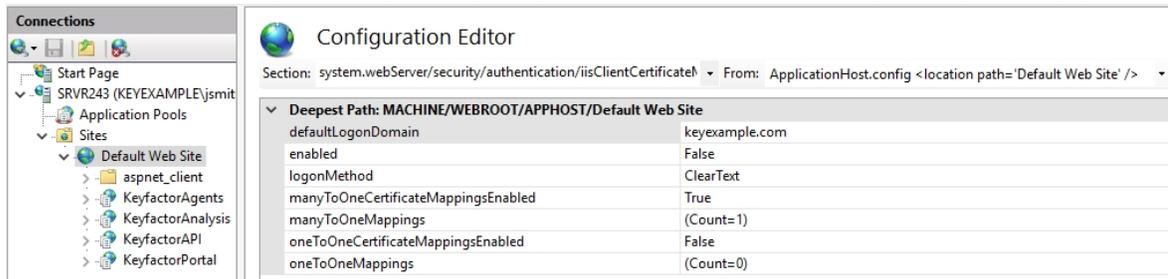

Figure 607: Configure IIS Client Certificate Mapping Authentication for the Default Web Site

- In the Collection Editor for the manytoOneMappings, click **Add** and enter appropriate values for the properties. The service account entered here will be used as the identity in Keyfactor Command of all orchestrators that authenticate via client certificate.

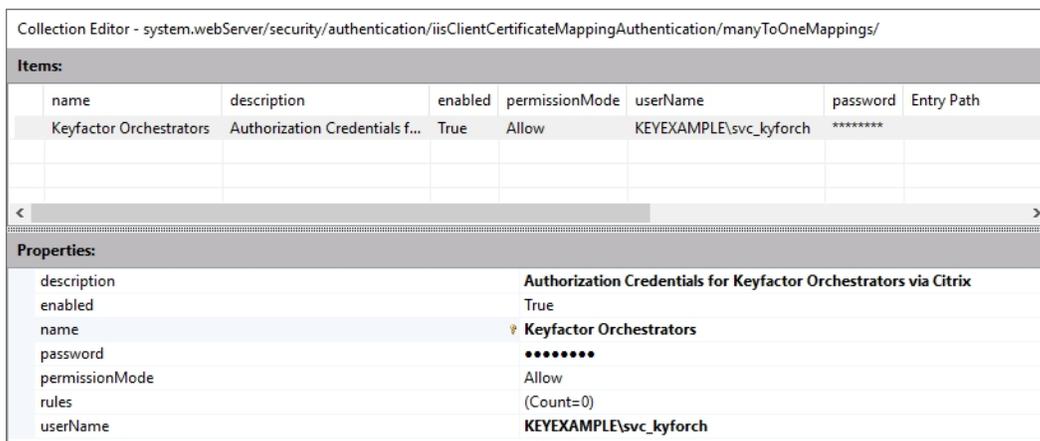

Figure 608: Configure Authorization Credentials for Keyfactor Orchestrators

- In the IIS Management console, drill down into sites and into the Default Web Site (or other web site if your Keyfactor Command instance has been installed in an alternate web site). Under the Default Web Site, locate the KeyfactorAgents application and open the Configuration Editor tool for it.
- In the Configuration Editor tool at the KeyfactorAgents application level, browse to:

system.webServer/security/authentication/iisClientCertificateMappingAuthentication

Enable the mapping authentication option at this level. The configuration should have replicated down from the Default Web Site level.

Configure the Keyfactor Command Application Setting to Use the Certificate from the Header

When the orchestrator is configured to use a client certificate to authenticate to a proxy and then the proxy is configured to use a separate client certificate to authenticate to the Keyfactor Command server, authentication to the Keyfactor Command application should be done using the original certificate from the orchestrator, not the certificate inserted in the process at the proxy level. This is done by including the original certificate from the orchestrator in the request header to Keyfactor Command. To assure that Keyfactor Command gives priority to this certificate and not the certificate the proxy uses to authenticate, set the Keyfactor Command authentication application setting *Always Use Certificate from Header* to *True*.

Application Settings ?

Application Settings define operational parameters for the system.

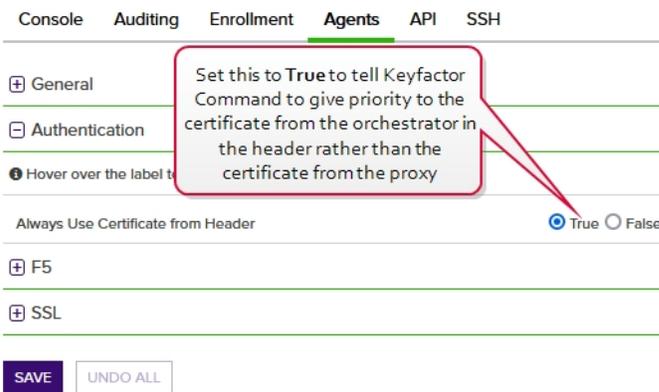

Figure 609: Configure Application Setting in Keyfactor Command to use the Header Certificate

Tip: In some proxy configurations, the proxy may be unable to negotiate the client certificate handshake with IIS. IIS won't ask directly for a client certificate, and if, during the handshake, the proxy doesn't send one, the client authentication will fail. If this occurs, you may need to enable client certificate negotiation at a lower level below IIS. To do this:

1. On the Keyfactor Command server, open a command prompt using the "Run as administrator" option.
2. Execute the following command to output the current configuration for SSL certificate bindings:

```
netsh http show sslcert
```

Output from this command will look something like this (you may see multiple sections if you have multiple web sites on the server):

SSL Certificate bindings:

```
-----  
IP:port : 0.0.0.0:443  
Certificate Hash : 649dfa6df693583f609af499fe4237f2c1d64224  
Application ID : {4dc3e181-e14b-4a21-b022-59fc669b0914}  
Certificate Store Name : My  
Verify Client Certificate Revocation : Enabled  
Verify Revocation Using Cached Client Certificate Only : Disabled  
Usage Check : Enabled  
Revocation Freshness Time : 0  
URL Retrieval Timeout : 0  
Ctl Identifier : (null)  
Ctl Store Name : (null)  
DS Mapper Usage : Enabled  
Negotiate Client Certificate : Disabled  
Reject Connections : Disabled  
Disable HTTP2 : Not Set  
Disable QUIC : Not Set  
Disable TLS1.2 : Not Set  
Disable TLS1.3 : Not Set  
Disable OCSP Stapling : Not Set  
Disable Legacy TLS Versions : Not Set
```

3. Look at the value for the *Negotiate Client Certificate* setting for the web site on which Keyfactor Command is installed. If the value is *Disabled*, retrieve from the output the values for the *IP:port*, *Certificate Hash*, and *Application ID*.
4. Execute the following commands to remove and re-add the *IP:port* with *Negotiate Client Certificate* enabled (referencing the correct values for *ipport*, *certhash*, and *appid*):

```
netsh http delete sslcert ipport=0.0.0.0:443  
netsh http add sslcert ipport=0.0.0.0:443  
certhash=649dfa6df693583f609af499fe4237f2c1d64224 appid={4dc3e181-e14b-4a21-  
b022-59fc669b0914} clientcertnegotiation=enable
```

5. Execute the *show* command again to confirm that the setting is now shown as enabled.
6. Restart the IIS services (*iisreset*) and try the certificate authentication again.

5.6.3 Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication with Certificates Stored in Active Directory

The Keyfactor Universal Orchestrator can be configured to support client certificate authentication by acquiring a certificate for the Keyfactor Command connect service account user or machine

account of the orchestrator and storing it in Active Directory and then providing the associated Active Directory credentials to authenticate to Keyfactor Command. This has an advantage over the reverse proxy method (see [Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication via a Reverse Proxy: Citrix ADC on page 3023](#)) in that a username and password do not need to be stored anywhere (other than in Active Directory). This method does have a heavier reliance on Active Directory.

Complete the following steps and then configure the orchestrator to enable client certificate authentication as per the installation instructions (see [ClientCertificate \(Client Certificate Authentication\) on page 2904](#) or [Install the Universal Orchestrator on a Linux Server on page 2912](#)).

 **Tip:** Using this method, you do not necessarily need to configure certificate authentication in Keyfactor Command, unlike for the proxy method (see [Appendix - Set up the Universal Orchestrator to Use Client Certificate Authentication via a Reverse Proxy: Citrix ADC on page 3023](#)), since the certificate authentication is occurring at the IIS layer before the request reaches Keyfactor Command. You may wish to configure certificate authentication in Keyfactor Command to allow Keyfactor Command to monitor certificate authentication and to support automated certificate renewal (see [Register a Client Certificate Renewal Extension on page 2961](#)). If you enable certificate authentication in Keyfactor Command with this method, you will need to provide a value in the *Certificate Authentication HTTP Header* field. This header field is used to pass the certificate contents to Keyfactor Command command in instances when the certificate is not used directly (such as in the reverse proxy scenario). The value is required when configuring certificate authentication in Keyfactor Command, but since for this method you do not need to extract the certificate from the header, the value you set here is unimportant.

 **Important:** If you do opt to enable certificate authentication in Keyfactor Command, be aware that this will force all orchestrators to use certificate authentication when communicating with Keyfactor Command on the configured server.

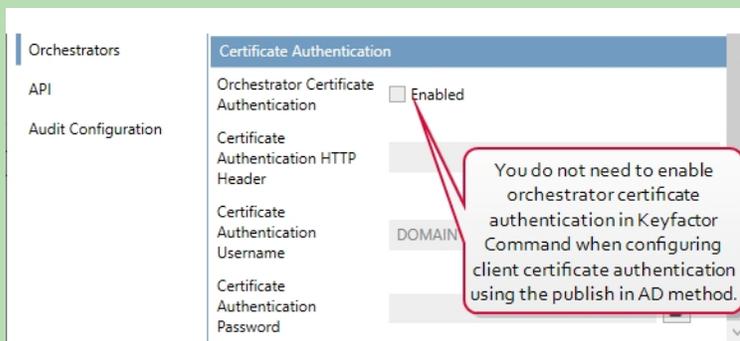

Figure 610: Client Certificate Authentication with AD Storage Does Not Require Certificate Authentication Configuration in Keyfactor Command

Note: The following instructions assume that your Keyfactor Command server is already installed and configured with an SSL certificate that is trusted in your environment. If this is not the case, this will also need to be done.

Install the Required Windows Module

On your Keyfactor Command server, install the following additional module:

- *Client Certificate Mapping Authentication* (rather than *IIS Client Certificate Mapping Authentication*)

If you have more than one Keyfactor Command server with separated roles, this only needs to be installed on the server accepting traffic to the /KeyfactorAgents web application.

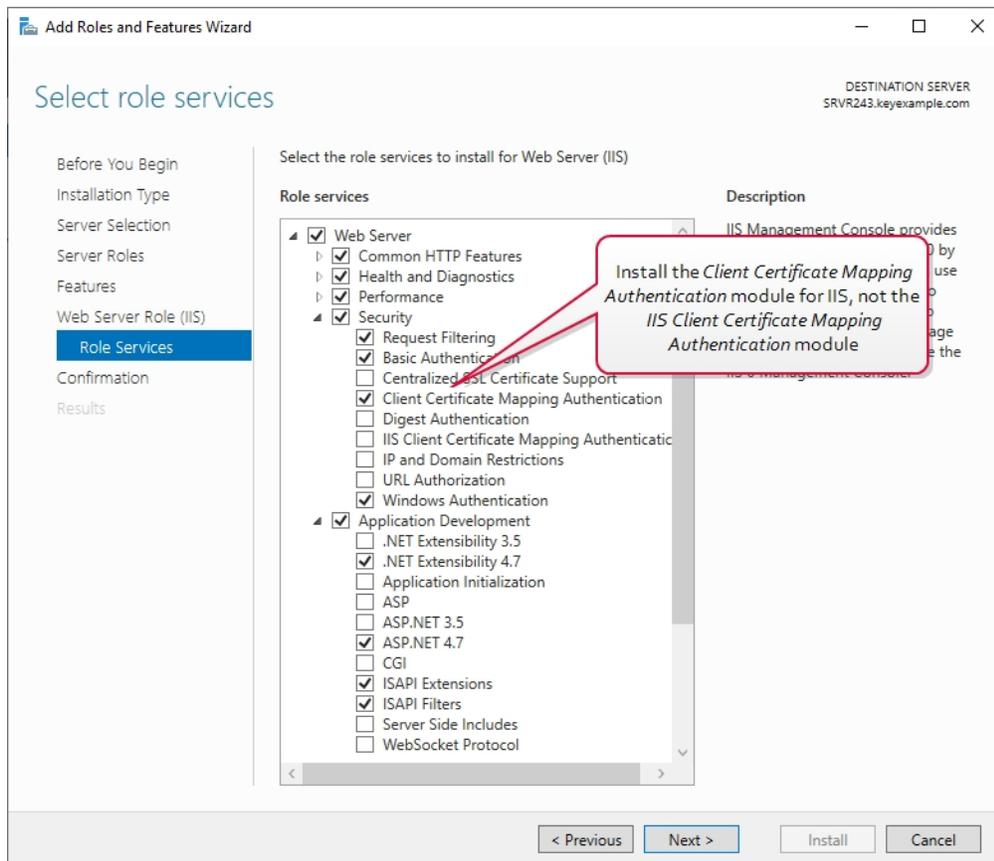

Figure 611: IIS Module for Client Certificate Authentication with AD Storage

The PowerShell command to install the appropriate module is :

```
Add-WindowsFeature Web-Client-Auth
```

Configure Certificate Authentication and SSL Settings in IIS

Make the following changes in the IIS Management console on the Keyfactor Command server:

1. In the IIS Management console, highlight the server name on the left and open Authentication. Change the status of *Active Directory Client Certificate Authentication* to **Enabled**.

Figure 612: Configure Client Certificate Authentication at the Server Level in IIS

2. In the IIS Management console, drill down into sites and into the Default Web Site (or other web site if your Keyfactor Command instance has been installed in an alternate web site). Under the Default Web Site, locate the KeyfactorAgents application and open Authentication for this. Disable all the authentication methods shown here. The *Active Directory Client Certificate Authentication* method does not appear here.

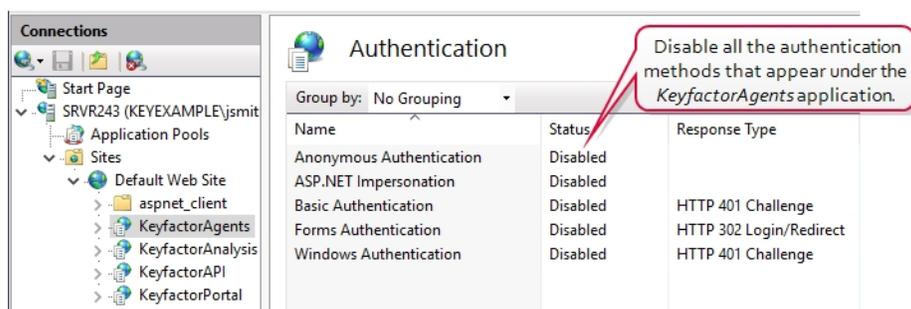

Figure 613: Disable Authentication Methods at the Application Level in IIS

Tip: At the Default Web Site level, the only authentication method that should be enabled is Anonymous. This should not be changed.

3. In the IIS Management console, open SSL Settings for the KeyfactorAgents application. Check the **Require SSL** box and select either **Require** or **Accept** for *Client certificates*.

Important: Only selected **Require** if your are only using orchestrators that support client certificate authentication and plan to configure all of them for certificate authentication.

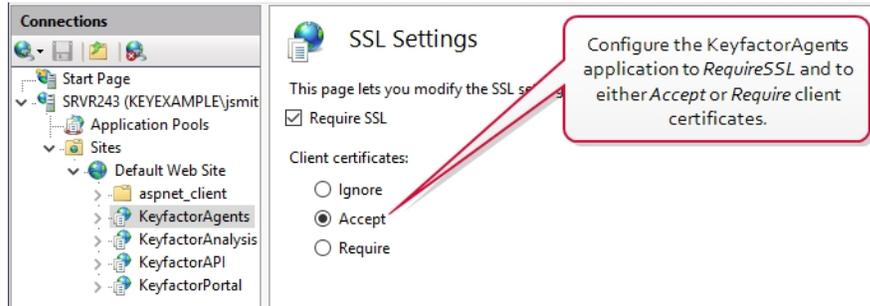

Figure 614: Configure SSL Settings in IIS for Client Certificate Authentication

Tip: At the Default Web Site level, it is good security practice to check the *Require SSL* box, but you do not need to accept client certificates at this level and should not require them at this level.

Create a Certificate Template for Orchestrator Certificates

This method of certificate authentication functions by sending a client certificate from the orchestrator to IIS on the Keyfactor Command server, where IIS does a lookup in Active Directory to determine what Active Directory user is associated with that certificate and then turns around and uses that identity to connect to Keyfactor Command. In order for the certificate to be associated with the Active Directory identity, it must be enrolled using a template that has the *Publish certificate in Active Directory* option enabled.

To create the certificate template that will be used for orchestrator client authentication certificates, start by duplicating a template with a *Computer* subject type. In addition to any standards for your environment, the templates needs:

- The *Publish certificate in Active Directory* box checked.

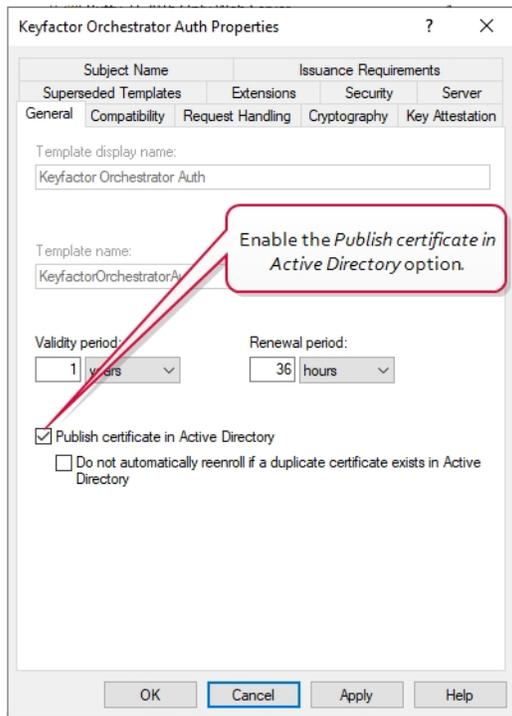

Figure 615: Microsoft Certificate Template General for Client Authentication Certificate

- A key usage that includes Digital Signature.

- An extended key usage (EKU) of Client Authentication.

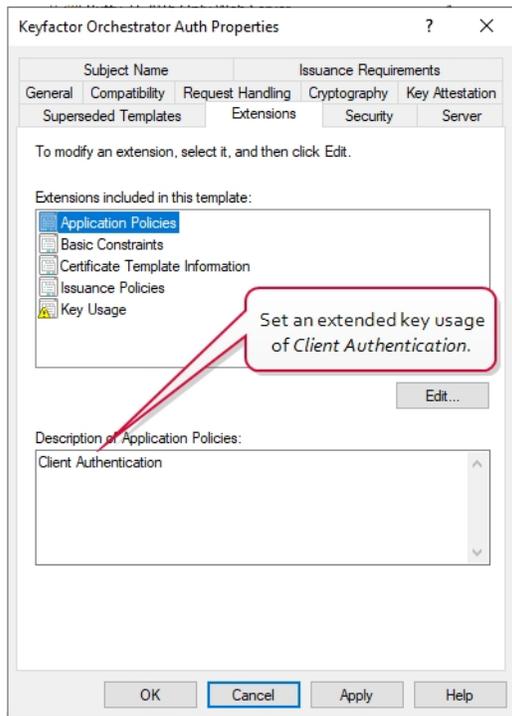

Figure 617: Microsoft Certificate Template Application Policies for Client Authentication Certificate

- Enroll permissions for either the service account that the orchestrator will run as or the machine account for the orchestrator machine (see).

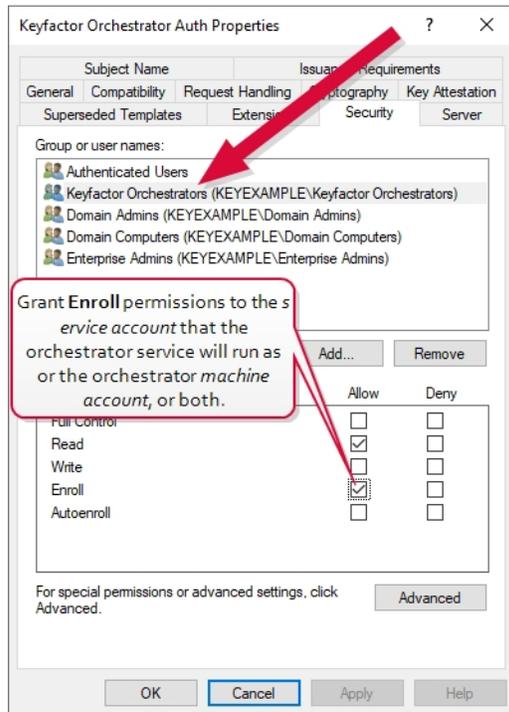

Figure 618: Microsoft Certificate Template Security for Client Authentication Certificate

Enroll for a Client Authentication Certificate

To acquire a certificate for use by the Universal Orchestrator using a Microsoft CA, first create a template using the appropriate configurations as described above and make it available for enrollment on a CA to which the Universal Orchestrator machine has access. If you plan to enroll for the certificate through Keyfactor Command, you will also need to enable the template for enrollment in Keyfactor Command.

You can enroll for a client authentication certificate for the orchestrator in a variety of ways. The certificate needs to be installed in the **local computer** personal store on the Windows server on which the orchestrator is installed. Some possible ways to do this are:

- Use Keyfactor Command to enroll for the certificate using the PFX enrollment method and then import the PFX file on the orchestrator server. If you select this method, you will need to login to the Keyfactor Command Management Portal as the orchestrator service account being used on the Keyfactor Command side of the fence (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)) in order to enroll for the certificate in the correct context or use the Keyfactor API to submit a request in a specific user context (see [PFX Enrollment in Keyfactor Command Using a PowerShell Script on the next page](#)). The orchestrator service account will need enroll permissions on the CA, on the template, and in Keyfactor Command.
- Use IIS or the certificates MMC on the orchestrator server to generate a CSR, use the Keyfactor Command CSR enrollment method to enroll for a certificate using the CSR, and then import the CSR on the orchestrator server, marrying it with the private key generated on the

server. If you select this method, you will need to login to the Keyfactor Command Management Portal as the orchestrator service account being used on the Keyfactor Command side of the fence (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)) in order to enroll for the certificate in the correct context. The orchestrator service account will need enroll permissions on the CA, on the template, and in Keyfactor Command.

- If there is an existing Universal Orchestrator on the server already running and communicating with Keyfactor Command, use the Keyfactor Command PFX enrollment method and push the certificate out to the certificate store on the orchestrator server using Keyfactor Command. If you select this method, you will need to login to the Keyfactor Command Management Portal as the orchestrator service account being used on the Keyfactor Command side of the fence (see [Create Service Accounts for the Universal Orchestrator on page 2884](#)) in order to enroll for the certificate in the correct context or use the Keyfactor API to submit a request in a specific user context (see [PFX Enrollment in Keyfactor Command Using a PowerShell Script below](#)). The orchestrator service account will need enroll permissions on the CA, on the template, and in Keyfactor Command.
- Use the Microsoft MMC on the orchestrator server to enroll for a certificate. If you select this method, the orchestrator will connect to Keyfactor Command using the orchestrator machine account rather than an Active Directory user account. The orchestrator machine account will need enroll permissions on the CA and on the template. This method will only work for servers joined to the same Active Directory forest in which Keyfactor Command is installed.

PFX Enrollment in Keyfactor Command Using a PowerShell Script

To enroll for a certificate using the PFX enrollment method in Keyfactor Command, you can either do this in the Keyfactor Command Management Portal while logged in as the orchestrator service account or with a PowerShell script. In either case, the orchestrator service account will need PFX enroll permissions in Keyfactor Command. Below is a sample PowerShell script. Once the PFX file has been generated, import it into the local machine store on the orchestrator server.

Tip: The service account you provide in the PowerShell script is the service account used to provide a connection from the orchestrator to Keyfactor Command. This is not necessarily the same service account that runs the orchestrator service on the orchestrator server. For an orchestrator in a separate forest from Keyfactor Command, this would be a service account in the Keyfactor Command forest, not the orchestrator forest. See [Create Service Accounts for the Universal Orchestrator on page 2884](#).

```
#Set variables with the username and password for the orchestrator service account
$orchUsername = 'KEYEXAMPLE\svc_kyforch'
$orchPassword = 'MySecureServiceAccountPassword'
$pair = "$($orchUsername):($orchPassword)"

# Base-64 encode the service account credentials
$encodedCreds = [System.Convert]::ToBase64String([System.Text.Encoding]::ASCII.GetBytes($pair))
```

```

$UTCTime = (Get-Date).ToUniversalTime().ToString("yyyy-MM-ddTHH:mm:ssZ")
$keyfactorServer = 'keyfactor.keyexample.com' # FQDN of the Keyfactor Command server
$caName = 'corpca01.keyexample.com\CorpIssuing01' # CA to use for the enrollment
$templateName = 'KeyfactorOrchestratorAuth' # Template to use for the enrollment
$certSubject = 'Orchestrator Cert Auth' # Using a template that is configured to build from AD will
cause this subject to be replaced
$pxPassword = 'MySecurePFXPassword' # Password for the resulting PFX file
$outputFile = 'C:\stuff\OrchCertAuth.pfx' # Path and file name for the PFX file to be generated

$basicAuthValue = "Basic $encodedCreds"

$headers = @{
    "Authorization"=$basicAuthValue
    "Accept"="application/json"
    "x-keyfactor-requested-with"="APIClient"
    "x-certificateformat"="PFX"
}

$body = @{
    "Password" = "$pxPassword"
    "Subject" = "$certSubject"
    "IncludeChain" = "true"
    "CertificateAuthority" = "$caName"
    "Timestamp" = "$UTCTime"
    "Template" = "$templateName"
}

# Output response as a PFX file
$response = Invoke-WebRequest -Uri "https://$keyfactorServer/KeyfactorAPI/Enrollment/PFX" -Method:Post -Headers $headers -ContentType "application/json" -Body ($body|ConvertTo-Json) -ErrorAction:Stop -TimeoutSec 60
$responseContent = $response.Content | ConvertFrom-Json
$bytes = [Convert]::FromBase64String($responseContent.CertificateInformation.Pkcs12Blob)
[IO.File]::WriteAllBytes($outputFile, $bytes)

```

PFX Enrollment and Deployment in Keyfactor Command Using a PowerShell Script

To enroll for a certificate using the PFX enrollment method in Keyfactor Command and deploy it to the orchestrator server using Keyfactor Command, you can either do this in the Keyfactor Command Management Portal while logged in as the orchestrator service account or with a PowerShell script. In either case, the orchestrator service account will need PFX enroll permissions and certificate store management permissions in Keyfactor Command. Below is a sample PowerShell script. This solution is only an option if your orchestrator is already up and running and successfully authenticating to Keyfactor Command using standard authentication (or previously configured

certificate authentication).

Tip: The service account you provide in the PowerShell script is the service account used to provide a connection from the orchestrator to Keyfactor Command. This is not necessarily the same service account that runs the orchestrator service on the orchestrator server. For an orchestrator in a separate forest from Keyfactor Command, this would be a service account in the Keyfactor Command forest, not the orchestrator forest. See [Create Service Accounts for the Universal Orchestrator on page 2884](#).

```
#Set variables with the username and password for the orchestrator service account
$orchUsername = 'KEYEXAMPLE\svc_kyforch'
$orchPassword = 'MySecureServiceAccountPassword'
$pair = "$($orchUsername):($orchPassword)"

# Base-64 encode the service account credentials
$encodedCreds = [System.Convert]::ToBase64String([System.Text.Encoding]::ASCII.GetBytes($pair))

$UTCTime = (Get-Date).ToUniversalTime().ToString("yyyy-MM-ddTHH:mm:ssZ")
$keyfactorServer = 'keyfactor.keyexample.com' # FQDN of the Keyfactor Command server
$storeName = 'websrvr38.keyexample.com' # FQDN of the orchestrator server as defined as a certificate store in Keyfactor Command
$caName = 'corpca01.keyexample.com\CorpIssuing01' # CA to use for the enrollment
$templateName = 'KeyfactorOrchestratorAuth' # Template to use for the enrollment
$certSubject = 'Orchestrator Cert Auth' # Using a template that is configured to build from AD will cause this subject to be replaced

$basicAuthValue = "Basic $encodedCreds"

$enrollHeaders = @{
    "Authorization"=$basicAuthValue
    "Accept"="application/json"
    "x-keyfactor-requested-with"="APIClient"
    "x-certificateformat"="Store"
}

$deployHeaders = @{
    "Authorization"=$basicAuthValue
    "Accept"="application/json"
    "x-keyfactor-requested-with"="APIClient"
}

$enrollBody = @{
```

```

    "Subject" = "$certSubject"
    "IncludeChain" = "true"
    "CertificateAuthority" = "$caName"
    "Timestamp" = "$UTCtime"
    "Template" = "$templateName"
}

# Enroll for a certificate using the PFX enrollment method and retrieve the certificate ID from the
response (as part of the content)
$enrollResponse = Invoke-WebRequest -Uri "https://$keyfactorServer/KeyfactorAPI/Enrollment/PFX" -
Method:Post -Headers $enrollHeaders -ContentType "application/json" -Body ($enrollBody|ConvertTo-
Json) -ErrorAction:Stop -TimeoutSec 60
$enrollContent = $enrollResponse.Content | ConvertFrom-Json

# Get the store GUID for the certificate store specified by the client machine name in the query
string with the storeName variable
$storeInfo = Invoke-WebRequest -Uri "https://$key-
factorServer/KeyfactorAPI/CertificateStores?certificateStoreQuery.queryString=ClientMachine%20-
eq%20%22$storeName%22" -Method:Get -Headers $deployHeaders -ContentType "application/json" -
ErrorAction:Stop -TimeoutSec 60
$storeContent = $storeInfo.Content | ConvertFrom-Json
$storeGUID = $storeContent.Id

$deployBody = @{
    "StoreIds" = @( "$storeGUID" )
    "StoreTypes" = @(
        @{
            "StoreTypeId" = 6 # Store type 6 is IIS personal
            "Overwrite" = "false"
        }
    )
    "CertificateId" = $enrollContent.CertificateInformation.KeyfactorId
}

# Deploy certificate to certificate store
Invoke-WebRequest -Uri "https://$keyfactorServer/KeyfactorAPI/Enrollment/PFX/Deploy" -Method:Post -
Headers $deployHeaders -ContentType "application/json" -Body ($deployBody|ConvertTo-Json) -ErrorAc-
tion:Stop -TimeoutSec 60

```

MMC Enrollment

To enroll for a certificate using the MMC:

1. On the Universal Orchestrator machine, do one of following:
 - Using the GUI:
 - a. Open an empty instance of the Microsoft Management Console (MMC).
 - b. Choose **File->Add/Remove Snap-in...**
 - c. In the *Available snap-ins* column, highlight **Certificates** and click **Add**.
 - d. In the Certificates snap-in popup, choose the radio button for Computer account, click **Next**, accept the default of Local computer, and click **Finish**.
 - e. Click **OK** to close the Add or Remove Snap-ins dialog.
 - Using the command line:
 - a. Open a command prompt using the “Run as administrator” option.
 - b. Within the command prompt type the following to open the certificates MMC:
certlm.msc
2. Drill down to the Personal folder under **Certificates** for the Local Computer, right-click, and choose **All Tasks->Request New Certificate...**
3. Follow the certificate enrollment wizard, selecting the template you created for orchestrator certificate authentication and providing any required information.

Grant the Service Account Certificate Private Key Permissions

Whichever method you decide to use to acquire the client authentication certificate for the orchestrator, you will need to grant the Universal Orchestrator service account—the account that the orchestrator service is running as on the server—permissions to read the private key of that certificate.

Tip: If the service account is a member of the local administrators group, this step may not be necessary, since the local administrators group is typically granted these permissions automatically.

To grant private key permissions on the certificate using the MMC:

1. On the Universal Orchestrator machine, do one of following:
 - Using the GUI:
 - a. Open an empty instance of the Microsoft Management Console (MMC).
 - b. Choose **File->Add/Remove Snap-in...**
 - c. In the *Available snap-ins* column, highlight **Certificates** and click **Add**.
 - d. In the Certificates snap-in popup, choose the radio button for Computer account,

click **Next**, accept the default of Local computer, and click **Finish**.

e. Click **OK** to close the Add or Remove Snap-ins dialog.

- Using the command line:

- a. Open a command prompt using the “Run as administrator” option.

- b. Within the command prompt type the following to open the certificates MMC:

```
certlm.msc
```

2. Drill down to the Personal folder under **Certificates** for the Local Computer to locate the certificate.
3. Highlight the certificate and choose **All Tasks->Manage Private Keys...**
4. In the Permissions for private keys dialog, click **Add**, add the service account under which the Universal Orchestrator is running (created as per [Create Service Accounts for the Universal Orchestrator on page 2884](#)), and grant that service account **Read** but not **Full control** permissions. Click **OK** to save.

Tip: If you receive the following error when selecting your certificate in the orchestrator configuration wizard:

The request was aborted: Could not create SSL/TLS secure channel.

- Confirm that the orchestrator server trusts the root and issuing certificates for the SSL certificate on the Keyfactor Command server and the client authentication certificate you are trying to use (see [Configure Certificate Root Trust for the Universal Orchestrator on page 2888](#)).
- Confirm that the orchestrator server has access to the CRLs for both the SSL certificate on the Keyfactor Command server and the client authentication certificate you are trying to use and that these CRLs are valid.
- Confirm that you have granted the service account under which the orchestrator service runs private key permissions on the client authentication certificate.

5.6.4 Appendix - Set up the Universal Orchestrator to Use a Forwarding Proxy

Typically with services that use a forwarding proxy, there is a specific proxy configuration done within the application, but the Universal Orchestrator doesn't have such a configuration. Instead, it makes use of an environment variable to retrieve this information on either Windows or Linux.

On Windows, configure a system environment variable of either HTTP_PROXY or HTTPS_PROXY (this is not case sensitive on Windows) pointing to your proxy's URL, including port, then restart the Universal Orchestrator service if the orchestrator is already installed.

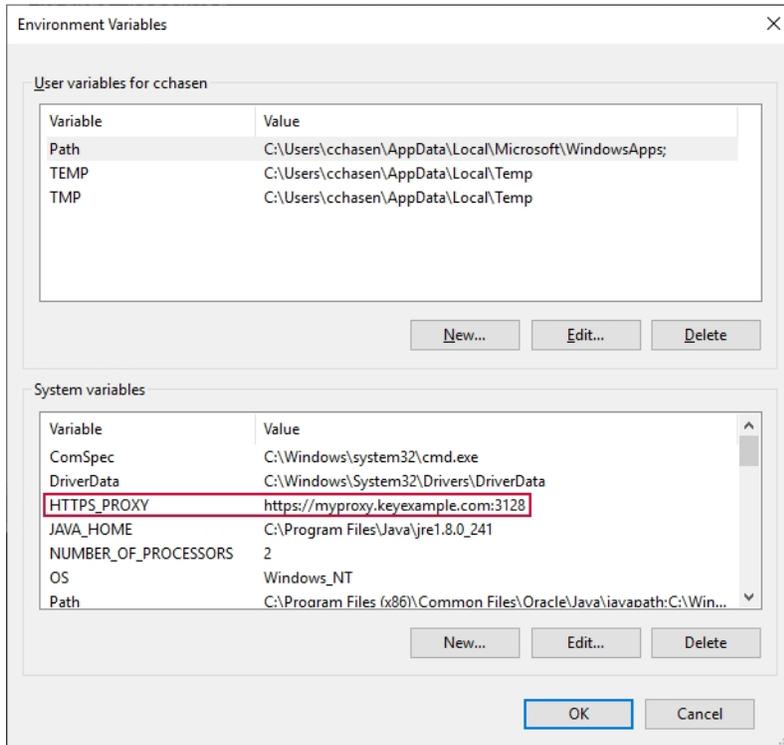

Figure 619: System Environment Variable to Define a Proxy URL for Use by the Universal Orchestrator on Windows

On Linux, there are multiple approaches to setting an environment variable. One method for setting a system-wide environment variable that will be retained after reboot is to add an environment variable statement to the `/etc/environment` file using a command similar to the following (as root):

```
echo https_proxy=https://myproxy.keyexample.com:3128/" >> /etc/environment
```

After setting the environment variable, restart the Universal Orchestrator service if the orchestrator has already been installed.

Note: If you've configured an `HTTPS_PROXY` environment variable because you're using a secure channel to communicate with Keyfactor Command (SSL), you will most likely also need an `HTTP_PROXY` environment variable for the orchestrator to do revocation status (CRL) checking unless you disable revocation status checking.

6.0 Release Notes & Upgrading

The Keyfactor Command suite of documentation is released as both major releases, with version numbers ending in zero, and minor releases, with incremental fixes and updates following the major release. When reviewing release notes, be sure to review those for both the minor releases and their corresponding major release.

Upgrade instructions are included for Keyfactor-hosted and self-hosted installation (see [Upgrade Overviews below](#)).

6.1 Upgrade Overviews

The *Keyfactor Command Upgrade Overview* is provided in two formats for different users. Follow the appropriate upgrade instructions for your configuration.

- [Upgrade Overview - Keyfactor-Hosted below](#)

Use this guide if you do any of the following:

- Consume Keyfactor Command certificate lifecycle automation as a service hosted by Keyfactor
- Consume a managed PKI hosted by Keyfactor

- [Upgrade Overview - Self-Hosted on page 3055](#)

Use this guide if you have any of the following:

- Have deployed Keyfactor Command on premise in your data center or cloud
- Have deployed the Keyfactor CA Policy Module and associated CA policy handlers on premise in your data center or cloud

6.1.1 Upgrade Overview - Keyfactor-Hosted

The Keyfactor Command solution by Keyfactor allows organizations to issue and manage certificates across enterprise infrastructures. For a comprehensive description of the components that make up Keyfactor Command, see [Logical Architecture on page 2696](#) and [Installing Orchestrators on page 2875](#). There are also Keyfactor installation guides for third-party CA gateways that interface with Keyfactor Command. For an overview of the key new features in the latest version of Keyfactor Command, see the [Release Notes & Upgrading above](#).

This document provides guidance to help you prepare for and complete an upgrade. The Keyfactor Command server software will be upgraded for you. If you need assistance upgrading other components, please contact your Client Success Manager.

Before upgrading to a major version, Keyfactor recommends first upgrading to the final incremental version of the previous major version—completing both the software installation and configuration with the configuration wizard—for the optimal upgrade experience. For example, if you are currently on version 9.4 and want to upgrade to version 10.0 or later, you should upgrade first to version

9.10.1 (the final incremental version of 9.x) before upgrading. Contact your Client Success Manager for more information.

6.1.1.1 Upgrading

Most Keyfactor Command upgrades are brief with a minimum of changes to existing user accounts, groups, CA templates, firewall settings, etc. The prerequisites have not materially changed from previous versions and the current version can generally be installed using the same hardware and existing instances of the supporting software. The upgrade process is often completed within three to four hours, including the time spent by your Keyfactor representative to upgrade your hosted environment.

The overall task flow consists of the following steps:

Upgrade of the Server Software

The Keyfactor Command server software will be installed and configured for you. Once this is complete, you may upgrade any orchestrators and gateways in your environment.

Upgrade the Keyfactor Universal Orchestrator

In many cases the Keyfactor Universal Orchestrator can be installed over the existing installation without uninstalling the previous version. For specific upgrade guidance, see [Upgrading the Universal Orchestrator on page 2895](#).

Update from Windows Orchestrators

Support for the Keyfactor Windows Orchestrator was deprecated in Keyfactor Command release 11.0. All uses of the Keyfactor Windows Orchestrator should be updated to the Keyfactor Universal Orchestrator. The Keyfactor Universal Orchestrator replaces the Keyfactor Windows Orchestrator and runs on both Windows or Linux servers. The following functions that were part of the Keyfactor Windows Orchestrator are supported in the Keyfactor Universal Orchestrator with custom extensions:

- Interact with F5 devices for certificate management
- Interact with NetScaler devices for certificate management
- Interact with Amazon Web Services (AWS) resources for certificate management
- Interact with Windows certificate stores and IIS

For more information about using custom extensions with the Keyfactor Universal Orchestrator, see [Installing Custom-Built Extensions on page 2940](#).

Important: The Keyfactor Universal Orchestrator is only compatible with Keyfactor Command version 9.0 or later. The current version of the Keyfactor Universal Orchestrator is 11.1 and requires .NET 6.

If you're upgrading from a version of Keyfactor Command prior to 8.0, you will need to update any Windows Orchestrators (a.k.a. Windows Agents) that are used for SSL scanning to support the current scanning architecture. Install and configure the Keyfactor Universal Orchestrator software (see [Upgrading the Universal Orchestrator on page 2895](#)).

Note: The orchestrator endpoint location changed for Keyfactor Command release 6 and may need to be modified in your orchestrator endpoint configuration—from CMSAgents to KeyfactorAgents.

Cloud Gateway

The latest version of the Keyfactor Cloud Gateway—used to support management of certificates in the hosted Keyfactor Command environment—is 23.3 released in mid 2023. If you are already using this version, no configuration changes need to be made. Restart the gateway service to refresh the connection to the upgraded Keyfactor Command instance.

If you're using a recent version of the gateway (20.6 or newer), you don't need to upgrade the gateway unless the gateway contains a change that's needed in your environment. See the gateway release notes in the [Keyfactor Cloud Gateway Installation & Configuration Guide](#) to review some of the recent changes.

In most cases, the Keyfactor gateway software can be installed over the existing software installation without uninstalling the previous version. Review the configuration for your gateway, and then install and configure the software as per the [Keyfactor Cloud Gateway Installation & Configuration Guide](#), retaining the same installation location.

EJBCA CA Gateway

If you're using an EJBCA gateway and wish to make use of the new feature in Keyfactor Command for native support of EJBCA CAs, you will need to follow the EJBCA gateway upgrade process to unlink the EJBCA certificates in your Keyfactor Command database from your EJBCA gateway CA to enable them to be relinked to a native CA configured in Keyfactor Command. For more information, contact Keyfactor support.

Other CA Gateways

In most cases, the Keyfactor gateway software can be installed over the existing software installation without uninstalling the previous version. Review the configuration for your gateway, and then install and configure the software as per the Keyfactor gateway guide for the particular gateway, retaining the same installation location. The gateway configuration wizard has significantly changed in recent releases for many of the gateways, which may require modification to your configuration.

Tip: New versions of CA gateways are not necessarily released at the same time as new versions of Keyfactor Command and so gateways may not need upgrading at the same time as Keyfactor Command.

API

Important: The Classic API, also known as the CMS API or CMSAPI, has been deprecated in Keyfactor Command version 11.0. Customers should migrate all uses of the Classic API to the Keyfactor API prior to upgrading to Keyfactor Command version 11.

Please see the latest [Release Notes & Upgrading on page 3051](#) if you are using any custom scripts that leverage the Keyfactor API.

Post-Install Configuration and Testing

See [Post-Upgrade Steps below](#).

The bulk of the time upgrading will be spent verifying that all functions and configurations have correctly carried over and the upgraded instance is performing correctly.

6.1.1.2 Post-Upgrade Steps

There is no particular order in which the tasks on the following pages must be accomplished.

Tip: If, following the upgrade, you open a page in the Keyfactor Command Management Portal and find it unexpectedly blank or otherwise displaying incorrectly, try refreshing the page with a CTRL-F5. If this doesn't resolve the problem, try clearing the browser cache and then reloading the page. It may be helpful to advise all end users to do this following an upgrade.

Testing

Once everything is up and running again, confirm that the following features are operating correctly:

- Does the Keyfactor Command Management Portal load correctly?
- Run a report in the Keyfactor Command Management Portal to confirm that the connectivity to LogiAnalytics is operating correctly.
- Issue a certificate in the Keyfactor Command Management Portal to confirm connectivity to CAs.

Post-Install Configuration

If you are upgrading from any release of Keyfactor Command version 6 or greater, you may want to make some additional configuration changes post-installation:

- Upgrade any Keyfactor CA gateways in your environment that are based on the AnyGateway. The AnyGateway must be upgraded to at least 22.1 to be compatible with Keyfactor Command 10.0 and later.
- Consider whether you wish to implement Keyfactor Command workflows and whether a Keyfactor Command-level workflow could replace CA-level manager approval for any templates

that are configured to require CA-level manager approval.

- Review the new enrollment default and policy settings for enrollment. Enrollment defaults and policies can be defined at two levels:
 - System-wide settings apply to all enrollments done through Keyfactor Command unless they are overridden by template-specific settings.
 - Template-level settings allow you to modify any established enrollment defaults or policies on a per-template basis.

There are several settings available for configuration as part of the template policies:

- Allow Wildcards
- Allow Public Key Reuse
- Enforce RFC 2818 Compliance
- Supported Key Types

Enrollment defaults allow you to pre-populate the subject fields in PFX Enrollment and CSR Generation. Users are allowed to override these at enrollment.

- If you're using certificate metadata or regular expressions, optionally define these for each template. Certificate metadata fields and regular expressions can be defined at two levels:
 - System-wide settings apply to all enrollments done through Keyfactor Command unless they are overridden by template-specific settings.
 - Template-level settings allow you to modify any established certificate metadata or regular expressions on a per-template basis (for instance, for a metadata field, whether the field is required, what default value it should provide, or whether to hide the field during enrollment, regardless of system-wide setting).
- The enrollment configuration will have been carried over in the upgrade, however you may want to confirm the configuration of Certificate Authority and Template enrollment (PFX, CSR, and CSR generation) and make any changes.
- Review any template that is configured to require manager approval at the CA level and confirm that a Keyfactor Command private key retention policy is in place.
- Review the new reports in the Keyfactor Command Report Manager and add them to the menu or favorite them, if desired.

6.1.2 Upgrade Overview - Self-Hosted

The Keyfactor Command solution by Keyfactor allows organizations to issue and manage certificates across enterprise infrastructures. For a comprehensive description of the components that make up Keyfactor Command, see [Logical Architecture on page 2696](#) and [Installing Orchestrators on page 2875](#). There are also Keyfactor installation guides for third-party CA gateways that interface with Keyfactor Command. For an overview of the key new features in the latest version of Keyfactor Command, see the [Release Notes & Upgrading on page 3051](#).

This document provides guidance to help you prepare for and complete an upgrade. If you need assistance with the upgrade, please contact your Client Success Manager.

Before upgrading to a major version, Keyfactor recommends first upgrading to the final incremental version of the previous major version—completing both the software installation and configuration with the configuration wizard—for the optimal upgrade experience. For example, if you are currently on version 9.4 and want to upgrade to version 10.0 or later, you should upgrade first to version 9.10.1 (the final incremental version of 9.x) before upgrading. Contact your Client Success Manager for more information.

Important: Keyfactor Command version 10.0 and later require an encrypted connection to the SQL server. Upgrades will fail if the SQL server is not correctly configured to support this. See [System Requirements on page 3060](#).

6.1.2.1 Preparing

This section describes the steps that need to be taken prior to a Keyfactor Command upgrade to complete the prerequisites, create any required supporting components, and gather the necessary information to complete the Keyfactor Command upgrade process.

The following are some key things to be aware of and preparation steps that need to be addressed in order to upgrade to version 11.1:

- If you're migrating from Active Directory to an identity provider other than Active Directory in version 11, be aware that it's important to leave Basic Authentication and Windows Authentication disabled in IIS once you enable the OAuth option in the Keyfactor Command configuration. Attempting to use OAuth with Basic Authentication and/or Windows Authentication enabled can result in unexpected access to Keyfactor Command by users with lingering Active Directory permissions in Keyfactor Command from before the upgrade.
- Select substitutable special text tokens provide the ability for parts of the Keyfactor Command system to look up data in Active Directory to use in alerts and workflows. Lookups for these locate the object in Active Directory identified by the user or computer account that requested the certificate from the CA and substitute the contents of the referenced attribute. For example, an alert might reference *requester:displayname* to look up the requester's display name in Active Directory.

The substitutable special text tokens that begin *requester:* or *principal:* (but not the standalone *requester* token) are only supported when using Active Directory as an identity provider. They cannot be used with other identity providers since there is no Active Directory to query. Customers wishing to use similar functionality with a different identity provider will need to do API calls to query the identity provider, populate the data into a metadata field, and use the metadata field when populating alert and workflow messages.

- In Keyfactor Command version 11.0, the route information for each virtual application (the host name, web site name, use ssl setting, and virtual directory name) has been moved from being stored in the database to being stored in local files on the Keyfactor Command server (one *appsettings.json* file for each virtual application). On upgrade, the information is copied from the database to each local file. However, if you encounter any issues with the upgrade process, you may be required to re-enter this data. Be sure to make note of the values before beginning your upgrade.

Host Name	<input type="text" value="keyfactor.keyexample.com"/>	<input checked="" type="checkbox"/> Use SSL
Web Site	<input type="text" value="Default Web Site"/>	
Virtual Directory	<input type="text" value="KeyfactorPortal"/>	
Application Pool	<input type="text" value="KeyfactorPortal"/>	

Figure 620: Configuration Wizard Route Information for the Keyfactor Portal

- Keyfactor Command version 10.0 and later by default connects to SQL with an encrypted connection using an SSL certificate configured on your SQL server. Customers should acquire and install an SSL certificate for the SQL server before upgrading to Keyfactor Command version 10.0 or later (see [Using SSL to Connect to SQL Server on page 2746](#)). If you would prefer not to use an encrypted channel for your connection to SQL, see [Configurable SQL Connection Strings on page 2750](#).
- Upgrade to SQL Server 2016 CU2 or higher and adjust the database compatibility level if needed. For more information, see [System Requirements on page 3060](#).
- As of Keyfactor Command version 10.0, Windows Server 2016 is no longer supported. The installer will not check your server version nor prevent installation, but the product will not function properly in some instances. Customers should upgrade to Windows Server 2019 or higher before upgrading to Keyfactor Command version 10.0 or later. If you choose to use Server 2016, any PFXs will need to be configured to use SHA1 and 3DES for encryption for use by Keyfactor Command.
- Before upgrading to a major version, Keyfactor recommends first upgrading to the final incremental version of the previous major version—completing both the software installation and configuration with the configuration wizard—for the optimal upgrade experience. For example, if you are currently on version 9.4 and want to upgrade to version 10.0 or later, you should upgrade first to version 9.10.1 (the final incremental version of 9.x) before upgrading. Contact your Client Success Manager for more information.
- If you have any saved certificate collections containing any of the following deprecated certificate search fields, these collections will need to be removed or updated to remove use of these fields that are no longer in version 10.0 and later:
 - *KeyfactorRequestId*
 - *RequestResolutionDate*
 - *CARequestId*

These certificate search fields parsers have been removed to allow for native EJBCA support in Keyfactor Command as of version 10.0.

- If you have the CA Policy module version 7.0 installed on the same server as the Keyfactor Command Management Portal, you'll need to upgrade the module to version 7.1 or later before running the Keyfactor Command version 10.0 or later upgrade.
- Be Aware of the following certificate store changes in Keyfactor Command v11:
 1. The following store types have been deprecated and will no longer be shipped with Keyfactor Command: All F5 store types, AWS, NetScaler.
 These store types will not be created with new databases. Upon upgrading, they will be removed if the customer does not have any stores or containers defined for the type (per type. i.e. if an AWS store or container is defined and the other types are not, the AWS type will not be removed on upgrade, but the other types will be removed).

2. The built-in functions for IIS and FTP certificate store management in the Keyfactor Universal Orchestrator have been deprecated in Keyfactor Command version 11.0. Customers should migrate all uses of IIS certificate store management to the Keyfactor Universal Orchestrator with the IIS custom extension publicly available at:

<https://github.com/Keyfactor/iis-orchestrator>

For more information, see [Installing Custom-Built Extensions on page 2940](#).

For customers who have FTP certificate store type, when you upgrade Keyfactor Command to version 11 your FTP stores and related data will not be removed on upgrade. In order to manage the FTP certificate store, you will need to use an older version of the UO that still has the FTP extension.

Licensing

You will receive a new license file for the new version of Keyfactor Command. Before upgrading, locate your existing license file so that, should you need to revert to your existing software version, you will easily be able to do so without requesting a new license file from Keyfactor. (License files have the file extension '.cmslicense'.)

As you begin the upgrade, have both your new license file and your existing license file on hand.

If you need assistance with a license, send a request to support@keyfactor.com.

Users, Service Accounts and Groups

Review the Active Directory service accounts and groups used by your Keyfactor Command implementation. You will need to have these accounts and groups available during the upgrade process, along with the passwords for the service accounts. For a full overview of the required service accounts and groups, see [Create Service Accounts for Keyfactor Command on page 2757](#) and [Create Groups to Control Access to Keyfactor Command Features on page 2762](#) in the *Keyfactor Command Server Installation Guide*. The most common service accounts are:

Keyfactor Command Service Account

In many environments, a single service account is used for most Keyfactor Command functions, including the application pool service account and the service account for the Keyfactor Command Service¹. In some environments, separate service accounts are used for these functions.

Keyfactor Command LogiAnalytics Service Account

Keyfactor Command uses the reporting engine LogiAnalytics. This reporting engine uses the same service account the application pool is configured to use.

¹If you're running the Certificate Management System rather than Keyfactor Command, this service will be called the CMS Timer Job Service.

Keyfactor Command Orchestrator Service Accounts

If you are using orchestrators, you will need the account(s) the orchestrators are configured to run as and the account(s) used to connect to the Keyfactor Command Orchestrators site.

Keyfactor Command Policy Module

If you are using the Keyfactor Command policy module with any of the standard policy handlers or any custom policy handlers, you will need to have access to upgrade these on the CA if you will be upgrading these at the same time.

CA Gateways

Important: All CA Gateways must be upgraded to AnyGateway v22.1 to work with Keyfactor Command v10.

If you are upgrading any of the CA Gateways, you will need to have the correct credentials to connect to the cloud-based certificate authority. The format of these varies depending on the CA provider. Some providers use a username and password while others use client certificate authentication. Some support the choice of either.

If you are unable to locate the existing passwords for your service accounts, you will need to reset the passwords so that the accounts will have known values in preparation for the upgrade. These password changes will need to be coordinated with your existing Keyfactor Command installation to avoid a service interruption. On your Keyfactor Command server(s), the password for the Keyfactor Command service account (assuming you are using just one) will need to be changed:

- In IIS for the CMS/Keyfactor Command application pool.
- In the Services MMC for the Keyfactor Command Service¹.
- Via the Keyfactor Command Configuration Wizard for the LogiAnalytics connectivity.
- Via the Keyfactor Command Orchestrator Configuration Wizard for any orchestrators running in the environment.

Password updates for the Keyfactor Command service accounts can be done via the Keyfactor Command Configuration Wizard during the upgrade process and do not need to be done ahead of the upgrade. The password(s) should be changed in Active Directory as close to upgrade time as possible to limit down time in the existing Keyfactor Command implementation.

If possible, identify the user account that was used to do the original installation of Keyfactor Command (the “installer” account) and use this same account to perform the upgrade. If you are upgrading under a different account than this, the permissions required in SQL will be different. See [SQL Permissions on the next page](#).

¹Or CMS Timer Job Service for older versions of the software.

SQL Permissions

The user who upgrades Keyfactor Command must have permissions to administer the SQL server and update databases. The user may need to be able to add users (logins), depending on the features used. Full sysadmin permissions in SQL are needed if you're upgrading from a previous version of Keyfactor Command and the user running the install is not the same user who installed the previous version of Keyfactor Command. If the user is the same, only the dbcreator, public and securityadmin roles are needed.

Once Keyfactor Command has been upgraded, these permissions can be removed for the user.

Connecting to SQL over SSL

By default, Keyfactor Command connects to SQL using an encrypted connection. This requires configuration of an SSL certificate on your SQL server.

If your SQL server is not configured correctly for SSL, you'll see an error message similar to the following when you try to make a connection from Keyfactor Command:

```
Unable to establish a connection to the database server. Please ensure that the server name is correct and sufficient privileges have been granted to the connection account.: Encountered an invalid or untrusted certificate and could not connect to the database. TLS encryption is enabled by default. Please visit 'Planning and Preparing --> SQL Server' In the Keyfactor Installing Server guide to resolve this.
```

To acquire a new SSL certificate or check for an existing certificate, see [Using SSL to Connect to SQL Server on page 2746](#) in the *Keyfactor Command Server Installation Guide*.

If you would prefer not to use an encrypted channel for your connection to SQL, see [Configurable SQL Connection Strings on page 2750](#) in the *Keyfactor Command Server Installation Guide*.

System Requirements

For a full list of the requirements, see [System Requirements on page 2702](#) in the *Keyfactor Command Server Installation Guide*.

Operating System

Keyfactor Command server is supported on Windows Server 2019 or 2022.

PKI Architecture

Please visit [Confirm the Architecture on page 3062](#) and review the implications of upgrading with regard to the PKI architecture elements.

SQL Server

As of Keyfactor Command version 10.0, Microsoft SQL Server 2017, 2019 or 2022 is required and connectivity to the SQL server requires TLS encryption. For information about configuring TLS for SQL server, see [Using SSL to Connect to SQL Server on page 2746](#) in the *Keyfactor Command Server Installation Guide* and:

<https://docs.microsoft.com/en-us/sql/database-engine/configure-windows/enable-encrypted-connections-to-the-database-engine?view=sql-server-ver15>

.NET Framework

Microsoft .NET 4.7.2 or greater must be installed on the Keyfactor Command server(s) prior to installation of the latest Keyfactor Command software.

For Windows Server 2019 and Windows Server 2022, .NET is a standard Windows feature added through the Windows Server Manager tool. It can be updated to .NET 4.7.2 or greater with a downloadable update package or through Windows update. For information on checking the .NET version, see [Install IIS and .NET on the Keyfactor Command Server on page 2768](#) in the *Keyfactor Command Server Installation Guide*.

PowerShell Requirement

More recent versions of Keyfactor Command make use of the Active Directory tools for PowerShell to do group membership queries in Active Directory in some functions (e.g. when using a group to create a mapping between a Linux logon for SSH and one or more SSH keys). If this feature is not already installed on your Keyfactor Command server, you will need to install it before upgrading the Keyfactor Command software. The *Active Directory module for Windows PowerShell* is installed as a feature as part of the *Remote Server Administrator Tools*. You may install this through the Roles and Features wizard or using the following PowerShell command:

```
Install-WindowsFeature RSAT-AD-PowerShell
```

Download the Software

Your Keyfactor contact should provide you with a link to download the updated software versions. Be sure to download all the files you will need ahead of the actual upgrade date. This includes the main Keyfactor Command server software as well as the software for the Keyfactor CA Policy Module, any orchestrators (e.g. Keyfactor Universal Orchestrator, Keyfactor Java Agent) or gateways (e.g. AnyGateway), that you will be upgrading at the same time or new software you will be deploying.

Before upgrading to a major version, Keyfactor recommends first upgrading to the final incremental version of the previous major version—completing both the software installation and configuration with the configuration wizard—for the optimal upgrade experience. For example, if you are currently on version 9.4 and want to upgrade to version 10.0 or later, you should upgrade first to version

9.10.1 (the final incremental version of 9.x) before upgrading. Contact your Client Success Manager for more information.

Configuration File

Keyfactor Command can use a file to pass the configuration information into the configuration wizard, which saves a significant amount of typing when you do your initial installation. You may have been provided one of these already configured for your initial implementation, or you may have created one after typing in all the configuration information during the initial implementation. If you can locate this file, it can save some time in the upgrade process. You won't want to import the existing file again, as the file structure may change between versions and importing the file again will overwrite any changes you might have made to the configuration since your initial install, but you can refer to the file for previous configuration information.

The configuration files generally have a .cmscfg extension. When creating the file, you have the option to encrypt and password protect the file. If the file has been password protected, sensitive information in the file, such as any service account passwords, will be encrypted, but the remainder of the file will be human readable. You will need to know the password used to protect the file in order to use the file in its complete state.

Confirm the Architecture

Before you start your upgrade, make sure you have a clear picture of your Keyfactor Command architecture and all the parts that make up the environment, and carefully consider the following.

Roles

Identify all the servers that play a role in the Keyfactor Command environment, including whether you have duplicates of any server roles to support high availability, and make note of what role or roles will need upgrading on each one. Think about whether you want to make any changes to the architecture at this time, such as adding high availability, or consolidating roles.

Certificate Authorities

Keyfactor Command includes a constraint (introduced in version 9.0) that prevents any two certificate authorities from having the same logical name and host name combination. Think about the logical name and host name of the CAs that will be implemented with Keyfactor Command and check for duplicates.

Important: During upgrade, if duplicates are found, then among the duplicates, if there is only one that has any information tied to it, such as certificates, API applications, etc., then all of the others will be removed by the upgrade script. If more than one of the duplicates has any information associated with it, then the upgrade script will stop with an error. In that instance, you will need to manually fix the data before upgrading can proceed.

Templates

Keyfactor Command 10.0 and later upgrades will fail if the database has duplicate templates, defined as:

- Duplicate CommonName and Forest, or
- Duplicate OID and Forest

This should be a rare case. If it does occur, contact Keyfactor support. Support will be able to identify the duplicate templates, save the desired templates, and remove the duplicates.

Backup

Immediately before starting the upgrade, make a backup of these items:

- Your Keyfactor Command SQL database
- Your SQL server Service Master Key (SMK) and/or Database Master Key (DMK), if needed (see Important note)

If you plan to migrate your Keyfactor Command implementation to a different SQL server during the upgrade, you need a thorough understanding of how Keyfactor Command uses the SMK and DMK. Review the data in [SQL Encryption Key Backup on page 821](#) in the *Keyfactor Command Reference Guide* and make appropriate plans before beginning your upgrade. If you plan to stay on the same SQL instance for the upgrade, you don't necessarily need to backup the SMK or DMK immediately before starting the upgrade. These can just be backed up as part of your normal disaster recovery planning process. Failing to back up the SMK and/or DMK will result in data loss and require manual re-entry of any secret data into Keyfactor Command in the event that the Keyfactor Command database needs to be restored from a backup to a SQL instance other than the original installed instance of SQL server.

Note: For more information about how Keyfactor Command uses the SMK and DMK and how to back these up, see [SQL Encryption Key Backup on page 821](#) in the *Keyfactor Command Reference Guide*. For more details on the mechanics of SQL Server Encryption and related disaster recovery procedures, see the SQL Server documentation.

- If you're using Keyfactor Command encryption, backup your encryption certificate, with private key (see below).

More recent versions of Keyfactor Command allow you to encrypt select sensitive data stored in the Keyfactor Command database using a separate encryption methodology. This Keyfactor Command encryption utilizes a Keyfactor-defined certificate on top of the SQL server encryption noted above. This additional layer of encryption (Keyfactor Command encryption) protects the data in cases where the SQL Server master keys cannot be adequately protected. More information is provided in [SQL Server on page 2742](#) in the *Keyfactor Command Server Installation Guide*.

- Backup the NLog configuration file for each application to be upgraded. The location of this file varies depending on the application in question. For older versions of the Keyfactor Command

server, it can be found in one of these locations:

```
C:\Program Files\Common Files\Certified Security Solutions\Certificate Management System\NLog.config  
C:\Program Files\Common Files\Keyfactor\Keyfactor Platform\NLog.config
```

More recent versions of Keyfactor Command separate the NLog configuration into multiple files, with these locations, by default:

```
C:\Program Files\Keyfactor\Keyfactor Platform\Configuration\NLog_ Configuration.config  
C:\Program Files\Keyfactor\Keyfactor Platform\KeyfactorAPI\NLog_KeyfactorAPI.config  
C:\Program Files\Keyfactor\Keyfactor Platform\Service\NLog_TimerService.config  
C:\Program Files\Keyfactor\Keyfactor Platform\WebAgentServices\NLog_ Orchestrators.config  
C:\Program Files\Keyfactor\Keyfactor Platform\WebAPI\NLog_ClassicAPI.config  
C:\Program Files\Keyfactor\Keyfactor Platform\WebConsole\NLog_Portal.config
```

- Make a backup of the Logi configuration file, which is found here by default:

```
C:\Program Files\Keyfactor\Keyfactor Platform\Logi\Definitions\_Settings.lgx
```

- If you have any custom extension handlers (e.g. auto-registration, alert events), make a backup of these.
- If you've have any other text-based configuration files that have been modified (this is most common for users who have enabled a third-party PAM provider such as CyberArk), make a backup of these.
- If you're using a custom logo for your Management Portal, make a backup of this image. This file can be found here, by default:

```
C:\Program Files\Keyfactor\Keyfactor Platform\WebConsole\Images\Banner.png
```

- Review the authentication settings you have configured in IIS for each of the Keyfactor Command applications under the Default Web Site (or other web site if you've installed elsewhere) and make notes as to how they are configured so that you can confirm that the configuration is the same following upgrade.
- If you're using a virtualization solution for your Keyfactor Command application server(s), backup each virtual server as an image.
- If you are using a version of Keyfactor Command older than 6 and have existing SSL scans, export them to a file using the following script. Replace the bold italicized parts with the information relevant to your environment. This step is not necessary if you're upgrading from release version 6 or later.

```
$connectionString = "Data Source=SQLServerName;Integrated Security=SSPI;Initial Catalog=KeyfactorDB"  
$connection = new-object
```

```

System.Data.SqlClient.SqlConnection($connectionString)
$connection.Open()
# Password can be read from an encrypted file which can be secured as follows:
# Create a password file while logged in as the service account that will run this script:
# $credential = Get-Credential
# $credential.Password | ConvertFrom-SecureString | Set-Content
C:\Keyfactor\PowerShell\encrypted_password1.txt
# use the code below for the credentials
#$password = Get-Content C:\Keyfactor\PowerShell\encrypted_password1.txt | ConvertTo-SecureString
#comment out the below line if using secure credentials
$password = "Password" | ConvertTo-SecureString -AsPlainText -Force
#Update with the credentials for your environment
$username = "domain\administrator"
$credential = New-Object System.Management.Automation.PSCredential($username, $password)
$passphrase = $username + ":" + $password
$fileName = "DiscoveryGroupsExported.txt"
#The name of the agent in your environment
$AgentName = "kyfagent1.domain.com"
#Update with the URLs for your environment.
$kyfAgentUrl = "http://kyfagent1.domain.com/CMSAPI/SSL/1/Agents"
$kyfGroupUrl = "http://kyfagent1.domain.com/CMSAPI/SSL/1/AddEndpointGroup"
$kyfEndpointUrl = "http://kyfagent1.domain.com/CMSAPI/SSL/1/AddEndpoint"
$Bytes = [System.Text.Encoding]::Unicode.GetBytes($passphrase)
$EncodedText = [Convert]::ToBase64String($Bytes)
$headers = @{ "Authorization" = "Basic $EncodedText";
              "Content-Type" = "application/json;" }
$responseAgent = Invoke-RestMethod -Method Get -Uri $kyfAgentUrl -Header
$headers -Credential $credential
if ($responseAgent)
{
    write-host $responseAgent.Name.ToLower()
    if ($responseAgent.Name.ToLower() -eq $AgentName.ToLower())
    {
        $AgentGUID = $responseAgent.Guid
    }
    write-host $AgentGUID
    $kyfEndpointGroups = "http://ky-
fagent1.domain.com/CMSAPI/SSL/1/EndpointGroups?agentId=$AgentGUID"
    write-host $kyfEndpointGroups
    $responseEndpointGroups = Invoke-RestMethod -Method Get -Uri $kyfEndpointGroups -Header
$headers -Credential $credential
    if ($responseEndpointGroups)
    {
        foreach($res in $responseEndpointGroups)
        {

```

```

write-host $res.Name
$GroupName = $res.Name
#write-host $res.guid
$GroupGuid = $res.Guid
$sql = "SELECT VALUE, TypeID FROM cms_agents.SslEndpointGroupItems WHERE GroupID =
'$GroupGuid'"
#write-host $sql $command = new-object System.Data.SqlClient.SqlCommand($sql,$connection)
$reader = $command.ExecuteReader()
while ($reader.Read())
{
    $value = ""
    $type = ""
    $value = $reader["Value"]
    $typeId = $reader["TypeId"]
    #Add-Content $filename "$GroupName,$GroupGuid,$value,$typeId"
}
$reader.Close()
}
}
else
{
    write-host "Agent not found."
}
$connection.Close()

```

The resulting text file will contain the network definitions you currently have and can be opened in Excel. When Keyfactor Command has been upgraded, you can copy and paste from the file into the newly defined *Networks* that replace the previous *Discovery* and *Monitoring* groups.

6.1.2.2 Upgrading

Most Keyfactor Command upgrades are brief with a minimum of changes to existing user accounts, groups, CA templates, firewall settings, etc. The prerequisites have not materially changed from previous versions and the current version can generally be installed using the same hardware and existing instances of the supporting software. The upgrade process is often completed within three to four hours.

Before upgrading, please be sure you have reviewed and addressed the important preparation steps (see [Preparing on page 3056](#)).

Important: The MicrosoftECCurveUpgradeModule may fail due to a pre-version 10.0 issue in which Certificate Request Contents were truncated to 4k characters when saved to the database. If your upgrade fails when the MicrosoftECCurveUpgradeModule is run, contact

Keyfactor Support to obtain assistance with the scripts that will have to be run to fix this issue.

Important: During the upgrade process Keyfactor Command prevents duplicate template records from being inserted into the database. Duplicate templates could be found, for example, if there are templates in different forests with the same name. If you receive an error message during upgrade, and the log shows a list of the duplicate templates, contact Keyfactor Support. We will be able to support you through the process of resolving the issue and completing the upgrade.

Before upgrading to a major version, Keyfactor recommends first upgrading to the final incremental version of the previous major version—completing both the software installation and configuration with the configuration wizard—for the optimal upgrade experience. For example, if you are currently on version 9.4 and want to upgrade to version 10.0 or later, you should upgrade first to version 9.10.1 (the final incremental version of 9.x) before upgrading. Contact your Client Success Manager for more information.

The overall task flow consists of the following steps:

Upgrade of the Server Software

In most cases the Keyfactor Command server software can be installed over the existing software installation without uninstalling the previous version. Install the software retaining the same installation location (see [Installing on page 2780](#)). In the configuration wizard, populate the fields while referring to your configuration file open in a text editor (see [Configuration File on page 3062](#)). Use the existing IIS application pool.

Important: If you're using the Keyfactor CA Policy Module on one or more certificate authorities, you may have been advised in the past to implement a workaround to resolve an error similar to the following:

```
Could not load file or assembly 'CSS.Common, Version=1.0.0.0, Culture=neutral,
PublicKeyToken=0ed89d330114ab09' or one of its dependencies. The system cannot
find the file specified. at CSS.PKI.X509.X509Utilities..cctor()
```

```
2022-07-25 17:06:06.6851 CSS.CMS.CA.Msft.PolicyModule.Policy [Debug] -
Certificate request denied or failed by handler
CSSManagedTrustedSubject.PolicyHandler: -2146233088
```

denied by policy module

The workaround involved creating files *CertSrv.exe.config* and *MMC.exe.config* in C:\Windows\System32 on any certificate authority on which you encountered this issue.

With the release of version 11.0 of Keyfactor Command, this workaround needs to be reversed. If the workaround is not reversed, you will encounter errors such as the following on enrollment attempts:

```
Unable to enroll for certificate. The certificate request failed with the reason '0x80131902.'
```

```
2023-10-24 15:57:07.8547 Keyfactor.CA.Msft.PolicyModule.Policy [Error] - Failure verifying request: Configuration system failed to initialize
```

```
Unrecognized configuration section system.web.  
(C:\Windows\system32\certsrv.exe.config line 35)
```

To reverse the workaround, on the affected certificate authority:

1. Rename C:\Windows\System32\CertSrv.exe.config to an alternate name or remove it from the System32 directory.
2. Rename C:\Windows\System32\MMC.exe.config to an alternate name or remove it from the System32 directory.
3. Restart the CA services.
4. Confirm that certificate enrollment is working as desired and that the policy handler(s) in place are working as desired.

Upgrade the Keyfactor Universal Orchestrator

In many cases the Keyfactor Universal Orchestrator can be installed over the existing installation without uninstalling the previous version. For specific upgrade guidance, see [Upgrading the Universal Orchestrator on page 2895](#).

Update from Windows Orchestrators

Support for the Keyfactor Windows Orchestrator was deprecated in Keyfactor Command release 11.0. All uses of the Keyfactor Windows Orchestrator should be updated to the Keyfactor Universal Orchestrator. The Keyfactor Universal Orchestrator replaces the Keyfactor Windows Orchestrator and runs on both Windows or Linux servers. The following functions that were part of the Keyfactor Windows Orchestrator are supported in the Keyfactor Universal Orchestrator with custom extensions:

- Interact with F5 devices for certificate management
- Interact with NetScaler devices for certificate management
- Interact with Amazon Web Services (AWS) resources for certificate management
- Interact with Windows certificate stores and IIS

For more information about using custom extensions with the Keyfactor Universal Orchestrator, see [Installing Custom-Built Extensions on page 2940](#).

Important: The Keyfactor Universal Orchestrator is only compatible with Keyfactor Command version 9.0 or later. The current version of the Keyfactor Universal Orchestrator is 11.1 and requires .NET 6.

If you're upgrading from a version of Keyfactor Command prior to 8.0, you will need to update any Windows Orchestrators (a.k.a. Windows Agents) that are used for SSL scanning to support the current scanning architecture. Install and configure the Keyfactor Universal Orchestrator software (see [Upgrading the Universal Orchestrator on page 2895](#)).

Note: The orchestrator endpoint location changed for Keyfactor Command release 6 and may need to be modified in your orchestrator endpoint configuration—from CMSAgents to KeyfactorAgents.

Keyfactor CA Policy Module

Important: The most recent versions of the Keyfactor CA Policy Module software need to be upgraded using the below method and PowerShell script and can't be installed over an existing implementation of the Keyfactor CA Policy Module as an upgrade method.

To upgrade a Keyfactor CA Policy Module:

1. Make a note of all your existing policy module configuration, including which policy handlers are enabled and what configurations are set within each handler. **During the upgrade process, you will uninstall the policy module, which will remove your configuration.** The upgrade script should successfully restore the configuration as part of the upgrade process, but you will want to have a complete record of the configuration as a backup.
2. On the Keyfactor CA Policy Module server, open a PowerShell window using the "Run as administrator" option.
3. In the PowerShell window, change to the directory in which you placed the upgrade script included with the latest version of the Keyfactor CA Policy Module and execute it in *archive* mode. For example:

```
.\Keyfactor-CA-Modules-Upgrade-Script.ps1 -Mode archive -InformationAction Continue  
-ErrorAction Stop
```

Note: This step is creating a backup of your policy module configuration before you uninstall the old policy module. It will create an output file, *Keyfactor-CA-Policy.dat*, in the current directory.

Tip: Additional options are available in the upgrade script and can be viewed using the `-full` switch with `Get-Help`. For example:

```
Get-Help .\Keyfactor-CA-Modules-Upgrade-Script.ps1 -full
```

4. Unload the existing policy module in the CA MMC, and close the MMC.
5. **Uninstall the existing policy module.**
6. Install the latest version of the Keyfactor CA Policy Module but do not configure it (see [Installing the Keyfactor CA Policy Module Handlers on page 2846](#) in the *Keyfactor Command Server Installation Guide*). Be sure to install all the same policy handlers that were installed previously.

Execute the upgrade script included with the latest version of the Keyfactor CA Policy Module again, but this time in *restore* mode. For example:

```
.\Keyfactor-CA-Modules-Upgrade-Script.ps1 -Mode restore -InformationAction Continue  
-ErrorAction Stop
```

Note: This step takes the backup of your policy module configuration from the first run of the upgrade script and restores the information to the correct locations so that you will not need to re-configure the policy module. Be sure that the output file from the first run of the upgrade script, *Keyfactor-CA-Policy.dat*, is in the current directory.

7. Open the CA MMC and load the Keyfactor CA Policy Module (see [Installing the Keyfactor CA Policy Module Handlers on page 2846](#) in the *Keyfactor Command Server Installation Guide*).
8. Open the Properties for the policy module and, if you've received a new license, install the new license on the License tab. On the Custom Handlers tab, review all the configuration to confirm that it has been correctly restored by the upgrade script.

Tip: New versions of the policy module are not necessarily released at the same time as new versions of Keyfactor Command and so the policy module may not need upgrading at the same time as Keyfactor Command.

EJBCA CA Gateway

If you're using an EJBCA gateway and wish to make use of the new feature in Keyfactor Command for native support of EJBCA CAs, you will need to follow the EJBCA gateway upgrade process to unlink the EJBCA certificates in your Keyfactor Command database from your EJBCA gateway CA to enable them to be relinked to a native CA configured in Keyfactor Command. For more information, contact Keyfactor support.

Other CA Gateways

In most cases, the Keyfactor gateway software can be installed over the existing software installation without uninstalling the previous version. Review the configuration for your gateway, and then

install and configure the software as per the Keyfactor gateway guide for the particular gateway, retaining the same installation location. The gateway configuration wizard has significantly changed in recent releases for many of the gateways, which may require modification to your configuration.

Tip: New versions of CA gateways are not necessarily released at the same time as new versions of Keyfactor Command and so gateways may not need upgrading at the same time as Keyfactor Command.

API

Important: The Classic API, also known as the CMS API or CMSAPI, has been deprecated in Keyfactor Command version 11.0. Customers should migrate all uses of the Classic API to the Keyfactor API prior to upgrading to Keyfactor Command version 11.

Please see the latest [Release Notes & Upgrading on page 3051](#) if you are using any custom scripts that leverage the Keyfactor API.

Replacing or Re-Updating Customized Files

Files such as the `nlog.config` file or customized files for third-party PAM integration (e.g. `web.config` customizations for CyberArk) may have slight changes in the latest version as compared to the previous version, so you should not just copy your old, customized versions of those files over the current stock versions of these files. You will need to compare the files and make your customizations in the current versions of the files.

Post-Install Configuration and Testing

See [Post-Upgrade Steps below](#)

The bulk of the time upgrading will be spent verifying that all functions and configurations have correctly carried over and the upgraded instance is performing correctly.

6.1.2.3 Post-Upgrade Steps

The recommended best practices for after you finish running the Keyfactor Command configuration wizard(s) are:

- The server should be rebooted to assure that the services have a clean start. If this is not possible:
 - Restart Keyfactor Command Service
 - Restart IIS
- Advise users to clear the cache on their web browser and reload the Keyfactor Command Management Portal.

There is no particular order in which the tasks on the following pages must be accomplished.

Tip: If, following the upgrade, you open a page in the Keyfactor Command Management Portal and find it unexpectedly blank or otherwise displaying incorrectly, try refreshing the page with a CTRL-F5. If this doesn't resolve the problem, try clearing the browser cache and then reloading the page. It may be helpful to advise all end users to do this following an upgrade.

Testing

Once everything is up and running again, confirm that the following features are operating correctly:

- Does the Keyfactor Command Management Portal load correctly?
- Run a report in the Keyfactor Command Management Portal to confirm that the connectivity to LogiAnalytics is operating correctly.
- Issue a certificate in the Keyfactor Command Management Portal to confirm connectivity to CAs and that Kerberos authentication is operating correctly (assuming the environment is configured for Kerberos authentication).
- Check the Keyfactor Command log files to confirm that no errors are appearing and that logging is occurring correctly.

Post-Install Configuration

If you are upgrading from any release of Keyfactor Command version 6 or greater, you may want to make some additional configuration changes post-installation:

- Upgrade any Keyfactor CA gateways in your environment that are based on the AnyGateway. The AnyGateway must be upgraded to at least 22.1 to be compatible with Keyfactor Command 10.0 and later.
- Consider whether you wish to implement Keyfactor Command workflows and whether a Keyfactor Command-level workflow could replace CA-level manager approval for any templates that are configured to require CA-level manager approval.

Note: To prevent REST requests from being made to inappropriate locations by malicious users, if you plan to implement REST type workflows, configure a system environment variable of `KEYFACTOR_BLOCKED_OUTBOUND_IPS` on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:

```
192.168.12.0/24,192.168.14.22/24
```

When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.

- Review the new enrollment default and policy settings for enrollment. Enrollment defaults and policies can be defined at two levels:

- System-wide settings apply to all enrollments done through Keyfactor Command unless they are overridden by template-specific settings.
- Template-level settings allow you to modify any established enrollment defaults or policies on a per-template basis.

There are several settings available for configuration as part of the template policies:

- Allow Wildcards
- Allow Public Key Reuse
- Enforce RFC 2818 Compliance
- Supported Key Types

Enrollment defaults allow you to pre-populate the subject fields in PFX Enrollment and CSR Generation. Users are allowed to override these at enrollment.

- If you're using certificate metadata or regular expressions, optionally define these for each template. Certificate metadata fields and regular expressions can be defined at two levels:
 - System-wide settings apply to all enrollments done through Keyfactor Command unless they are overridden by template-specific settings.
 - Template-level settings allow you to modify any established certificate metadata or regular expressions on a per-template basis (for instance, for a metadata field, whether the field is required, what default value it should provide, or whether to hide the field during enrollment, regardless of system-wide setting).
- Review any alert PowerShell event handlers you may have configured to ensure they are in the path (or subdirectory thereof) as defined in the *Extension Handler Path* application setting value. Changes as of version 9.0 will cause PowerShell event handlers to fail if not located in the defined directory. For more information, see [Adding PowerShell Handlers to Alerts on page 223](#) in the *Keyfactor Command Reference Guide*.
- The enrollment configuration will have been carried over in the upgrade, however you may want to confirm the configuration of Certificate Authority and Template enrollment (PFX, CSR, and CSR generation) and make any changes.
- Review any template that is configured to require manager approval at the CA level and confirm that a Keyfactor Command private key retention policy is in place.
- Update any monitoring or other processes that reference the log files to point to the new log file location.
- Review the new reports in the Keyfactor Command Report Manager and add them to the menu or favorite them, if desired.

If you are upgrading from a release prior to Keyfactor Command version 6.1, please contact support (support@keyfactor.com) for upgrade assistance.

6.1.2.4 Troubleshooting

Typically, an upgrade completes with few hiccups and the new version of Keyfactor Command comes up without incident. If this doesn't happen, start by checking the log file(s) for any errors. By default, these are located in C:\Keyfactor\logs. It is sometimes helpful to enable debug or trace level

logging. This is done by editing the `nlog.config` file for each application. For more information, see [Editing NLog on page 796](#) in the *Keyfactor Command Reference Guide*.

Error During Upgrade

If you encounter an error during upgrade, this can be the result of a number of different things. Often, it's related to connectivity to SQL or issues on the SQL server. Check the *Command_Configuration_Log.txt* for messages related to upgrading and upgrade failures. This will point you in the right direction to begin troubleshooting.

The following error message indicates that the referenced upgrade script failed because it took longer to run than the allowed limit for SQL tasks:

```
2022-12-07 10:19:07.5078 Keyfactor.Sql.Management.Upgrade.UpgradePlan [Error] - Failed to run upgrade module CSS.CMS.Install.Upgrade.Scripts.EJBCA_Resolved_Request_Contents_Removal.sql: Execution Timeout Expired. The timeout period elapsed prior to completion of the operation or the server is not responding.
```

The Keyfactor Command upgrade process includes multiple scripts, each doing different tasks, and each script is run in batches to limit the time and load of any one SQL request, but it's still possible to encounter a batch that exceeds the limit with vary large or complex databases. To resolve this particular issue, you can increase the timeout limit and restart the upgrade. You do not need to restore and start over.

To increase the timeout limit:

1. On the Keyfactor Command server, open a text editor (e.g. Notepad) using the "Run as administrator" option.
2. In the text editor, browse to open the *CSS.CMS.Install.ConfigurationWizard.exe.config* file (*ConfigurationWizardConsole.exe.config* if you're doing a command-line install) in the Configuration directory under the installed directory. By default, this is:

```
C:\Program Files\Keyfactor\Keyfactor  
Platform\Configuration\CSS.CMS.Install.ConfigurationWizard.exe.config
```

3. Locate the `appSettings` line that contains *Keyfactor.Sql.DbCommandTimeout*. This will look something like:

```
<add key="Keyfactor.Sql.DbCommandTimeout" value="1800" />
```

4. The timeout value is set in seconds, so the default of 1800 seconds is 30 minutes. Set it to a new, longer value to allow the upgrade to complete. Don't set it to a value that's too high, as you do want the upgrade to time out if there's some fundamental problem communicating with SQL.
5. Save the file, close the configuration wizard, open the configuration wizard again (you should find it on the menu), and begin the upgrade again.

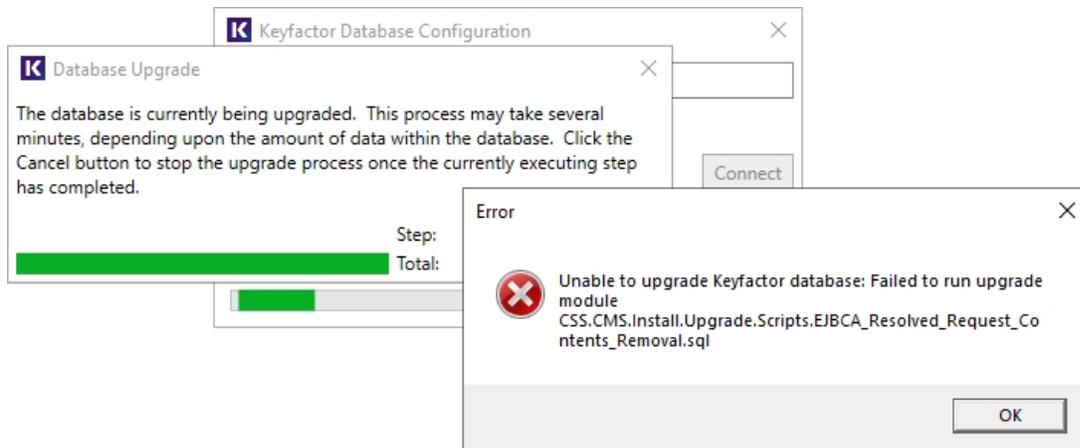

Figure 621: Error During Upgrade

Note: In previous versions of Keyfactor Command, the timeout was controlled with the `command timeout` setting in the connection string of the `SharedSqlConnectionStrings.config` file and had a default of 360 seconds (6 minutes).

Management Portal Doesn't Load After Upgrade

If the Keyfactor Command Management Portal appears to partially load or does not appear to include expected updates after the upgrade, try clearing the browser cache, closing the browser, and opening a fresh browser session. Try using CTRL-F5 to request the page again without cached content. In some upgrade cases, with Internet Explorer, the Certificate Search page only partially loads. With some browsers, opening the Developer Tools with the F12 key and clearing the cache will resolve the problem.

Certificate Enrollment Fails

If the certificate enrollment fails, this is often an indication that there is a Kerberos authentication problem. Confirm that the service principal name (SPN) is set correctly for the application pool service account and that Kerberos constrained delegation is configured correctly from the Keyfactor Command server(s) to the CA(s). For more information, see [Configure Kerberos Authentication on page 2822](#) in the *Keyfactor Command Server Installation Guide*.

Event Handlers Don't Run

If your alert PowerShell event handlers or renewal event handlers do not run correctly, be sure that you have updated them to the correct new location. Scripted alert handlers will fail to run if not in the path (or a subdirectory of it) specified by the `Extension Handler Path` application setting. By default, this is `C:\Program Files\Keyfactor\Keyfactor Platform\ExtensionLibrary\`. For more information, see [Adding PowerShell Handlers to Alerts on page 223](#) in the *Keyfactor Command Reference Guide*.

500 Error on the Dashboard or in Reports

If you receive a 500 error loading the dashboard and running reports but the remainder of the Management Portal seems to be operating correctly, check to be sure that the IP address(es) configured in the Configuration Wizard on the Dashboard and Reports tab have been entered correctly.

Underlying Connection Closed

If you receive an error when opening the Management Portal that “the underlying connection was closed” please be sure you have all the latest Windows updates installed.

Please refer to the Keyfactor Command [Release Notes & Upgrading on page 3051](#) for known issues.

If you need further assistance, please contact support. During normal business hours, support can be reached at support@keyfactor.com or (877)-715-5448.

6.2 Major Release 11.0 Notes

October 2023

We're thrilled to announce Keyfactor Command 11.0, which includes some major new features and updates such as support for OAuth 2.0, Universal Orchestrator Container, and certificate renewal tracking.

Please refer to [Upgrade Overviews on page 3051](#) for important information about the upgrade process.

Important: The MicrosoftECCurveUpgradeModule may fail due to a pre-v10 issue in which Certificate Request Contents were truncated to 4k characters when saved to the database. If your upgrade fails when the MicrosoftECCurveUpgradeModule is run, contact Keyfactor Support to obtain assistance with the scripts that will have to be run to fix this issue.

Tip: We encourage customers to contact their customer success manager to discuss the new features and functionality in Keyfactor Command 11, and to schedule an upgrade. Please refer to [Upgrade Overviews on page 3051](#) for important information about the upgrade process.

Highlights

New Security Permission Model

For release 11.0 of Keyfactor Command, a new permission structure has been introduced. Users of Keyfactor Command through the Management Portal will see some changes, including:

- The permissions tabs on the Security Roles Role Information For: *Role Name* page have a new look and method for setting permissions using check boxes in a tree structure.
- The Security Identities page has been removed.
- A new page for Claims has been added. This page allows the user to see the roles a claim is in.
- The security permissions for PKI Administration (*PKI Management: Read* and *PKI Management: Modify*) have been replaced with two new security permissions: *Certificate Authorities (Read and Modify)* and *Certificate Templates (Read and Modify)*. The upgrade process will appropriately translate the old security permission to the new ones.

Users of Keyfactor Command through the Keyfactor API will need to understand the new model.

On upgrade, existing security roles will be converted to the new permission structure.

The version one permission model was largely replaced in Keyfactor Command version 11.0, but is retained for backwards compatibility for use with select Keyfactor API endpoints.

Support for OAuth 2.0

Release 11.0 of Keyfactor Command introduces support for open authorization (OAuth) 2.0 compliant identity providers as an alternative to Microsoft Active Directory. Keyfactor offers the Keyfactor Identity Provider, which is a lightweight application that is easily installed in the same environment as Keyfactor Command and can be used to provide standalone authentication with user and group management for Keyfactor Command. It may be used directly or federated to another open authorization (OAuth) 2.0 compliant identity provider (e.g. Okta, Ping Identity). Keyfactor Identity Provider runs in a Linux-based container (e.g. Docker).

The Management Portal has been updated to include a new system setting, *Identity Providers*, that provides the ability to view and edit the identity provider configured for your Keyfactor Command implementation. Active Directory as an identity provider cannot be edited. New identity providers should be added through the Keyfactor Command Configuration Wizard. Authentication with only one identity provider at a time for a given Keyfactor Command server is supported.

When using Keyfactor Identity Provider, there is now a login page to present the user with a login prompt where he or she can choose to login directly to Keyfactor Identity Provider or click a link that will redirect to the login page of the federated identity provider.

The logout functionality for users authenticated with Keyfactor Identity Provider will log the user out and redirect them to the login page. Users authenticated via Active Directory will receive a message instructing them to “Close your browser to sign out” as per earlier versions of Keyfactor Command.

Identity provider secrets can be managed by a PAM provider, if desired. Please see the [Identity Provider Operations on page 755](#) for more information.

Important: Select substitutable special text tokens provide the ability for parts of the Keyfactor Command system to look up data in Active Directory to use in alerts and workflows.

Lookups for these locate the object in Active Directory identified by the user or computer account that requested the certificate from the CA and substitute the contents of the referenced attribute. For example, an alert might reference *requester:displayname* to look up the requester's display name in Active Directory.

The substitutable special text tokens that begin *requester:* or *principal:* (but not the standalone *requester* token) are only supported when using Active Directory as an identity provider. They cannot be used with other identity providers since there is no Active Directory to query. Customers wishing to use similar functionality with a different identity provider will need to do API calls to query the identity provider, populate the data into a metadata field, and use the metadata field when populating alert and workflow messages.

Certificate Renewal Tracking

When certificates are renewed in Keyfactor Command via the Management Portal or Keyfactor API, a new *Keyfactor Renewal* record is created. This can be used as a filter for *Ignore Renewed Certificates* in certificate collections. A history record will now show on the original and renewed certificates showing the thumbprint it was renewed from/to.

Keyfactor Universal Orchestrator in a Container

The Keyfactor Universal Orchestrator can now be deployed as a Linux container using a containerization platform such as Docker or Kubernetes. This will make deployments faster and less error prone and can fit into the CI/CD pipeline.

Updates

Changes & Improvements

- **Script/Handler Library in Command DB**
 - POST Extension/Script API endpoint added for registering PowerShell scripts for alerts for certificate requests, SSH and workflow, that results in their storage in the Keyfactor Command database (there is no Management Portal equivalent for security reasons). Alert and custom workflow scripts are now loaded from the Keyfactor Command database instead of the file system and available from dropdowns on any dialogs that use scripts, so users can select from the list of registered scripts. The upgrade process will retrieve scripts from the extension library folder and import into Keyfactor Command DB.
 - When configuring alerts and workflows, script selection now appears as a dropdown in the Management Portal. Only those scripts that have been defined in the Keyfactor Command database and configured for the selected category appear in the dropdown.
 - When upgrading from a version of Keyfactor Command prior to version 11, the upgrade process will search the file location defined in the *Application Settings > Console Tab > Extension Handler Path* setting and add all the files found in that directory to the database with the naming convention of *foldername (_subfolder name, if applicable)_filename* so it is

clear which scripts were imported from which location. The upgrade process will also identify which, if any, of the categories the script is configured for and add that information to the database with the script so that existing scripts will work upon upgrade. The extension library directory has an added file called *Migration-<date>.txt* that informs the user that this directory has had its scripts migrated to the database.

- **.NET Updates**

Updates have been made to allow the Keyfactor Command solution to multi target to .NET Framework (NET FX) 4.7.2 and .NET Core 6.0 to allow progress towards the goal of allowing Keyfactor Command to run on Linux-based operating systems and achieving cross-platform containerization. Eventually, the platform will not use NET FX.

- **System Alert Bar Design Change**

System alerts are now indicated by a bell icon in the header. Clicking on the bell will open a menu of alerts:

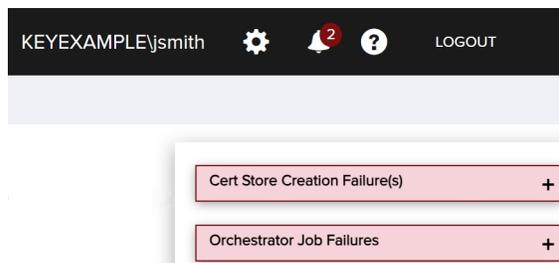

Figure 622: System Alerts

- **One-Click Renewal Enhancements**

More control was added for allowing one-click renewal on certificates. If you wish to use *One-Click Renewal* for certificates, the **Allow One-Click Renewals** option must be enabled in both the templates and CAs to which you want *One-Click Renewal* to apply (see [Certificate Template Operations on page 381](#) and [Adding or Modifying a CA Record on page 354](#)). For more information about one-click renewals, see [Renew on page 69](#).

- **Enrollment Enhancements**

Added an information message on the PFX Enrollment page to let the user know the required password length.

Added three new download options to PFX Enrollment: PEM, DER, and P7B.

Added the option to select an algorithm and key size when using CSR Generation and PFX Enrollment.

Added an auto-select option to the enrollment pages. When a template is selected that has 2 or more available CAs, the default option in the CA drop down will be auto-select, which will use the first eligible and reachable CA to do the enrollment.

PFX Enrollment, CSR Enrollment, and CSR Generation now support RSA key size 3072.

- **New Email Metadata Type**

For new databases the standard *Email-Contact* metadata field will be created as the new email metadata type field. For existing databases, any *Email-Contact* data will be unaffected, but the new metadata type will be available.

- **Alerts**

Expiration alerts will no longer determine the time range based on the *LastExpiration* service settings field. Instead, each expiration alert will have its own last execution time. When created, the value will be set to the current UTC time. The next time it is executed, the time span will be from the time in the *LastExecution* field and the current UTC time. After execution, the time will update to the current UTC time. Previously, alerts would update the *LastRun* field in the service settings. This no longer happens. The *LastRun* field was removed. Users can still see when alerts were last run by looking at the event logs.

- **Installation and Configuration Changes**

The configuration wizard service tab has been changed. Individual Keyfactor Command Service job check boxes have been removed, leaving only the **Start service on bootup** checkbox. By checking **Start service on bootup** all jobs default to **true**. A given job can be disabled by changing this setting to **false** in the *appsettings.json* file (see [Keyfactor Command Service Job Settings on page 778](#) for more information).

The configuration wizard settings *{filename}.cmsfg* file in Keyfactor Command version 11 has a new `<AdminUsers>` section, where the settings for the **Administrative Users** tab of the configuration wizard are saved/defined. This new section contains the additional parameters for the new identity provider and security protocol in v11. In previous Keyfactor Command versions, the **Administrative Users** were saved/defined in the `<Console>` section, `<AdminUser>` parameter. Running the configuration wizard for v11 with an older version *{filename}.cmsfg* will populate the configuration wizard **Administrative Users** tab from the details in the `<Console>` section, `<AdminUser>` parameter. Once populated, additional information will need to be provided on the **Administrative Users** section for v11.

- **Supported Browsers**

The supported browsers for Keyfactor Command have been updated to:

- Chrome: 99.0.4844.74
- Firefox: 98.0
- Microsoft Edge: 99.0.1150.30

- **Certificate Search Updates**

Added download options to the Certificate Search page. The options are now: PEM, DER, P7B, PFX, ZIP PEM, and JKS. (Previously, the options were PEM, SER, P7B, and PFX.)

Users without renew certificate permission will no longer see the Renew button.

On the Certificate Store - View Inventory dialog when you click **Query Certificate** on a selected inventory item, Keyfactor Command will include the *Revoked* and *Expired* check boxes if either condition is true for that certificate.

When a certificate collection is saved, the collection record will include the *Revoked* and *Expired* check box state and these will load in the appropriate state when the collection is loaded.

- **Certificate Templates**

On the Certificate Templates grid, the Key Type column is renamed to Key Types and displays all the template's key algorithms and key sizes in a comma-separated list with format *KeyType KeySize*. For example, a template that supports all key types would look like this: RSA 2048, RSA 4096 and ECC p-256, ECC p-384. Currently, the supported key types are RSA, ECC, ECDSA, Ed448, Ed25519. There is also a new section *Key Types and Sizes* on the *Template > Details* tab which list all key type and size information for the template.

Support is now provided in Keyfactor Command for a single certificate template containing multiple key types, sizes and/or curves.

- **Certificate Store Types**

Certificate Store Type Entry Parameters can now be added, edited, or deleted regardless of whether the certificate store type is in use or not. It should be noted that the parameter type (String, Bool, Multiple Choice, or Secret) cannot be changed.

Certificate Store Type Custom Fields can be added, edited, and deleted even if the type is in use. The custom field's type, however, cannot be changed after it is created. If you want to change that, you must delete the property and add it back with a different type.

Certificate Store Type Short Name and Name fields can be edited. The Custom Capability field length has been expanded to 64 characters.

- **Keyfactor Command Service**

New Keyfactor Command Service related application settings have been added around lock acquisition for ensuring that only one Keyfactor Command Service job runs at a time across multiple servers. On the Console > General tab:

- Lock Timeout (seconds) - The amount of time to attempt to acquire a lock.
- Lock Heartbeat Interval (seconds) - How often to update the lock to keep it alive while running a long running Keyfactor Command Service job.
- LockHoldTimeout (seconds) - How long to wait after the last successful heartbeat interval before the lock is considered to be lost and can be acquired by another machine.

- **Certificate Stores**

The maximum length for certificate store reenrollment jobs has been increased from 256 chars to 850 chars.

- **Custom Extension Handling Updates**

To reduce the number of assemblies listed in the shared assemblies file, a new extension registration option, *LoadInUpstreamContext*, is available. When set to *True* it causes all of the extension's assemblies to be shared with the calling assembly. The *SendEmailOrchestratorJobCompleteHandler* should be updated to add and set *LoadInUpstreamContext* to *True* (see [Editing Job Completion Handlers on page 771](#)).

- **Logging**

Improved logging for EJBCA Gateway configuration connection errors.

Correlation IDs are now returned in the API 's HTTP response header as *X-Keyfactor-Correlation-Id*. These match the correlation GUID tracked in the log files.

- **Improved CA Synchronization Performance**

Improved performance for synchronizing CAs that have a large number of duplicate keys.

- **Dashboard**

The ability to authenticate to the Dashboards and Reports Engine, Logi Analytics, no longer requires IP addresses.

The error message that displays in the case of an error condition has been simplified to remove any sensitive information that might reveal inappropriate information to an attacker (e.g. server hostname or IP address). The message will be displayed as: *Your logon credentials failed. Please contact Keyfactor support at support@keyfactor.com for assistance with report customization or migration to the new platform.*

- **SQL Updates**

Previously, SQL retry logic was controlled by parameters in the web.config files. With the migration to .NET 6, these settings have been moved to the appsettings.json file located in the Configuration folder of the KeyfactorAPI and/or WebConsole folders. Additionally, to allow for the rest of the product to also use the same retry logic, the parameters in the web.config files for projects that are still in .NET framework have been moved to the appsettings section of the web.config. See [Keyfactor Command Changing SQL Retry Settings on page 787](#) for more information.

- **Orchestrator Management**

The WebAgentServices\Configuration\appsettings.json file has some added configuration settings for managing orchestrator behavior. For more information, see [Keyfactor Command Web Agent Services on page 773](#)

For Keyfactor Command instances configured to use Keyfactor Identity Provider, the Keyfactor Orchestrator API calls support the use of bearer tokens.

- **PAM**

Added an optional capability to the Universal Orchestrator to ignore certificate store passwords from Keyfactor Command and obtain them from a client-side PAM provider instead. For more information, see [Installing Custom PAM Provider Extensions on page 743](#).

In previous versions of Keyfactor Command, once a PAM provider had been associated with an orchestrator whose certificate stores were configured to retrieve their secrets from a PAM provider, it was not possible to edit the PAM provider configuration. In Keyfactor Command v11, the PAM configuration can be edited even if the configuration is in use. Note that the PAM configuration can not be deleted if it is in use.

PAM provider role based access controls have been updated. Previously, certificate store containers were used to provide the security for PAM providers. Since PAM is now being

leveraged across Keyfactor Command, this has been removed and replaced with a new security role permission for PAM providers.

- **CA Policy Module**

When upgrading from a previous version of the Keyfactor CA Policy Module, refer to [Keyfactor CA Policy Module on page 3069](#) for important upgrade guidance and an upgrade script.

- **Workflow**

Added a new REST API step in the workflows to support the use of an OAuth bearer token.

In addition to the tokens in the dropdown in Workflows, any data in the current data bucket can be referenced by entering an appropriate reference string. For example, to return the CSR for an enrollment request you can use $\$(CSR)$. Refer to the `CurrentStateData` field in the response to the `GET /Workflow/Instances/{instanceId}` API method for information on all the data found in the current (as opposed to initial) data bucket (see [GET Workflow Instances Instance ID on page 2630](#)).

The PowerShell *Set Variable Data* workflow step now allows support for the `ConvertFrom` and `ConvertTo` cmdlets.

Fixes

- Denied alerts configured with metadata fields as substitutable special text tokens in the message were not getting the metadata values inserted on alert generation.
- The `GET /OrchestratorJobs/JobStatus/Data` endpoint was returning a 404 error even with a valid `jobHistoryId`.
- Template names were being treated as case sensitive during enrollment API calls. In addition resolution this issue, logging improvements were made to assist in troubleshooting similar items in the future.
- The CSR generation page would not allow input of subject information if the RFC 2818 compliance policy was turned on at either the template or system-wide settings level.
- Deleting a CA and then re-adding it was causing the CA sync to get stuck.
- OCSP files could not be uploaded in the Management Portal.
- Editing certificate metadata caused the certificate import date to change.
- Metadata fields could not be deleted if they had custom settings defined on a template.
- Pending certificate requests without CNs could not be approved.
- The dashboard was not accurately reflecting the counts of certificate collections that included the revoked and expired certificates.
- The certificate store type “Depends On” radio button would not display the available fields when selected.
- The Metadata, Enrollment RegExes, and Enrollment Defaults tabs on Certificate Templates were incorrectly displaying multi-select checkboxes.
- The Dashboard could hang when trying to remove a widget.

- An LDAP CRL could hang when loading the Dashboard Revocation Monitoring widget.
- Reports that have templates as parameters were not allowing the template parameter to be selected.
- When saving an HTTPS CA, on the Authorization methods tab, there is a database field length limit that applies to the secret supplied for the authentication certificate. Errors encountered with a lengthy secret for the certificate have been resolved by saving only the end-entity certificate to the database, rather than the whole chain.
- Certificates that were part of a certificate renewal chain could not be deleted. Now, whenever a certificate is deleted that is a part of a certificate renewal chain, the certificates on either end of the deleted certificate(s) will have their certificate histories updated to show that either a certificate before or after the certificate was deleted in the renewal chain of that certificate.
- Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.

Deprecation

Important: The Classic API, also known as the CMS API or CMSAPI, has been deprecated in Keyfactor Command version 11.0. Customers should migrate all uses of the Classic API to the Keyfactor API prior to upgrading to Keyfactor Command version 11.

- The Keyfactor Java Agent will be deprecated in a future release of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at: <https://github.com/Keyfactor/remote-file-orchestrator>.

For more information, see [Installing Custom-Built Extensions on page 2940](#).

- The following store types have been deprecated and will no longer be shipped with Keyfactor Command:
 - All F5 store types
 - AWS
 - NetScaler
 - IIS certificate store types

These store types will not be created with new databases. Upon upgrading, they will be removed if the customer does not have any stores or containers defined for the type (per type. i.e. if an AWS store or container is defined and the other types are not, the AWS type will not be removed on upgrade, but the other types will be removed). If you would like to manage these types of

stores, you will create new certificate store types as per the appropriate Keyfactor-built custom extension for managing the selected store type (see [Installing Custom-Built Extensions on page 2940](#)).

- The built-in functions for IIS and FTP certificate store management in the Keyfactor Universal Orchestrator have been deprecated in Keyfactor Command version 11.0.

Customers should migrate all uses of IIS certificate store management to the Keyfactor Universal Orchestrator with the IIS custom extension publicly available at: <https://github.com/Keyfactor/iis-orchestrator>.

For more information, see [Installing Custom-Built Extensions on page 2940](#).

For customers who have FTP certificate store type, when you upgrade Keyfactor Command to version 11 your FTP stores and related data will not be removed on upgrade. In order to manage the FTP certificate store, you will need to use an older version of the UO that still has the FTP extension.

- The prescript and postscript functionality of the Keyfactor Universal Orchestrator has been replaced by other functionality in Keyfactor Command such as that provided by Keyfactor Command workflows (see [Workflow Definitions on page 230](#)). As a result, prescript and post-script functionality has been deprecated and will be removed from a future release.
- Windows Orchestrator has been deprecated in v11. The reason for this change is that there has not been a new version since Keyfactor Command v8 and our policy is to support orchestrators for the latest two (2) versions of the products. Additionally, all Windows Orchestrator functionality is available in the new Universal Orchestrator and its associated extensions.
- In preparation for separating the vSCEP web application into its own solution, the configuration wizard no longer provides the option to install vSCEP. Customers wishing to upgrade and also still use vSCEP should install vSCEP on a separate server. The separate vSCEP application will be released at some point in the future.

Future Changes

Known Issues/Limitations

- Updating a workflow step's type without changing the unique name will result in an error. To get around this issue, when changing a workflow step's type also change the step's unique name. Another work-around is to delete the step you no longer want and add the new step you do want.
- If the .NET Hosting Bundle is installed before IIS is installed, you may have to repair the hosting bundle after IIS is installed. The official Microsoft page for the hosting bundle specifically mentions this scenario is at: <https://learn.microsoft.com/en-us/aspnet/core/host-and-deploy/iis/hosting-bundle?view=aspnetcore-7.0#install-the-net-core-hosting-bundle>.
- Although permissions for a container can be viewed or modified using the permission option on the certificate store containers tab, Keyfactor recommends best practice is to manage permissions as part of the overall permission configuration (see [Security Roles and Claims on page 622](#)), as additional system-wide configuration settings are available there that cannot be viewed or modified from certificate store containers - permissions page.

- Any renewal instances that were in-flight within the workflows that have been started in version 10 will not create a new renewal link in the certificate's renewal chain unless the workflow instance was created after an upgrade.
- In Keyfactor Command v11, the v1 security role endpoints only work for Active Directory users. If you move to OAuth and have any integrations against certain security roles APIs, they will not work. Security API endpoints that support OAuth have been added as version v2 of the endpoints.
- The Management Portal and the Keyfactor API do not display duplicate SANs. For certificates that have duplicate SANs, the Management Portal and Keyfactor API only show the unique list and count of the certificate SANs. For example, a certificate with four SANs, of which three are the same (duplicates), would only show two unique SANs on the Certificate Details page and the GET Certificates Keyfactor API method.
- SSH management in Keyfactor Command with the Keyfactor Bash Orchestrator is only supported when using Active Directory as an identity provider (see [Selecting an Identity Provider for Keyfactor Command on page 2704](#)). The SSH option in the Management Portal will only appear when Keyfactor Command is installed using Active Directory as an identity provider (and with a license that supports SSH).
- Orchestrator auto-registration in Keyfactor Command is only supported when using Active Directory as an identity provider (see [Selecting an Identity Provider for Keyfactor Command on page 2704](#)). If you need auto-registration with Keyfactor Identity Provider authentication, see [Custom Auto-Registration Handlers on page 495](#).
- The configuration options on the Keyfactor Universal Orchestrator for remote CA management require that the *AdditionalCertificateAuthoritiesAllowed* value be set to **true** regardless of whether you populate the *CertificateAuthorities* section with your CA information.
- In version 11, if you attempt to access the Management Portal when the SQL server is offline, you will get a blank page with a 503 unavailable error. Note that an IIS reset will be needed to connect to the Management Portal when you restart the SQL server. In version 10 and prior, you would get a screen that said that there was an issue.
- When using Keyfactor Command on a non-domain-joined server, there are some areas in the Keyfactor Command Management Portal that may cause confusion since they reference Active Directory. These places are not going to be addressed for 11:
 - Certificate authority import may show an empty dropdown.
 - The orchestrator auto-registration Validate Users function will return a *could not be resolved* error.
- When querying a workflow by ID with the *contains* or *starts with* operators and a partial id value an error is reported that it is an *Invalid Id value*.
- In the configuration wizard under Authentication, there is a field for *Identity Provider Hint*. This field has been deprecated and will be removed in a future version of Keyfactor Command.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

To reflect the changes made during the .NET 6 migration, in Keyfactor Command version 11, the *Keyfactor API Reference and Utility* (Swagger) link from the Management Portal is changed as follows:

- The URL for the *Keyfactor API Reference and Utility* changed from <https://keyfactor.keyexample.com/KeyfactorAPI/ref/index#> to <https://keyfactor.keyexample.com/KeyfactorAPI/swagger/index.html>

 **Tip:** Where *keyfactor.keyexample.com* is the Keyfactor Command Management Portal server and **KeyfactorAPI** is the virtual directory assigned to the Keyfactor Command Management Portal in the configuration wizard.

- There is no longer an individual URL link to each API endpoint within the *Keyfactor API Reference and Utility* (such as https://keyfactor.keyexample.com/KeyfactorAPI/ref/index#!/Certificate/Certificate_QueryCertificates) at the bottom of each *Keyfactor API Reference Guide* documentation page—just the one link to the main page of the *Keyfactor API Reference and Utility*.
- At the top of the *Keyfactor API Reference and Utility* under the title there is a link to allow easy access to the raw OpenAPI JSON.

 **Important:** The Classic API, also known as the CMS API, was deprecated in Keyfactor Command version 11. All uses of the Classic API should be migrated to the Keyfactor API prior to upgrading to Keyfactor Command version 11.

Table 856: API Change Log

Endpoint	Methods	Action	Notes
AppSetting	GET, PUT	Added	
AppSetting/{id}	GET	Added	
AppSetting/{id}/Set	PUT	Added	
AppSetting/{name}/Set	PUT	Added	
CertificateAuthority/SourceCount	GET	Added	
CertificateAuthority/ConfigurationTenants	GET	Added	
CertificateAuthority/HealthMonitoring/Schedule	GET	Added	

Endpoint	Methods	Action	Notes
CertificateAuthority/AlertRecipients/CAHealthRecipients	GET	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients	POST	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients	GET	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients	POST	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients/{id}	DELETE	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients/{id}	GET	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients/{id}	PUT	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id}	DELETE	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id}	GET	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id}	PUT	Added	

Endpoint	Methods	Action	Notes
CertificateAuthority/Import	POST	Added	
CertificateAuthority/ConfigurationTenants	GET	Changed	The endpoint is now renamed to GET /CertificateAuthority/AvailableForests and the definition is changed to: Returns a list of available forests that are in Active Directory.
Certificates/CSV	GET	Added	
Certificates/IdentityAudit/{id}	GET	Added to V2 definitions	This API endpoint is available in both the V1 and V2 definitions in the Keyfactor API Reference and Utility and acts exactly the same in both.
CertificateCollections/{id}/Permissions	POST	Removed	Instead use POST Security/Roles/{id}/Permissions/Collection.
CertificateCollections/{id}	DELETE	Added	
CertificateCollections/NavItems	GET	Added	
CertificateCollections/CollectionList	GET	Added	
CertificateCollections/{id}/Favorite	PUT	Added	
CertificateStores/Server	GET, POST, PUT	Deprecated	
CertificateStoreTypes	GET	Changed	The API will return ALL certificate store types if at least one of these conditions are met: <ul style="list-style-type: none"> The end-user has one of the /certificate_

Endpoint	Methods	Action	Notes
			stores/read/ global permissions. <ul style="list-style-type: none"> The end-user has permission to at least one certificate store container.
ComponentInstallation/{id}	DELETE	Added	
ComponentInstallation/	GET	Added	
EventHandlerRegistration/{id}	GET, DELETE, PUT	Added	
EventHandlerRegistration/	GET, POST	Added	
Extensions/Scripts/{id}	DELETE, GET	Added	
Extensions/Scripts	GET, POST, PUT	Added	
IdentityProviders/{id}	GET, PUT	Added	
IdentityProviders	GET	Added	
IdentityProviders/Types	GET	Added	
Permissions	GET	Added	
PermissionSets/{id}	GET, DELETE	Added	
PermissionSets	GET, POST, PUT	Added	
Scheduling	POST	Added	
Security/Containers/{id}/Roles	GET,	Added	

Endpoint	Method-s	Action	Notes
	POST		
Security/Audit/Collections/{id}	GET	Added	
Security/Claims/{id}	GET, DELETE	Added	
Security/Claims	GET, POST, PUT	Added	
Security/Claims/Roles	GET	Added	
Security/Identities	GET	Changed	The non-working query string field has been removed.
Security/Roles/{id}/Permissions/PamProviders	GET, PUT	Added	
Security/Roles (V1) Security/Roles/{id} (V1) Security/Roles/{id}/Identities(V1) Security/Roles/{id}/copy(V1)	GET, POST, PUT	Deprec-ated in V1	All SecurityRoles API endpoints (except DELETE / {id}) have been deprecated from the V1 API, as they only work against Active Directory users. There are new Security/Roles endpoints in the V2 API
Security/Roles(V2) Security/Roles/{id}(V2)	GET, POST, PUT	Added in V2	Security/ Roles API endpoints have been recreated in V2 API to work with both OAUTH and AD users.
Templates/{id}	GET	Changed	Now returns an object with a TemplatePolicy property and a KeyAlgorithms property that show the policies and algorithms the template supports.
Templates/Import	GET, POST	Changed	Now supports multiple algorithms.

Endpoint	Methods	Action	Notes
Templates/Settings	GET, PUT	Changed	The Template Policy property used to update global application settings now contains four properties: ECDSA, RSA, Ed448, and Ed25519. These replace the AllowEd448, AllowEd25519, RSAValidCurves, and ECCValidCurves.

6.2.1 Incremental Release 11.1 Notes

December 2023

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Important: If you're using the Keyfactor CA Policy Module on one or more certificate authorities, you may have been advised in the past to implement a workaround to resolve an error similar to the following:

```
Could not load file or assembly 'CSS.Common, Version=1.0.0.0, Culture=neutral, PublicKeyToken=0ed89d330114ab09' or one of its dependencies. The system cannot find the file specified. at CSS.PKI.X509.X509Utilities..cctor()
```

```
2022-07-25 17:06:06.6851 CSS.CMS.CA.Msft.PolicyModule.Policy [Debug] - Certificate request denied or failed by handler CSSManagedTrustedSubject.PolicyHandler: - 2146233088
```

denied by policy module

The workaround involved creating files *CertSrv.exe.config* and *MMC.exe.config* in C:\Windows\System32 on any certificate authority on which you encountered this issue.

With the release of version 11.0 of Keyfactor Command, this workaround needs to be reversed. If the workaround is not reversed, you will encounter errors such as the following on enrollment attempts:

Unable to enroll for certificate. The certificate request failed with the reason '0x80131902.'

2023-10-24 15:57:07.8547 Keyfactor.CA.Msft.PolicyModule.Policy [Error] - Failure verifying request: Configuration system failed to initialize

Unrecognized configuration section system.web.
(C:\Windows\system32\certsrv.exe.config line 35)

To reverse the workaround, on the affected certificate authority:

1. Rename C:\Windows\System32\CertSrv.exe.config to an alternate name or remove it from the System32 directory.
2. Rename C:\Windows\System32\MMC.exe.config to an alternate name or remove it from the System32 directory.
3. Restart the CA services.
4. Confirm that certificate enrollment is working as desired and that the policy handler(s) in place are working as desired.

New Features

- Agnostic Identity Provider Support for Keyfactor Command.

Updates and Fixes

- Update: Do not display mini table of contents and navigation buttons when the browser is narrower than 880 pixels.
- Update: PFX certificate download includes the option to manually set the password.
- Update: New optional fields for scope and audience are added to the OAuth REST workflow step. When requesting a token during the OAuth REST workflow step, the scope and audience values configured in the step are used if provided.
- Update: New scope and audience configuration parameters can be defined in the OAuth Universal Orchestrator appsettings.json configuration file.
- Update: The colors and fonts on the Management Portal have been changed to match the new Keyfactor branding, including hovers, highlights and buttons changes.
- Fix: Cannot query individual certification in a collection with no global permissions.
- Fix: The TOC button in the documentation did not work in smaller browser sizes.

- Fix: Separate users for appools results in Logi error.
- Fix: Cannot change orchestrator associated with certificate store.
- Fix: Workflow enters/leaves collection timer job causes high SQL load.
- Fix: The IdpHint application setting is removed.
- Fix: A known issue of CA sync using an orchestrator with an invalid CSR causing the sync to stop is fixed. Instead of throwing an exception, such errors will log a warning message, and the record will be skipped.
- Fix: Certificate store reenrollment error when selecting template from separate tenant is fixed. The template dropdown will be filtered to only display the templates associated with the selected certificate authority and based on the CSR Enrollment enabled flag on the templates.
- Fix: The API endpoint GET SSL/Networks reports back an incorrect value for AutoMonitor parameter. The AutoMonitor parameter is removed from the GET SSL/Networks response object.
- Fix: Now the correct notification recipient(s) are shown for field SslAlertRecipients in the response of API endpoint GET SSL/Networks.

Deprecation

- The Classic API was deprecated in Keyfactor Command version 11.0. All existing uses of the Classic API should be migrated to use Keyfactor API prior to upgrading to Keyfactor Command version 11+. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see [Application Settings: API Tab on page 619](#)). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.
- The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

Known Issues

- .NET Decryption error with separate pool accounts or non-domain joined installation. The solution is to set private key permissions for all app pool users on the encryption certificate.

API Endpoint Change Log

No API endpoint changes were made in this release.

6.3 Major Release 10.0 Notes

September 2022

We're thrilled to announce Keyfactor Command 10.0, which includes some major new features and updates to improve the user experience, enhance automation, and provide native integration with EJBCA.

Important: The MicrosoftECCurveUpgradeModule may fail due to a pre-v10 issue in which Certificate Request Contents were truncated to 4k characters when saved to the database. If your upgrade fails when the MicrosoftECCurveUpgradeModule is run contact Keyfactor Support to obtain assistance with the scripts that will have to be run to fix this issue.

Tip: We encourage customers to contact their customer success manager to discuss the new features and functionality in Keyfactor Command 10, and to schedule an upgrade. Please refer to the [Keyfactor Command Upgrade Overview](#) for important information about the upgrade process.

Highlights

Workflow Builder

Workflows in Keyfactor Command allow for automation and governance of certificate enrollment and revocation. The workflow builder makes it easy to define workflows within the Keyfactor Command Management Portal to automate event-driven tasks when a certificate is requested (including renewals) or revoked. The workflows can be built with multiple steps between the start and end of the operation that offer a simple way to send notifications, submit approvals, and configure end-to-end automation throughout the environment. This provides for operational agility in an intuitive and easy-to-user tool. Supported built-in steps that can be used in the workflow builder include one or more approval steps supporting one or more approvers, calls to REST APIs, calls to PowerShell, sending emails, and updating enrollment requests with changes to the submitted subject or SANs, if needed. Custom steps can also be built to address specific needs. The workflow builder provides an easy-to-use experience to create rich workflows with multiple steps.

EJBCA Integration with Keyfactor Command

EJBCA is a robust and highly scalable certificate authority. Keyfactor Command now natively integrates with EJBCA version 7.8.1 or higher without the need for a gateway, providing a simpler architecture. The Certificate Authorities area of Keyfactor Command now allows an administrator to enter connection information to an EJBCA CA to manage certificates and support enrollment. With native EJBCA integration, Keyfactor Command offers an alternative to Microsoft CAs. EJBCA is a much more scalable CA with options for multiple CAs on a single server and high availability configuration options that the Microsoft CA lacks. It can also handle a much larger number of certificates than the Microsoft CA.

CA Gateway 22.1 required for Keyfactor Command v10

Upgrade to AnyGateway 22.1 if using gateways on Keyfactor Command v10.

Expanded Template Functionality

- System-wide settings for enrollment templates have moved from the application settings to the templates page.
- Templates can be configured to set policies for the following at both the template level and the system-wide configuration level:
 - Allow Wildcards
 - Allow Public Key Reuse
 - Enforce RFC 2818 Compliance
 - Supported Key Types
- Added a new configuration tab at both the template level and the system-wide configuration level called *Enrollment Defaults* that allows for defining default values for select certificate subject parts that will auto-populate on the PFX Enrollment and CSR Generation pages.
- *Template RegExes* has been renamed to *Enrollment RegExes*. Regular expressions for certificate subject values can be defined at both the template level and the system-wide configuration level.
- Metadata can be configured on a per-template basis to control which fields are shown during enrollment and what default values they have.
- When enrolling with the template, the key size of the request is validated against the template key size. This allows for a key size to be set on a template in Keyfactor Command for validation purposes that can be different than the CA template key size setting.
 - If a CSR Enrollment request is made with a key size that is not valid, per the template policy settings, an error will be displayed when you click the **Enroll** button (for example, the CSR has a key size of 2048 but the template policy supports only 4096).
 - For PFX Enrollment, the request will contain the minimum settings from the Keyfactor Command presiding template settings.
- During the upgrade process Keyfactor Command prevents duplicate template records from being inserted into the database. Duplicate templates could be found if there are templates in different forests with the same name. If you receive an error message during upgrade, contact Keyfactor Support. We will be able to support you through the process of resolving the issue and completing the upgrade. See the [Keyfactor Command Upgrade Overview](#) for more information.

Keyfactor API Endpoints

The Keyfactor API now has endpoints for most of the functionality found in the product. See the [API Endpoint Change Log on page 3105](#) for information on new and updated API endpoints.

Updates

Changes & Improvements

- **CARecordID Replaces CARquestID**

The field CARecordID has been added and the field CARquestID has been removed.

- **Forest has been Renamed *Configuration Tenant***

- To broaden Keyfactor Command's compatibility with certificate authorities, the Microsoft-centric term **forest** has been renamed to **configuration tenant**. For EJBCA, there should be one configuration tenant per EJBCA server install. For Microsoft, there should be one per forest. Note that configuration tenants cannot be mixed, so Microsoft and EJBCA CAs cannot exist on the same configuration tenant.
- Added the ability to search templates by configuration forest and key type. The option to search by forest has been retained for backwards compatibility.

- **SQL Server Connection over SSL**

As of Keyfactor Command version 10.0, by default Keyfactor Command connects to SQL using an encrypted connection using an SSL certificate configured on your SQL server. Customers should acquire and install an SSL certificate for the SQL server before upgrading to Keyfactor Command 10.0 (see [Using SSL to Connect to SQL Server on page 2746](#) in the *Keyfactor Command Server Installation Guide*). If you would prefer not to use an encrypted channel for your connection to SQL, see [Configurable SQL Connection Strings on page 2750](#).

- **SQL Encryption Key Backup**

When Keyfactor Command is installed, the option is presented to make a backup of the SQL database master key (DMK). In previous versions of Keyfactor Command, this option backed up the service master key (SMK) instead. For more information about how Keyfactor Command uses the DMK and SMK, see [SQL Encryption Key Backup on page 821](#) in the *Keyfactor Command Reference Guide*.

- **SQL Server 2022 Compatibility**

Keyfactor Command is compatible with SQL Server 2022.

- **Certificate Requests**

- The Certificate Requests page is now sorted in descending order by submission date by default. This has been done to cause the more recent requests to appear at the top of the page.
- The Certificate Requests page is now separated into tabs for pending, external validation, and denied/failed certificate requests.
- The Denied/Failed tab on the Certificate Requests page now includes only certificate requests denied through Keyfactor Command (see [Viewing Certificate Requests on page 163](#) in the *Keyfactor Command Reference Guide*).
- The Revoked view filter has been removed from the Certificate Requests page since the expectation is that Keyfactor Command workflows will be used for enrollments and the

history can be viewed as part of that (see [Workflow Instances on page 305](#) in the *Keyfactor Command Reference Guide*).

- **Alerts**

- When an alert is copied, “ - Copy” is appended to the display name to prevent alert display names being duplicated.
- To aid in clarity, changed the wording on templates when configuring alerts from *None* to *All Templates*.

- **SMTP Application Settings**

When making changes to the SMTP configuration, the test email can be sent without saving the configuration changes.

- **Certificate Authorities**

- Added an option to delegate enrollment requests to the Authorization Methods tab. This is in addition to the option to delegate management functions. This allows Keyfactor Command to delegate the authenticated user’s credentials to the CA during enrollment to provide end-to-end authentication without unpacking the credentials at the Keyfactor Command layer. If this is not enabled the Restrict Allowed Requesters setting will be used instead. Please see the [Authorization Methods Tab on page 367](#) in the *Keyfactor Command Reference Guide* for more information.
- When configuring a new certificate authority in the Management Portal, there is now an option to test the connection to the CA before saving the configuration, and CAs will be tested and must be verified and valid to be saved.
- Updated the CA synchronization so that it logs a message if it could not chain a certificate up to a CA in the system instead of throwing an error.
- Added a new application setting, *CA Sync Consecutive Error Limit*, which controls the number of times an error can occur before the synchronization job is abandoned.
- There is no longer the need to register offline CAs, as the root/policy CA certificates can be imported from the issuing CA sync without them. Additionally, the new CA validation makes it impossible to save offline CAs.

- **Certificate Stores**

- Added the ability for users with only container-level permission to create and use certificate stores in the container, including certificate store types that have a server component. Users will not be able to access certificate stores outside of the containers they have permissions to manage. (Previously, users needed to have Certificate Store Manage permissions in order to change client machine credentials as certificate store servers was shared across all certificate stores with the same type and server name. Now, certificate store servers are partitioned by container.)
- Added the ability to import PEM certificates that have comments in them when doing an inventory of an F5 REST certificate store.
- On the Discover tab the label for *Approve* has been changed to *Manage* for clarity.

- **Dashboard and Reporting**

- The Risk header can now be hidden via security role permissions.
- Some cosmetic updates have been made to the Risk header.
- The Collections Dashboard widget is limited to only displaying the first 25 collections configured to be on the dashboard. It sorts the list alphabetically.
- The stale date is visible in the CRL Monitoring Dashboard widget as a new column and is called *Next Publish by Date*. The stale date should not be used for calculating the status of the CRL. A stale CRL is a valid state and not something that needs to be warned on. If a CRL is stale, the system will check how far it is from expiration and if it is within the warning period it will have a status of *Warning*, or *Valid* if outside the warning period.
- Keyfactor Command v10 ships with a newer version of Logi Analytics (v14) which drives the Reports and Dashboards. This version provides a number of improvements and fixes some security vulnerabilities.
- CRL dates are always shown in UTC on the Revocation Monitoring Dashboard.
- A new report—SSH Key Usage—shows a table which displays a list of SSH keys that have not been used to log on in the given minimum number of days.
- The Risk header on the dashboard has been updated to avoid awkward text formatting and scrolling when resizing the page.
- The Risk header titles have been updated for consistency and clarity. Titles referring to expiring certificates are now all in the “Expiring” tense and consistent with each other. *Weak Keys* has been renamed to *Certs with Weak Keys*.
- The *Certificate Count by Template* report has been updated so that it takes the same parameters as the *Certificate Count per User by Template* report for consistency. This included changing the Evaluation Date to *Start Date* and adding an *End Date* field.
- All reports have been updated to reference UTC time to avoid confusion about which time zone is being applied.
- The *PKI Status for Collection* report has been updated to provide clarity on the meaning of *Total Active Certificates*.

- **Agent, Orchestrators, and Orchestrator Management**

- The Orchestrator Details dialog has been updated to show more information about the orchestrator:
 - Legacy Thumbprint
 - Current Thumbprint
 - Last Thumbprint Used
 - Last Register Status
 - Certificate Rotation Status
- The Job History now shows the time the job completed.

- The default value for the *Registration Handler Timeout (seconds)* application setting has been extended to 90 seconds for new implementations only. Keyfactor recommends any existing customers using or planning to use custom registration handlers consider extending this timeout to at least 60 seconds.
- SSL scan job parts are now grabbed more deterministically to help keep the job assignments more predictable. For more information, see [SSL Network Operations on page 456](#) in the *Keyfactor Command Reference Guide*.
- The SSL Scan Now option now allows you to select whether to start a discovery job, a monitoring job, or both (see [Initiating a Manual Scan on page 466](#) in the *Keyfactor Command Reference Guide*).
- The Keyfactor Universal Orchestrator now does CRL checking when contacting Keyfactor Command over an encrypted channel (when you configure the orchestrator with a URL referencing https) both when certificate authentication is used and when basic authentication is used. Previously this was only done when certificate authentication was used. If you attempt to connect your orchestrator using SSL and do not have a valid CRL available to the orchestrator, you will get an error message similar to the following:

```
The remote certificate is invalid because of errors in the certificate chain:
RevocationStatusUnknown, OfflineRevocation
```

For troubleshooting information, see [Troubleshooting on page 3003](#) in the *Keyfactor Orchestrators Installation and Configuration Guide*.

- **Reenrollment**

A certificate authority and template can now be specified when scheduling a reenrollment job.

- **Certificate Metadata**

- A certificate metadata field now cannot be deleted if it is in use in a certificate collection definition.
- When creating a new certificate metadata type, different fields will be displayed depending on the value selected in the Data Type dropdown field. For more information, see [Adding or Modifying a Metadata Field on page 710](#) in the *Keyfactor Command Reference Guide*.

- **Security Identities and Roles**

- A search bar has been added to search for the collections and containers in the security roles dialog.
- Improvements were made to performance when loading a large number of security roles in the portal.
- When copying a security role, a new disclaimer will appear to advise the user that copying a security role will also assign the new role to all the same security identities as the target role.
- The security roles dialog has been updated to be a tabbed dialog box.

- **UI Changes**

- Some edit dialogs have been changed to use sliding panels to accommodate two different views within the same page rather than pop up windows.
- Added scroll bars to the certificate details pop ups.
- Added the ability to copy data from grid information (e.g. SSL location information when expanding the certificate locations). Information in a grid field can be **copied** to the clipboard by highlighting text in a grid field and clicking **Ctrl+C**.
- Performance improvements have been made in loading large data sets in the Management Portal results grids.

- **System Alerts**

The alerts that are displayed in the UI for notification of things like failed orchestrator jobs have been renamed *System Alerts* for clarity.

- **Logging**

- The Keyfactor API and Orchestrator API logs on the Keyfactor Command server and the log for the Keyfactor Universal Orchestrator include a correlation ID that helps to identify log messages that originated from the same request. The correlation ID is a randomly generated GUID that often appears just after the date in the log entry and is the same for all log messages for the given request until the request completes.
- Lowered the logging level for the user's authentication from Info to Trace to avoid cluttering log files.

- **Mac Auto-Enrollment**

The Mac auto-enrollment process now identifies all the CAs that have the auto-enrollment template(s) available for enrollment and makes a determination as to whether the enrolling user has permissions to enroll on a CA and whether that CA is online before submitting a request to the CA. Previously, a CA was selected randomly among the CAs that had the template(s) available without regard to the user's permissions on the CA or the availability of the CA.

- **Auditing**

Orchestrator reset, approval, disapproval will now properly audit under the new *Orchestrator* category and their respective operation.

- **Installation**

- On installation, Keyfactor Command creates an initial record in the DatabaseUpgradeLog table that indicates the exact version of Keyfactor Command that created the database. This can be helpful for troubleshooting.
- If you are upgrading from an older version of Keyfactor Command the installation directory changed, as of Keyfactor Command v9, to C:\Program Files\Keyfactor. Move any scripts or files that are held in the old directory structure to the new location.

- **Policy Modules**

The policy modules have been migrated to leverage .NET Core.

- **Custom Registration Handlers**

A custom registration handler can now be designed to enroll against a specific certificate authority and template combination. The registration handler chooses which combination to use. If no combination is requested by the registration handler, then the certificate authority and template from the application settings are used. For more information, see [Register a Client Certificate Renewal Extension on page 2961](#) in the *Keyfactor Orchestrators Installation and Configuration Guide*.

- **Application-Level Encryption Certificate Thumbprint**

The reference thumbprint for the application-level encryption certificate, if configured, is now stored in the registry on the Keyfactor Command server(s) instead of the SQL database to provide a further level of separation from SQL.

Fixes

- **Keyfactor Command**

- Revocation Monitoring Dashboard panel no longer stalls as perpetually “Loading” for OSCP endpoints.
- Certificate subjects for PFX enrollment via the legacy API have been fixed so they can be formatted according to the `API.CertEnroll.Pkcs12CertificateSubjectFormat` app setting.
- Fixed an issue when parsing the CSR so that CSRs containing IP or Email SANs no longer cause excess warnings in CA syncs, and IP and Email SANs show up in the pending request details.
- Fixed an issue where syncing external certificates would cause an “object reference not set to an instance of an object” error.
- Fixed an issue with revocation monitoring alerts reporting time in the local time zone instead of UTC. Emails now have the time in UTC. The time is explicitly labeled UTC.
- Fixed an issue where special characters like apostrophes would appear HTML-encoded in the collection name.
- Fixed an issue in certificate enrollment where SANs for IPv4 and IPv6 addresses were not being validated properly.
- Fixed an issue where an untrusted certificate chain would prevent the certificate details dialog from opening. An error will still occur if a certificate chain is attempted to be downloaded and the chain build fails, but will not prevent the dialog from opening.
- Fixed an issue where the Identity Audit table wasn’t populating from the Certificate Search page.
- Fixed an issue where unscheduling an orchestrator management job failed to cancel the previously staged job.
- Fixed an issue in enrollment where the subject incorrectly added an extra quotation mark when the subject format default was set in certain ways.
- Fixed an issue where SQL would timeout when deleting over 1,000 certificates from the Keyfactor Command Management Portal.

- Fixed an issue where the gateway configured to run as a domain service account and running on the same server as Keyfactor Command caused RPC errors.
- Fixed an issue where the gateway configured to run as a domain service account caused RPC errors.
- Lowered the logging level for the user's authentication from Info to Trace to avoid cluttering log files.
- Fixed an issue where PEM files with headers could not convert to DER with BouncyCastle 1.9.0 and Keyfactor.PKI.dll v4.x.
- Fixed an issue for certificate store types with the *Advanced>Supports Custom Alias* setting set to **Forbidden**, so that the custom alias should only show on the Add to Certificate Store page when the **Overwrite** checkbox is checked.
- Fixed an issue where using *Delete All* on the Certificate Search page would not delete revoked and expired certificates.
- Fixed an issue in the *Issued Certificates Per Certificate Authority* report that was caused by having templates with the same name in separate forests.
- Fixed an issue with certificate store inventories where a certificate store that had completed an inventory scheduled for an interval would fail if it then was scheduled to run immediately.
- **Keyfactor Agents and Orchestrators**
 - Fixed an issue so that CRLs are now checked regardless of the authentication method being used by the orchestrator.
 - Fixed an issue where permissions were not being set correctly on the appsettings.json and orchestratorsettings.json file that prevented the files being read or updated if the service was running as the Network Service.
 - Fixed an issue where a misconfigured orchestrator using certificate authentication would renew certificate multiple times.
 - Fixed an issue where an orchestrator's registration session was still allowed even when denied by a registration handler and added an auditing event for the orchestrator session registration.

Deprecation

- **Windows Server 2016**

As of Keyfactor Command version 10.0, Windows Server 2016 is no longer supported.

- **Deprecated Certificate Search Fields**

The *KeyfactorRequestId*, *RequestResolutionDate*, and *CARequestId* certificate search fields parsers are deprecated due to native EJBCA support in Keyfactor Command as of v10. Any certificate collections using them must be changed before upgrading to v10+.

- **Archive Key on Templates**

As of Keyfactor Command v10 we no longer support enrolling for certificates that have the archive key option turned on in the template to enable the certificate to store the private key for the certificate in the CA. Attempting to enroll using a template that has this option turned on will result in the following error:

```
The certificate request failed with the reason 'The request is missing a required private key for archival by the server.'
```

- **CA Policy module v7.0**

You will need to upgrade the CA Policy module to v7.1 before running the Keyfactor Command 10.0 upgrade.

- **Reports**

The Resolution Date field has been removed from the *Certificate Count by User By Template* report.

Future Changes

- **Microsoft .NET Runtime version 3.1**

By the end of 2022, Microsoft will no longer be supporting .NET Runtime version 3.1. Currently both Microsoft .NET Runtime version 6.0 (x64) and version 3.1 are supported by Keyfactor.

If you wish to continue using older versions of the Universal Orchestrator but the newer .NET Runtime, you can update the .NET Runtime version on the orchestrator server without needing to reinstall the orchestrator (see [System Requirements on page 2880](#) in the *Keyfactor Orchestrators Installation and Configuration Guide*).

- **Intune Portal/SCEP Change-over**

Intune portal change-over will be required for SCEP when the old APIs are shut off by Microsoft's deprecation of ADAL at the end of the year.

Known Issues/Limitations

- When editing a template, changes will be lost without warning if the *Save* button isn't clicked before navigating away. This is slated to be fixed in a future release.
- When editing a template, the checkboxes for the Metadata, Enrollment RegExes, and Enrollment Defaults tabs do not allow for multi-edit. This will be fixed in a future release.
- When copying a security role, the identities associated with the security role will also be copied.
- The Condition Variable field in a step of the workflow builder accepts input values that are not valid. Only true, false and variables that will evaluate to true or false are supported.
- For most certificate stores, the *Client Machine* is the machine where the store is located, and the *Orchestrator* drop-down selects the orchestrator/agent. However, for the Java Keystore, the *Client Machine* field is actually the agent and there is no orchestrator dropdown. This will be made more clear in a future release.

- When creating a new certificate store type, the *Depends On Other* option may not be available when creating the parameter. The workaround is to save the certificate store type and then use edit to update the parameter.
- Using the browser back button after generating a report creates a nested instance of Keyfactor Command in Firefox.
- Occasionally, removing a widget from the Dashboard causes the dashboard to hang. Refreshing the browser should resolve this issue.
- The *-ne* operator in certificate search does not return NULL results for Boolean metadata fields. For a metadata field such as *Unit* use an advanced search such as *Unit -ne "false" OR Unit eq NULL* to get the desired results.
- The *Certificate Count Grouped by Single Metadata Field* report falsely reports no results if using the default metadata value. This will be fixed in a future release.
- The *PKI Status for Collection* report click-throughs do not retain the *Include Unknown* certificates option when clicking through to the certificate search results page. This will be fixed in a future release.
- SMTP Sender information isn't correctly saved by the Configuration Wizard. This will be fixed in a future release. It is recommended to check the SMTP Configuration page upon upgrade.
- Alert tests do not show certificate information if there is no recipient configured to receive an email even if **Send Alerts** is not selected. This will be fixed in a future release. The workaround is to add an email recipient when running the tests.
- Adding multiple enrollment fields at the same time is only saving the last field entered. This will be fixed in a future release. Workaround is to add and save each enrollment field one at a time.
- The *Certificates in Collection* report falsely reports ECC certificates with a certificate state of *Denied* rather than *Active*, revoked certificates with a certificate state of *Active* rather than *Revoked*, and shows a incorrectly shows a revocation reason of *Unspecified* for certificates with an *Active* certificate state. This will be fixed in a future release.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 857: API Change Log

Endpoint	Methods	Action	Notes
/Agents/{id}	GET	Add	
/Agents/Reset	POST	Add	
/AgentBlueprint	GET	Add	
/AgentBlueprint/{id}	GET, DELETE	Add	

Endpoint	Methods	Action	Notes
/AgentBlueprint/{id}/Jobs	GET	Add	
/AgentBlueprint/{id}/Stores	GET	Add	
/AgentBluePrint/ApplyBlueprint	POST	Add	
/AgentBluePrint/GenerateBluePrint	POST	Add	
/Alerts/Denied	GET, PUT, POST	Add	
/Alerts/Denied/{id}	GET, DELETE	Add	
/Alerts/Expiration	GET, PUT, POST	Add	
/Alerts/Expiration/{id}	GET, DELETE	Add	
/Alerts/Expiration/Schedule	GET, PUT	Add	
/Alerts/Expiration/Test	POST	Add	
/Alerts/Expiration/TestAll	POST	Add	
/Alerts/IssuedAlerts	GET, PUT, POST	Add	
/Alerts/IssuedAlerts/{id}	GET, DELETE	Add	
/Alerts/Issued/Schedule	GET, PUT	Add	
/Alerts/KeyRotation	GET, PUT, POST	Add	
/Alerts/KeyRotation/{id}	GET, DELETE	Add	
/Alerts/KeyRotation/Schedule	GET, PUT	Add	
/Alerts/KeyRotation/Test	POST	Add	

Endpoint	Methods	Action	Notes
/Alerts/KeyRotation/TestAll	POST	Add	
/Alerts/Pending	GET, PUT, POST	Add	
/Alerts/Pending/{id}	GET, DELETE	Add	
/Alerts/Pending/Schedule	GET, PUT	Add	
/Alerts/Pending/Test	POST	Add	
/Alerts/Pending/Test/{id}	POST	Add	
/CertificateAuthorities	GET	Update	Schedules are now included in the results.
/CertificateAuthorities	POST	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/CertificateAuthorities/{id}	PUT	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/CertificateAuthorities/{id}	DELETE	Update	Deletion is now prevented if schedules are associated.
/CertificateCollections	POST	Update	Query parameter no longer needed when a valid CopyFromId is provided.
/CertificateCollections/{id}/Permissions	POST	Deprecated	Replaced by /Security/Roles/{id}/Permissions/Collection.
/Certificates/Analyze	POST	Add	
/Certificates/IdentityAudit/{id}	GET	Add	
/CertificateStoreContainers	POST	Add	
/CertificateStoreContainers/{id}	PUT, DELETE	Add	

Endpoint	Methods	Action	Notes
/CertificateStores/Server	GET, POST, PUT	To Be Deprecated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/CertificateStores	GET, POST, PUT	Updated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/Enrollment/PFX (v2)	POST	Add	
/Enrollment/Settings/{id}	GET	Add	
/JobTypes/Custom	POST	Update	DefaultValue property is no longer required, validation is now performed on the JobTypeFields/DefaultValue property, validation prevents names containing spaces.
/JobTypes/Custom/{id}	DELETE	Update	Includes validation so that deletion is prevented if at least one associated approved orchestrator implements the capability.
/MacEnrollment	GET, PUT	Add	
/Monitoring/Revocation	GET, POST	Update	Renamed from /Workflow/RevocationMonitoring
/Monitoring/Revocation/{id}	GET, PUT, DELETE	Update	Renamed from /Workflow/RevocationMonitoring/{id}

Endpoint	Methods	Action	Notes
/Monitoring/Revocation/Test	POST	Add	
/Monitoring/Revocation/TestAll	POST	Add	
/Orchestrators/JobHistory	GET	Update	Added JobId field.
/Orchestrators/ScheduledJobs	GET	Add	
/OrchestratorJobs/Reschedule	POST	Add	
/OrchestratorJobs/Unschedule	POST	Add	
/OrchestratorJobs/Acknowledge	POST	Add	
/Security/Identities/{id}	GET	Add	
/Security/Roles/{id}/Identities	GET, POST	Add	
/Security/Roles/{id}/Containers	GET, POST	Add	
/Security/Roles/{id}/Copy	POST	Add	
/Security/Roles/{id}/Permissions	GET	Add	
/Security/Roles/{id}/Permissions/Global	GET, POST, PUT	Add	
/Security/Roles/{id}/Permissions/Collections	GET, POST, PUT	Add	Replaced the /CertificateCollections/{id}/Permissions endpoint functionality.
/Security/Roles/{id}/Permissions/Containers	GET, POST, PUT	Add	Returns only containers that have a permission set for the selected security role.
/SMTP	GET, PUT	Add	
/SMTP/Test	POST	Add	
/Templates	GET, PUT	Update	Includes template-specific policy information.
/Templates/{id}	GET	Update	Includes template defaults.
/Templates/Settings	GET, PUT	Update	Includes global template policies.

Endpoint	Methods	Action	Notes
/Template/SubjectParts	GET	Add	
/Templates/Global/Settings	GET, PUT	Add	
/Templates/Import	POST	Add	
/Workflow/Certificates/Pending	GET	Update	Now supports query fields of Requester and RequestType.
/Workflow/Definitions/Steps/{extensionName}	GET	Add	
/Workflow/Definitions/{definitionId}	GET, PUT, DELETE	Add	
/Workflow/Definitions	GET, POST	Add	
/Workflow/Definitions/Steps	GET	Add	
/Workflow/Definitions/Types	GET	Add	
/Workflow/Definitions/{definitionId}/Steps	PUT	Add	
/Workflow/Definitions/{definitionId}/Publish	POST	Add	
/Workflow/Instances/{instanceId}	GET, DELETE	Add	
/Workflow/Instances	GET	Add	
/Workflow/Instances/My	GET	Add	
/Workflow/Instances/AssignedToMe	GET	Add	
/Workflow/Instances/{instanceId}/Stop	POST	Add	
/Workflow/Instances/{instanceId}/Signals	POST	Add	
/Workflow/Instances/{instanceId}/Restart	POST	Add	

6.3.1 Incremental Release 10.5 Notes

November 2023

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Updates and Fixes

Fix: Certificate authority records could not be saved if they were using PAM for storing credential secrets.

Fix: On a seeded renewal (the Configure option), certificates with multiple SANs did not populate all of the SANs into the renewal form.

Fix: Certificate enrollment regular expressions were not successfully filtering on leading spaces when validating expressions.

Fix: With the application settings for *Allow Custom Friendly Name* and *Require Custom Friendly Name* set to True, on PFX enrollment if the *Include Chain* option was deselected, the value provided in the friendly name field was overwritten with the value from the CN field.

Fix: Certificates originally issued by a Microsoft certificate authority could not be renewed/reissued against an EJBCA certificate authority.

Deprecation

- The Classic API will be deprecated in Keyfactor Command version 11.0. All existing uses of the Classic API should be migrated to use Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see [Application Settings: API Tab on page 619](#) in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.
- The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

Known Issues

- Under some circumstance, the **Test Connection** button on the *Certificate Authority* dialog will erroneously display an error when clicked for a previously saved CA. Despite the error message, the CA still functions (i.e., syncs, enrollments still go through). To work around the error, click the **Save and Test** button.

API Endpoint Change Log

No API endpoint changes were made in this release.

6.3.2 Hot Fix Release 10.4.6 Notes

September 2023

Note: Keyfactor Command 10.4.6 is a hot fix release with a few fixes following the Keyfactor Command 10.4 incremental release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Updates and Fixes

- Update: The data field sizes for the certificate subject field were increased to support re-enrollment jobs for certificates with long subjects.
- Fix: CA synchronizations were hanging with the following error when a corrupted certificate request (for example, a Pending or External Validation record with no CSR) was encountered:

```
Keyfactor.CertificateAuthorityClient.Microsoft.MicrosoftClient [Error] - Value cannot be null.  
Parameter name: inArray
```

- Fix: In an environment with a large numbers of certificate store containers where the orchestrator user did not have global certificate store read permissions, SSL scan times could be excessively long during the certificate import step. This was due to frequent permission check queries on the containers. This hotfix removes unneeded checks. A workaround is to grant the account running the orchestrator the *Certificate Store Management: Read* permission.
- Fix: Workflow instance details for an enrollment request from an enrollment request with multiple SANs of the same type were only displaying the last SAN in the Management Portal. This was

limited to the Management Portal as the Keyfactor API returned the correct data.

- Fix: CSR enrollment with a CSR that included SAN data was also adding any SANs that were provided separately on the CSR enrollment page of the Management Portal, rather than replacing the SANs from the CSR with those entered on the CSR enrollment page. The proper behavior is that the enrollment should use *only* the SANs entered on the CSR enrollment page of the Management Portal if they are provided. If they are not provided on the CSR enrollment page of the Management Portal, the SANs in the CSR will be used on the certificate.
- Fix: SANs entered on the CSR enrollment page of the Management Portal or outside the CSR through the Keyfactor API were not displayed in the workflow instance details page.
- Fix: If the *Allow CSR SAN Entry* application setting was set to false, the Keyfactor API still allowed SANs to be sent in with the certificate request outside of the CSR.

Deprecation

- The Classic API will be deprecated in Keyfactor Command version 11.0. All existing uses of the Classic API should be migrated to use Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see [Application Settings: API Tab on page 619](#) in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.
- The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 858: API Change Log

Endpoint	Methods	Action	Notes
/Enrollment/CSR	POST	Fixed	Includes SANs entered outside the CSR only when the <i>Allow CSR SAN Entry</i> application setting is set to true. SANs entered outside the CSR replace SANs in the CSR rather than appending to SANs from the CSR.

Endpoint	Methods	Action	Notes
/Workflow/Instances	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/AssignedToMe	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/My	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/{instanceId}	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.

6.3.3 Hot Fix Release 10.4.5 Notes

September 2023

Note: Keyfactor Command 10.4.5 is a hot fix release with a few fixes following the Keyfactor Command 10.4 incremental release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Updates and Fixes

- Update: PFX Enrollment, CSR Enrollment, CSR Generation, and certificate renewal all now allow 3072-bit RSA keys.
- Fix: An agent registering with Keyfactor Command was causing SQL locking errors in environments with a large number of scheduled jobs.
- Fix: SANs were not displaying on the pending certificate requests page when a CSR enrollment was done while the *Keyfactor SAN Attribute Policy Handler* was installed on the Microsoft CA and configured for the template that was being used to enroll.

Deprecation

- The Classic API will be deprecated in Keyfactor Command version 11.0. All existing uses of the Classic API should be migrated to use Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see [Application Settings: API Tab on page 619](#) in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.
- The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 859: API Change Log

Endpoint	Methods	Action	Notes
/CSRGeneration/Generate	POST	Update	3072-bit RSA keys are supported.
/Enrollment/CSR	POST	Update	3072-bit RSA keys are supported.
/Enrollment/PFX	POST	Update	3072-bit RSA keys are supported.
/Enrollment/Renew	POST	Update	3072-bit RSA keys are supported.

6.3.4 Hot Fix Release 10.4.4 Notes

August 2023

Note: Keyfactor Command 10.4.4 is a hot fix release with a few fixes following the Keyfactor Command 10.4 incremental release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Updates and Fixes

- Fix: Expiration alert event handlers would fail if they referenced CN or DN in the handler parameters and encountered a null-valued CN or DN certificate during processing of certificates.
- Fix: One-click certificate renewal was not scheduling a job to add the new certificate to the certificate store when the renewal was done by selecting *Continue* instead of *Configure*. The certificate renewal step was completing with both *Continue* and *Configure*.
- Fix: Queries to display a warning about failed or possibly errored orchestrator jobs were impacting SQL performance.

Deprecation

- The Classic API will be deprecated in Keyfactor Command version 11.0. All existing uses of the Classic API should be migrated to use Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see [Application Settings: API Tab on page 619](#) in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.
- The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

API Endpoint Change Log

No API endpoint changes were made in this release.

6.3.5 Hot Fix Release 10.4.3 Notes

July 2023

Note: Keyfactor Command 10.4.3 is a hot fix release with a few fixes following the Keyfactor Command 10.4 incremental release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Updates and Fixes

- Fix: Certificate authorities of EJBCA version 8 could not be added to the certificate authorities page due to a failed version check.
- Fix: One-click renewal was encountering an error when trying to renew against EJBCA version 8.
- Fix: Importing templates to Keyfactor Command from EJBCA version 8 failed.
- Fix: External validation certificates being enrolled from public certificate authorities were sometimes resulting in the following error in the Management Portal with no errors in the log:

Cannot convert unidentified or null to object

Deprecation

- The Classic API will be deprecated in Keyfactor Command version 11.0. All existing uses of the Classic API should be migrated to use Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see [Application Settings: API Tab on page 619](#) in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.
- The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 860: API Change Log

Endpoint	Methods	Action	Notes
/CertificateAuthority/Test	POST	Fixed	EJBCA version 8 is supported.
/Enrollment/Renew	POST	Fixed	EJBCA version 8 is supported.
/Templates/Import	POST	Fixed	EJBCA version 8 is supported.

6.3.6 Hot Fix Release 10.4.2 Notes

June 2023

Note: Keyfactor Command 10.4.2 is a hot fix release with a few fixes following the Keyfactor Command 10.4 incremental release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Updates and Fixes

- Fix: Certificate profiles from EJBCA could not be imported if they were not the first CA listed in the *Allowed CAs* on the certificate profile.
- Fix: End entity profiles configured in EJBCA with *Any CA* in the *Allowed CAs* were not displaying in the Management Portal CSR and PFX enrollment pages.
- Fix: Upgrading to Keyfactor Command version 10 was very slow in environments with a large number of certificate requests in the database.

Deprecation

- The Classic API will be deprecated in Keyfactor Command version 11.0. All existing uses of the Classic API should be migrated to use Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see [Application Settings: API Tab on page 619](#) in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.
- The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

API Endpoint Change Log

No API endpoint changes were made in this release.

6.3.7 Hot Fix Release 10.4.1 Notes

June 2023

Note: Keyfactor Command 10.4.1 is a hot fix release with one update following the Keyfactor Command 10.4 incremental release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Updates and Fixes

- Update: BouncyCastle.Crypto is no longer treated as a shared assembly to allow integrations to be built with newer BouncyCastle classes.

Deprecation

- The Classic API will be deprecated in Keyfactor Command version 11.0. All existing uses of the Classic API should be migrated to use Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see [Application Settings: API Tab on page 619](#) in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.
- The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

API Endpoint Change Log

No API endpoint changes were made in this release.

6.3.8 Incremental Release 10.4 Notes

May 2023

Note: Keyfactor Command 10.4 is a minor release with incremental fixes and updates following the Keyfactor Command 10 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Changes and Improvements

- Workflow now includes two new types—Certificate Entered Collection and Certificate Left Collection—that are designed to help you monitor the comings and goings of certificates from collections and take actions in the event that a certificate unexpectedly appears or disappears from a collection. You might use one of these workflow types to monitor the Weak Keys collection to be alerted via email when a new certificate is added to the collection after being picked up on an SSL scan. Or you might use one of these workflows to monitor a collection of vital certificates and use a PowerShell or REST request to automatically open a support ticket if one of the certificates goes missing. These workflow types work together with the Keyfactor Command Service to periodically evaluate the collections configured for reporting and then initiate workflows for any certificates that have changed membership in the collections. The automated task runs every 10 minutes by default and is not end-user configurable. By default, a maximum of 1000 certificates can be reported on by any one instance of an automated task. This value is end-user configurable with the Concurrent Workflows, setting (see [Table 81: Keyfactor Command Jobs Services](#)). Certificate collections that are configured for workflows cannot be edited to prevent triggering a large number of entered/left workflows.
- Certificates with a key type of Dilithium2, Dilithium4, or Dilithium5 may now be imported into Keyfactor Command for management and reporting using the Add Certificate function (see [Add Certificate on page 74](#) in the *Keyfactor Command Reference Guide*). CA synchronization of certificates with this key type will be supported in a future release.
- Certificates with private keys can now be downloaded in JKS format either in PFX enrollment or certificate search. The JKS option for certificates for private keys is in addition to the PEM and PFX options for download format.
- On certificate download in both PFX enrollment and certificate search, you now have the option to select a chain order for the chain certificates in the resulting output file if you opt to include the certificate chain in the download. The choice is either *End Entity First* (at the beginning of the file) or *Root First*.

Updates and Fixes

- Update: The default timeout on the configuration wizard for Keyfactor Command upgrade job executions has been increased to 30 minutes. See [Troubleshooting on page 3073](#) in the *Keyfactor Command Upgrade Overview* for instructions on customizing the timeout.
- Update: The Keyfactor Universal Orchestrator now includes a configuration setting that allows it to skip checking the revocation status (CRL) of the SSL certificate on the Keyfactor Command server when connecting to Keyfactor Command.

- Update: On a new installation of Keyfactor Command, the **Revoke All** option on the Certificates page—controlled with the *Revoke All Enabled* application setting—will default to disabled. This change will not affect existing implementations of Keyfactor Command.
- Update: The wording on the Revoke All option has been changed to clarify that a revocation is occurring.
- Fix: SSL monitoring scans done with the Universal Orchestrator were failing to report TLS 1.3 timeouts.
- Fix: The maintenance job to remove expired stored private keys that are eligible for deletion was not running as expected on a daily basis to remove the keys.
- Fix: A user could be prompted to save changes to a template when viewing a template without making changes in certain template configurations.
- Fix: The certificate template regular expression `^$` to disallow any values in a field was in a catch 22 state requiring entry of a value in the field because a regular expression was defined for it and requiring no value because of the nature of the specific regular expression, causing the field not to function at all.
- Fix: Delegation was not working as expected for certificate revocation when the certificate authority record in Keyfactor Command was configured to *Delegate Management Operations*.
- Fix: Attempting to create records in Keyfactor Command for two certificate stores with the same name on the same server but of different types produced an error indicating that the second was a duplicate of the first; now stores of different types may successfully be created with the same name.
- Fix: Associating a PAM provider with a certificate store container, placing a certificate store in that certificate store container, and then attempting to set the PAM credentials for that certificate store failed with an error of “The supplied Secured Area is invalid for the selected provider”.
- Fix: Certificates with a SAN type of *DS Object Guid* could not be imported, producing an error of:

```
illegal object in GetInstance: Org.BouncyCastle.Asn1.DLTaggedObject
Parameter name: obj
```
- Fix: Attempting to validate a CA record for an EJBCA CA using the *Test Connection* option would fail if the client authentication certificate configured for the CA had no EKU defined, resulting in an error similar to:

```
There is a problem validating the CA with ID '3' (check the logs for more details):
Object reference not set to an instance of an object.
```
- Fix: Attempting to disapprove an instance of the Keyfactor Bash Orchestrator when the orchestrator had an SSH synchronization schedule configured or an instance of the Keyfactor Universal Orchestrator when the orchestrator had an SSL scanning schedule configured resulted in a 500 error.

Known Issues

- The Audit Log page offers a search comparison value of *Instance Signal* for the audit category but the results grid Category column references this same value as *Workflow Signal*.
- When a one-click renewal is done on a certificate from the Certificate Search page, even though the renewal succeeds, the grid doesn't refresh with the new status.
- The latest version of the Logi reporting engine has functionality which avoids a system timeout issue by periodically pinging the IIS session behind the scenes so that the dashboard doesn't time out when the session has been idle. As a result, the dashboard no longer refreshes after 20 minutes, but invokes this new functionality instead. The settings used to control this depend on the **Session State Timeout** and **Session Auto Keep Alive** attribute settings in IIS. For more information on this see:

<https://devnet.logianalytics.com/hc/en-us/articles/1500009515942-Manage-Session-Timeout>

- On an edit, if you change the workflow step type, you must also change the **Unique Name**. Changing the workflow step type without changing the unique name will result in an error similar to the following:

```
System.Collections.Generic.KeyNotFoundException: The given key was not present in the dictionary
```

Instead of changing both the workflow step type and unique name, you may prefer to delete the step and create a new step of the desired type.

Deprecation

- The Classic API will be deprecated in Keyfactor Command version 11.0. All existing uses of the Classic API should be migrated to use Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see [Application Settings: API Tab on page 619](#) in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.
- The Keyfactor Java Agent will be deprecated in version 11.0 of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 861: API Change Log

Endpoint	Methods	Action	Notes
/Enrollment/CSR	POST	Fixed	Includes SANs entered outside the CSR only when the <i>Allow CSR SAN Entry</i> application setting is set to true. SANs entered outside the CSR replace SANs in the CSR rather than appending to SANs from the CSR.
/Workflow/Instances	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/AssignedToMe	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/My	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/{instanceId}	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.

6.3.9 Hot Fix Release 10.3.1 Notes

April 2023

Note: Keyfactor Command 10.3.1 is a hot fix release with a few fixes following the Keyfactor Command 10.3 incremental release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Updates and Fixes

- Update: Keyfactor Command disallows installation on Windows Server 2016. This is necessary because Windows Server 2016 does not support PFX files being generated with AES encryption.
- Fix: Expiration reports were failing to generate when the user running the report only had permission to view one certificate collection.
- Fix: Saving a report schedule was failing when the user saving the report only had permission to view one certificate collection.
- Fix: The *Certificate Count Grouped by Single Metadata Field* report was failing when the first metadata field in the report dropdown was left at the default.

Deprecation

- The Classic API will be deprecated in Keyfactor Command version 11.0. All existing uses of the Classic API should be migrated to use Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see [Application Settings: API Tab on page 619](#) in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.
- The Keyfactor Java Agent will be deprecated in a future version of Keyfactor Command. Customers are encouraged to begin planning a migration to the Keyfactor Universal Orchestrator with the Remote File custom extension publicly available at:

<https://github.com/Keyfactor/remote-file-orchestrator>

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 862: API Change Log

Endpoint	Methods	Action	Notes
/Reports/{id}/Schedules	POST	Fixed	Reports can be scheduled when the user scheduling the report only has permission to view one certificate collection.

6.3.10 Incremental Release 10.3 Notes

March 2023

Note: Keyfactor Command 10.3 is a minor release with incremental fixes and updates following the Keyfactor Command 10 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Changes and Improvements

- The new **CertStoreContainer** certificate search field shows certificates in a certificate store that is included in the certificate store container specified by the search criteria.
- The Keyfactor Bash Orchestrator added additional support for using an SSSD user store (e.g. Active Directory) on requests to create logons and distribute key information, allowing keys to be managed for domain users. Domain users can be managed with or without preexisting home directories.
- Added the ability to use any symbols when creating a new SSH logon. This is required in order to facilitate creating a logon for an AD user using SSSD.
- The Universal Orchestrator now communicates with IIS certificate stores over TCP port 445 rather than using WinRM and default ports 5985/5986.
- The BASH Orchestrator now returns improved warning messages on the Job History page. See [SSH-Bash Orchestrator Job History Warning Resolution on page 790](#).

Updates and Fixes

- Update: The Keyfactor Bash Orchestrator now adds the command *restorecon* to the list of commands the orchestrator service account is allowed to execute via sudo on servers running SELinux.
- Update: The Keyfactor Bash Orchestrator now trims Windows line breaks from JSON payloads on send and receive and ignores any data in the `authorized_keys` file that is not a key (e.g. a comment).
- Update: An application setting—*Enable Legacy Encryption*—has been added to enable/disable the use of legacy encryption methods in PFX enrollment. When the value is set to true, the historical algorithm set (3DES/SHA1/RC2) is used for PFX enrollments. When the value is set to false, the newer algorithm set provided by Windows (AES256/SHA256/AES256) is used instead. The default is *false*.
- Update: A script has been added to allow the Keyfactor CA Policy Module to be upgraded from versions prior to 10.0 and retain existing configuration.

- Fix: EJBCA certificates with a leading zero in the serial number could not be revoked; an attempt to do so generated an error.
- Fix: EJBCA CA Config will give a notification if the certificate you selected doesn't meet requirements, and indicate exactly what the requirements are and what your certificate is lacking.
- Fix: The GET /SSL API endpoint was returning duplicate records.
- Fix: The DELETE /Workflow/Defintions/{id} API endpoint was returning an error if the workflow contained steps.
- Fix: Expiration alert tests displayed a blank dialog if the alert was configured with no recipients.
- Fix: The Keyfactor Bash Orchestrator install failed when the service account was provided an extremely long password.

Known Issues

- The dashboard will throw a secure key error if you let the dashboard sit idle for around 20 minutes. The temporary work-around is to refresh the page. It will be investigated in 11 for a possible fix.
- Because a "+" (plus sign) in a URL can represent either a space or a "+", Keyfactor Command has chosen to read "+" as a space. For CRL URLs that require a "+" (plus sign), rather than a space, replace plus signs in your CRL's URL with "%2B". Only replace the plus signs you don't wish to be treated as a space.
- A user without *Global Certificates - Read* and *Global Certificates - Import* will see a permission error dialog when attempting to view an enrollment workflow instance that has **completed**. The only impact of this error is that it will result in the certificate's information not being parsed in the *Instance Review dialog*. Users should not need these permissions to view their completed workflow instances, and so should not be seeing this error. This will be fixed in the next Keyfactor Command release. The raw data is still present. As a workaround, if a user wants to see the parsed data for that certificate, they would have to use the **KeyfactorId** (found on the workflow instance) in the certificate search page using the **CertId**.

API Endpoint Change Log

No API endpoint changes were made in this release.

6.3.11 Incremental Release 10.2 Notes

January 2023

Note: Keyfactor Command 10.2 is a minor release with incremental fixes and updates following the Keyfactor Command 10 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Changes and Improvements

- **Keyfactor Command (formerly, Timer) Service now runs in an HA environment.**

The Keyfactor Command (formerly, Timer) service can be installed on every server that Keyfactor Command is installed on. This will allow the service to check out jobs via a locking mechanism which will enforce that any jobs are running on only one service at a time. There is a new *CMSTimerService.exe.config* timeout setting for the service locking mechanism `<add key="Keyfactor.TimerJobs.LockTimeout" value="5000" />` which is the lock timeout. It's the number of ms Keyfactor Command will wait to acquire a lock. By default Keyfactor Command will attempt to get a lock for 5 secs and if unsuccessful, an error will be thrown.

- **Workflow Definitions can be Created via Copy**

A new option is available on the workflow definitions page that allows you to create a new workflow definition by copying an existing workflow definition. When you create a new workflow definition by copying an existing one, the word "copy" will be appended to the end of the definition name and the workflow key (template) will be cleared. Other data from the copied workflow will be retained.

- **Workflow Step Type Windows Enrollment Gateway - Populate from AD**

A new workflow step type has been added to support enrollment requests from the Keyfactor Windows Enrollment Gateway using client-side templates configured with the subject as *Build from this Active Directory information*. This workflow step type allows the requests to be completed in Keyfactor Command using an EJBCA template that is not configured to build the subject from Active Directory using the Active Directory information (subject, SANs, and/or SID) supplied in the request from the client.

Updates and Fixes

- Update: The maximum number of characters allowed in a certificate store path has been increased from 256 to 722.
- Update: Users now receive a warning if they attempt to use the Back button in a certificate template after making changes without saving.
- Update: Workflow steps of type Email and Require Approval now go to a failed state if an error occurs in sending an email.
- Fix: An issue encountered with upgrading larger databases in v10.1 is fixed in the current v10.2 release which addressed this specific portion of the database upgrade, and should allow upgrade without this issue.
- Fix: Agent Application Settings: An agent will not attempt to retry a job when this setting is set to 0.

- Fix: Certificate stores of a type that required a server but did not require authentication to access that server could not be saved using the “No Value” options for the server username and password.
- Fix: A base-64-encoded PEM certificate added to a PEM certificate store using the Certificates -> Add Certificate feature was not being correctly formatted for the store.
- Fix: If multiple template enrollment fields were added at the same time before saving, only the most recently added one was saved.
- Fix: The PKI Status for Collection report drill-downs did not include unknown certificates when the *Include Unknown* box was checked. The *Include Unknown* box also worked inconsistently.
- Fix: Custom orchestrators with a status of Disapproved changed to a status of New when their capabilities were changed. Only orchestrators with a status of Active should change to a status of new when their capabilities are changed.
- Fix: Certificate templates with a key size of Ed448 were imported and assigned a key type of 456.
- Fix: On an attempt to edit the parameters of a built-in report with a parameter of type RelativeDate, an error message appeared indicating “A saved parameter with type ‘RelativeDate’ is invalid with a value of ‘false’” and the user was not allowed to edit the parameters.
- Fix: Chain not being passed in Management Add Job.
- Fix: Certificates cannot be queried by KeyfactorRequestId.

Known Issues

- CSR enrollment fails against a standalone CA. This will be fixed in a future incremental release. Customers using CSR enrollment and standalone CAs should wait to upgrade.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 863: API Change Log

Endpoint	Methods	Action	Notes
/Security/My	GET	Add	Returns all the security roles and global permissions for the requesting user.
/Enrollment/CSR	POST	Update	The workflow instance ID has been added to the response.
/Enrollment/CSR	POST	Update	A new PrivateKey input field has been added to support private key retention on CSR enrollment.

Endpoint	Methods	Action	Notes
/Enrollment/PFX	POST	Update	The workflow instance ID has been added to the response.
/Certificates/Analyze	POST	Update	The endpoint requires Global Certificates-Read or Certificates-Import permissions.

6.3.12 Incremental Release 10.1 Notes

November 2022

Note: Keyfactor Command 10.1 is a minor release with incremental fixes and updates following the Keyfactor Command 10 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 10.0, please review the [Major Release 10.0 Notes on page 3094](#).

Tip: Keyfactor recommends that you check the Keyfactor GitHub Site (<https://keyfactor.github.io/integrations-catalog/>) with each release that you install to check if you will need to download the updated orchestrators to work with that version of Keyfactor Command.

Changes and Improvements

- **Keyfactor Universal Orchestrator Supports gMSA**

The Keyfactor Universal Orchestrator now supports running its service as a group managed service account (gMSA).

- **SSL Discovery and Monitoring Jobs have Reset Scan Option**

A new Reset Scan option has been added for SSL discovery and monitoring jobs that allows to you recover from an SSL job that appears to be stuck or crashed.

Updates and Fixes

- Update: All Keyfactor Command (timer) service jobs have consistent start and stop log messages in both the file and Windows Event Viewer.
- Update: A PAM provider can be used directly by the Keyfactor Universal Orchestrator, such that the server does not retrieve, and does not have access to, the credential.
- Update: Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
- Update: Improved support for the Keyfactor Command (timer) service—including a job locking mechanism—in High-Availability implementations.

- Fix: GET /SSL is returning duplicate info in some instances with endpoints sharing a common chain.
- Fix: Certificate store Discovery jobs could not be executed.
- Fix: AnyGateway was declaring all requests as new instead of renew or reissue.
- Fix: The SMTP Sender Account was not populated during the installation and configuration process.
- Fix: SSL discovery scan job errors for entries with a null display name.

Policy Module Updates

- Migrated the Policy Modules to .NET Core 6.
- Updated the Policy Module to create a Windows Event Log entry when the current license is within 60 days of expiration.
- Updated the Policy Module installer to include the EnterpriseLite, SubjectFormat and SCEPRequester modules.
- Updated the Policy Handler Configuration so that changes no longer require the ADCS service to be restarted.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 864: API Change Log

Endpoint	Methods	Action	Notes
/Templates	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/{id}	GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/Settings	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.

6.4 Major Release 9.0 Notes

August 2021

Release Highlights

We're thrilled to announce Keyfactor Command 9.0, which includes several new features and updates to improve the user experience, deployment flexibility, and risk awareness.

Highlights from the Keyfactor Command 9.0 release are listed here. More details are available in the New Features, and Updates and Improvements sections further down.

Important: There have been several UI updates to the navigation menu, drop-downs, and application settings. Thoroughly review these changes in the New Features section.

UI Enhancements

- **What problem does it solve?**

The Keyfactor Command interface should be easy to navigate and use.

- **How does it work?**

As we continue to improve the Keyfactor Command interface, we've added updates to the navigation menu, application settings, and dialogues, as well as an updated color scheme.

- **What's the benefit?**

Ease of Use: The Keyfactor Command interface is more intuitive for new and experienced users alike.

New Risk Header

- **What problem does it solve?**

PKI administrators and application owners want to easily identify risks and upcoming expirations for the certificates they have access to.

- **How does it work?**

A new fixed header above the dashboard displays expiring, weak, and revoked certificates for an at-a-glance view of risks.

- **What's the benefit?**

Risk Mitigation: Enables administrators to quickly identify the state of their certificates.

New Universal Orchestrator

- **What problem does it solve?**

The current Windows Orchestrator is only able to run on Windows systems.

- **How does it work?**

The new Keyfactor Universal Orchestrator runs on .NET Core 3.1, which allows it to be installed on servers/instances running either Linux or Windows.

- **What's the benefit?**

Flexibility: Enables customers to deploy orchestrators in cross-platform environments.

New Remote CA Gateway

- **What problem does it solve?**

Certain customers are unable to use Keyfactor PKI as-a-Service due to security or regulatory requirements, but they'd still like to leverage a SaaS-based solution for certificate management.

- **How does it work?**

The new Remote CA Gateway securely connects on-premise private PKI – Microsoft ADCS or PrimeKey EJBCA – to the Keyfactor Cloud. This allows customers to leverage Keyfactor Command as a Service (SaaS) while keeping their PKI within their datacenter.

- **What's the benefit?**

Cloud: On-premise customers now have more options to deploy Keyfactor in a SaaS model – while keeping their PKI in-house, if required.

Support for TLS 1.3

- **What problem does it solve?**

Before Keyfactor Command 9.0, Keyfactor Command did not support SSL/TLS scanning on endpoints using TLS 1.3.

- **How does it work?**

The Keyfactor Universal Orchestrator supports SSL/TLS scanning on endpoints using TLS 1.3.

- **What's the benefit?**

Increased Visibility: Organizations will have improved visibility over certificates.

Template-Level Metadata

- **What problem does it solve?**

Before Keyfactor Command 9.0, certificate metadata could only be applied system wide.

- **How does it work?**

Now administrators can apply metadata on a per-template basis, which will override system-wide settings for that specific template.

- **What's the benefit?**

Control: This gives administrators more granular control for metadata in certificate enrollment.

Ecosystem Updates

While separate from the Keyfactor Command 9.0 release, we've recently introduced several new integrations in GitHub to support more certificate authorities, applications, and services.

These include:

- Google Cloud CA Service: A new AnyCA Gateway implementation supports discovery and automation of certificates issued by Certificate Authority Service (CAS).
- Google Cloud IoT Core: The IoT Issued Alert Handler publishes device certificates to various cloud providers, including Google Cloud, Azure, and AWS.
- GoDaddy: The GoDaddy CA Gateway enables enrollment, renewal, re-issuance, and revocation of certificates via Keyfactor Command.
- Sectigo Certificate Manager: The Sectigo CA Gateway enables full lifecycle management of certificate issued by Sectigo via Keyfactor Command.
- Kubernetes: A proxy signs certificate-signing requests (CSRs) through Keyfactor via the Kubernetes CSR signer API.
- Azure Key Vault: Allows customers to inventory and manage certificates within their Azure Key Vault instances.

More information and developer resources can be found in the [Keyfactor GitHub](#).

New Features

UI Enhancements

Tip: We encourage existing Keyfactor Command customers to watch the [Keyfactor Command 9.0 UI Walkthrough](#) demo and read through the detailed UI changes listed below before upgrading to Keyfactor Command 9.

Keyfactor Command 9.0 includes significant updates to the UI, as well as several changes to the main navigation menu and drop-downs with a focus on improved usability. Please continue reading to review and understand these changes.

Previously, the navigation menu looked like the example below:

Figure 623: Example Navigation Menu Before Upgrade to 9.0

In Keyfactor Command 9.0, the navigation menu is more concise and user-centric:

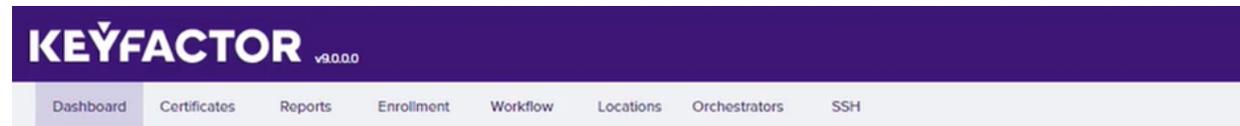

Figure 624: Example Navigation Menu After Upgrade to 9.0

Certificates drop-down

- Add Certificate: The Add Certificate selection is now located in the Certificates tab. Previously, it was accessed via the Certificate Locations tab.

Enrollment drop-down

- Certificate Requests: This option is now found in the new Enrollment tab, rather than the Workflow tab.

Workflow drop-down

- Revocation Monitoring: This option is now located in the Workflow tab. Previously, it was located in the PKI Management tab.
- Expiration: This selection was previously named Expiration Alerts.
- Pending Request: This selection was previously named Pending Request Alerts.
- Issued Request: This selection was previously named Issued Request Alerts.
- Denied Request: This selection was previously named Denied Request Alerts.
- Key Rotation: This selection was previously named Key Rotation Alerts.

Locations drop-down

- Certificate Stores: You will now access the Certificate Stores selection from the new Locations tab. Previously, it was accessed via the Certificate Locations tab.
- Certificate Authorities and Certificate Templates: These menu options are now found in the new Locations. Previously, they were located in the PKI Management tab.
- SSL Discovery: This selection is now located in the Locations tab. It was previously located in the Certificate Locations drop-down.

System Settings menu

- Certificate Store Types: You will now access the Certificate Store Types from the System Settings at the top-right of the screen. It was previously under Certificate Locations.

Certificate Search

- There is a new “ends with” operator. For example:

```
CN -endswith "keyexample.com"
```

- A new advanced search option has been added of %ME-AN%. This does a search for account name without domain. For example, the following search in certificate search:

```
NetBIOSRequester -contains "%ME-AN%"
```

Would return certificates requested by the current user as KEYEXAMPLE\jsmith and KEYOTHER\jsmith (assuming the current user is logged in with username jsmith in some domain).

New Risk Header

A *Risk Header* has been added to the Dashboard, which displays relevant information for certificates the user has permissions to. This includes a count of all active certificates, upcoming expirations, expired and revoked certificates, and weak keys (as seen below).

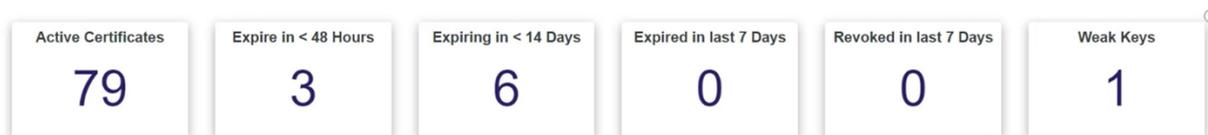

Figure 625: New Risk Header

Note: The new Risk Header is intended to provide an at-a-glance view of key metrics. Unlike items within the dashboard below it, the header cannot be moved or customized.

New Universal Orchestrator

Now available in Keyfactor Command 9.0, the new Keyfactor Universal Orchestrator can perform many of the same functions as the legacy Windows Orchestrator, such as IIS, SSL, FTP and CA management (we will continue to expand its functionality). However, unlike the legacy Windows Orchestrator, the new Keyfactor Universal Orchestrator is able to run on both Windows and Linux servers.

The purpose of orchestrators is to perform SSL scans, manage certificate stores (both Java Key Stores and Windows Certificate Stores), run custom certificate management jobs, inventory CAs, and collect logs to be viewed in the Keyfactor Command Console.

Please review the [Deprecation on page 3140](#) section for more information about the eventual deprecation of the legacy Windows Orchestrator. Refer to the [Installing Orchestrators on page 2875](#) guide for more information on the new Keyfactor Universal Orchestrator.

New Remote CA Gateway

Before Keyfactor Command 9.0, customers had the option to deploy Keyfactor Command on-premise or hosted in the cloud with a fully managed private PKI as a Service (PKIaaS). Now customers have the additional option to keep their PKI on-premise while leveraging Keyfactor Command in the cloud.

The Keyfactor Remote CA Gateway is the connection point between the new Keyfactor Command as-a-Service deployment model (aka Certificate Lifecycle Automation as a Service or CLaaS) and a customer's on-premise PKI behind their firewall.

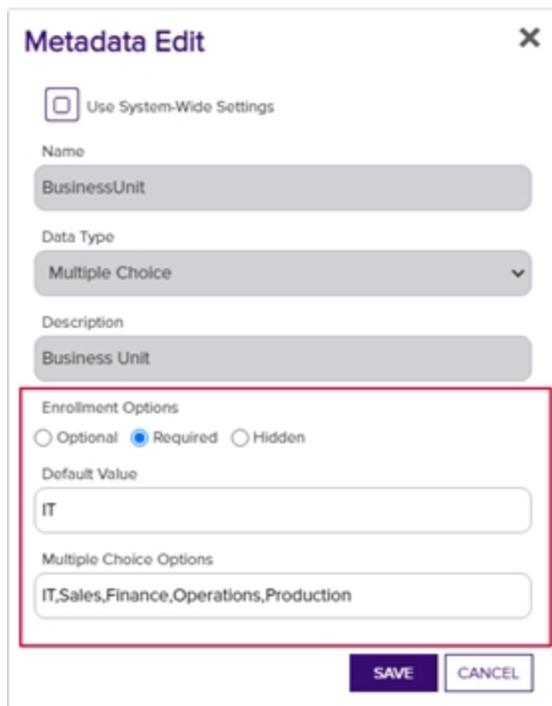

The Remote CA Gateway synchronizes in real-time to provide full visibility and governance over the inventory, enrollment, issuance, revocation and renewal of certificates from your on premise CA, requiring just a single, secure API connection on port 443 back to the Keyfactor Command Cloud.

Template-level Metadata

Certificate metadata fields can now be defined on a per-template basis. Before Keyfactor Command 9.0, metadata fields could only be defined as a system-wide setting.

This allows administrators to apply required, hidden or optional settings to a metadata field on a per-template basis so that only certain metadata fields will appear on certain templates.

System-wide settings for metadata fields can be overridden, so customers can choose which fields are displayed, during enrollment for a certificate, based on the template the user selects when enrolling.

Documentation Structure Updates

Next and Previous buttons have been added to the button row at the top of each page that allow you to navigate through the pages in the documentation in order.

The mini table of contents has been updated to only display by default on pages that contain subpages. This TOC displays—with links—any pages that appear below the current page in the document structure. The TOC button can be used to close and reopen the mini table of contents. The mini table of contents will not display on pages where no subpages are present.

The TOC button now appears when the documents are used in a small browser session (e.g. on a tablet).

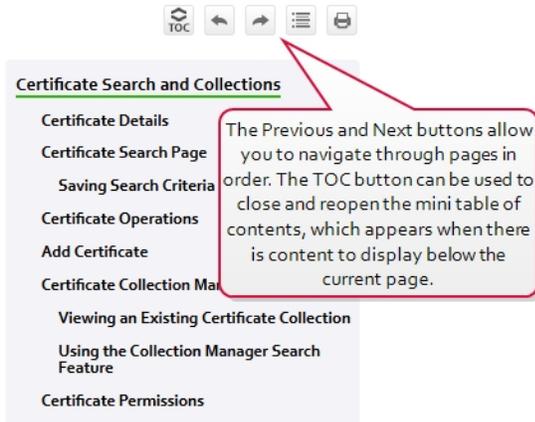

Figure 627: Navigate Forward and Backwards Through Pages

Updates and Improvements

- **Discovery**

SSL/TLS scanning has been updated to support discovery and monitoring of certificates at endpoints that serve certificates via TLS 1.3. The scan works with the TLS_AES_128_GCM_SHA256 cipher suite. TLS 1.3 connections will also work with SNI.

- **API**

More API endpoints have been added to do things such as manage security roles, configure certificate store jobs, and manage orchestrators. Please see the [Keyfactor API Reference on page 843](#) for more details. You can access this and the API Endpoint Utility from the portal via the Help icon.

Additionally, the need for an API application key and secret has been removed. We now control certificate enrollment on the template level within the portal.

- **Logging**

The log file default locations have moved from C:\CMS\Log to C:\Keyfactor\Log. In addition, the NLog.config files have moved from the C:\Program Files\Common Files location to application subfolders of the installation directory, which is C:\Program Files\Keyfactor\Keyfactor Platform by default. Instead of one large CMS_Log file, there are logs for each individual applications.

See [Editing NLog on page 796](#) in the *Keyfactor Command Reference Guide* for more information.

Tip: The API is used in conjunction with the applications and both the API log and the relevant other log (e.g. portal) should be consulted when troubleshooting.

- **Administration**

- There is now an option in the Application Settings to require users to agree to Subscriber Terms to enroll for a certificate. This setting also allows administrators to provide a link to those terms.
- CRL Stale Monitoring has been replaced with the ability for customers to define their own definition of “Stale” by generating alerts—and log entries—off the date that the CRL expires, rather than looking at the Next Publish date.

The main reason for that is that there is, by definition, a race condition between when the new CRL gets created (exactly at the Next Publish time), and when it is copied to the CRL distribution points. Basing alerts off CRL expiration allows customers to tune timeframes based on the way they handle their CRLs.

- **Automation**

A new constraint has been added to only allow the PowerShell event handlers to run scripts that are located in the path specified in the *Extension Handler Path* in the application settings. By default, this is “C:\Program Files\Keyfactor\Keyfactor Platform\ExtensionLibrary\”. Customers should move scripts to this location or a subdirectory of it and test alerts before going into production. See [Adding PowerShell Handlers to Alerts on page 223](#) in *Keyfactor Command Reference Guide* for more information.

- **Certificates**

- A new field for *Import Date* has been added to the certificate details page to log when the certificate was imported into the Keyfactor Command database.
- Certificate Validation now shows the tests that are run when you click on a certificate and the results of those tests.
- SSL/TLS network name is now displayed on the certificate details dialog.
- Denied certificate requests now show the denial reason.
- The CSR generation page has been updated to show the Extended Key Usage of the selected template.

- **Certificates**

Denied certificate requests are now labeled as *Denied/Failed* to align with public CA terminology.

- **Enrollment**

Email address subject alternative name option has been added to PFX enrollment.

- **Infrastructure**

Application pool and service accounts are no longer configured with the db_owner role in SQL, but use a new custom role instead.

- **Orchestrator**

The certificate thumbprint has been added to the failed job message to help identify which certificate was unable to be deployed to an endpoint.

- **Certificate Authorities**

A new uniqueness constraint has been added to the CertificateAuthorities table. As a result, Keyfactor Command now checks that no CAs share the same logical name and host name combination.

- **Reporting**

- Added the ability to add a custom logo to scheduled reports.
- A new report has been added called *Expiration Report by Days* that allows for a number of days to be specified to return a table of the certificates expiring in that timeframe.
- A column for Reverse DNS has been added to the *Certificates Found at TLS/SSL Endpoints* report.

- **Templates**

RFC 2818 enforcement has moved from the CA to the template level since different templates have different requirements. Standalone CAs still have the RFC 2818 setting on the CA level.

- **Certificates**

- Fixed an issue where container level permissions were being ignored during enrollment preventing users from being able to add a certificate to a certificate store in that container.
- Fixed an issue where regular expressions were being applied to empty values when they should not have been.

- **Dashboard**

Resolved an issue where the dashboard CRL widget failed to load when configured with a high number of CRLs.

- **Email**

An issue is fixed where the emails sent from the SSL/TLS scans sometimes reported incorrect totals.

Upgrade Prerequisites

- **Keyfactor Orchestrators**

We encourage customers to use the new Keyfactor Universal Orchestrator moving forward, which requires .NET Core version 3.1. For existing deployments, .NET version 4.7.2 is required for systems running the legacy Windows Orchestrator.

- **SQL Server 2016**

Support for SQL Server 2016 has been removed in Keyfactor Command 9.0. Customers should upgrade to SQL Server 2016 Cumulative Update 2 or higher before upgrading to Keyfactor Command 9.0.

- **Database Compatibility**

Customers will also need to ensure the database compatibility is updated to support 2016 or higher. For more information on updating the compatibility level, please see [System Requirements on page 2702](#) in the *Keyfactor Command Server Installation Guide*.

Upgrade Tasks

Pre-Installation

- If you are using the CA Policy module v7.0 on the same server that the Keyfactor Command Management Portal is installed on, you'll need to upgrade the module to v7.1 before running the Keyfactor Command 9.0 upgrade.
- Upgrade to SQL Server 2016 CU12 or higher and adjust the database compatibility level if needed (see above).

Post-Installation

After the upgrade is complete, some settings will need to be reconfigured due to changes in the way the Keyfactor Command Console handles tasks in Keyfactor Command 9.0:

- RFC 2818 enforcement has moved from the CA to the template level since different templates have different requirements. Standalone CAs still have the RFC 2818 setting on the CA level.
- Configure template-level metadata (if desired).
- Move all Event Handler scripts to the ExtensionLibrary folder under the Keyfactor program installation directory.
- Scripted alert handlers will fail to run if not in the path (or a subdirectory of it) specified by the *Extension Handler Path* application setting. By default, this is "C:\Program Files\Keyfactor\Keyfactor Platform\ExtensionLibrary". Customers should move the scripts to this location and test them before moving to production.
- Update any monitoring or other processes that reference the log files to point to the new log file location.

Tip: We encourage customers to contact their customer success manager to discuss the new features and functionality in Keyfactor Command 9, and to schedule an upgrade.

Deprecation

• API Applications

There is no longer the need to configure an API Application in the portal to allow for API enrollment for a certificate with a particular template. Template enrollment permissions are now controlled within the portal on the template level.

• Classic API

The API calls that were previously in the Classic API (CMSAPI) have now been migrated to the Keyfactor API. Customers should use the Keyfactor API going forward and plan to migrate off the CMSAPI in the near future. Support for the CMSAPI will continue for the near future to allow customers time to migrate.

• Expiration Renewals

Existing expiration renewals with Event Handlers will need to have the URLs updated to point to the Keyfactor API instead of the CMSAPI.

- **Windows Orchestrator**

We will continue to support the Windows Orchestrator. However, all new integrations and extensions will be delivered via the new Keyfactor Universal Orchestrator. We recommend customers use the Keyfactor Universal Orchestrator moving forward as new integrations become available.

- **Verbosity in API Calls**

In a future version of Keyfactor Command, the API will return all data regardless of the verbosity level. For backwards compatibility where performance is concerned, verbosity will be honored when loading certificate location data in the certificate query but has been replaced with new flags to include this data for future requests.

- **Active Directory**

In future releases, the ability to use the Active Directory (AD) password on PFX enrollment will be deprecated as we upgrade to allow authentication methods other than AD.

Known Issues/Limitations

Administration

- Daylight Savings Time (DST) is now shown as the time zone locale for clients using Keyfactor Command, rather than the UTC offset, which is the Microsoft CA default. This causes issues during DST to appear off by an hour, in time zones that do not have DST.
- Microsoft IIS settings to change authentication must be made manually to support the *Use Active Directory Password* application setting for the Keyfactor Command Management Portal.
- When using Basic Authentication, the authentication in Microsoft IIS may need to be configured manually for the KeyfactorAnalysis site.
- Authentication between the KeyfactorPortal, KeyfactorAPI, and KeyfactorAnalysis sites needs to be configured with the same authentication type, SSL, and host name.
- On the template RegEx settings, if you unselect use system-wide and do not enter a new RegEx the system-wide RegEx will still apply. To fix this, enter .* in the RegEx field to accept all values.
- When creating a new certificate store type, the *Depends On Other* option may not be available when creating the parameter. The workaround is to save the certificate store type and then use Edit to update the parameter.

Certificates

- Editing certificate details on a collection for a CA, while an initial sync is running on the CA, will cause inaccurate numbers to display in the Edit All window.
- If a CA is not scheduled to sync under Locations, it will not appear in lists to select for things like inclusion in Dashboards and Reports.
- Syncing an Issuing CA before syncing its parents in the chain causes Keyfactor Command to show the wrong requester for the chain certificates.

Keyfactor Command cannot support a CA in the local forest, with the same NetBIOS name as a CA in a trusted forest.

Infrastructure

- Running large SSL scans can impact Keyfactor Command application performance, if the Windows Agent/Orchestrator performing the scan is installed on the same server as the Keyfactor Command portal.
- If you receive an error when opening the portal that “the underlying connection was closed” please be sure you have the latest Windows Updates installed.

Reporting

- In Windows, drive mapping is done on a per-user basis. If you would like scheduled reports to be saved to a mapped drive, the timer service account needs to have that mapping created for them beforehand.
- Exporting a report to Microsoft Excel can fail with a 401 error in Microsoft Edge. Chrome or Firefox can successfully export to Excel. This problem is being worked on by the reporting engine vendor (Logi Analytics).
- Users configured for Logi Analytics reporting cannot have double quotes in the password field.

API

- The GET/Certificates API endpoint has a known issue where if a collection ID is not supplied the request fails. This will be fixed in an incremental release. The workaround in the meantime is to provide a collection ID of zero.

UI

- Occasionally, the “Please Wait” message will hang. Control + F5 will fix this.

Orchestrator

- There is an issue where the Universal Orchestrator is missing a task category in the Windows Event Log and instead reporting a task category of “(16)”. This will be fixed in a future release.
- The new Keyfactor Universal Orchestrator provides much of the same functionality as the legacy Windows Orchestrator (see table below).

Table 865: Keyfactor Universal Orchestrator vs Windows Orchestrator Capabilities

Capabilities	Windows Orchestrator	Universal Orchestrator
IIS Management	✓	✓
CA Synchronization	✓	✓
SSL/TLS Discovery	✓	✓

Capabilities	Windows Orchestrator	Universal Orchestrator
FTP	✓	✓
F5 (SOAP/REST)	✓	
AWS	✓	
NetScaler	✓	
Fetch Logs (new)		✓

New capabilities will be added to the Keyfactor Universal Orchestrator in a future release as we phase out use of the existing Windows Orchestrator over time.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 866: API Change Log

Endpoint	Method	Action	Notes
/Agents/Approve	POST	Add	
/Agents/Disapprove	POST	Add	
/CertificateCollections	PUT	Add	
/CertificateCollections/Copy	POST	Add	
/Certificates/{id}/History	GET	Add	
/Certificates/{id}/Security	GET	Add	
/Certificates/{id}/Validate	GET	Add	
/Certificates/Locations/{id}	GET	Add	
/Certificates/Metadata/Compare	GET	Add	
/Certificates/Metadata/All	PUT	Add	
/Certificates/RevokeAll	POST	Add	

Endpoint	Method	Action	Notes
/CertificateStoreContainers	GET	Add	
/CertificateStoreContainers/{id}	GET	Add	
/CertificateStores/Certificates/Add	POST	Add	
/CertificateStores/Certificates/Remove	POST	Add	
/Enrollment/CSR/Context/My	GET	Add	
/Enrollment/PFX/Context/My	GET	Add	
/JobTypes/Custom	GET, POST, PUT	Add	
/JobTypes/Custom/{id}	GET, DELETE	Add	
/OrchestratorJobs/Custom	POST	Add	
/OrchestratorJobs/JobHistory	GET	Add	
/OrchestratorJobs/JobStatus/Data	GET	Add	
/Reports	GET, PUT	Add	
/Reports/{id}	GET	Add	
/Reports/{id}/Parameters	GET, PUT	Add	
/Reports/{id}/Schedules	GET, POST, PUT	Add	
/Reports/Custom	GET, POST, PUT	Add	
/Reports/Custom/{id}	GET, DELETE	Add	
/Reports/Schedules/{id}	GET, DELETE	Add	
/Security/Identities	GET, POST	Add	
/Security/Identities/{id}	DELETE	Add	
/Security/Identities/Lookup	GET	Add	
/Security/Roles	GET, POST, PUT	Add	
/Security/Roles/{id}	GET, DELETE	Add	
/SSH/Keys/Unmanaged	DELETE	Add	

Endpoint	Method	Action	Notes
/SSH/ServiceAccounts	DELETE	Add	
/SSH/Users/Access	POST	Add	
/SSL/Networks/{id}/Scan	POST	Add	

6.4.1 Incremental Release 9.10 Notes

June 2022

Note: Keyfactor Command 9.10 is a minor release with incremental fixes and updates following the Keyfactor Command 9 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 9.0, please review the [Major Release 9.0 Notes on page 3130](#).

Updates and Improvements

- **Enrollment**

The enrollment options in Keyfactor Command now support enrolling for SubCA type certificates.

- **Expiration Alert Renewal Handler**

- Fixed an issue where the expiration alert renewal handler would generate an error if the alert contained more than one email recipient.
- Fixed an issue where the expiration alert renewal handler would not run on databases that had been upgraded from versions of Keyfactor Command prior to 5.

- **PAM Secret Storage**

Fixed an issue where PAM parameters of type secret (often passwords) weren't being loaded in Keyfactor Command correctly when returned from the PAM provider.

Note: No changes were made to the Keyfactor Universal Orchestrator in this release, as such the 9.5 version of the Universal Orchestrator should still be considered the latest and is fully compatible with the Keyfactor Command 9.10 release.

API Endpoint Change Log

No API endpoint changes were made in this release.

6.4.2 Incremental Release 9.9 Notes

May 2022

Note: Keyfactor Command 9.9 is a minor release with incremental fixes and updates following the Keyfactor Command 9 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 9.0, please review the [Major Release 9.0 Notes on page 3130](#).

New Features

Metadata Access on View Inventory Dialog

- **What problem does it solve?**

The View Inventory dialog for certificate stores previously displayed each certificate found in the certificate store but did not include the Keyfactor Command metadata field values configured for the certificates.

- **How does it work?**

The View Inventory dialog on the Certificate Stores page now includes a Metadata section to allow you to view the metadata fields configured in Keyfactor Command for each certificate found in the certificate store.

- **What's the benefit?**

Streamlining: You no longer need to look up the metadata fields for the certificates separately.

Updates and Improvements

- **GET /Agents Keyfactor API Endpoint**

The GET /Agents Keyfactor API endpoint now includes a query parser to allow searching by AgentId. For example:

```
AgentId -eq "d2f0d545-c3b3-4ea3-bc0a-0232865e24c3"
```

- **Logging**

Changes have been made to the way that Keyfactor Command logs are initialized to support logging from multiple source libraries including Quartz.

- **Alerts Do Not Resume After a Database Connection Failure**

Fixed an issue in which expiration alerts and pending, issued, and denied certificate alerts that failed due to a database connection problem would not restart on resolution of the database connection issues until the Keyfactor Command service was restarted.

- **Revoke All of Entirely Revoked or Expired Certificates Fails**

Fixed an issue in which attempting to revoke all for a group of certificates that contains only certificates that are revoked already and/or expired results in an error message.

- **SSH Server Groups Incompatible with Domain Names Containing Hyphens**

Fixed an issue in which SSH server groups could not be created in environments where the Keyfactor Command domain contains a hyphen because the SSH server group owner field would not support a hyphen in the domain name.

- **Certificate Signing Requests Can Produce an Error on Decoding**

Fixed an issue in which CSR decoder used in CSR enrollment can produce an error on decoding the CSR under select circumstances. These can include SCEP requests with no SANs and CSRs with no extensions.

- **Keyfactor API GET Requests with a Sort Produce a 500 Error**

Fixed an issue in which Keyfactor API GET endpoints that support query sorting in the URL would produce a 500 error if the sort field was not provided correctly (e.g. the fieldname was entered with a space or was a valid fieldname but not one that was supported for sorting).

Note: No changes were made to the Keyfactor Universal Orchestrator in this release, as such the 9.5 version of the Universal Orchestrator should still be considered the latest and is fully compatible with the Keyfactor Command 9.9 release.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 867: API Change Log

Endpoint	Methods	Action	Notes
/Reports/<any>	GET	Fix	Spaces within the sortField no longer results in an exception.
/Reports/{id}/Schedules	GET	Fix	An invalid sortField no longer results in an exception.
/Agents	GET	Update	New query parser to support the AgentId GUID.

6.4.3 Incremental Release 9.8 Notes

April 2022

Note: Keyfactor Command 9.8 is a minor release with incremental fixes and updates following the Keyfactor Command 9 major release. For more details on new features, improve-

ments, and known limitations in Keyfactor Command 9.0, please review the [Major Release 9.0 Notes on page 3130](#).

Updates and Improvements

- **PFX Generation**

Consolidated PFX generation code so that the PFX files are generated identically from the enrollment and download components.

- **SCEP Intune Integration**

Keyfactor's Simple Certificate Enrollment Protocol (SCEP) component has been updated to utilize the latest Intune API: Microsoft Authentication Library (MSAL) and Azure AD Graph API.

- **Pending Certificate Request SAN**

Fixed an issue in which pending certificate requests containing a User Principal Name (UPN) in the Subject Alternative Name (SAN) would be prefixed with '[0]', and IPv6 addresses were not displayed.

- **vSCEP Challenge Error**

Fixed an issue in which attempting to obtain a Validated SCEP (vSCEP) challenge resulted in an assembly loading error.

- **Denied Alert Email SAN**

Fixed an issue in which Denied Certificate Alert email did not contain the certificate Subject Alternative Names (SANs).

- **Expiration Alert Logging**

Fixed an issue in which excessive and superfluous log messages were generated during Expiration Alert processing.

Note: No changes were made to the Keyfactor Universal Orchestrator in this release, as such the 9.5 version of the Universal Orchestrator should still be considered the latest and is fully compatible with the Keyfactor Command 9.8 release.

API Endpoint Change Log

No API endpoint changes were made in this release.

6.4.4 Incremental Release 9.7 Notes

March 2022

Note: Keyfactor Command 9.7 is a minor release with incremental fixes and updates following the Keyfactor Command 9 major release. For more details on new features, improvements,

and known limitations in Keyfactor Command 9.0, please review the [Major Release 9.0 Notes on page 3130](#).

Updates and Improvements

- **JavaScript Caching**

Updated pages not to cache static files, including JavaScript.

Note: After upgrading to 9.7, the cache will still need to be cleared one final time so that the latest version of the pages get loaded with the updated cache setting.

- **API CA Auto-selection**

The Keyfactor API will auto-select an enrollment certificate authority if one is not explicitly provided.

- **Certificate Stores**

Fixed an issue in which a user could assign a certificate store to a container without explicit permissions to that certificate store.

- **Certificate Stores**

Fixed an issue in which database upgrades fail on Azure SQL for newly created databases.

- **Certificate Stores—Scheduling**

Fixed an issue in which jobs could appear to be scheduled for a certificate store with no available agent.

- **Security Configuration**

Fixed an issue in which the security roles management page could not be loaded after deletion of an associated Active Directory (AD) group.

- **Metadata String & Integer Fields**

Corrected an issue where default values could not be set for metadata fields of type string or integer.

- **Certificate Store Deployment**

Fixed an issue where a certificate cannot be deployed to a certificate store when deploying using a property instead of a certificate store type or Id.

Note: No changes were made to the Keyfactor Universal Orchestrator in this release, as such the 9.5 version of the Universal Orchestrator should still be considered the latest and is fully compatible with the Keyfactor Command 9.7 release.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 868: API Change Log

Endpoint	Methods	Action	Notes
/KeyfactorAPI/License	GET	Add	

6.4.5 Incremental Release 9.6 Notes

February 2022

Note: Keyfactor Command 9.6 is a minor release with incremental fixes and updates following the Keyfactor Command 9 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 9.0, please review the [Major Release 9.0 Notes on page 3130](#).

Updates and Improvements

- **Configuration Wizard**

Fixed an issue in which the SQL Server login for the application pool account was not created by the configuration wizard.

- **Azure Database Creation**

Fixed an issue in which database upgrades fail on Azure SQL for newly created databases.

- **Certificate Store—Scheduling**

Fixed an issue in which jobs rescheduled for *immediate* would not execute.

- **Command Line Configuration Wizard**

Fixed an issue in which the console configuration wizard cannot populate Azure SQL databases.

- **Custom Orchestrator Job Blueprint**

Corrected an issue where a duplicate custom job schedule was created when applying the same blueprint to orchestrator.

- **Expiration Report by Days**

Corrected an issue where the Expiration Report by Days would crash on DD/MM/YYYY formatted dates.

- **Certificate Renewal in Single Store**

Fixed an issue where a single certificate stored at multiple aliases within the same certificate store was not renewed successfully.

- **CRL Alert Emails**

Corrected an issue in which a CRL alert email would be sent even if a new CRL was available.

Note: No changes were made to the Keyfactor Universal Orchestrator in this release, as such the 9.5 version of the Universal Orchestrator should still be considered the latest and is fully compatible with the Keyfactor Command 9.6 release.

API Endpoint Change Log

No API endpoint changes were made in this release.

6.4.6 Incremental Release 9.5 Notes

January 2022

Note: Keyfactor Command 9.5 is a minor release with incremental fixes and updates following the Keyfactor Command 9 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 9.0, please review the [Major Release 9.0 Notes on page 3130](#).

Updates and Improvements

- **Agents and Orchestrators**

Several enhancements have been made to the orchestrators:

- The alias column size has increased to allow for longer alias names.
- A new setting allows the IIS stores to be accessed using WinRM over SSL (port 5986).
- The last thumbprint used for client certificate authentication by orchestrators is now tracked and can be returned using the GET /Agents API method.
- The UI now allows you to see why an orchestrator could not register for a session rather than having to look in the logs.
- A new API endpoint has been added to request or require that one or more orchestrators enroll for a new client authentication certificate on the orchestrator's next session registration (POST /Agents/SetAuthCertificateReenrollment).
- A new API endpoint has been added to reset an orchestrator (POST /Agents/{id}/Reset). Updates include removing orchestrator jobs, deleting associated certificate stores, setting the orchestrator status to new, and clearing thumbprint data as below.
- The orchestrator reset function in the UI and API now clears the orchestrator client authentication certificate thumbprint data to allow the orchestrator to be reconfigured with a new certificate.

- **Management Portal—Reports**

The “Expiring in less than two weeks” text in the *PKI Status for Collection* report has been updated to change the color scheme to be more readable (white text on a maroon background).

- **API**

Fixed an issue with the Enrollment/PFX API call not working without specifying a CA. The JobTypes/Custom API call now returns the Job Retry Count.

- **Certificates—Metadata**

Fixed an issue so that hidden metadata now shows when using *Edit All*.

- **Certificate Stores—Scheduling**

Fixed an issue to now prompt the user to enter schedule values for *Exactly once* and for *Daily* schedules.

- **Certificate Store—Inventory**

Fixed an issue when viewing the inventory of certificate store that has an alias without a certificate.

- **Installation—Modify/Remove**

Corrected an issue where the MSI would freeze if trying to modify or uninstall an installation that had been done without any components selected to be installed.

- **Orchestrators and Agents—Custom Job Retry**

Corrected an issue where custom jobs would not retry if the job complete handlers failed.

- **Alerting—Email Address Format**

Fixed an issue where the email address validation was not allowing some valid subdomains.

- **Registration Handler—Enrollment**

The registration handler now receives the certificate chain for enrollments performed via the enrollment callback.

- **Management Portal Reports**

Updates to Management Portal reports to handle upgrade scenarios and other user interface fixes.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 869: API Change Log

Endpoint	Methods	Action	Notes
/Enrollment/PFX	POST	Update	No longer requires a certificate authority name to be provided.

6.4.7 Incremental Release 9.4 Notes

December 2021

Note: Keyfactor Command 9.4 is a minor release with incremental fixes and updates following the Keyfactor Command 9 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 9.0, please review the [Major Release 9.0 Notes on page 3130](#).

Updates and Improvements

- **Log4j CVE Vulnerability**

Keyfactor has conducted an assessment of the recently-announced CVE for the log4j library (<https://github.com/advisories/GHSA-jfh8-c2jp-5v3q>). We have identified that the vast majority of the Keyfactor suite of products are NOT affected. This includes EJBCA, SignServer, the Keyfactor Command platform, Keyfactor Control, and Code Assure.

The only component that does make use of the log4j library is the Java Agent for Keyfactor Command; for clarity, all other Keyfactor agents and gateways are NOT affected.

Details

According to the CVE, exploit of the vulnerability requires compelling log4j to log user-controlled input. In the case of the Java agent, there are mitigating factors, such as:

- The Java agent has an “outbound-only” connection pattern and does not accept inbound network connections of any kind.
- Users of the Java agent who could control such input are typically Keyfactor administrators.
- The limited nature of things the Java agent is expected to log.

From [Log4j – Apache Log4j Security Vulnerabilities](#):

- Mitigation: This behavior can be mitigated by setting either the system property `log4j2.formatMsgNoLookups` or the environment variable `LOG4J_FORMAT_MSG_NO_LOOKUPS` to true.

Patch Implementation—The 8.7.2 version of the Java Agent to utilize the patched version of Log4j, and mitigate the vulnerability.

- **Orchestrator Certs**

Ability for an orchestrator to use a TLS client authentication certificate to map to a Windows identity in IIS and to use a different TLS certificate provided in an HTTP header to identify the orchestrator to Keyfactor Command.

- **External Validation Certificate Requests**

Certificate requests returning a status of `EXTERNAL_VALIDATION` are not treated as failures and will be sync'd with appropriate metadata when the certificate is available.

- **Certificate Detail Data Efficiency**

The certificate details are obtained from the server when needed, and not as part of the initial certificate query. This greatly increases the efficiency and performance of the page.

- **Query Optimization for Large Scale Environments**

Multiple optimizations have been made to improve management portal query performance, scalability, and stability in large scale environments.

- **Pending Certificates API Endpoint**

Metadata for certificate requests in a pending state is now available for retrieval via the /Workflow/Certificates/Pending API endpoints (GET /Workflow/Certificates/{id} and GET /Workflow/Certificates/Pending).

- **SSL Scanning Chunk Sizes**

Distinct SSL scanning chunk size application settings are now available for discovery and monitoring to allow for greater control over performance tuning.

- **Dashboard Risk Header Clarifications**

The dashboard Risk Header now contains verbiage to clarify that no filtering exists for renewed certificates in expired query counts.

In addition, the dashboard Risk Header contains verbiage noting that the certificate counts are global and not limited to only those to which the current user has access.

- **Custom Job Blueprint Duplication**

An issue was fixed so that a copy operation on a blueprint successfully copies custom jobs.

- **Certificate Count by Template Report**

An issue was fixed so to properly retain the selected default certificate authority.

- **SSL Quiet Hours Daylight Savings**

Updates were made to the SSL Quiet Hours to better handle schedules involving Daylight Savings Times.

- **SSL Monitoring Emails**

SSL Monitoring emails now send the complete and correct data when multiple orchestrators are in simultaneous use.

- **Certificate Detail Before/Not After Dates**

Certificate details now display the time in addition to the date for Before and Not After dates.

- **SSL Scanning Certificate History**

A fix was implemented to properly display the history of certificates imported into the system via SSL scanning.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 870: API Change Log

Endpoint	Methods	Action	Notes
/Workflow/Certificates/Pending	GET	Update	Now returns the associated metadata.

6.4.8 Incremental Release 9.3 Notes

November 2021

Note: Keyfactor Command 9.3 is a minor release with incremental fixes and updates following the Keyfactor Command 9 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 9.0, please review the [Major Release 9.0 Notes on page 3130](#).

Updates and Improvements

- **Certificate Search**

The certificate search functionality has been optimized to increase speed and efficiency, especially with higher numbers of certificates and associated certificate locations. This means certificate searches done in the management portal for large data sets that include certificates found in certificate stores (e.g. 250,000+ certificates each in 5 or more certificate stores) now complete more quickly.

- **Failed Certificate Management Jobs**

Certificate management jobs that have failed no longer continue to run.

- **PKI Status Report Time Zone**

Corrected the format of time zones in the PKI Status for Collection Report.

- **Database Encryption Configuration**

The Configuration Wizard now verifies the selected database encryption certificate has an associated valid private key.

- **SSL Scanning**

Updates made to the SSL scanning process to be more efficient and eliminate potential process-locking scenarios.

- **Management Portal User Interface**

Various Management Portal user interface fixes.

- **Management Portal Reports**

Updates to Management Portal reports to handle upgrade scenarios and other user interface fixes.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 871: API Change Log

Endpoint	Methods	Action	Notes
/JobTypes/Custom	POST	Fix	No longer requires default field values.

6.4.9 Incremental Release 9.2 Notes

October 2021

Note: Keyfactor Command 9.2 is a minor release with incremental fixes and updates following the Keyfactor Command 9 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 9.0, please review the [Major Release 9.0 Notes on page 3130](#).

New Features

UI Support for PAM CA Password Entry

- **What problem does it solve?**

The API previously supported the entry of certificate authority passwords to be stored within a Privileged Access Management (PAM) instance, but the UI did not implement this functionality.

- **How does it work?**

The certificate authority editor dialog allows for entry of a password to be stored in a PAM instance.

- **What's the benefit?**

Flexibility: Allows for multiple ways to securely store and manage certificate authority passwords

Custom Orchestrator Bulk Scheduling

- **What problem does it solve?**

Custom orchestrator jobs can currently only be scheduled individually.

- **How does it work?**

An API endpoint (POST OrchestratorJobs/Custom/Bulk) has been created to implement bulk schedules. The job identifiers along with the desired schedule can be provided in a single call.

- **What's the benefit?**

Ease-of-Use: Enables administrators to easily schedule large batches of custom orchestrator jobs.

Updates and Improvements

- **CA Management with PAM**

When configuring the *Use Explicit Credentials* option on a CA, you can now choose a PAM provider as the storage location for the credential password or the Keyfactor secrets table.

- **Logi Analytics License**

A new license for Logi Analytics is required as the previous version is expiring. The 9.2 release includes the license update. Please see [Updating Logi Analytics License on the next page](#) for more information.

- **CSR Parsing Containing Spaces**

CSRs containing spaces can now be parsed successfully during enrollment.

- **Robust SSL Certificate Parsing Error Handling**

Certificates that fail to be parsed during SSL scanning are now logged but do not cause the entire scan to immediately fail.

- **Robust Alert Failure Error Handling**

A failure processing an alert no longer prevents processing of subsequent alerts.

- **Hidden Metadata Enrollment Fields**

Metadata fields which are hidden during the enrollment process are now displayed properly in the resulting certificate details.

- **Collection-based Reports Failing**

Reports based on collections containing Revocation, Certificate State or Common Name no longer fail.

- **Incorrect CSR Enrollment CA**

The proper forest certificate authority is used for enrollment when using the API to enroll via CSR.

- **Denied Alerts Template**

The Denied Certificate Request alerts are once again properly scoped to the selected template. This was a regression from a previous release.

- **Java & C Agent Inventory Error**

An error was corrected in which an error was thrown if no entry updates were returned during inventory processing.

- **Orchestrator/Agent Re-Enrollment Error**

Fixed an issue in which an object reference error was thrown during re-enrollment operations.

- **Orchestrator Ceases Processing after Batch Submission**

Corrected an issue in which the orchestrators would cease processing after submission of a large batch of SSL results.

Updating Logi Analytics License

Logi is a 3rd party BI tool which is used by Keyfactor Command for its dashboard and report features. The license required for Logi is integrated into Keyfactor Command and resides within the product's Logi folder. The license's current term is 3 years with a 7-day grace period after expiration. During that grace period, an alert will appear, and a new license should be used to remediate the issue. Here are two examples:

- License close to expiration:

Figure 628: Keyfactor Logi License Expiration Alert

Dashboard:

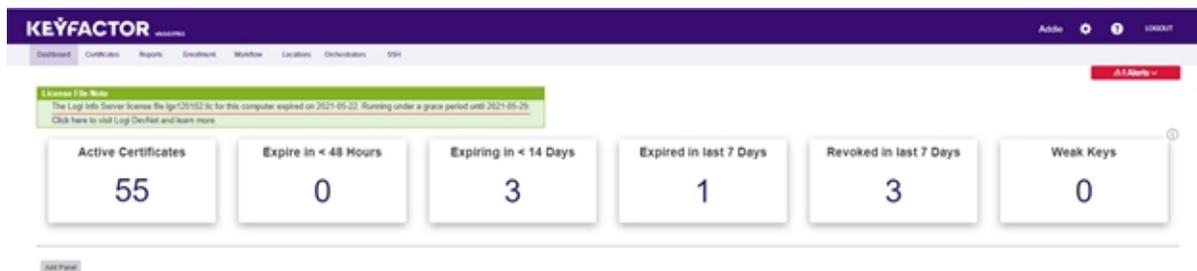

Figure 629: Keyfactor Logi License Expiration Alert on the Dashboard

Report:

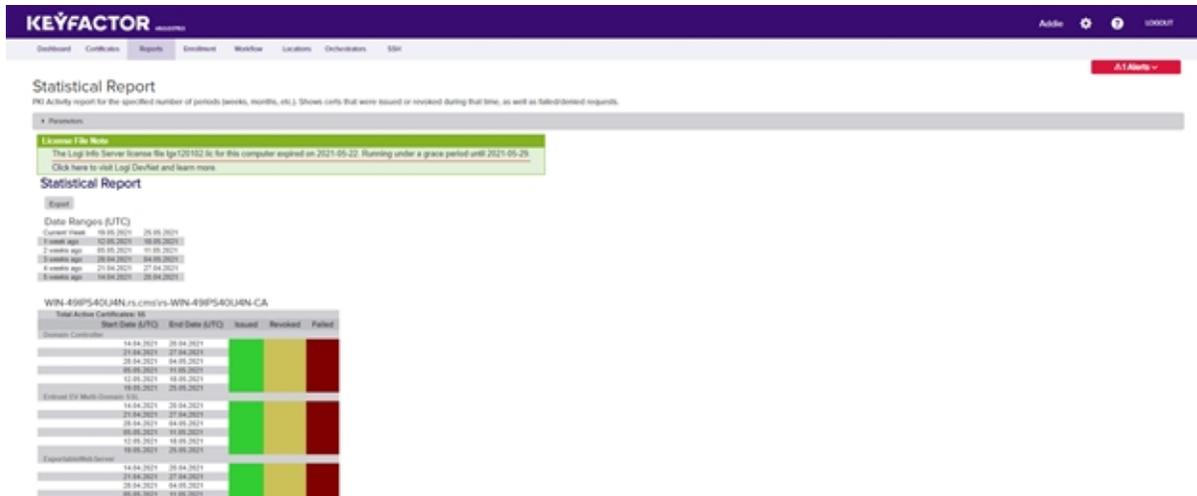

Figure 630: Keyfactor Logi License Expiration Alert on Report

- Expired license:

The Dashboard and Reporting capability is not available with an error message displayed like the one below.

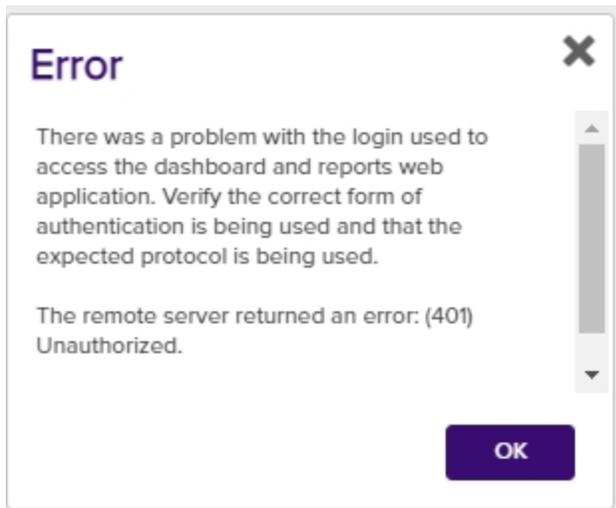

Figure 631: Keyfactor Expired Logi Error Message

Solution

The updated license for Logi is included in release 9.2 and will be installed automatically as part of the upgrade to or fresh installation of this version. If you are not installing Keyfactor Command v9.2, replace the license manually as follows:

1. On your Keyfactor Command server, navigate to the Logi folder in your Keyfactor Command instance. By default, this is:

C:\Program Files\Keyfactor\KeyfactorPlatform\Logi

If you are on an earlier version of Keyfactor Command your license file will by default be found in the following directory:

C:\Program Files\Certified Security Solutions\Certificate Management System\Logi]

2. The license file ends with an extension of *.lic*. Replace the license file with a valid one provided to you by Keyfactor. The license filename cannot be changed and should remain as “lgx120102.lic”.

If the license has already expired, once it is replaced with a valid one and the browser is refreshed, the product will work as expected. The alert will no longer appear.

If you upgrade to a version of Keyfactor Command prior to v9.2 after replacing the license file, you will need to manually add the new license file again.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 872: API Change Log

Endpoint	Methods	Action	Notes
/Certificates	GET	Fix	No longer fails if a collection id is not provided.
/OrchestratorJobs/JobHistory	GET	Fix	Request no longer fails for ‘Dynamic’ job types.
/Reports/Schedules/{id}	DELETE	Fix	Response code is now 200 when the user role does not have <i>Modify – Report</i> permission.

6.4.10 Incremental Release 9.1 Notes

September 2021

Note: Keyfactor Command 9.1 is a minor release with incremental fixes and updates following the Keyfactor Command 9 major release. For more details on new features, improvements, and known limitations in Keyfactor Command 9.0, please review the [Major Release 9.0 Notes on page 3130](#).

New Features

Custom Certificate Store Parameters

- **What problem does it solve?**

Provide the ability to associate custom parameters with certificate stores and certificate store entries to associate useful information.

- **How does it work?**

The certificate store type dialog now provides tabs for entry parameters, in addition to custom fields. These parameters and custom fields can be defined for input during enrollment, storage and management of certificate store inventory. For more information, see [Entry Parameters Tab on page 707](#) in the *Keyfactor Command Reference Guide*.

- **What's the benefit?**

Flexibility: Allows for further customization around certificate stores which can be dictated by customizable data.

Certificate Store Inventory

- **What problem does it solve?**

The previous version of certificate store inventory leveraged the certificate search functionality. While this worked, it was not always well-suited for the viewing of certificate store inventory.

- **How does it work?**

Clicking on the *View Inventory* button with a certificate store selected will now load a dialog with the inventory of the store.

- **What's the benefit?**

Ease-of-Use: Enables administrators to efficiently review certificate store inventory.

Certificate Store Type Parameters

- **What problem does it solve?**

The previous certificate store type parameters were defined via a comma-separated list and were not strongly typed.

- **How does it work?**

A formalized list is available to define parameters explicitly, including type (String, Boolean, Multiple Choice, Secret).

- **What's the benefit?**

Flexibility: Enables more powerful definition of certificate stores and data-validity checking.

Certificate Store Parameter Reporting

- **What problem does it solve?**

The current on-boarding of certificate stores requires manual data entry of custom fields and parameters.

- **How does it work?**

The Keyfactor Command orchestrator framework provides for orchestrators to report certificate store entry parameters.

- **What's the benefit?**

Flexibility: Enables customers to more easily track new certificate stores and changes to them made out-of-band from Keyfactor Command.

Keyfactor Command Configuration Wizard

The Keyfactor Command server configuration wizard now supports entry of group managed service accounts (gMSA) in the Administrative Users field on the Keyfactor Portal tab.

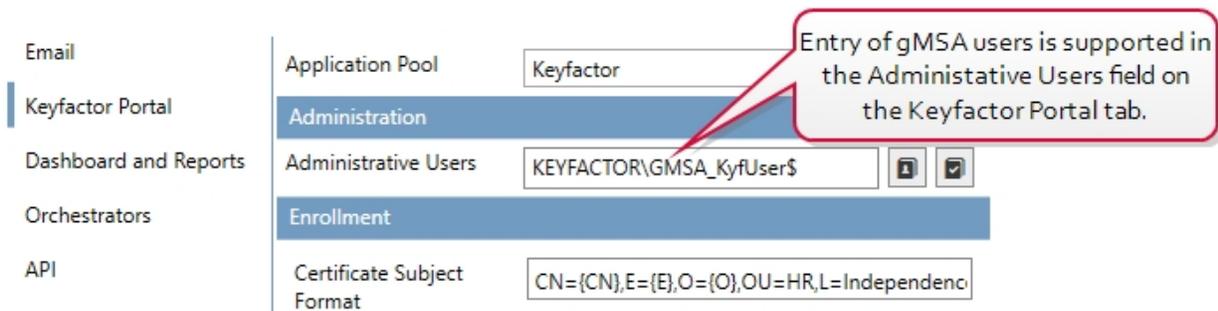

Figure 632: Entry of gMSA Users in the Administrative Users Field

Note: Entry of gMSA users is not supported in the fields that require entry of a password in the configuration wizard (e.g. the service account on the Service tab) at this time. GMSA users cannot be selected using the people picker.

Updates and Improvements

- **Job Completion**

Job completion handler is now provided the certificate identifier upon renewal so that the handler can perform any related tasks.

- **API Endpoint Deprecation**

The CertificateCollections/{id}/Permissions endpoint due to an update slated for the Keyfactor Command v10 release and the fact that the endpoint is not updating permissions properly.

- **Permissions Message**

An incorrect error message was displayed to users without sufficient permissions to a certificate collection.

- **Certificate Store Deletion**

Fixed an issue in which a Certificate Store cannot be deleted if there is a job staged against it.

- **Pending Alerts**

Pending alerts were being sent on certificate issuance regardless of the associated template.

- **Certificate Inventory**

Corrected a permissions problem in which users with only read permissions on a Certificate Store were unable to view inventory of that certificate store.

Known Issues

- **CSR Enrollment**

In cases where there are duplicate template names in multiple forests, CSR enrollment can sometimes go to the wrong CA. This will be fixed in a future incremental release. Customers with environments with duplicate templates should wait to upgrade.

API Endpoint Change Log

The following changes were made to the API endpoints. Please review these carefully if you have implemented any integration using these endpoints.

Table 873: API Change Log

Endpoint	Methods	Action	Notes
/CertificateStores/{id}/Inventory	GET	Add	
/Enrollment/PFX/Replace	POST	Fix	SuccessfulStores collection now only includes Ids of stores that were successfully processed.
/Enrollment/PFX/Deploy	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertStoreTypes	POST/PUT	Update	EntryParameters can now be set via these methods.
/CertificateStores/Certificates/Add	POST	Update	Now allows for multiple

Endpoint	Methods	Action	Notes
			stores of the same type with different parameters.
/CertificateStores/Certificates/Remove	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateCollections/{id}/Permissions	GET	Deprecate	

6.5 Keyfactor Command v11 Compatibility Matrix

Keyfactor Command version 11's compatibility with the various supported Keyfactor gateways, agents and orchestrators is shown in the table below (see also [Keyfactor Command Compatibility Matrix Legend 1](#)).

Table 874: Compatibility Matrix for Keyfactor Command v11

7.0 Glossary

A

AIA

The authority information access (AIA) is included in a certificate--if configured--and identifies a location from which the chain certificates for that certificate may be retrieved.

AnyAgent

The AnyAgent, one of Keyfactor's suite of orchestrators, is used to allow management of certificates regardless of source or location by allowing customers to implement custom agent functionality via an API.

AnyGateway

The Keyfactor AnyGateway is a generic third party CA gateway framework that allows existing CA gateways and custom CA connections to share the same overall product framework.

API

A set of functions to allow creation of applications. Keyfactor offers the Keyfactor API, which allows third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command.

Argument

A parameter or argument is a value that is passed into a function in an application.

Authority Information Access

The authority information access (AIA) is included in a certificate--if configured--and identifies a location from which the chain certificates for that certificate may be retrieved.

B

Bash Orchestrator

The Bash Orchestrator, one of Keyfactor's suite of orchestrators, is used to discover and manage SSH keys across an enterprise.

Blueprint

A snapshot of the certificate stores and scheduled jobs on one orchestrator, which can be used to create matching certificate stores and jobs on another orchestrator with just a few clicks.

C

CA

A certificate authority (CA) is an entity that issues digital certificates. Within Keyfactor Command, a CA may be a Microsoft CA or a Keyfactor gateway to a cloud-based or remote CA.

Certificate Authority

A certificate authority (CA) is an entity that issues digital certificates. Within Keyfactor Command, a CA may be a Microsoft CA or a Keyfactor gateway to a cloud-based or remote CA.

Certificate Revocation List

A Certificate Revocation List (CRL) is a list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted.

Certificate Signing Request

A CSR or certificate signing request is a block of encoded text that is submitted to a CA when enrolling for a certificate. When you generate a CSR within Keyfactor

Command, the matching private key for it is stored in Keyfactor Command in encrypted format and will be married with the certificate once returned from the CA.

CN

A common name (CN) is the component of a distinguished name (DN) that represents the primary name of the object. The value varies depending on the type of object. For a user object, this would be the user's name (e.g. CN=John Smith). For SSL certificates, the CN is typically the fully qualified domain name (FQDN) of the host where the SSL certificate will reside (e.g. server-name.keyexample.com or www.keyexample.com).

Collection

The certificate search function allows you to query the Keyfactor Command database for certificates from any available source based on any criteria of the certificates and save the results as a collection that will be available in other places in the Management Portal (e.g. expiration alerts and certain reports).

Common Name

A common name (CN) is the component of a distinguished name (DN) that represents the primary name of the object. The value varies depending on the type of object. For a user object, this would be the user's name (e.g. CN=John Smith). For SSL certificates, the CN is typically the fully qualified domain name (FQDN) of the host where the SSL certificate will reside (e.g. server-name.keyexample.com or www.keyexample.com).

Configuration Tenant

A grouping of CAs. The Microsoft concept of forests is not used in EJBCA so to

accommodate the new EJBCA functionality, and to avoid confusion, the term forest needed to be renamed. The new name is configuration tenant. For EJBCA, there would be one configuration tenant per EJBCA server install. For Microsoft, there would be one per forest. Note that configuration tenants cannot be mixed, so Microsoft and EJBCA cannot exist on the same configuration tenant.

CRL

A Certificate Revocation List (CRL) is a list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted.

CSR

A CSR or certificate signing request is a block of encoded text that is submitted to a CA when enrolling for a certificate. When you generate a CSR within Keyfactor Command, the matching private key for it is stored in Keyfactor Command in encrypted format and will be married with the certificate once returned from the CA.

D

DER

A DER format certificate file is a DER-encoded binary certificate. It contains a single certificate and does not support storage of private keys. It sometimes has an extension of .der but is often seen with .cer or .crt.

Distinguished Name

A distinguished name (DN) is the name that uniquely identifies an object in a directory. In the context of Keyfactor Command, this directory is generally Active Directory. A DN is made up of attribute=value pairs,

separated by commas. Any of the attributes defined in the directory schema can be used to make up a DN.

DN

A distinguished name (DN) is the name that uniquely identifies an object in a directory. In the context of Keyfactor Command, this directory is generally Active Directory. A DN is made up of attribute=value pairs, separated by commas. Any of the attributes defined in the directory schema can be used to make up a DN.

DNS

The Domain Name System is a service that translates names into IP addresses.

E

ECC

Elliptical curve cryptography (ECC) is a public key encryption technique based on elliptic curve theory that can be used to create faster, smaller, and more efficient cryptographic keys. ECC generates keys through the properties of the elliptic curve equation instead of the traditional method of generation as the product of very large prime numbers.

Endpoint

An endpoint is a URL that enables the API to gain access to resources on a server.

Enrollment

Certificate enrollment refers to the process by which a user requests a digital certificate. The user must submit the request to a certificate authority (CA).

EOBO

A user with an enrollment agent certificate can enroll for a certificate on behalf of another user. This is often used when provisioning technology such as smart cards.

F

Forest

An Active Directory forest (AD forest) is the top most logical container in an Active Directory configuration that contains domains, and objects such as users and computers.

G

Gateway Connector

The Keyfactor Gateway Connector is installed in the customer forest to provide a connection between the on-premise CA and the Azure-hosted, Keyfactor managed Hosted Configuration Portal to provide support for synchronization, enrollment and management of certificates through the Azure-hosted instance of Keyfactor Command for the on-premise CA. It is supported on both Windows and Linux.

H

Host Name

The unique identifier that serves as name of a computer. It is sometimes presented as a fully qualified domain name (e.g. server-name.keyexample.com) and sometimes just as a short name (e.g. servername).

Hosted Config Portal

The Keyfactor Hosted Configuration Portal is used to configure connections between on-premise instances of the Keyfactor

Gateway Connector and on-premise CAs to make them available to Azure-hosted instance of Keyfactor Command. The portal is Azure-hosted and managed by Keyfactor.

Hosted Configuration Portal

The Keyfactor Hosted Configuration Portal is used to configure connections between on-premise instances of the Keyfactor Gateway Connector and on-premise CAs to make them available to Azure-hosted instance of Keyfactor Command. The portal is Azure-hosted and managed by Keyfactor.

Hostname

The unique identifier that serves as name of a computer. It is sometimes presented as a fully qualified domain name (e.g. server-name.keyexample.com) and sometimes just as a short name (e.g. servername).

J

Java Agent

The Java Agent, one of Keyfactor's suite of orchestrators, is used to perform discovery of Java keystores and PEM certificate stores, to inventory discovered stores, and to push certificates out to stores as needed.

Java Keystore

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

JKS

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based

applications for authentication and encryption.

K

Key Length

The key size or key length is the number of bits in a key used by a cryptographic algorithm.

Key Pair

In asymmetric cryptography, public keys are used together in a key pair with a private key. The private key is retained by the key's creator while the public key is widely distributed to any user or target needing to interact with the holder of the private key.

Key Size

The key size or key length is the number of bits in a key used by a cryptographic algorithm.

Key Type

The key type identifies the type of key to create when creating a symmetric or asymmetric key. It references the signing algorithm and often key size (e.g. AES-256, RSA-2048, Ed25519).

Keyfactor CA Management Gateway

The Keyfactor CA Management Gateway is made up of the Keyfactor Gateway Connector, installed in the customer forest to provide a connection to the local CA, and the Azure-hosted and Keyfactor managed Hosted Configuration Portal. The solution is used to provide a connection between a customer's on-premise CA and an Azure-hosted instance of Keyfactor Command for synchronization, enrollment, and management of certificates.

Keyfactor Gateway Connector

The Keyfactor Gateway Connector is installed in the customer forest to provide a connection between the on-premise CA and the Azure-hosted, Keyfactor managed Hosted Configuration Portal to provide support for synchronization, enrollment and management of certificates through the Azure-hosted instance of Keyfactor Command for the on-premise CA. It is supported on both Windows and Linux.

Keyfactor Universal Orchestrator

The Keyfactor Universal Orchestrator, one of Keyfactor’s suite of orchestrators, is used to interact with servers and devices for certificate management, run SSL discovery and management tasks, and manage synchronization of certificate authorities in remote forests. With the addition of custom extensions, it can provide certificate management capabilities on a variety of platforms and devices (e.g. Amazon Web Services (AWS) resources, Citrix\NetScaler devices, F5 devices, IIS stores, JKS keystores, PEM stores, and PKCS#12 stores) and execute tasks outside the standard list of certificate management functions. It runs on either Windows or Linux servers or Linux containers.

Keystore

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

L

Logical Name

The logical name of a CA is the common name given to the CA at the time it is created. For Microsoft CAs, this name can

be seen at the top of the Certificate Authority MMC snap-in. It is part of the FQDN\Logical Name string that is used to refer to CAs when using command-line tools and in some Keyfactor Command configuration settings (e.g. ca2.keyexample.-com\Corp Issuing CA Two).

M

MAC Agent

The MAC Agent, one of Keyfactor’s suite of orchestrators, is used to manage certificates on any keychains on the Mac on which the Keyfactor MAC Agent is installed.

Metadata

Metadata provides information about a piece of data. It is used to summarize basic information about data, which can make working with the data easier. In the context of Keyfactor Command, the certificate metadata feature allows you to create custom metadata fields that allow you to tag certificates with tracking information about certificates.

O

Object Identifier

Object identifiers or OIDs are a standardized system for identifying any object, concept, or “thing” with a globally unambiguous persistent name.

OID

Object identifiers or OIDs are a standardized system for identifying any object, concept, or “thing” with a globally unambiguous persistent name.

Orchestrator

Keyfactor orchestrators perform a variety of functions, including managing certificate stores and SSH key stores.

P

P12

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

P7B

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

P7C

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

Parameter

A parameter or argument is a value that is passed into a function in an application.

PEM

A PEM format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PEM certificates always begin and end with entries like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. PEM certificates can contain a single certificate or a full certificate chain and may contain a private key. Usually, extensions of .cer and .crt are certificate files with no private key, .key is a separate private key file, and .pem is both a certificate and private key.

PFX

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

PKCS #7

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

PKCS#12

A PFX file (personal information exchange format), also known as a PKCS#12 archive,

is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

PKI

A public key infrastructure (PKI) is a set of roles, policies, and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

Private Key

Private keys are used in cryptography (symmetric and asymmetric) to encrypt or sign content. In asymmetric cryptography, they are used together in a key pair with a public key. The private or secret key is retained by the key's creator, making it highly secure.

Public Key

In asymmetric cryptography, public keys are used together in a key pair with a private key. The private key is retained by the key's creator while the public key is widely distributed to any user or target needing to interact with the holder of the private key.

Public Key Infrastructure

A public key infrastructure (PKI) is a set of roles, policies, and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

R

Rogue Key

A rogue key, in the context of Keyfactor Command, is an SSH public key that appears in an `authorized_keys` file on a

server managed by the SSH orchestrator without authorization.

Root of Trust

A root of trust (RoT) is a source within a cryptographic system that can always be trusted. It is typically a hardened hardware module. HSMs (hardware security modules) and TPMs (trusted platform modules) are examples of RoTs.

RoT

A root of trust (RoT) is a source within a cryptographic system that can always be trusted. It is typically a hardened hardware module. HSMs (hardware security modules) and TPMs (trusted platform modules) are examples of RoTs.

RPC

Remote procedure call (RPC) allows one program to call a function from a program located on another computer on a network without specifying network details. In the context of Keyfactor Command, RPC errors often indicate Kerberos authentication or delegation issues.

rsyslog

Rsyslog is an open-source software utility used on UNIX and Unix-like computer systems for forwarding log messages in an IP network.

S

SAN

The subject alternative name (SAN) is an extension to the X.509 specification that allows you to specify additional values when enrolling for a digital certificate. A variety of SAN formats are supported, with DNS name being the most common.

server name indication

Server name indication (SNI) is an extension to TLS that provides for including the host-name of the target server in the initial handshake request to allow the server to respond with the correct SSL certificate or allow a proxy to forward the request to the appropriate target.

SMTP

Short for simple mail transfer protocol, SMTP is a protocol for sending email messages between servers.

SNI

Server name indication (SNI) is an extension to TLS that provides for including the host-name of the target server in the initial handshake request to allow the server to respond with the correct SSL certificate or allow a proxy to forward the request to the appropriate target.

SSH

The SSH (secure shell) protocol provides for secure connections between computers. It provides several options for authentication, including public key, and protects the communications with strong encryption.

SSL

TLS (Transport Layer Security) and its predecessor SSL (Secure Sockets Layer) are protocols for establishing authenticated and encrypted links between networked computers.

Subject Alternative Name

The subject alternative name (SAN) is an extension to the X.509 specification that allows you to specify additional values when enrolling for a digital certificate. A variety of

SAN formats are supported, with DNS name being the most common.

T

Template

A certificate template defines the policies and rules that a CA uses when a request for a certificate is received.

TLS

TLS (Transport Layer Security) and its predecessor SSL (Secure Sockets Layer) are protocols for establishing authenticated and encrypted links between networked computers.

Trusted CA

A certificate authority in the forest in which Keyfactor Command is installed or in a forest in a two-way trust with the forest in which Keyfactor Command is installed.

U

Untrusted CA

A certificate authority in a forest in a one-way trust with the forest in which Keyfactor Command is installed or in a forest that is untrusted by the forest in which Keyfactor Command is installed. Non-domain-joined standalone CAs also fall into this category.

W

Web API

A set of functions to allow creation of applications. Keyfactor offers the Keyfactor API, which allows third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command.

Windows Orchestrator

The Windows Orchestrator, one of Keyfactor's suite of orchestrators, is used to manage synchronization of certificate authorities in remote forests, run SSL discovery and management tasks, and interact with Windows servers as well as F5 devices, NetScaler devices, Amazon Web Services (AWS) resources, and FTP capable devices, for certificate management. In addition, the AnyAgent capability of the Windows Orchestrator allows it to be extended to create custom certificate store types and management capabilities regardless of source platform or location.

Workflow

A workflow is a series of steps necessary to complete a process. In the context of Keyfactor Command, it refers to the workflow builder, which allows you automate event-driven tasks when a certificate is requested or revoked.

X

x.509

In cryptography, X.509 is a standard defining the format of public key certificates. An X.509 certificate contains a public key and an identity (e.g. a host name or an organization or individual name), and is either signed by a certificate authority or self-signed. When a certificate is signed by a trusted certificate authority it can be used to establish trusted secure communications with the owner of the corresponding private key. It can also be used to verify digitally signed documents and emails.
