

## Keyfactor Web APIs 11.2

Reference Guide

# Table of Contents

<b>1.0 Introduction</b>	<b>1</b>
<b>2.0 Keyfactor API Reference</b>	<b>2</b>
2.1 Overview	2
2.2 Authenticating to the Keyfactor API	3
2.3 Transaction Security	8
2.4 Endpoint Common Features	8
2.5 Versioning	11
2.6 Keyfactor API Endpoints	11
2.6.1 Agents	12
2.6.1.1 GET Agents ID	13
2.6.1.2 GET Agents	17
2.6.1.3 POST Agents Reset	23
2.6.1.4 POST Agents Approve	24
2.6.1.5 POST Agents Disapprove	24
2.6.1.6 POST Agents ID Reset	25
2.6.1.7 POST Agents ID FetchLogs	26
2.6.1.8 POST Agents Set Auth Certificate Reenrollment	26
2.6.2 Agent Blueprint	28
2.6.2.1 DELETE Agent Blueprint ID	29
2.6.2.2 GET Agent Blueprint ID	30
2.6.2.3 GET Agent Blueprint	31
2.6.2.4 GET Agent Blueprint ID Jobs	32
2.6.2.5 GET Agent Blueprint ID Stores	37
2.6.2.6 POST AgentBlueprint ApplyBlueprint	40
2.6.2.7 POST AgentBlueprint GenerateBlueprint	41
2.6.3 Agent Pools	42
2.6.3.1 DELETE Agent Pools ID	42
2.6.3.2 GET Agent Pools ID	43
2.6.3.3 GET Agent Pools	45
2.6.3.4 POST Agent Pools	48
2.6.3.5 PUT Agent Pools	50
2.6.3.6 GET Agent Pools Agents	53
2.6.4 Alerts	55
2.6.4.1 Alerts Denied	55
2.6.4.2 Alerts Expiration	88
2.6.4.3 Alerts Issued	127
2.6.4.4 Alerts Key Rotation	164
2.6.4.5 Alerts Pending	199
2.6.5 AppSetting	242
2.6.5.1 GET AppSetting	242
2.6.5.2 GET AppSetting ID	244
2.6.5.3 PUT AppSetting	246
2.6.5.4 PUT AppSetting ID Set	248
2.6.5.5 PUT AppSetting Name Set	250
2.6.6 Audit	252
2.6.6.1 GET Audit ID	252
2.6.6.2 GET Audit ID Validate	258
2.6.6.3 GET Audit	259
2.6.6.4 GET Audit Download	265
2.6.6.5 GET Audit Related Entities	269
2.6.7 Certificates	275
2.6.7.1 GET Certificates ID Security	277
2.6.7.2 GET Certificates ID Validate	279
2.6.7.3 GET Certificates Locations ID	284
2.6.7.4 GET Certificates Identity Audit ID	287
2.6.7.5 DELETE Certificates ID	291

2.6.7.6	GET Certificates ID	292
2.6.7.7	GET Certificates Metadata Compare	305
2.6.7.8	GET Certificates ID History	306
2.6.7.9	DELETE Certificates	308
2.6.7.10	GET Certificates	310
2.6.7.11	PUT Certificates Metadata	325
2.6.7.12	PUT Certificates Metadata All	326
2.6.7.13	POST Certificates Import	331
2.6.7.14	POST Certificates Revoke	336
2.6.7.15	POST Certificates Analyze	338
2.6.7.16	POST Certificates Recover	339
2.6.7.17	POST Certificates Download	343
2.6.7.18	POST Certificates Revoke All	346
2.6.7.19	DELETE Certificates Query	349
2.6.7.20	DELETE Certificates Private Key	350
2.6.7.21	DELETE Certificates Private Key ID	351
2.6.8	Certificate Authority	352
2.6.8.1	DELETE Certificate Authority ID	355
2.6.8.2	GET Certificate Authority ID	355
2.6.8.3	GET Certificate Authority	369
2.6.8.4	POST Certificate Authority	384
2.6.8.5	PUT Certificate Authority	414
2.6.8.6	POST Certificate Authority Test	445
2.6.8.7	POST Certificate Authority PublishCRL	449
2.6.8.8	GET Certificate Authority Source Count	449
2.6.8.9	GET Certificate Authority Available Forests	450
2.6.8.10	GET Certificate Authority Health Monitoring Schedule	451
2.6.8.11	GET Certificate Authority Alert Recipients CA Health Recipients	452
2.6.8.12	POST Certificate Authority Alert Recipients CA Health Recipients	452
2.6.8.13	GET Certificate Authority Alert Recipients CA Health Recipients ID	453
2.6.8.14	DELETE Certificate Authority Alert Recipients CA Health Recipients ID	454
2.6.8.15	PUT Certificate Authority Alert Recipients CA Health Recipients ID	455
2.6.8.16	DELETE Certificate Authority Alert Recipients CA Threshold Recipients ID	456
2.6.8.17	GET Certificate Authority Alert Recipients CA Threshold Recipients	456
2.6.8.18	GET Certificate Authority Alert Recipients CA Threshold Recipients ID	457
2.6.8.19	POST Certificate Authority Alert Recipients CA Threshold Recipients	458
2.6.8.20	PUT Certificate Authority Alert Recipients CA Threshold Recipients ID	459
2.6.8.21	POST Certificate Authority Import	459
2.6.9	Certificate Collections	460
2.6.9.1	GET Certificate Collections	461
2.6.9.2	POST Certificate Collections	464
2.6.9.3	PUT Certificate Collections	470
2.6.9.4	GET Certificate Collections ID	474
2.6.9.5	DELETE Certificate Collection ID	476
2.6.9.6	GET Certificate Collections Name	477
2.6.9.7	POST Certificate Collections Copy	479
2.6.9.8	GET Certificate Collection Nav Items	485
2.6.9.9	PUT Certificate Collection ID Favorite	485
2.6.9.10	GET Certificate Collections List	486
2.6.10	Certificate Stores	489
2.6.10.1	DELETE Certificate Stores	491
2.6.10.2	GET Certificate Stores	492
2.6.10.3	POST Certificate Stores	503
2.6.10.4	PUT Certificate Stores	529
2.6.10.5	DELETE Certificate Stores ID	556
2.6.10.6	GET Certificate Stores ID	557
2.6.10.7	GET Certificate Stores ID Inventory	573
2.6.10.8	GET Certificate Stores Server	576
2.6.10.9	POST Certificate Stores Server	579
2.6.10.10	PUT Certificate Stores Server	584
2.6.10.11	PUT Certificate Stores Password	590
2.6.10.12	PUT Certificate Stores Discovery Job	592

2.6.10.13	PUT Certificate Stores Assign Container	598
2.6.10.14	POST Certificate Stores Approve	608
2.6.10.15	POST Certificate Stores Schedule	619
2.6.10.16	POST Certificate Stores Reenrollment	622
2.6.10.17	POST Certificate Stores Certificates Add	624
2.6.10.18	POST Certificate Stores Certificates Remove	630
2.6.11	Certificate Store Containers	633
2.6.11.1	GET Certificate Store Containers	633
2.6.11.2	POST Certificate Store Containers	636
2.6.11.3	PUT Certificate Store Containers	641
2.6.11.4	DELETE Certificate Store Containers ID	664
2.6.11.5	GET Certificate Store Containers ID	665
2.6.12	Certificate Store Types	684
2.6.12.1	DELETE Certificate Store Types ID	684
2.6.12.2	GET Certificate Store Types ID	685
2.6.12.3	GET CertificateStoreTypes Name Name	691
2.6.12.4	DELETE Certificate Store Types	698
2.6.12.5	GET Certificate Store Types	699
2.6.12.6	POST Certificate Store Types	705
2.6.12.7	PUT Certificate Store Types	720
2.6.13	Component Installation	736
2.6.13.1	DELETE Component Installation ID	737
2.6.13.2	GET Component Installation	738
2.6.14	CSR Generation	739
2.6.14.1	DELETE CSR Generation Pending ID	740
2.6.14.2	GET CSR Generation Pending ID	741
2.6.14.3	DELETE CSR Generation Pending	741
2.6.14.4	GET CSR Generation Pending	742
2.6.14.5	POST CSR Generation Generate	743
2.6.15	Custom Job Types	748
2.6.15.1	DELETE Custom Job Types ID	748
2.6.15.2	GET Custom Job Types ID	749
2.6.15.3	GET Custom Job Types	751
2.6.15.4	POST Custom Job Types	753
2.6.15.5	PUT Custom Job Types	757
2.6.16	Enrollment	761
2.6.16.1	GET Enrollment Settings ID	762
2.6.16.2	GET Enrollment CSR Content My	769
2.6.16.3	GET Enrollment PFX Content My	786
2.6.16.4	GET Enrollment Available Renewal ID	803
2.6.16.5	GET Enrollment Available Renewal Thumbprint	805
2.6.16.6	POST Enrollment CSR	807
2.6.16.7	POST Enrollment PFX	812
2.6.16.8	POST Enrollment CSR Parse	829
2.6.16.9	POST Enrollment PFX Deploy	831
2.6.16.10	POST Enrollment PFX Replace	837
2.6.16.11	POST Enrollment Renew	840
2.6.17	Event Handler Registration	842
2.6.17.1	GET Event Handler Registration	843
2.6.17.2	POST Event Handler Registration	845
2.6.17.3	GET Event Handler Registration ID	846
2.6.17.4	PUT Event Handler Registration ID	848
2.6.17.5	DELETE Event Handler Registration ID	849
2.6.18	Extensions Scripts	849
2.6.18.1	DELETE Extensions Scripts ID	850
2.6.18.2	GET Extensions Scripts ID	851
2.6.18.3	GET Extensions Scripts	852
2.6.18.4	POST Extensions Scripts	854
2.6.18.5	PUT Extensions Scripts	858
2.6.19	Identity Providers	861
2.6.19.1	GET Identity Providers ID	862
2.6.19.2	PUT Identity Providers ID	873

2.6.19.3	GET Identity Providers	896
2.6.19.4	GET Identity Providers Types	908
2.6.20	License	910
2.6.20.1	GET License	910
2.6.21	MacEnrollment	913
2.6.21.1	GET MacEnrollment	913
2.6.21.2	PUT MacEnrollment	914
2.6.22	MetadataFields	916
2.6.22.1	DELETE Metadata Fields ID	917
2.6.22.2	GET Metadata Fields ID	918
2.6.22.3	GET Metadata Fields Name	921
2.6.22.4	GET Metadata Fields ID In Use	925
2.6.22.5	DELETE Metadata Fields	926
2.6.22.6	GET Metadata Fields	927
2.6.22.7	POST Metadata Fields	931
2.6.22.8	PUT Metadata Fields	938
2.6.23	Monitoring	945
2.6.23.1	DELETE Monitoring Revocation ID	946
2.6.23.2	GET Monitoring Revocation ID	947
2.6.23.3	GET Monitoring Revocation	951
2.6.23.4	POST Monitoring Revocation	956
2.6.23.5	PUT Monitoring Revocation	964
2.6.23.6	POST Monitoring Resolve OSCP	972
2.6.23.7	POST Monitoring Revocation Test	973
2.6.23.8	POST Monitoring Revocation Test All	974
2.6.24	Orchestrator Jobs	976
2.6.24.1	GET Orchestrator Jobs Job Status Data	977
2.6.24.2	GET Orchestrator Jobs Job History	978
2.6.24.3	GET Orchestrator Jobs Scheduled Jobs	984
2.6.24.4	POST Orchestrator Jobs Custom	988
2.6.24.5	POST Orchestrator Jobs Reschedule	993
2.6.24.6	POST Orchestrator Jobs Unschedule	995
2.6.24.7	POST Orchestrator Jobs Acknowledge	997
2.6.24.8	POST Orchestrator Jobs Custom Bulk	998
2.6.25	PAM Providers	1005
2.6.25.1	DELETE PAM Providers ID	1006
2.6.25.2	GET PAM Providers ID	1007
2.6.25.3	GET PAM Providers Types	1019
2.6.25.4	POST PAM Providers Types	1023
2.6.25.5	GET PAM Providers	1030
2.6.25.6	POST PAM Providers	1045
2.6.25.7	PUT PAM Providers	1062
2.6.25.8	GET PAM Providers Types ID	1078
2.6.26	Permissions	1081
2.6.26.1	GET Permissions	1082
2.6.27	Permission Sets	1083
2.6.27.1	GET Permission Sets ID	1086
2.6.27.2	DELETE Permission Sets ID	1087
2.6.27.3	GET Permission Sets	1087
2.6.27.4	POST Permission Sets	1089
2.6.27.5	PUT Permission Sets	1090
2.6.28	Reports	1092
2.6.28.1	GET Reports ID	1093
2.6.28.2	DELETE Reports Custom ID	1101
2.6.28.3	GET Reports Custom ID	1102
2.6.28.4	DELETE Reports Schedules ID	1103
2.6.28.5	GET Reports Schedules ID	1104
2.6.28.6	GET Reports ID Parameters	1108
2.6.28.7	PUT Reports ID Parameters	1111
2.6.28.8	GET Reports	1113
2.6.28.9	PUT Reports	1116
2.6.28.10	GET Reports Custom	1119

2.6.28.11	POST Reports Custom	1121
2.6.28.12	PUT Reports Custom	1123
2.6.28.13	GET Reports ID Schedules	1124
2.6.28.14	POST Reports ID Schedules	1129
2.6.28.15	PUT Reports ID Schedules	1140
2.6.29	Scheduling	1151
2.6.29.1	POST Scheduling	1152
2.6.30	Security	1154
2.6.30.1	DELETE Security Identities ID	1155
2.6.30.2	GET Security Identities ID	1156
2.6.30.3	GET Security Identities Lookup	1161
2.6.30.4	GET Security Identities	1161
2.6.30.5	POST Security Identities	1165
2.6.30.6	GET Security Containers ID Roles	1167
2.6.30.7	POST Security Containers ID Roles	1168
2.6.30.8	GET Security Audit Collections ID	1169
2.6.30.9	GET Security My	1172
2.6.31	Security Claims	1173
2.6.31.1	GET Security Claims	1173
2.6.31.2	POST Security Claims	1176
2.6.31.3	PUT Security Claims	1179
2.6.31.4	GET Security Claims ID	1181
2.6.31.5	DELETE Security Claims ID	1183

# 1.0 Introduction

The *Keyfactor Command Documentation Suite* includes:

- *Keyfactor Command Reference Guide*
- *Keyfactor API Reference Guide*
- *Keyfactor Command Server Installation Guide*
- *Keyfactor Orchestrators Installation and Configuration Guide*
- *Keyfactor Command Release Notes & Upgrading*

In addition, Keyfactor offers documentation for products that are not part of the *Keyfactor Command Documentation Suite*, including the *Keyfactor Command Upgrade Overview* and installation guides for third-party CA gateways that interface with Keyfactor, which are available upon request.

## 2.0 Keyfactor API Reference

The Keyfactor Command solution exposes an API to allow third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command in a secure manner and to provide a mechanism for automating routine or bulk tasks that would be cumbersome to perform through the browser-based user interface. The API complements the web components of Keyfactor Command and offer a number of HTTP method calls that provide similar functionality to that available within the Management Portal's user interface, but which can be accessed programmatically by any system capable of making web requests. The API has the following goals and constraints:

- Provide a simple interface to make integration easy for third parties.
- Develop interoperability between different technology frameworks and operating systems.
- Support common certificate enrollment and management tasks.
- Deliver a securable interface.
- Preserve backward-compatibility so that existing clients continue to work, where possible.

**Important:** The Classic API, also known as the CMS API, was removed in Keyfactor Command version 11. All uses of the Classic API should be migrated to the Keyfactor API prior to upgrading to Keyfactor Command version 11 or later.

## 2.1 Overview

In the current release, Keyfactor exposes one API for external use. The Keyfactor API was introduced in Keyfactor Command version 6.1 and as of Keyfactor Command 11.0 is the only supported API. The Keyfactor API allows for integration with other systems to automate certificate lifecycle management tasks. It will continue to be developed going forward to expose more core functionality that is built into the main product to allow for more in-depth integrations.

Documentation for the Keyfactor API is available as two companion pieces—this document (the *Keyfactor API Reference Guide*), which provides an overview of the API's endpoints, parameters to be provided in them, and data expected back from them, and the interactive code examples installed with your Keyfactor Command instance in the *Keyfactor API Reference and Utility*.

**Important:** The Classic API, also known as the CMS API, was removed in Keyfactor Command version 11. All uses of the Classic API should be migrated to the Keyfactor API prior to upgrading to Keyfactor Command version 11 or later.

## 2.2 Authenticating to the Keyfactor API

When you make a connection to Keyfactor Command using the Keyfactor API, you need to provide authentication. If you're using Active Directory as an identity provider, you have the choice to authenticate to Keyfactor Command using Basic authentication or Windows integrated authentication. Any users who have already authenticated to Keyfactor Command before opening the Keyfactor API Reference and Utility in the same browser session will be seamlessly authenticated to Keyfactor Command automatically, and will not need to re-authenticate. The need to intentionally provide authentication for the Keyfactor API comes into play in situations such as:

- You are developing or running an application or script that leverages the Keyfactor API.
- You are running a workflow step of type *Invoke REST Request* with Active Directory Basic or Windows authentication.
- You are running a workflow step of type *Invoke REST Request with OAuth* with an identity provider other than Active Directory and token authentication.
- You are using the Keyfactor API Reference and Utility and using an identity provider other than Active Directory (see [Acquire a Token to Authenticate to the Keyfactor API on the next page](#)).
- You are using the Keyfactor API Reference and Utility, using Active Directory as an identity provider, and have not authenticated to Keyfactor Command within the same browser session.

In many of these cases, you will probably want to make the API requests not as an individual user, but as a service account. The service account you use depends on the identity provider you're using:

- If you're using Active Directory as an identity provider, a standard Active Directory service account in the primary Keyfactor Command server forest can be used.
- If you're using an identity provider other than Active Directory, a client (not user) in your identity provider is used. The client should be configured with a secret and have *Client authentication* and *Service account roles* enabled (see *Using Keyfactor Identity Provider: Service Accounts* in the *Keyfactor Command Server Installation Guide*). The user who will make use of the API will need the client ID and secret as well as the bearer token URL. This is the URL of the token endpoint for your identity provider instance. For example:

```
https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/token
```

For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see *Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation* in the *Keyfactor Command Server Installation Guide*).

## Keyfactor-API-Workflow-User OpenID Connect

Clients are applications and services that connect to the Keyfactor Identity Provider on behalf of a user.

Settings Keys **Credentials** Roles Client scopes Service accounts roles Sessions Advanced

Client Authenticator Client Id and Secret

Save

Copy your Client Secret

Client secret ..... [eye icon] [copy icon] Regenerate

Registration access token ..... [copy icon] Regenerate

Figure 1: Client Secret for Keyfactor API in Keyfactor Identity Provider

This service account needs to be granted appropriate permissions in Keyfactor Command to complete the API requests that will be run as this service account.

### Acquire a Token to Authenticate to the Keyfactor API

If you're using the Keyfactor API Reference and Utility (Swagger) and using an identity provider other than Active Directory, you will need to acquire a token from your identity provider in order to authenticate to the Keyfactor API Reference and Utility. There are a number of approaches to doing this. Here we provide a couple of examples.

First, be sure that you have created a client in your identity provider (see *Using Keyfactor Identity Provider: Service Accounts* in the *Keyfactor Command Server Installation Guide*) and that you know this information about the client:

- Client ID
- Client Secret
- Bearer Token URL

To acquire a token to authenticate to the Keyfactor API either via the Keyfactor API Reference and Utility or directly, from a Linux server execute a curl command similar to the following, referencing appropriate values for your client ID, client secret, and bearer token URL:

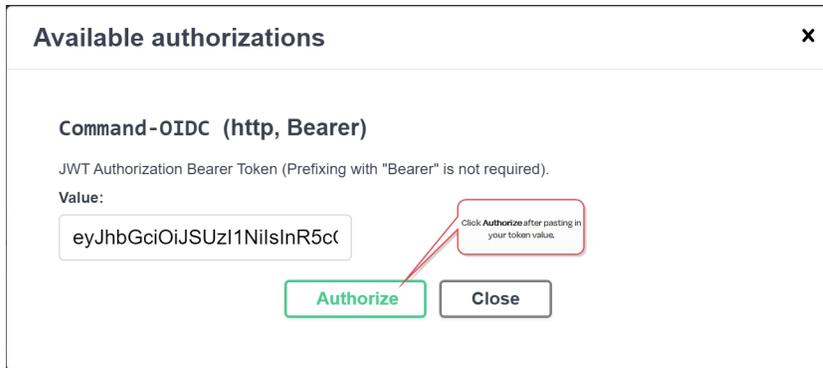

Figure 4: Enter Access Token in the Keyfactor API Reference and Utility

4. If authorization is successful, the Authorize button will change to *Logout*, and the padlocks will change to locked.

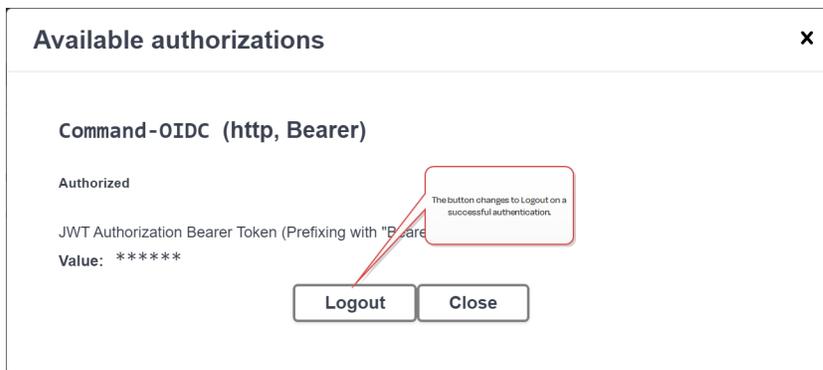

Figure 5: Successful Authorization in the Keyfactor API Reference and Utility

**Tip:** When using a token in the Keyfactor API Reference and Utility, you use the token value only. When you use a token to authenticate to the Keyfactor API other than through the Keyfactor API Reference and Utility, you need to precede the token value with *Bearer*. For example:

```
# Build the headers for the API request
$headers = @{
    "Authorization"="Bearer " + $TokenValue.access_token
    "Accept"="application/json"
    "x-keyfactor-requested-with"="APIClient"
}
```

For an example script using a token to authenticate to Keyfactor Command, see *Workflow Definitions Configuration Parameters Example: Use Custom PowerShell with Embedded REST Request, Send Email, and Require Approval* in the *Keyfactor API Reference Guide*.

**Important:** Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

## 2.3 Transaction Security

The Keyfactor API relies on SSL/TLS to protect the HTTP communications between the client and Keyfactor Command server. In a typical deployment, the API will be configured for Basic authentication, where client credentials are provided in an HTTP header, formatted as *DOMAIN\user:Password* and base-64-encoded. Basic Authentication itself is not a secure way to pass a set of user credentials. However, it is very interoperable and works well across all of the various technologies that use the API. SSL is used to protect the confidentiality of user credentials; therefore, SSL should be used with the Keyfactor API.

Keyfactor recommends that any device using the API already be configured to trust the SSL certificate presented by Keyfactor Command, allowing the SSL connection to be established without error. The process for this will depend on the platform and operating environment of the connecting client, but the appropriate documentation or support for your platform should outline the necessary steps for this.

Access to the API methods can be limited per client to a maximum request frequency. The amount of time required between calls can be configured in the Keyfactor Command Management Portal Application Settings for the API (see Application Settings: API Tab in the *Keyfactor Command Reference Guide*). Increasing this interval can mitigate certain threats such as denial of service or dictionary attacks against passwords and other sensitive data. However, setting this too high can negatively impact performance of client applications that need to make a large number of requests.

## 2.4 Endpoint Common Features

Some aspects of the Keyfactor API request and response formats are consistent across all endpoints. This includes a small set of HTTP headers, HTTP statuses returned by the server for successful requests, and various error conditions. Common request headers are given in [Table 1: Common Request Headers](#), common response headers (for successful requests and certain unsuccessful requests) are given in [Table 2: Common Response Headers](#), and HTTP statuses are given in [Table 3: HTTP Statuses](#).

By default, all Keyfactor API methods start with a base path, which corresponds to an application under IIS; this path is configurable at install time. The default base path is *KeyfactorApi*. The API component name and method name then comprise the parts of the URL, each separated by a forward slash. For example, */KeyfactorApi/Certificates/Import* would be the URL format for the Import method of the Certificates component.

Table 1: Common Request Headers

Header Name	API Version	Header Value	Description
Content-Type	Both	application/json OR application/xml	POST methods use application/json. When application/xml is needed, it is specifically indicated on the endpoint page.
Accept	Both	application/json; charset=utf-8	Most methods returning complex values will use this content type.
Authorization	Both	Basic <base-64 DOMAIN\user:pass>	In most cases, Web API clients will use Basic authentication over SSL/TLS.
Host	Both	<Keyfactor Command server hostname>	Address of Keyfactor Command server. Automatically generated in most clients.
Content-Length	Both	Request length in bytes	Optional, but automatically generated by most clients.
X-Keyfactor- Requested-With	Both	XMLHttpRequest	This is mandatory to send in a request to the Keyfactor API on POSTs, PUTs, and DELETEs, and the value is case sensitive. This is for security.
X-Keyfactor- API-Version	Keyfactor API	1 or 2	Desired version of the endpoint. If not provided, this defaults to version 1.

Table 2: Common Response Headers

Header Name	Header Value	Description
Cache-Control	no-cache	API requests are generally not cacheable. Note that this is not respected by all client systems.
Pragma	no-cache	API requests are generally not cacheable. Note that this is not respected by all client systems.
Content-Length	<varies>	Length of the HTTP response.
Content-Type	application/json	Most calls return application/json, but occasionally text/-

Header Name	Header Value	Description
		plain or text/xml.
Expires	-1	Usually ignored.
Server	<varies>	Software version reported by IIS platform hosting Keyfactor Command.
X-Keyfactor-Product-Version	<varies>	Keyfactor Command platform version.
X-Total-Count	<varies>	Total number of elements returned.
X-AspNet-Version	<varies>	Version of ASP.NET supporting Keyfactor Command installation.
X-Powered-By	ASP.NET	Header added by underlying ASP.NET implementation.
Date	<varies>	Timestamp of the HTTP response.

Table 3: HTTP Statuses

Number/Name	Description
200 OK	Request successful; results in response body
204 No Content	Request successful; no content in response body
400 Bad Request	Malformed or invalid data; additional information may be available in the response body and/or Keyfactor Command server logs
401 Unauthorized	Invalid credentials (user unauthenticated)
403 Forbidden	Can often indicate that the credentials map to a user without permissions for this action in Keyfactor Command (user unauthorized)
404 Page not Found	Invalid request path
500 Internal Server Error	Keyfactor Command encountered an unexpected error attempting to handle the request. See response body and Keyfactor Command server logs for details.
502 Bad Gateway	Keyfactor Command attempted to contact a CA or other upstream server to process the request, but was unable to. See Keyfactor Command server logs for details.

## 2.5 Versioning

The Keyfactor API is versioned as a set and released in conjunction with Keyfactor Command at the same version level (e.g. version 11.2). In addition, the Keyfactor API may have multiple versions of select endpoints.

The current strategy is to increment the version of an API when changes are made that might break backwards compatibility for existing clients. New endpoints are generally implemented in the most recent version of their API.

Generally, updates to an existing version of an endpoint are restricted to updates that should not break existing clients. Updates may be made that add HTTP response headers or response body parameters, or that correct existing bugs, or must be made to conform to newer or more granular security constraints. When an update cannot be made without breaking existing clients, a new endpoint is added in a later API version.

Figure 6: Select a Version in the Keyfactor API Reference and Utility

Most Keyfactor API endpoints have only one version, though a second version has been released for a select few endpoints. The Keyfactor API uses the `x-keyfactor-api-version` request header to differentiate between versions 1 and 2 of a given endpoint. If a version isn't specified, version 1 is assumed.

**Important:** The Classic API, also known as the CMS API, was removed in Keyfactor Command version 11. All uses of the Classic API should be migrated to the Keyfactor API prior to upgrading to Keyfactor Command version 11 or later.

## 2.6 Keyfactor API Endpoints

The documentation for the Keyfactor API endpoints in the following sections includes descriptions for all the parameters available for each endpoint and short examples of specific parameters where that has been deemed to be helpful. For complete usage examples, see the Keyfactor API Reference and Utility.

**Tip:** Click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Logout** button to find the embedded web copies of the *Keyfactor Command*

## Documentation Suite and the Keyfactor API Reference and Utility.

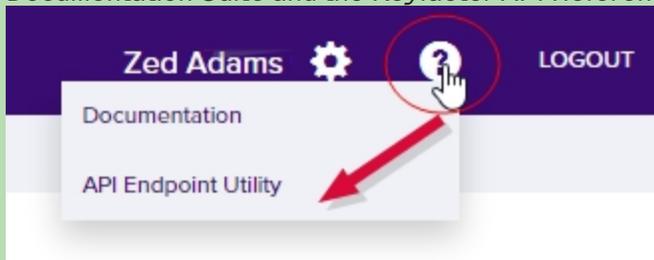

Figure 7: Documentation in the Help Dropdown

You can also browse to the *Keyfactor API Reference and Utility* directly using the following link (where *keyfactor.keyexample.com* is the fully qualified domain name of your Keyfactor Command server or the DNS alias you are using to reference your Keyfactor Command server, if applicable):

```
https://keyfactor.keyexample.com/KeyfactorAPI/ref/index#
```

```
https://keyfactor.keyexample.com/KeyfactorAPINET6/swagger
```

This link assumes that the Keyfactor API has been installed in the default IIS virtual directory (KeyfactorAPI). If you have installed in an alternate virtual directory, your path will be different.

## 2.6.1 Agents

The Agents component of the Keyfactor API includes methods necessary to list orchestrators and agents and schedule jobs to retrieve log files for orchestrators and agents that support that functionality.

Table 4: Agents Endpoints

Endpoint	Method	Description	Link
/id	GET	Returns details for a single orchestrator or agent.	<a href="#">GET Agents ID on the next page</a>
/	GET	Returns a list of all orchestrators and agents according to the provided filters and input parameters.	<a href="#">GET Agents on page 17</a>
/Reset	POST	Resets one or more orchestrators or agents to a new state and clears jobs.	<a href="#">POST Agents Reset on page 23</a>

Endpoint	Method	Description	Link
/Approve	POST	Approves an orchestrator.	<a href="#">POST Agents Approve on page 24</a>
/Disapprove	POST	Disapproves an orchestrator.	<a href="#">POST Agents Disapprove on page 24</a>
/{id}/Reset	POST	Resets a single orchestrator or agent to a new state and clears jobs.	<a href="#">POST Agents ID Reset on page 25</a>
/{id}/FetchLogs	POST	Schedules a job on the orchestrator or agent to retrieve log files.	<a href="#">POST Agents ID FetchLogs on page 26</a>
/SetAuthCertificateReenrollment	POST	Configures an orchestrator or agent to either request or require a new client authentication certificate on its next session registration.	<a href="#">POST Agents Set Auth Certificate Reenrollment on page 26</a>

### 2.6.1.1 GET Agents ID

The GET /Agents/{id} method is used to retrieve a single orchestrator or agent registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all orchestrator details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/

Table 5: GET Agents{id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The GUID of the orchestrator to retrieve. Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 17</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUID.

Table 6: GET Agent {id} Response Data

Name	Description																		
AgentId	A string indicating the GUID of the orchestrator.																		
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																		
Username	A string indicating the Active Directory user or service account the orchestrator is using to connect to Keyfactor Command.																		
AgentPlatform	<p>An integer indicating the platform for the orchestrator. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Keyfactor Windows Orchestrator</td> </tr> <tr> <td>2</td> <td>Keyfactor Java Agent</td> </tr> <tr> <td>3</td> <td>Keyfactor Mac Auto-Enrollment Agent</td> </tr> <tr> <td>4</td> <td>Keyfactor Android Agent</td> </tr> <tr> <td>5</td> <td>Keyfactor Native Agent</td> </tr> <tr> <td>6</td> <td>Keyfactor Bash Orchestrator</td> </tr> <tr> <td>7</td> <td>Keyfactor Universal Orchestrator</td> </tr> </tbody> </table>	Value	Parameter Value	0	Unknown	1	Keyfactor Windows Orchestrator	2	Keyfactor Java Agent	3	Keyfactor Mac Auto-Enrollment Agent	4	Keyfactor Android Agent	5	Keyfactor Native Agent	6	Keyfactor Bash Orchestrator	7	Keyfactor Universal Orchestrator

Name	Description								
Blueprint	A string indicating the name of the blueprint associated with the orchestrator.								
Thumbprint	A string indicating the thumbprint of the certificate that Keyfactor Command is expecting the orchestrator to use for client certificate authentication.								
LegacyThumbprint	A string indicating the thumbprint of the certificate previously used by the orchestrator for client certificate authentication before a certificate renewal operation took place (rotating the current thumbprint into the legacy thumbprint). The legacy thumbprint is cleared once the orchestrator successfully registers with the new thumbprint.								
AuthCertificateReenrollment	<p>An integer indicating the value of the orchestrator certificate reenrollment request or require status. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td> </tr> <tr> <td>1</td> <td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td> </tr> <tr> <td>2</td> <td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td> </tr> </tbody> </table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description								
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).								
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.								
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.								
LastThumbprintUsed	A string indicating the thumbprint of the certificate that the orchestrator most recently used for client certificate authentication. In most cases, this will match the <i>Thumbprint</i> .								
LastErrorCode	An integer indicating the last error code, if any, reported from the orchestrator when trying to register a session. This code is cleared on successful session registration.								
LastErrorMessage	A string indicating the last error message, if any, reported from the orchestrator when trying to register a session. This message is cleared on successful session registration.								

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.1.2 GET Agents

The GET /Agents method is used to retrieve a list of orchestrators and agents registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all orchestrator details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/agents/management/read/`

Table 7: GET Agents Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Orchestrator Management Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• AgentId</li> <li>• Blueprint</li> <li>• Capabilities (See <a href="#">Table 8: GET Agent Response Data Capabilities</a>)</li> <li>• ClientMachine</li> <li>• ErrorCode</li> <li>• ErrorMessage (last error message)</li> <li>• Identity (Username)</li> <li>• LastSeen (DateTime)</li> <li>• Platform (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator)</li> <li>• Status (1-New, 2-Approved, 3-Disapproved)</li> <li>• Version</li> </ul> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> Use the following query to return only approved orchestrators:</p> <p style="text-align: center;"><code>Status -eq "2"</code></p> <p>A value of 1 will return orchestrators with a status of <i>New</i> and a value of 3 will return orchestrators with a status of <i>Disapproved</i>.</p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Name	In	Description
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>AgentId</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 8: GET Agent Response Data

Name	Description																		
AgentId	A string indicating the GUID of the orchestrator.																		
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																		
Username	A string indicating the Active Directory user or service account the orchestrator is using to connect to Keyfactor Command.																		
AgentPlatform	<p>An integer indicating the platform for the orchestrator. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Keyfactor Windows Orchestrator</td> </tr> <tr> <td>2</td> <td>Keyfactor Java Agent</td> </tr> <tr> <td>3</td> <td>Keyfactor Mac Auto-Enrollment Agent</td> </tr> <tr> <td>4</td> <td>Keyfactor Android Agent</td> </tr> <tr> <td>5</td> <td>Keyfactor Native Agent</td> </tr> <tr> <td>6</td> <td>Keyfactor Bash Orchestrator</td> </tr> <tr> <td>7</td> <td>Keyfactor Universal Orchestrator</td> </tr> </tbody> </table>	Value	Parameter Value	0	Unknown	1	Keyfactor Windows Orchestrator	2	Keyfactor Java Agent	3	Keyfactor Mac Auto-Enrollment Agent	4	Keyfactor Android Agent	5	Keyfactor Native Agent	6	Keyfactor Bash Orchestrator	7	Keyfactor Universal Orchestrator

Name	Description								
Blueprint	A string indicating the name of the blueprint associated with the orchestrator.								
Thumbprint	A string indicating the thumbprint of the certificate that Keyfactor Command is expecting the orchestrator to use for client certificate authentication.								
LegacyThumbprint	A string indicating the thumbprint of the certificate previously used by the orchestrator for client certificate authentication before a certificate renewal operation took place (rotating the current thumbprint into the legacy thumbprint). The legacy thumbprint is cleared once the orchestrator successfully registers with the new thumbprint.								
AuthCertificateReenrollment	<p>An integer indicating the value of the orchestrator certificate reenrollment request or require status. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td> </tr> <tr> <td>1</td> <td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td> </tr> <tr> <td>2</td> <td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td> </tr> </tbody> </table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description								
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).								
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.								
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.								
LastThumbprintUsed	A string indicating the thumbprint of the certificate that the orchestrator most recently used for client certificate authentication. In most cases, this will match the <i>Thumbprint</i> .								
LastErrorCode	An integer indicating the last error code, if any, reported from the orchestrator when trying to register a session. This code is cleared on successful session registration.								
LastErrorMessage	A string indicating the last error message, if any, reported from the orchestrator when trying to register a session. This message is cleared on successful session registration.								

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.1.3 POST Agents Reset

The POST /Agents/Reset method is used to reset one or more orchestrators, including:

- Remove all current orchestrator jobs for the selected orchestrator(s).
- Delete all associated certificate stores.
- Set the orchestrator status to new.
- For orchestrators configured to use client certificate authentication, clear the certificate thumbprints stored for the orchestrator(s) to allow them to be reconfigured with a new certificate.

This endpoint returns 204 with no content upon success. On a failure, a 400 is returned with an error message.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/  
/agents/management/modify/

Table 9: POST Agents Reset Input Parameters

Name	In	Description
agentIds	Body	<b>Required.</b> An array of strings indicating the Keyfactor Command reference GUIDs of the orchestrators to reset. Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 17</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.1.4 POST Agents Approve

The POST /Agents/Approve method is used to approve one or more orchestrators (a.k.a. agents). An orchestrator must be approved before jobs for it can be scheduled or carried out. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/  
/agents/management/modify/

Table 10: POST Agents Approve Input Parameters

Name	In	Description
agentIds	Body	<b>Required.</b> An array of strings indicating the GUIDs of the orchestrators to approve. Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 17</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.1.5 POST Agents Disapprove

The POST /Agents/Disapprove method is used to disapprove one or more orchestrators (a.k.a. agents). When an orchestrator is disapproved, operations with Keyfactor Command can no longer be carried out by this orchestrator. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/  
/agents/management/modify/

Table 11: POST Agents Disapprove Input Parameters

Name	In	Description
agentIds	Body	<b>Required.</b> An array of strings indicating the orchestrator GUIDs to disapprove. Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 17</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.1.6 POST Agents ID Reset

The POST `/Agents/{id}/Reset` method is used to reset a single orchestrator, including:

- Remove all current orchestrator jobs for the selected orchestrator.
- Delete all associated certificate stores.
- Set the orchestrator status to new.
- For orchestrators configured to use client certificate authentication, clear the certificate thumbprints stored for the orchestrator to allow it to be reconfigured with a new certificate.

This endpoint returns 204 with no content upon success. On a failure, a 400 is returned with an error message.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/agents/management/read/`  
`/agents/management/modify/`

Table 12: POST Agents {id} Reset Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The GUID of the orchestrator to reset. Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 17</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.1.7 POST Agents ID FetchLogs

The POST /Agents/{id}/FetchLogs method is used to schedule a job on a Native Agent to retrieve log files. The job will be scheduled to run immediately, which means it should complete within a few minutes depending on other activity occurring at the same time. This method is currently only supported for the Native Agent. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/  
/agents/management/modify/

**Tip:** To schedule a job to retrieve logs from a Keyfactor Universal Orchestrator, use the POST /OrchestratorJobs/Custom method (see [POST Orchestrator Jobs Custom on page 988](#)).

Table 13: POST Agents {id} FetchLogs Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The GUID of the orchestrator to schedule the job for. Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 17</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.1.8 POST Agents Set Auth Certificate Reenrollment

The POST /Agents/SetAuthCertificateReenrollment method is used to request or require that one or more orchestrators (a.k.a. agents) enroll for a new client authentication certificate on the

orchestrator's next session registration. This method returns HTTP 200 OK on a success with information about any failed requests.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/read/  
/agents/management/modify/

Table 14: POST Agents Set Auth Certificate Reenrollment Input Parameters

Name	In	Description								
OrchestratorIds	Body	<p><b>Required.</b> An array of strings indicating the GUIDs of the orchestrators on which you want to change the AuthCertificateReenrollment value to request or require the orchestrator(s) to enroll for a new client authentication certificate on the next session registration.</p> <p>Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 17</a>) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.</p>								
Status	Body	<p>An integer indicating the value that AuthCertificateReenrollment should be set to. Status options are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td> </tr> <tr> <td>1</td> <td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td> </tr> <tr> <td>2</td> <td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td> </tr> </tbody> </table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description									
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).									
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.									
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.									

Table 15: POST Agents Set Auth Certificate Reenrollment Response Data

Name	Description								
FailedOrchestratorIds	An array of strings indicating the GUIDs of orchestrators that failed to update.								
Status	<p>A string indicating the value for AuthCertificateReenrollment that was requested. Status options are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td> </tr> <tr> <td>1</td> <td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td> </tr> <tr> <td>2</td> <td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td> </tr> </tbody> </table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description								
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).								
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.								
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.								

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.2 Agent BluePrint

The Agent BluePrint component of the Keyfactor API includes methods necessary to list, generate, and apply orchestrator and orchestrator blueprints for orchestrators and agents that support blueprint functionality.

Table 16: Agent BluePrint Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the orchestrator blueprint	<a href="#">DELETE Agent</a>

Endpoint	Method	Description	Link
		with the specified GUID.	<a href="#">BluePrint ID on the next page</a>
/ {id}	GET	Returns details for the orchestrator blueprint with the specified GUID.	<a href="#">GET Agent BluePrint ID on the next page</a>
/	GET	Returns details for all orchestrator blueprints.	<a href="#">GET Agent BluePrint on page 31</a>
/ {id}/Jobs	GET	Returns details of the certificate store scheduled jobs for the orchestrator blueprint with the specified GUID.	<a href="#">GET Agent BluePrint ID Jobs on page 32</a>
/ {id}/Stores	GET	Returns details of the certificate stores for the orchestrator blueprint with the specified GUID.	<a href="#">GET Agent BluePrint ID Stores on page 37</a>
/ApplyBlueprint	POST	Applies an orchestrator blueprint to one or more orchestrators.	<a href="#">POST AgentBluePrint ApplyBlueprint on page 40</a>
/GenerateBlueprint	POST	Creates a new orchestrator blueprint from an orchestrator.	<a href="#">POST AgentBluePrint GenerateBlueprint on page 41</a>

### 2.6.2.1 DELETE Agent BluePrint ID

The DELETE /AgentBluePrint/{id} method is used to delete an existing orchestrator blueprint with the specified blueprint GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/read/  
/agents/management/modify/

Table 17: DELETE Agent BluePrint {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be deleted. Use the <i>GET AgentBluePrint</i> method (see <a href="#">GET Agent BluePrint on page 31</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.2.2 GET Agent Blueprint ID

The GET /AgentBlueprint/{id} method is used to retrieve information about the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with information about the blueprint.

**Tip:** To see the certificate stores or scheduled jobs associated with the blueprint, use the GET /AgentBlueprint/{id}/Jobs method (see [GET Agent Blueprint ID Jobs on page 32](#)) or GET /AgentBlueprint/{id}/Stores method (see [GET Agent Blueprint ID Stores on page 37](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/

Table 18: GET Agent Blueprint {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be retrieved. Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on the next page</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.

Table 19: GET Agent Blueprint {id} Response Data

Name	Description
AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	A string indicating the name of the blueprint.
RequiredCapabilities	An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM).
LastModified	A string indicating the date and time the blueprint was created.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.2.3 GET Agent Blueprint

The GET /AgentBlueprint method is used to retrieve a list of blueprints defined for the orchestrators and agents registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all blueprint details.

**Tip:** The following permissions (see [Security Roles and Claims](#) in the [Keyfactor Command Reference Guide](#)) are required to use this feature:  
`/agents/management/read/`

Table 20: GET Agent Blueprint Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 21: GET Agent BluePrint Response Data

Name	Description
AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	A string indicating the name of the blueprint.
RequiredCapabilities	An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM).
LastModified	A string indicating the date and time the blueprint was created.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.2.4 GET Agent BluePrint ID Jobs

The GET /AgentBluePrint/{id}/Jobs method is used to retrieve details of the scheduled certificate store jobs for the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with a list of all the blueprint scheduled job details, including certificate stores.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/

Table 22: GET Agent Blueprint {id} Jobs Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be retrieved. Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on page 31</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>StorePath</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 23: GET Agent Blueprint {id} Jobs Response Data

Name	Description
AgentBlueprintJobId	A string indicating the GUID of the certificate store job associated with the blueprint.
AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.
AgentBlueprintId	A string indicating the GUID of the blueprint.
JobType	A string indicating the GUID of the certificate store job type.
JobTypeName	A string indicating the certificate store job type (e.g. JksInventory).
OperationType	An integer indicating the type of operation (e.g. 2 = add to certificate store, 3 = remove from certificate store).
Thumbprint	A string indicating the thumbprint of the certificate to add to or remove from the certificate store. This field is populated only for management jobs.
Contents	A string containing the certificate to be added to the certificate store. This field is populated only for management add to certificate store jobs.
Alias	A string indicating the alias to be used for the certificate upon entry into or removal from the certificate store. The function of the alias varies depending on the certificate store type. For example, for a Java keystore, it is user-generated and stored in the keystore associated with the certificate while for PEM stores it is the thumbprint of the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field is populated only for management jobs.
PrivateKeyEntry	A Boolean indicating whether the certificate store has a separate private key file. This field is populated only for management jobs.
Overwrite	A Boolean indicating whether the certificate already in the certificate store should be overwritten with the new certificate, if applicable. This field is populated only for management jobs.
HasEntryPassword	A Boolean indicating whether the certificate in the certificate store has a different password from the certificate store itself. This field is populated only for management jobs.
HasPfxPassword	A Boolean indicating whether the certificate being added to the certificate store has a private key. This field is populated only for management jobs.
RequestTimestamp	A string indicating the time at which the management job was requested. This

Name	Description						
	field is populated only for management jobs.						
KeyfactorSchedule	An object containing the schedule for the certificate store job. This field is populated only for inventory and discovery jobs.						
Subject	A string containing the reenrollment subject name using X.500 format. This field is populated only for reenrollment jobs.						
Directories	A string containing the directory or directories to search during a discovery job. This field is populated only for discovery jobs.						
IgnoredDirectories	A string containing the directories that should not be included in the search during discovery jobs. This field is populated only for discovery jobs.						
SymLinks	A Boolean indicating whether the job should follow symbolic links on Linux and UNIX operating systems and report both the actual location of a found certificate store file in addition to the symbolic link pointing to the file during discovery jobs. This option is ignored on Windows. This field is populated only for discovery jobs.						
Compatibility	A Boolean indicating whether the job will run using the compatibility mode introduced in Java version 1.8 to locate both JKS and PKCS12 type files (true) or not (false) during Java keystore discovery jobs. This field is populated only for discovery jobs.						
FileExtensions	A string containing the file extensions for which to search during a discovery job. For example, search for files with the extension “jks” in order to exclude files with other extensions such as “txt”. This field is populated only for discovery jobs.						
FileNamePatterns	A string against which to compare the file names of certificate store files and return only those that contain the specified string (e.g. myjks) during discovery jobs. This field is populated only for discovery jobs.						
AgentBlueprintStores	<p>An object that includes the certificate store information of the job. The following certificate store details are included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AgentBlueprintStoreId</td> <td>A string indicating the GUID of the certificate store associated with the blueprint.</td> </tr> <tr> <td>AgentBlueprintId</td> <td>A string indicating the GUID of the blueprint.</td> </tr> </tbody> </table>	Name	Description	AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.	AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	Description						
AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.						
AgentBlueprintId	A string indicating the GUID of the blueprint.						

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StorePath</td> <td>A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>ContainerId</td> <td>An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a>).</td> </tr> <tr> <td>CertStoreType</td> <td>An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.</td> </tr> <tr> <td>CertStoreTypeName</td> <td>A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).</td> </tr> <tr> <td>Approved</td> <td>A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.</td> </tr> </tbody> </table>	Name	Description	StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a> ).	CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.	CertStoreTypeName	A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).	Approved	A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
Name	Description												
StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a> ).												
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.												
CertStoreTypeName	A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).												
Approved	A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.												

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CreateIfMissing</td> <td>A Boolean indicating whether a new certificate store should be created with the information provided (true) or not (false). The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</td> </tr> </tbody> </table>	Name	Description	CreateIfMissing	A Boolean indicating whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.	Properties	A string containing additional properties for the store. Only some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).
Name	Description						
CreateIfMissing	A Boolean indicating whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.						
Properties	A string containing additional properties for the store. Only some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).						

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.2.5 GET Agent Blueprint ID Stores

The GET `/AgentBlueprint/{id}/Stores` method is used to retrieve details of the certificate stores for the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with a list of all the blueprint certificate store details.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/agents/management/read/`

Table 24: GET Agent Blueprint {id} Stores Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be retrieved. Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on page 31</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>StorePath</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 25: GET Agent Blueprint {id} Stores Response Data

Name	Description
AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.
AgentBlueprintId	A string indicating the GUID of the blueprint.
StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a> ).
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
CertStoreTypeName	A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).
Approved	A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean indicating whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.2.6 POST AgentBlueprint ApplyBlueprint

The POST /AgentBlueprint/ApplyBlueprint method is used to apply a blueprint with associated certificate stores and scheduled jobs to an orchestrator. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /agents/management/read/  
 /agents/management/modify/

Table 26: POST Agent Blueprint Apply Blueprint Input Parameters

Name	In	Description
templatedId	Query	A string indicating the Keyfactor Command GUID of the blueprint to apply to the orchestrator(s). Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on page 31</a> ) to retrieve a list of all the blueprints to determine the blueprint GUIDs.
	Query	<b>Required.</b> An array of strings indicating the GUIDs of the orchestrators to which the blueprint should be applied. Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 17</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.   <b>Note:</b> Orchestrators must be approved before a blueprint can be applied.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.2.7 POST AgentBlueprint GenerateBlueprint

The POST /AgentBlueprint/GenerateBlueprint method is used to create a new blueprint based on the certificate stores and scheduled jobs of one orchestrator. This method returns HTTP 200 OK on a success with details of the new blueprint.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/  
/agents/management/modify/

Table 27: POST Agent Blueprint Generate Input Parameters

Name	In	Description
agentIds	Body	<b>Required.</b> A string indicating the GUID of the orchestrator that should be used to generate the blueprint. Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 17</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.
name	Body	<b>Required.</b> A string indicating the name for the new blueprint.

Table 28: POST Agent Blueprint Generate Response Data

Name	Description
AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	A string indicating the name of the blueprint.
RequiredCapabilities	An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM).
lastModified	A string indicating the date the blueprint was generated in UTC time.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.3 Agent Pools

The Agent Pools component of the Keyfactor API includes methods necessary to programmatically add, edit, get, and delete Agent Pools. An orchestrator (a.k.a. agent) pool is a group of Keyfactor Command Windows Orchestrators and/or Universal Orchestrators that have the SSL capability. Each pool is used to divide the work of scanning a network between all orchestrators that are members of it.

Table 29: Agent Pool Endpoints

Endpoint	Method	Description	Links
/id	DELETE	Deletes the specified orchestrator pool.	<a href="#">DELETE Agent Pools ID below</a>
/id	GET	Returns limited information about the orchestrators in the specified pool.	<a href="#">GET Agent Pools ID on the next page</a>
/	GET	Returns a list of all orchestrator pools with limited information about the orchestrators assigned to each pool.	<a href="#">GET Agent Pools on page 45</a>
/	POST	Creates an orchestrator pool based on information in the request.	<a href="#">POST Agent Pools on page 48</a>
/	PUT	Updates an orchestrator pool based on information in the request.	<a href="#">PUT Agent Pools on page 50</a>
/Agents	GET	Returns a list of orchestrators associated with the Default Agent Pool.	<a href="#">GET Agent Pools Agents on page 53</a>

### 2.6.3.1 DELETE Agent Pools ID

The DELETE /AgentPools/{id} method is used to delete an existing orchestrator (a.k.a. agent) pool. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssl/read/  
/ssl/modify/

Table 30: DELETE Agent Pools {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator pool to delete. Use the <i>GET /AgentPools</i> method (see <a href="#">GET Agent Pools on page 45</a> ) to retrieve a list of all the orchestrator pools to determine the orchestrator pool GUID. The Default Agent Pool cannot be deleted.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.3.2 GET Agent Pools ID

The *GET /AgentPools/{id}* method is used to return information about a single orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with details about the requested orchestrator pool.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/read/

Table 31: GET Agent Pools {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator pool to retrieve. Use the <i>GET /AgentPools</i> method (see <a href="#">GET Agent Pools on page 45</a> ) to retrieve a list of all the orchestrator pools to determine the orchestrator pool GUID.

Table 32: GET AgentPools {id} Response Data

Name	Description																
AgentPoolId	A string indicating the GUID of the orchestrator pool.																
Name	A string indicating the name of the orchestrator pool.																
DiscoverAgentsCount	An integer specifying the number of orchestrators in the pool that can perform discovery jobs.																
MonitorAgentsCount	An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.																
Agents	<p>An array of objects containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AgentId</td> <td>A string indicating the GUID of the orchestrator.</td> </tr> <tr> <td>EnableDiscover</td> <td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td> </tr> <tr> <td>EnableMonitor</td> <td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td> </tr> <tr> <td>Version</td> <td>A string indicating the version of the orchestrator.</td> </tr> <tr> <td>AllowsDiscover</td> <td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td> </tr> <tr> <td>AllowsMonitor</td> <td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td> </tr> <tr> <td>ClientMachine</td> <td>A string indicating the client machine on which the orchestrator is installed.</td> </tr> </tbody> </table>	Name	Description	AgentId	A string indicating the GUID of the orchestrator.	EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).	EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).	Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.3.3 GET Agent Pools

The GET /AgentPools method is used to retrieve all orchestrator (a.k.a. agent) pools. This method returns HTTP 200 OK on a success with a list of all agent pool details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssl/read/`

Table 33: GET Agent Pools Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• <i>Id</i> (AgentPoolID)</li> <li>• <i>Name</i></li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 34: GET AgentPools Response Data

Name	Description																
AgentPoolId	A string indicating the GUID of the orchestrator pool.																
Name	A string indicating the name of the orchestrator pool.																
DiscoverAgentsCount	An integer specifying the number of orchestrators in the pool that can perform discovery jobs.																
MonitorAgentsCount	An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.																
Agents	<p>An array of objects containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AgentId</td> <td>A string indicating the GUID of the orchestrator.</td> </tr> <tr> <td>EnableDiscover</td> <td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td> </tr> <tr> <td>EnableMonitor</td> <td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td> </tr> <tr> <td>Version</td> <td>A string indicating the version of the orchestrator.</td> </tr> <tr> <td>AllowsDiscover</td> <td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td> </tr> <tr> <td>AllowsMonitor</td> <td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td> </tr> <tr> <td>ClientMachine</td> <td>A string indicating the client machine on which the orchestrator is installed.</td> </tr> </tbody> </table>	Name	Description	AgentId	A string indicating the GUID of the orchestrator.	EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).	EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).	Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.3.4 POST Agent Pools

The POST /AgentPools method is used to create a new orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with information about the orchestrator pool.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /ssl/read/  
 /ssl/modify/

Table 35: POST Agent Pools Input Parameters

Name	In	Description								
Name	Body	<b>Required.</b> A string indicating the name of the orchestrator pool.								
Agents	Body	A list of orchestrators that will be part of this orchestrator pool. The orchestrators <b>must not be</b> assigned to a different orchestrator pool (except the Default Agent Pool). Per orchestrator data that can be provided includes: <table border="1" data-bbox="516 1157 1403 1577"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AgentId</td> <td><b>Required.</b> A string indicating the GUID of the orchestrator being assigned.</td> </tr> <tr> <td>EnableDiscover</td> <td><b>Required*</b>. A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b>.</td> </tr> <tr> <td>EnableMonitor</td> <td><b>Required*</b>. A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b>.</td> </tr> </tbody> </table>	Name	Description	AgentId	<b>Required.</b> A string indicating the GUID of the orchestrator being assigned.	EnableDiscover	<b>Required*</b> . A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .	EnableMonitor	<b>Required*</b> . A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .
Name	Description									
AgentId	<b>Required.</b> A string indicating the GUID of the orchestrator being assigned.									
EnableDiscover	<b>Required*</b> . A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .									
EnableMonitor	<b>Required*</b> . A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .									

Table 36: POST Agent Pools Response Data

Name	Description																
AgentPoolId	A string indicating the GUID of the orchestrator pool.																
Name	A string indicating the name of the orchestrator pool.																
DiscoverAgentsCount	An integer specifying the number of orchestrators in the pool that can perform discovery jobs.																
MonitorAgentsCount	An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.																
Agents	<p>An array of objects containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AgentId</td> <td>A string indicating the GUID of the orchestrator.</td> </tr> <tr> <td>EnableDiscover</td> <td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td> </tr> <tr> <td>EnableMonitor</td> <td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td> </tr> <tr> <td>Version</td> <td>A string indicating the version of the orchestrator.</td> </tr> <tr> <td>AllowsDiscover</td> <td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td> </tr> <tr> <td>AllowsMonitor</td> <td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td> </tr> <tr> <td>ClientMachine</td> <td>A string indicating the client machine on which the orchestrator is installed.</td> </tr> </tbody> </table>	Name	Description	AgentId	A string indicating the GUID of the orchestrator.	EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).	EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).	Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.3.5 PUT Agent Pools

The PUT /AgentPools method is used to update an existing orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with information about the orchestrator pool.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /ssl/read/
- /ssl/modify/

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 37: PUT Agent Pools Input Parameters

Name	In	Description								
AgentPoolId	Body	<b>Required.</b> A string indicating the GUID of the orchestrator pool that is to be updated.								
Name	Body	<b>Required.</b> A string indicating the name of the orchestrator pool.								
Agents	Body	<p>A list of orchestrators that will be part of this orchestrator pool. The orchestrators <b>must not be</b> assigned to a different orchestrator pool (except the Default Agent Pool). Per orchestrator data that can be provided includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AgentId</td> <td><b>Required.</b> A string indicating the GUID of the orchestrator being assigned.</td> </tr> <tr> <td>EnableDiscover</td> <td><b>Required*</b> A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b>.</td> </tr> <tr> <td>EnableMonitor</td> <td><b>Required*</b> A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b>.</td> </tr> </tbody> </table>	Name	Description	AgentId	<b>Required.</b> A string indicating the GUID of the orchestrator being assigned.	EnableDiscover	<b>Required*</b> A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .	EnableMonitor	<b>Required*</b> A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .
Name	Description									
AgentId	<b>Required.</b> A string indicating the GUID of the orchestrator being assigned.									
EnableDiscover	<b>Required*</b> A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .									
EnableMonitor	<b>Required*</b> A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .									

Table 38: PUT Agent Pools Response Data

Name	Description																
AgentPoolId	A string indicating the GUID of the orchestrator pool.																
Name	A string indicating the name of the orchestrator pool.																
DiscoverAgentsCount	An integer specifying the number of orchestrators in the pool that can perform discovery jobs.																
MonitorAgentsCount	An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.																
Agents	<p>An array of objects containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AgentId</td> <td>A string indicating the GUID of the orchestrator.</td> </tr> <tr> <td>EnableDiscover</td> <td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td> </tr> <tr> <td>EnableMonitor</td> <td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td> </tr> <tr> <td>Version</td> <td>A string indicating the version of the orchestrator.</td> </tr> <tr> <td>AllowsDiscover</td> <td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td> </tr> <tr> <td>AllowsMonitor</td> <td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td> </tr> <tr> <td>ClientMachine</td> <td>A string indicating the client machine on which the orchestrator is installed.</td> </tr> </tbody> </table>	Name	Description	AgentId	A string indicating the GUID of the orchestrator.	EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).	EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).	Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.3.6 GET Agent Pools Agents

The GET /AgentPools/Agents method is used to retrieve the orchestrators (a.k.a. agents) associated with the Default Agent Pool. This method has no required input parameters. It returns HTTP 200 OK on a success with information about the Default Agent Pool orchestrators.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssl/read/`

Table 39: GET Agent Pools Default Agent Pool Agents Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Collection Manager</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• Id (Orchestrator ID, AgentID)</li> <li>• ClientMachine</li> <li>• EnableDiscover (true or false)</li> <li>• EnableMonitor (true or false)</li> <li>• Version</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>AgentId</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 40: GET Agent Pools Default Agent Pool Agents Response Data

Name	Description
AgentId	A string indicating the GUID of the orchestrator.
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).
Version	A string indicating the version of the orchestrator.
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).
ClientMachine	A string indicating the client machine on which the orchestrator is installed.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.4 Alerts

The Alerts component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, test and delete alerts for denied certificate requests, expired certificates, issued certificate requests, pending certificate requests and SSH Key Rotations.

- [Alerts Denied below](#)
- [Alerts Expiration on page 88](#)
- [Alerts Issued on page 127](#)
- [Alerts Key Rotation on page 164](#)
- [Alerts Pending on page 199](#)

### 2.6.4.1 Alerts Denied

The Alerts Denied component of the Keyfactor API includes methods necessary to create, update, retrieve, and delete alerts for denied certificate requests.

Table 41: Alerts Denied

Endpoint	Method	Description	Link
/Alerts/Denied/{id}	DELETE	Deletes a denied certificate request alert for the specified ID.	<a href="#">DELETE Alerts Denied ID below</a>
/Alerts/Denied/{id}	GET	Retrieves details for a denied certificate request alert for the specified ID.	<a href="#">GET Alerts Denied ID on the next page</a>
/Alerts/Denied	PUT	Updates a denied certificate request alert for the specified ID.	<a href="#">PUT Alerts Denied on page 78</a>
/Alerts/Denied	GET	Retrieves details for all configured denied certificate request alerts.	<a href="#">GET Alerts Denied on page 62</a>
/Alerts/Denied	POST	Creates a new denied certificate request alert.	<a href="#">POST Alerts Denied on page 68</a>

## DELETE Alerts Denied ID

The DELETE /Alerts/Denied/{id} method is used to delete the denied certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 42: DELETE Alerts Denied {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the denied certificate request alert to be deleted. Use the <i>GET /Alerts/Denied</i> method (see <a href="#">GET Alerts Denied on page 62</a> ) to retrieve a list of all the issued request alerts to determine the alert ID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Denied ID

The GET /Alerts/Denied/{id} method is used to retrieve details for the denied certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified denied certificate request alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 43: GET Alerts Denied {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the denied certificate request alert. Use the <i>GET /Alerts/Denied</i> method (see <a href="#">GET Alerts Denied on page 62</a> ) to retrieve a list of all the issued request alerts to determine the alert ID.

Table 44: GET Alerts Denied {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="581 598 1404 865" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} <ul style="list-style-type: none"> <li>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> </li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description										
Template	<p>An object containing information about the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Possible values are:</p> <table border="1" data-bbox="581 464 1398 1203"> <thead> <tr> <th data-bbox="581 464 898 525">Value</th> <th data-bbox="898 464 1398 525">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 525 898 659">Id</td> <td data-bbox="898 525 1398 659">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td data-bbox="581 659 898 821">DisplayName</td> <td data-bbox="898 659 1398 821">A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td> </tr> <tr> <td data-bbox="581 821 898 1104">ForestRoot</td> <td data-bbox="898 821 1398 1104">           A string indicating the forest root of the template.           <div data-bbox="919 926 1382 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div> </td> </tr> <tr> <td data-bbox="581 1104 898 1203">ConfigurationTenant</td> <td data-bbox="898 1104 1398 1203">A string indicating the configuration tenant of the template.</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div data-bbox="919 926 1382 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	A string indicating the forest root of the template. <div data-bbox="919 926 1382 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>6</td> <td>DeniedLogger</td> </tr> <tr> <td>7</td> <td>DeniedPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DisplayName</td> <td>A string containing the name of the event handler.</td> </tr> <tr> <td>UseHandler</td> <td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>6</td> <td>DeniedLogger</td> </tr> <tr> <td>7</td> <td>DeniedPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>6</td> <td>DeniedLogger</td> </tr> <tr> <td>7</td> <td>DeniedPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell								
ID	Event Handler Type														
6	DeniedLogger														
7	DeniedPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td>Key</td> <td>A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td>DefaultValue</td> <td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td> </tr> <tr> <td>ParameterType</td> <td>A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget</li> </ul> </td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget</li> </ul>				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).														
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget</li> </ul>														

Name	Description					
	<table border="1"> <thead> <tr> <th data-bbox="581 275 834 338">Value</th> <th data-bbox="834 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 338 834 1335"></td> <td data-bbox="834 338 1398 1335"> <p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered.  **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Denied

The GET /Alerts/Denied method is used to retrieve details of all denied certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified denied certificate request alerts.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/read/`

Table 45: GET Alerts Denied Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• DisplayName</li> <li>• Message</li> <li>• RegisteredEventHandlerId</li> <li>• Subject</li> <li>• Template_Id</li> <li>• UseHandler</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 46: GET Alerts Denied Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="581 598 1404 865" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} <ul style="list-style-type: none"> <li>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> </li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description										
Template	<p>An object containing information about the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Possible values are:</p> <table border="1" data-bbox="581 464 1398 1203"> <thead> <tr> <th data-bbox="587 472 898 527">Value</th> <th data-bbox="898 472 1391 527">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 527 898 659">Id</td> <td data-bbox="898 527 1391 659">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td data-bbox="587 659 898 821">DisplayName</td> <td data-bbox="898 659 1391 821">A string containing the name of the template.  **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## POST Alerts Denied

The POST /Alerts/Denied method is used to create a new denied certificate request alert. This method returns HTTP 200 OK on a success with details about the denied certificate request alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/modify/`

Table 47: POST Alerts Denied Input Parameters

Name	Description
Display-Name	<p><b>Required.</b> A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.</p>
Subject	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="284 913 1404 1102" style="background-color: #e0f2f1; padding: 10px; border-radius: 5px;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <div data-bbox="284 1291 1404 1690" style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <pre>"Hello {requester:givenname}, \n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason: \n\n{cmnt} \n\nCertificate information includes: \n\n&lt;table&gt; \n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt; \n&lt;/table&gt; \n\nThanks! \n\nYour Certificate Management System"</pre> </div> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

Name	Description
	<p> <b>Note:</b> The <code>\$(requester:givenname)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li><code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> <p> <b>Note:</b> The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"> <li>Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.</li> </ul>
Template ID	<p>An integer indicating the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests.</p> <p>Use the <a href="#">GET /Templates</a> method (see <a href="#">GET Templates on page 1548</a>) to retrieve a list of all the templates to determine the template ID.</p>

Name

## Description

Registered

An object containing the event handler configuration for the alert, if applicable. Possible values are:

Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" data-bbox="516 598 1377 793"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>6</td> <td>DeniedLogger</td> </tr> <tr> <td>7</td> <td>DeniedPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell
ID	Event Handler Type						
6	DeniedLogger						
7	DeniedPowershell						
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).						

Handler

For more information about event handlers, see *Using Event Handlers* in the *Keyfactor Command Reference Guide*.

Event

An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:

Value	Description
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
Key	A string indicating the reference name of the configured parameter.
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which</li> </ul>

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## PUT Alerts Denied

The PUT /Alerts/Denied method is used to update a denied certificate request alert. This method returns HTTP 200 OK on a success with details about the denied certificate request alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 49: PUT Alerts Denied Input Parameters

Name	Description
id	An integer indicating the Keyfactor Command reference ID of the denied request alert.
Display Name	<p><b>Required.</b> A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.</p>
Subject	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="277 1073 1404 1272" style="border: 1px solid #c8e6c9; padding: 10px; margin: 10px 0;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <div data-bbox="277 1451 1404 1734" style="border: 1px solid #e0e0e0; padding: 10px; margin: 10px 0;"> <pre>"Hello {requester:givenname}, \n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason: \n\n{cmnt} \n\nCertificate information includes: \n\n&lt;table&gt; \n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;SANS: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address:</pre> </div>

Name	Description
	<pre data-bbox="315 415 1357 512">{metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt; \n&lt;/table&gt; \n\nThanks! \n\nYour Certificate Management System"</pre> <p data-bbox="277 558 1305 617">See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> <div data-bbox="277 646 1406 737" style="background-color: #e1f5fe; padding: 5px;">  <b>Note:</b> The <code>\$(requester:givenname)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider. </div>
Recipients	<p data-bbox="277 772 1406 905">An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul data-bbox="277 915 1386 1010" style="list-style-type: none"> <li data-bbox="277 915 1386 1010">• <code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> <div data-bbox="277 1037 1406 1127" style="background-color: #e1f5fe; padding: 5px;">  <b>Note:</b> The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider. </div> <ul data-bbox="277 1157 1341 1220" style="list-style-type: none"> <li data-bbox="277 1157 1341 1220">• Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.</li> </ul>
Template ID	<p data-bbox="277 1255 1406 1350">An integer indicating the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests.</p> <p data-bbox="277 1360 1317 1419">Use the <code>GET /Templates</code> method (see <a href="#">GET Templates on page 1548</a>) to retrieve a list of all the templates to determine the template ID.</p>

Name

## Description

Return An object containing the event handler configuration for the alert, if applicable. Possible values are:

Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" data-bbox="516 598 1377 793"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>6</td> <td>DeniedLogger</td> </tr> <tr> <td>7</td> <td>DeniedPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell
ID	Event Handler Type						
6	DeniedLogger						
7	DeniedPowershell						
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).						

For more information about event handlers, see *Using Event Handlers* in the *Keyfactor Command Reference Guide*.

Event Return An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:

Value	Description
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
Key	A string indicating the reference name of the configured parameter.
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which</li> </ul>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.4.2 Alerts Expiration

The Alerts Expiration component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for expired certificates.

Table 51: Alerts Expiration

Endpoint	Method	Description	Link
/Alerts/Expiration/{id}	DELETE	Deletes an expired certificate alert for the specified ID.	<a href="#">DELETE Alerts Expiration ID below</a>
/Alerts/Expiration/{id}	GET	Retrieves details for an expired certificate alert for the specified ID.	<a href="#">GET Alerts Expiration ID on the next page</a>
/Alerts/Expiration/Schedule	GET	Retrieves details of the schedule for delivery of expired certificate alerts.	<a href="#">GET Alerts Expiration Schedule on page 94</a>
/Alerts/Expiration/Schedule	PUT	Updates the schedule for delivery of expired certificate alerts.	<a href="#">PUT Alerts Expiration Schedule on page 95</a>
/Alerts/Expiration	GET	Retrieves details for all configured expired certificate alerts.	<a href="#">GET Alerts Expiration on page 96</a>
/Alerts/Expiration	POST	Creates a new expired certificate alert.	<a href="#">POST Alerts Expiration on page 102</a>
/Alerts/Expiration	PUT	Updates an expired certificate for the specified ID.	<a href="#">PUT Alerts Expiration on page 112</a>
/Alerts/Expiration/Test	POST	Test an Expiration Alert	<a href="#">POST Alerts Expiration Test on page 123</a>
/Alerts/Expiration/TestAll	POST	Test All Expiration Alerts	<a href="#">POST Alerts Expiration Test All on page 125</a>

### DELETE Alerts Expiration ID

The DELETE /Alerts/Expiration/{id} method is used to delete the expiration alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 52: DELETE Alerts Expiration {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the expiration alert to be deleted. Use the <i>GET /Alerts/Expiration</i> method (see <a href="#">GET Alerts Expiration on page 96</a> ) to retrieve a list of all the expiration alerts to determine the alert ID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Expiration ID

The *GET /Alerts/Expiration/{id}* method is used to retrieve details for the expiration alert with the specified ID. This method returns HTTP 200 OK on a success with details about the specified alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 53: GET Alerts Expiration {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the expiration alert. Use the <i>GET /Alerts/Expiration</i> method (see <a href="#">GET Alerts Expiration on page 96</a> ) to retrieve a list of all the expiration alerts to determine the alert ID.

Table 54: GET Alerts Expiration {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the expiration alert.
DisplayName	A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.
Subject	A string indicating the subject for the email message that will be delivered when the alert is triggered.
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
ExpirationWarningDays	<p>An integer indicating the number of days prior to expiration to send the warning.</p> <div data-bbox="581 999 1406 1759" style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p> <b>Example:</b> When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September</p> </div>

Name	Description						
	 2nd at 12:00 am UTC would be alerted on.						
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>						
CertificateQuery	<p>An object indicating the certificate collection on which the alert is based. Possible values are:</p> <table border="1" data-bbox="581 835 1404 1096"> <thead> <tr> <th data-bbox="587 844 748 898">Value</th> <th data-bbox="748 844 1398 898">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 898 748 997">Id</td> <td data-bbox="748 898 1398 997">An integer indicating the Keyfactor Command reference ID for the certificate collection.</td> </tr> <tr> <td data-bbox="587 997 748 1087">Name</td> <td data-bbox="748 997 1398 1087">A string containing the name of the certificate collection.</td> </tr> </tbody> </table> <p>For more information about certificate collections, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.	Name	A string containing the name of the certificate collection.
Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.						
Name	A string containing the name of the certificate collection.						

Name	Description																
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1" data-bbox="581 359 1398 995"> <thead> <tr> <th data-bbox="587 367 808 428">Value</th> <th data-bbox="808 367 1391 428">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 428 808 804">Id</td> <td data-bbox="808 428 1391 804"> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 533 1369 785"> <thead> <tr> <th data-bbox="837 541 980 602">ID</th> <th data-bbox="980 541 1362 602">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 602 980 663">1</td> <td data-bbox="980 602 1362 663">ExpirationLogger</td> </tr> <tr> <td data-bbox="837 663 980 724">2</td> <td data-bbox="980 663 1362 724">ExpirationPowershell</td> </tr> <tr> <td data-bbox="837 724 980 785">3</td> <td data-bbox="980 724 1362 785">ExpirationRenewal</td> </tr> </tbody> </table> </td> </tr> <tr> <td data-bbox="587 804 808 896">DisplayName</td> <td data-bbox="808 804 1391 896">A string containing the name of the event handler.</td> </tr> <tr> <td data-bbox="587 896 808 989">UseHandler</td> <td data-bbox="808 896 1391 989">A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 533 1369 785"> <thead> <tr> <th data-bbox="837 541 980 602">ID</th> <th data-bbox="980 541 1362 602">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 602 980 663">1</td> <td data-bbox="980 602 1362 663">ExpirationLogger</td> </tr> <tr> <td data-bbox="837 663 980 724">2</td> <td data-bbox="980 663 1362 724">ExpirationPowershell</td> </tr> <tr> <td data-bbox="837 724 980 785">3</td> <td data-bbox="980 724 1362 785">ExpirationRenewal</td> </tr> </tbody> </table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description																
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 533 1369 785"> <thead> <tr> <th data-bbox="837 541 980 602">ID</th> <th data-bbox="980 541 1362 602">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 602 980 663">1</td> <td data-bbox="980 602 1362 663">ExpirationLogger</td> </tr> <tr> <td data-bbox="837 663 980 724">2</td> <td data-bbox="980 663 1362 724">ExpirationPowershell</td> </tr> <tr> <td data-bbox="837 724 980 785">3</td> <td data-bbox="980 724 1362 785">ExpirationRenewal</td> </tr> </tbody> </table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal								
ID	Event Handler Type																
1	ExpirationLogger																
2	ExpirationPowershell																
3	ExpirationRenewal																
DisplayName	A string containing the name of the event handler.																
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).																
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1" data-bbox="581 1247 1398 1730"> <thead> <tr> <th data-bbox="587 1255 837 1316">Value</th> <th data-bbox="837 1255 1391 1316">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 1316 837 1409">Id</td> <td data-bbox="837 1316 1391 1409">An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td data-bbox="587 1409 837 1501">Key</td> <td data-bbox="837 1409 1391 1501">A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td data-bbox="587 1501 837 1635">DefaultValue</td> <td data-bbox="837 1501 1391 1635">A string indicating the value for the parameter.  **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Expiration Schedule

The GET /Alerts/Expiration/Schedule method is used to retrieve the schedule for delivery of expiration alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for expiration alerts. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 55: GET Alerts Expiration Schedule Response Data

Name	Description								
Schedule	An object indicating the schedule for delivery of the expiration alerts. Possible values are: <table border="1"><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:<table border="1"><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr></tbody></table><p>For example, daily at 11:30 pm:</p><pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre></td></tr></tbody></table>	Name	Description	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1"><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Time</td><td>The date and time to next run the job. Name	Description								
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1"><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr></tbody></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).				
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).								

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## PUT Alerts Expiration Schedule

The PUT /Alerts/Expiration/Schedule method is used to create or update the schedule for delivery of expiration alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for the alerts.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 56: PUT Alerts Expiration Schedule Input Parameters

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>				
Name	Description								
Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>								

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Expiration

The GET /Alerts/Expiration method is used to retrieve details of all expiration alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified alert.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 58: GET Alerts Expiration Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• CertificateQueryId</li> <li>• Days</li> <li>• DisplayName</li> <li>• Message</li> <li>• RegisteredEventHandlerId</li> <li>• ScheduledTaskId</li> <li>• Subject</li> <li>• UseHandler</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 59: GET Alerts Expiration Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the expiration alert.
DisplayName	A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.
Subject	A string indicating the subject for the email message that will be delivered when the alert is triggered.
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
ExpirationWarningDays	<p>An integer indicating the number of days prior to expiration to send the warning.</p> <div data-bbox="581 999 1409 1759" style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p> <b>Example:</b> When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September</p> </div>

Name	Description						
	 2nd at 12:00 am UTC would be alerted on.						
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>						
CertificateQuery	<p>An object indicating the certificate collection on which the alert is based. Possible values are:</p> <table border="1" data-bbox="581 835 1404 1094"> <thead> <tr> <th data-bbox="587 844 748 898">Value</th> <th data-bbox="748 844 1398 898">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 898 748 995">Id</td> <td data-bbox="748 898 1398 995">An integer indicating the Keyfactor Command reference ID for the certificate collection.</td> </tr> <tr> <td data-bbox="587 995 748 1085">Name</td> <td data-bbox="748 995 1398 1085">A string containing the name of the certificate collection.</td> </tr> </tbody> </table> <p>For more information about certificate collections, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.	Name	A string containing the name of the certificate collection.
Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.						
Name	A string containing the name of the certificate collection.						

Name	Description																
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1" data-bbox="581 359 1398 995"> <thead> <tr> <th data-bbox="587 367 808 430">Value</th> <th data-bbox="808 367 1391 430">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 430 808 806">Id</td> <td data-bbox="808 430 1391 806"> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 533 1369 785"> <thead> <tr> <th data-bbox="837 541 980 604">ID</th> <th data-bbox="980 541 1362 604">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 604 980 659">1</td> <td data-bbox="980 604 1362 659">ExpirationLogger</td> </tr> <tr> <td data-bbox="837 659 980 714">2</td> <td data-bbox="980 659 1362 714">ExpirationPowershell</td> </tr> <tr> <td data-bbox="837 714 980 768">3</td> <td data-bbox="980 714 1362 768">ExpirationRenewal</td> </tr> </tbody> </table> </td> </tr> <tr> <td data-bbox="587 806 808 898">DisplayName</td> <td data-bbox="808 806 1391 898">A string containing the name of the event handler.</td> </tr> <tr> <td data-bbox="587 898 808 995">UseHandler</td> <td data-bbox="808 898 1391 995">A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 533 1369 785"> <thead> <tr> <th data-bbox="837 541 980 604">ID</th> <th data-bbox="980 541 1362 604">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 604 980 659">1</td> <td data-bbox="980 604 1362 659">ExpirationLogger</td> </tr> <tr> <td data-bbox="837 659 980 714">2</td> <td data-bbox="980 659 1362 714">ExpirationPowershell</td> </tr> <tr> <td data-bbox="837 714 980 768">3</td> <td data-bbox="980 714 1362 768">ExpirationRenewal</td> </tr> </tbody> </table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal	DisplayName	A string containing the name of the event handler.  **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST Alerts Expiration

The POST /Alerts/Expiration method is used to create a new expiration alert. This method returns HTTP 200 OK on a success with details about the expiration alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 60: POST Alerts Expiration Input Parameters

Name	Description
Display-Name	<p><b>Required.</b> A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.</p>
Subject	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="277 911 1403 1108" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {cn} in the alert definition and each alert generated at processing time will contain the specific common name of the given certificate instead of the variable {cn}.</p> </div>
Message	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <div data-bbox="272 1285 1406 1734" style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <pre>"Hello {requester:givenname}, \n\nThe certificate in the name {cn} issued on {certnotbefore} from {CReqID} using the {template} template will expire on {cert-notafter}. If this certificate is still in use, please consider getting a new one. \n\nCertificate information includes: \n\n&lt;table&gt; \n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt; \n&lt;/table&gt;\n\nThanks! \n\nYour Certificate Management System"</pre> </div> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference</i></p>

## Description

*Guide* for a complete list of available substitutable special text strings.

**Note:** The `$(requester:givenname)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

Expires

**Required.** An integer indicating the number of days prior to expiration to send the warning.

**Example:** When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run. For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.

If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September 2nd at 12:00 am UTC would be alerted on.

Recipients

An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:

- `{requester:mail}`

The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.

**Note:** The `$(requester:mail)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

- Your custom email-based metadata field, which would be specified similarly to `{metadata:AppOwnerEmailAddress}`.

An object containing the event handler configuration for the alert, if applicable. Possible values are:

Value	Description								
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" data-bbox="516 1234 1377 1491"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>ExpirationLogger</td> </tr> <tr> <td>2</td> <td>ExpirationPowershell</td> </tr> <tr> <td>3</td> <td>ExpirationRenewal</td> </tr> </tbody> </table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal
ID	Event Handler Type								
1	ExpirationLogger								
2	ExpirationPowershell								
3	ExpirationRenewal								
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).								

For more information about event handlers, see *Using Event Handlers* in the *Keyfactor Command Reference Guide*.

## Description

An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:

Value	Description
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
Key	A string indicating the reference name of the configured parameter.
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li> <b>LogTarget</b>            This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.         </li> <li> <b>Script</b>            This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).         </li> <li> <b>Token</b>            This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.         </li> <li> <b>Value</b>            This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.         </li> </ul>

For example, for a PowerShell handler:

```
"EventHandlerParameters": [
  {
    "Id": 28,
```

N  
a  
m  
e

## Description

```
    "Key": "cn",
    "DefaultValue": "cn",
    "ParameterType": "Token"
  },
  {
    "Id": 29,
    "Key": "AppOwnerFirstName",
    "DefaultValue": "metadata:AppOwnerFirstName",
    "ParameterType": "Token"
  },
  {
    "Id": 30,
    "Key": "Text",
    "DefaultValue": "Expiration Alert: Enterprise Web Server",
    "ParameterType": "Value"
  },
  {
    "Id": 32,
    "Key": "ScriptName",
    "DefaultValue": "MyScript.ps1",
    "ParameterType": "Script"
  }
]
```

Table 61: POST Alerts Expiration Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the expiration alert.

		<ul style="list-style-type: none"> <li>• LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).</li> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## PUT Alerts Expiration

The PUT /Alerts/Expiration method is used to update an expiration alert. This method returns HTTP 200 OK on a success with details about the alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 62: PUT Alerts Expiration Input Parameters

Name	Description
id	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the expiration alert.</p>
Display Name	<p><b>Required.</b> A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.</p>
Subject	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="272 1073 1403 1272" style="background-color: #e0f2f1; padding: 10px; border-radius: 5px;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {cn} in the alert definition and each alert generated at processing time will contain the specific common name of the given certificate instead of the variable {cn}.</p> </div>
Message	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <div data-bbox="272 1451 1403 1734" style="background-color: #f5f5f5; padding: 10px; border-radius: 5px;"> <pre>"Hello {requester:givenname}, \n\nThe certificate in the name {cn} issued on {certnotbefore} from {CAreqID} using the {template} template will expire on {cert-notafter}. If this certificate is still in use, please consider getting a new one. \n\nCertificate information includes: \n\n&lt;table&gt; \n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;</pre> </div>

## Description

```

\<tr><td>SANS: {san}</td><td>App Owner Email Address: {metadata:Ap-
pOwnerEmailAddress}</td></tr> \<tr><td>DN: {dn}</td><td>Business Critical:
{metadata:BusinessCritical}</td></tr> \</table>\n\nThanks! \n\nYour Certificate
Management System"

```

See *Table: Substitutable Special Text for Expiration Alerts* in the *Keyfactor Command Reference Guide* for a complete list of available substitutable special text strings.

**Note:** The `$(requester:givenname)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

**Required.** An integer indicating the number of days prior to expiration to send the warning.

**Example:** When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.

For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.

If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September 2nd at 12:00 am UTC would be alerted on.

An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:

- `{requester:mail}`

The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.

d

**Required.** An integer indicating the certificate collection on which to base the alert.

Use the `GET /CertificateCollections` method (see [GET Certificate Collections on page 461](#)) to retrieve a list of all the certificate collections to determine the collection ID.

## Description

An object containing the event handler configuration for the alert, if applicable. Possible values are:

Value	Description								
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" data-bbox="516 600 1377 856"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>ExpirationLogger</td> </tr> <tr> <td>2</td> <td>ExpirationPowershell</td> </tr> <tr> <td>3</td> <td>ExpirationRenewal</td> </tr> </tbody> </table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal
ID	Event Handler Type								
1	ExpirationLogger								
2	ExpirationPowershell								
3	ExpirationRenewal								
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).								

For more information about event handlers, see *Using Event Handlers* in the *Keyfactor Command Reference Guide*.

An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:

Value	Description
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
Key	A string indicating the reference name of the configured parameter.
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which</li> </ul>

Name

## Description

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST Alerts Expiration Test

The POST /Alerts/Expiration/Test method is used to test individual certificate expiration alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated or a response of “NoActionTaken” if no certificates match the test criteria entered.

**Tip:** Alerts are generated when a certificate has expired or is approaching expiration as defined by the timeframe configured in the alert. By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Expiration Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you’ll have the opportunity to view the first 100 alerts generated.

If you’re using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written, certificates renewed) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/  
/monitoring/alerts/test/

Table 64: POST Alerts Expiration Test Input Parameters

Name	In	Description
AlertId	Body	n integer indicating the reference ID of expiration alert to test. Use the GET /Alerts/Expiration method (see <a href="#">GET Alerts Expiration on page 96</a> ) to retrieve a list of all your expiration alerts to determine the alert Id.
EvaluationDate	Body	A string indicating the start date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring certificates for testing purposes.
PreviousEvaluationDate	Body	A string indicating the end date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 65: POST Alerts Expiration Test Response Data

Parameter	Description																		
ExpirationAlerts	<p>An object containing alert details resulting from the test. Expiration alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CAName</td> <td>A string indicating the certificate authority that issued the certificate in hostname\logical name format.</td> </tr> <tr> <td>CARow</td> <td>An integer containing the CA's reference ID for certificate.</td> </tr> <tr> <td>IssuedCN</td> <td>A string indicating the common name of the certificate.</td> </tr> <tr> <td>Expiry</td> <td>A string indicating the date and time when the certificate expires.</td> </tr> <tr> <td>Subject</td> <td>A string indicating the subject for the email message, including any replaced substitutable special text.</td> </tr> <tr> <td>Message</td> <td> <p>A string indicating the email message, including any replaced substitutable special text.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> </td> </tr> <tr> <td>Recipients</td> <td>An array of strings containing the recipients for the alert.</td> </tr> <tr> <td>SendDate</td> <td>A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).</td> </tr> </tbody> </table>	Name	Description	CAName	A string indicating the certificate authority that issued the certificate in hostname\logical name format.	CARow	An integer containing the CA's reference ID for certificate.	IssuedCN	A string indicating the common name of the certificate.	Expiry	A string indicating the date and time when the certificate expires.	Subject	A string indicating the subject for the email message, including any replaced substitutable special text.	Message	<p>A string indicating the email message, including any replaced substitutable special text.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>	Recipients	An array of strings containing the recipients for the alert.	SendDate	A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).
Name	Description																		
CAName	A string indicating the certificate authority that issued the certificate in hostname\logical name format.																		
CARow	An integer containing the CA's reference ID for certificate.																		
IssuedCN	A string indicating the common name of the certificate.																		
Expiry	A string indicating the date and time when the certificate expires.																		
Subject	A string indicating the subject for the email message, including any replaced substitutable special text.																		
Message	<p>A string indicating the email message, including any replaced substitutable special text.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>																		
Recipients	An array of strings containing the recipients for the alert.																		
SendDate	A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).																		
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).																		

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST Alerts Expiration Test All

The POST `/Alerts/Expiration/TestAll` method is used to test all certificate expiration alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated or a response of “NoActionTaken” if no certificates match the test criteria entered.

**Tip:** Alerts are generated when a certificate has expired or is approaching expiration as defined by the timeframe configured in the alert. By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Expiration Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you’ll have the opportunity to view the first 100 alerts generated.

If you’re using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written, certificates renewed) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/read/`  
`/monitoring/alerts/test/`

Table 66: POST Alerts Expiration Test All Input Parameters

Name	In	Description
EvaluationDate	Body	A string indicating the start date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring certificates for testing purposes.
PreviousEvaluationDate	Body	A string indicating the end date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 67: POST Alerts Expiration Test All Response Data

Parameter	Description																		
ExpirationAlerts	<p>An object containing alert details resulting from the test. Expiration alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CAName</td> <td>A string indicating the certificate authority that issued the certificate in hostname\logical name format.</td> </tr> <tr> <td>CARow</td> <td>An integer containing the CA's reference ID for certificate.</td> </tr> <tr> <td>IssuedCN</td> <td>A string indicating the common name of the certificate.</td> </tr> <tr> <td>Expiry</td> <td>A string indicating the date and time when the certificate expires.</td> </tr> <tr> <td>Subject</td> <td>A string indicating the subject for the email message, including any replaced substitutable special text.</td> </tr> <tr> <td>Message</td> <td>A string indicating the email message, including any replaced substitutable special text. <i>See Table: Substitutable Special Text for Expiration Alerts in the Keyfactor Command Reference Guide for a complete list of available substitutable special text strings.</i></td> </tr> <tr> <td>Recipients</td> <td>An array of strings containing the recipients for the alert.</td> </tr> <tr> <td>SendDate</td> <td>A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).</td> </tr> </tbody> </table>	Name	Description	CAName	A string indicating the certificate authority that issued the certificate in hostname\logical name format.	CARow	An integer containing the CA's reference ID for certificate.	IssuedCN	A string indicating the common name of the certificate.	Expiry	A string indicating the date and time when the certificate expires.	Subject	A string indicating the subject for the email message, including any replaced substitutable special text.	Message	A string indicating the email message, including any replaced substitutable special text. <i>See Table: Substitutable Special Text for Expiration Alerts in the Keyfactor Command Reference Guide for a complete list of available substitutable special text strings.</i>	Recipients	An array of strings containing the recipients for the alert.	SendDate	A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).
Name	Description																		
CAName	A string indicating the certificate authority that issued the certificate in hostname\logical name format.																		
CARow	An integer containing the CA's reference ID for certificate.																		
IssuedCN	A string indicating the common name of the certificate.																		
Expiry	A string indicating the date and time when the certificate expires.

Message	A string indicating the email message, including any replaced substitutable special text. <i>See Table: Substitutable Special Text for Expiration Alerts in the Keyfactor Command Reference Guide for a complete list of available substitutable special text strings.</i>																		
Recipients	An array of strings containing the recipients for the alert.																		
SendDate	A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).																		
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).																		

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.4.3 Alerts Issued

The Alerts Issued component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for issued certificate requests.

Table 68: Alerts Issued

Endpoint	Method	Description	Link
/Alerts/Issued/{id}	DELETE	Deletes an issued certificate request alert for the specified ID.	<a href="#">DELETE Alerts Issued ID below</a>
/Alerts/Issued/{id}	GET	Retrieves details for an issued certificate request alert for the specified ID.	<a href="#">GET Alerts Issued ID on the next page</a>
/Alerts/Issued/Schedule	GET	Retrieves details of the schedule for delivery of issued certificate request alerts.	<a href="#">GET Alerts Issued Schedule on page 133</a>
/Alerts/Issued/Schedule	PUT	Updates the schedule for delivery of issued certificate request alerts.	<a href="#">PUT Alerts Issued Schedule on page 135</a>
/Alerts/Issued	GET	Retrieves details for all configured issued certificate request alerts.	<a href="#">GET Alerts Issued on page 138</a>
/Alerts/Issued	POST	Creates a new issued certificate request alert.	<a href="#">POST Alerts Issued on page 144</a>
/Alerts/Issued	PUT	Updates an issued certificate request alert for the specified ID.	<a href="#">PUT Alerts Issued on page 154</a>

#### DELETE Alerts Issued ID

The DELETE /Alerts/Issued/{id} method is used to delete the issued certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 69: DELETE Alerts Issued {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the issued certificate request alert to be deleted. Use the <i>GET /Alerts/Issued</i> method (see <a href="#">GET Alerts Issued on page 138</a> ) to retrieve a list of all the issued request alerts to determine the alert ID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Issued ID

The *GET /Alerts/Issued/{id}* method is used to retrieve details for the issued certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified issued certificate request alert.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
*/monitoring/alerts/read/*

Table 70: GET Alerts Issued {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the issued certificate request alert. Use the <i>GET /Alerts/Issued</i> method (see <a href="#">GET Alerts Issued on page 138</a> ) to retrieve a list of all the issued request alerts to determine the alert ID.

Table 71: GET Alerts Issued {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="581 598 1404 865" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} <ul style="list-style-type: none"> <li>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> </li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description										
Template	<p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table border="1" data-bbox="581 464 1398 1199"> <thead> <tr> <th data-bbox="587 472 898 527">Value</th> <th data-bbox="898 472 1391 527">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 527 898 659">Id</td> <td data-bbox="898 527 1391 659">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td> </tr> <tr> <td data-bbox="587 659 898 821">DisplayName</td> <td data-bbox="898 659 1391 821">A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td> </tr> <tr> <td data-bbox="587 821 898 1104">ForestRoot</td> <td data-bbox="898 821 1391 1104">           A string indicating the forest root of the template.           <div data-bbox="919 926 1377 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div> </td> </tr> <tr> <td data-bbox="587 1104 898 1190">ConfigurationTenant</td> <td data-bbox="898 1104 1391 1190">A string indicating the configuration tenant of the template.</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div data-bbox="919 926 1377 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	A string indicating the forest root of the template. <div data-bbox="919 926 1377 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>IssuedLogger</td> </tr> <tr> <td>5</td> <td>IssuedPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DisplayName</td> <td>A string containing the name of the event handler.</td> </tr> <tr> <td>UseHandler</td> <td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>IssuedLogger</td> </tr> <tr> <td>5</td> <td>IssuedPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>IssuedLogger</td> </tr> <tr> <td>5</td> <td>IssuedPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell								
ID	Event Handler Type														
4	IssuedLogger														
5	IssuedPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td>Key</td> <td>A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td>DefaultValue</td> <td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td> </tr> <tr> <td>ParameterType</td> <td>A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget</li> </ul> </td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget</li> </ul>				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).														
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget</li> </ul>

Value	Description					
	<p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).</li> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>					

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Issued Schedule

The GET /Alerts/Issued/Schedule method is used to retrieve the schedule for delivery of issued certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for issued certificate request alerts. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 72: GET Alerts Issued Schedule Response Data

Name	Description														
Schedule	<p>An object indicating the schedule for delivery of the issued request alerts. Possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description														
Minutes	An integer indicating the number of minutes between each interval.														
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).														

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Issued

The GET /Alerts/Issued method is used to retrieve details of all issued certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified issued certificate request alerts.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/read/`

Table 75: GET Alerts Issued Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• DisplayName</li> <li>• Message</li> <li>• RegisteredEventHandlerId</li> <li>• Subject</li> <li>• Template_Id</li> <li>• UseHandler</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 76: GET Alerts Issued Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="581 598 1404 865" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} <ul style="list-style-type: none"> <li>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> </li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description										
Template	<p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table border="1" data-bbox="581 464 1398 1199"> <thead> <tr> <th data-bbox="587 472 898 527">Value</th> <th data-bbox="898 472 1391 527">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 527 898 659">Id</td> <td data-bbox="898 527 1391 659">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td> </tr> <tr> <td data-bbox="587 659 898 821">DisplayName</td> <td data-bbox="898 659 1391 821">A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td> </tr> <tr> <td data-bbox="587 821 898 1104">ForestRoot</td> <td data-bbox="898 821 1391 1104">           A string indicating the forest root of the template.           <div data-bbox="919 926 1377 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div> </td> </tr> <tr> <td data-bbox="587 1104 898 1190">ConfigurationTenant</td> <td data-bbox="898 1104 1391 1190">A string indicating the configuration tenant of the template.</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div data-bbox="919 926 1377 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	A string indicating the forest root of the template. <div data-bbox="919 926 1377 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1" data-bbox="581 359 1398 932"> <thead> <tr> <th data-bbox="587 367 808 430">Value</th> <th data-bbox="808 367 1391 430">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 430 808 743">Id</td> <td data-bbox="808 430 1391 743"> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 533 1369 722"> <thead> <tr> <th data-bbox="837 541 987 604">ID</th> <th data-bbox="987 541 1362 604">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 604 987 659">4</td> <td data-bbox="987 604 1362 659">IssuedLogger</td> </tr> <tr> <td data-bbox="837 659 987 714">5</td> <td data-bbox="987 659 1362 714">IssuedPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td data-bbox="587 743 808 835">DisplayName</td> <td data-bbox="808 743 1391 835">A string containing the name of the event handler.</td> </tr> <tr> <td data-bbox="587 835 808 932">UseHandler</td> <td data-bbox="808 835 1391 932">A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 533 1369 722"> <thead> <tr> <th data-bbox="837 541 987 604">ID</th> <th data-bbox="987 541 1362 604">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 604 987 659">4</td> <td data-bbox="987 604 1362 659">IssuedLogger</td> </tr> <tr> <td data-bbox="837 659 987 714">5</td> <td data-bbox="987 659 1362 714">IssuedPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 533 1369 722"> <thead> <tr> <th data-bbox="837 541 987 604">ID</th> <th data-bbox="987 541 1362 604">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 604 987 659">4</td> <td data-bbox="987 604 1362 659">IssuedLogger</td> </tr> <tr> <td data-bbox="837 659 987 714">5</td> <td data-bbox="987 659 1362 714">IssuedPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell								
ID	Event Handler Type														
4	IssuedLogger														
5	IssuedPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1" data-bbox="581 1184 1398 1717"> <thead> <tr> <th data-bbox="587 1192 837 1255">Value</th> <th data-bbox="837 1192 1391 1255">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 1255 837 1348">Id</td> <td data-bbox="837 1255 1391 1348">An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td data-bbox="587 1348 837 1440">Key</td> <td data-bbox="837 1348 1391 1440">A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td data-bbox="587 1440 837 1570">DefaultValue</td> <td data-bbox="837 1440 1391 1570">A string indicating the value for the parameter. ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget</li> </ul>														

Name	Description	
	Value	Description
		<p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).</li> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST Alerts Issued

The POST /Alerts/Issued method is used to create a new issued certificate request alert. This method returns HTTP 200 OK on a success with details about the issued certificate request alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/modify/`

Table 77: POST Alerts Issued Input Parameters

Name	Description
Display-Name	<p><b>Required.</b> A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.</p>
Subject	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="280 909 1404 1108" style="background-color: #e0f2f1; padding: 10px; border-radius: 5px;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <div data-bbox="280 1285 1404 1696" style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <pre>"Hello {requester:givenname}, \n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here: \n\n {dnldlink} \n\nCertificate information includes: \n\n&lt;table&gt; \n&lt;tr&gt;&lt;th&gt;Cer- tificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Serial Number: {seri- al}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:Ap- pOwnerLastName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt; \n&lt;/table&gt; \n\nThanks! \n\nYour Certificate Management System"</pre> </div> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

Name	Description
	<p> <b>Note:</b> The <code>\$(requester:givenname)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li><code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> <p> <b>Note:</b> The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"> <li>Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.</li> </ul>
Template ID	<p>An integer indicating the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests.</p> <p>Use the <a href="#">GET /Templates</a> method (see <a href="#">GET Templates on page 1548</a>) to retrieve a list of all the templates to determine the template ID.</p>

Name

## Description

Reference

An object containing the event handler configuration for the alert, if applicable. Possible values are:

Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" data-bbox="516 598 1377 793"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>IssuedLogger</td> </tr> <tr> <td>5</td> <td>IssuedPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell
ID	Event Handler Type						
4	IssuedLogger						
5	IssuedPowershell						
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).						

Reference

For more information about event handlers, see *Using Event Handlers* in the *Keyfactor Command Reference Guide*.

Event

An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:

Value	Description
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
Key	A string indicating the reference name of the configured parameter.
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which</li> </ul>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## PUT Alerts Issued

The PUT /Alerts/Issued method is used to update an issued certificate request alert. This method returns HTTP 200 OK on a success with details about the issued certificate request alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 79: PUT Alerts Issued Input Parameters

Name	Description
id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
Display Name	<p><b>Required.</b> A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.</p>
Subject	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="277 1073 1403 1272" style="background-color: #e0f2f1; padding: 10px; border-radius: 5px;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <div data-bbox="277 1451 1403 1728" style="background-color: #e0e0e0; padding: 10px; border-radius: 5px;"> <pre>"Hello {requester:givenname}, \n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. 	<p>event should be logged.</p> <ul style="list-style-type: none"> <li>• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).</li> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

For example, for a PowerShell handler:

```

"EventHandlerParameters": [
  {
    "Id": 28,
    "Key": "cn",
    "DefaultValue": "cn",
    "ParameterType": "Token"
  },
  {
    "Id": 29,
    "Key": "AppOwnerFirstName",
    "DefaultValue": "metadata:AppOwnerFirstName",
    "ParameterType": "Token"
  },
  {
    "Id": 30,
    "Key": "Text",
    "DefaultValue": "Issued Alert: Enterprise Web Server",

```

Name	Description
	<pre data-bbox="277 367 1406 982">        "ParameterType": "Value"       },       {         "Id": 31,         "Key": "DownloadLink",         "DefaultValue": "dnldlink",         "ParameterType": "Token"       },       {         "Id": 32,         "Key": "ScriptName",         "DefaultValue": "MyScript.ps1",         "ParameterType": "Script"       }     ]</pre>

Table 80: PUT Alerts Issued Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="581 600 1406 867" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} <ul style="list-style-type: none"> <li>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> </li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description										
Template	<p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table border="1" data-bbox="581 464 1403 1205"> <thead> <tr> <th data-bbox="581 464 899 527">Value</th> <th data-bbox="899 464 1403 527">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 527 899 659">Id</td> <td data-bbox="899 527 1403 659">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td> </tr> <tr> <td data-bbox="581 659 899 821">DisplayName</td> <td data-bbox="899 659 1403 821">A string containing the name of the template. **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.4.4 Alerts Key Rotation

The Alerts Key Rotation component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for SSH keys approaching the end of the key lifetime. The default key lifetime is 365 days, but this setting is configurable (see *Application Settings: SSH Tab* in the *Keyfactor Command Reference Guide*). Key rotation alerts apply to both user keys (see *My SSH Key* in the *Keyfactor Command Reference Guide*) and service account keys (see *Service Account Keys* in the *Keyfactor Command Reference Guide*) generated within Keyfactor Command.

Table 81: Alerts Key Rotation

Endpoint	Method	Description	Link
/Alerts/KeyRotation/{id}	DELETE	Deletes an SSH key rotation alert for the specified ID.	<a href="#">DELETE Alerts Key Rotation ID on the next page</a>
/Alerts/KeyRotation/{id}	GET	Retrieves details for the SSH key rotation alert for the specified ID.	<a href="#">GET Alerts Key Rotation ID on the next page</a>
/Alerts/KeyRotation/Schedule	GET	Retrieves details of the schedule for delivery of SSH key rotation alerts.	<a href="#">GET Alerts Key Rotation Schedule on page 168</a>
/Alerts/KeyRotation/Schedule	PUT	Updates the schedule for delivery of SSH key rotation alerts.	<a href="#">PUT Alerts Key Rotation Schedule on page 171</a>
/Alerts/KeyRotation	GET	Retrieves details for all configured SSH key rotation alerts.	<a href="#">GET Alerts Key Rotation on page 174</a>
/Alerts/KeyRotation	POST	Creates a new SSH key rotation alert.	<a href="#">POST Alerts Key Rotation on page 178</a>
/Alerts/KeyRotation	PUT	Updates the SSH key rotation alert for a specified ID.	<a href="#">PUT Alerts Key Rotation on page 186</a>
/Alerts/KeyRotation/Test	POST	Used to test specific SSH key rotation alerts.	<a href="#">POST Alerts Key Rotation Test on page 195</a>
/Alerts/KeyRotation/TestAll	POST	Used to test all SSH key rotation alerts.	<a href="#">POST Alerts Key Rotation Test All on page 197</a>

## DELETE Alerts Key Rotation ID

The DELETE /Alerts/KeyRotation/{id} method is used to delete the SSH key rotation alert with the specified ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 82: DELETE Alerts Key Rotation {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH key rotation alert to be deleted. Use the GET /Alerts/KeyRotation method (see <a href="#">GET Alerts Key Rotation on page 174</a> ) to retrieve a list of all the SSH key rotation alerts to determine the alert ID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Key Rotation ID

The GET /Alerts/KeyRotation/{id} method is used to retrieve details for the SSH key rotation alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified SSH key rotation alert.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 83: GET Alerts Key Rotation {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH key rotation alert. Use the GET /Alerts/KeyRotation method (see <a href="#">GET Alerts Key Rotation on page 174</a> ) to retrieve a list of all the SSH key rotation alerts to determine the alert ID.

Table 84: GET Alerts Key Rotation {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.
DisplayName	A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="553 600 1406 835" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
RotationWarningDays	An integer indicating the number of days prior to the end of an SSH key's lifetime the alert should be triggered.

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1" data-bbox="553 363 1401 898"> <thead> <tr> <th data-bbox="553 363 797 428">Value</th> <th data-bbox="797 363 1401 428">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 428 797 743">Id</td> <td data-bbox="797 428 1401 743"> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="821 533 1377 726"> <thead> <tr> <th data-bbox="821 533 951 598">ID</th> <th data-bbox="951 533 1377 598">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="821 598 951 663">10</td> <td data-bbox="951 598 1377 663">SSHKeyRotationLogger</td> </tr> <tr> <td data-bbox="821 663 951 726">11</td> <td data-bbox="951 663 1377 726">SSHKeyRotationPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td data-bbox="553 743 797 808">DisplayName</td> <td data-bbox="797 743 1401 808">A string containing the name of the event handler.</td> </tr> <tr> <td data-bbox="553 808 797 898">UseHandler</td> <td data-bbox="797 808 1401 898">A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="821 533 1377 726"> <thead> <tr> <th data-bbox="821 533 951 598">ID</th> <th data-bbox="951 533 1377 598">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="821 598 951 663">10</td> <td data-bbox="951 598 1377 663">SSHKeyRotationLogger</td> </tr> <tr> <td data-bbox="821 663 951 726">11</td> <td data-bbox="951 663 1377 726">SSHKeyRotationPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell	DisplayName	A string containing the name of the event handler. Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging</li> </ul>														

Name	Description	
	Value	<p data-bbox="867 359 1390 453">handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul data-bbox="841 468 1390 1213" style="list-style-type: none"> <li data-bbox="841 468 1390 730">• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).</li> <li data-bbox="841 743 1390 1041">• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li data-bbox="841 1054 1390 1213">• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### GET Alerts Key Rotation Schedule

The GET /Alerts/KeyRotation/Schedule method is used to retrieve the schedule for delivery of SSH key rotation alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for SSH key rotation alerts. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/read/`

Table 85: GET Alerts Key Rotation Schedule Response Data

Name	Description														
Schedule	<p>An object indicating the schedule for delivery of the SSH key rotation alerts. Possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Key Rotation

The GET /Alerts/KeyRotation method is used to retrieve details of all SSH key rotation alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified SSH key rotation alerts.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/read/`

Table 88: GET Alerts Key Rotation Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• Days</li> <li>• DisplayName</li> <li>• Message</li> <li>• RegisteredEventHandlerId</li> <li>• ScheduledTaskId</li> <li>• Subject</li> <li>• UseHandler</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 89: GET Alerts Key Rotation Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.
DisplayName	A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="553 600 1406 835" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
RotationWarningDays	An integer indicating the number of days prior to the end of an SSH key's lifetime the alert should be triggered.

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>10</td> <td>SSHKeyRotationLogger</td> </tr> <tr> <td>11</td> <td>SSHKeyRotationPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DisplayName</td> <td>A string containing the name of the event handler.</td> </tr> <tr> <td>UseHandler</td> <td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>10</td> <td>SSHKeyRotationLogger</td> </tr> <tr> <td>11</td> <td>SSHKeyRotationPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>10</td> <td>SSHKeyRotationLogger</td> </tr> <tr> <td>11</td> <td>SSHKeyRotationPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell								
ID	Event Handler Type														
10	SSHKeyRotationLogger														
11	SSHKeyRotationPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td>Key</td> <td>A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td>DefaultValue</td> <td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td> </tr> <tr> <td>ParameterType</td> <td>A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging</li> </ul> </td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging</li> </ul>				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).														
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging</li> </ul>														

Name	Description	
	Value	<p data-bbox="867 359 1390 453">handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul data-bbox="841 468 1390 1213" style="list-style-type: none"> <li data-bbox="841 468 1390 730">• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).</li> <li data-bbox="841 743 1390 1041">• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li data-bbox="841 1054 1390 1213">• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST Alerts Key Rotation

The POST /Alerts/KeyRotation method is used to create a new SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/modify/`

Table 90: POST Alerts Key Rotation Input Parameters

Name	Description
Display Name	<p><b>Required.</b> A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.</p>
Subject	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="272 911 1403 1108" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}.</p> </div>
Message	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <div data-bbox="272 1285 1403 1768" style="background-color: #f5f5f5; padding: 10px; border: 1px solid #ccc; border-radius: 10px;"> <pre>"Hello,\n\nYou requested an SSH key pair almost a year ago with the following information: \n\n&lt;table&gt; \n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value &lt;/th&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt;{username}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt;{fingerprint}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt;&lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt;{server-logons}&lt;/td&gt;&lt;/tr&gt; \n&lt;/table&gt; \n\nCorporate policy requires key rotation every year. Please visit the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshMyKey\"&gt; My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href=f=\"https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys\"&gt; Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair. \n\nThanks!"</pre> </div>

An object containing the event handler configuration for the alert, if applicable. Possible values are:

Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"><thead><tr><th>ID</th><th>Event Handler Type</th></tr></thead><tbody><tr><td>10</td><td>SSHKeyRotationLogger</td></tr><tr><td>11</td><td>SSHKeyRotationPowershell</td></tr></tbody></table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell
ID	Event Handler Type						
10	SSHKeyRotationLogger						
11	SSHKeyRotationPowershell						
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).						

For more information about event handlers, see *Using Event Handlers* in the *Keyfactor Command Reference Guide*.

Name

## Description

Parameter

Event

An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:

Value	Description
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
Key	A string indicating the reference name of the configured parameter.
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"><li>• LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li><li>• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).</li><li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li><li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li></ul>

For example, for a PowerShell handler:

```
"EventHandlerParameters": [  
  {  
    "Id": 28,  
    "Key": "user",  
    "DefaultValue": "username",  
    "ParameterType": "Token"  
  },  
  {  
    "Id": 29,  
    "Key": "comment",  
    "DefaultValue": "comment",  
    "ParameterType": "Token"  
  },  
  {  
    "Id": 30,  
    "Key": "Text",  
    "DefaultValue": "Key Rotation Alert: 3 Days",  
    "ParameterType": "Value"  
  },  
  {  
    "Id": 32,  
    "Key": "ScriptName",  
    "DefaultValue": "MyScript.ps1",  
    "ParameterType": "Script"  
  }  
]
```

Table 91: POST Alerts Key Rotation Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.
DisplayName	A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="553 600 1406 835" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
RotationWarningDays	An integer indicating the number of days prior to the end of an SSH key's lifetime the alert should be triggered.

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1" data-bbox="553 363 1401 898"> <thead> <tr> <th data-bbox="553 363 797 426">Value</th> <th data-bbox="797 363 1401 426">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 426 797 741">Id</td> <td data-bbox="797 426 1401 741"> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="821 533 1377 726"> <thead> <tr> <th data-bbox="821 533 951 596">ID</th> <th data-bbox="951 533 1377 596">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="821 596 951 659">10</td> <td data-bbox="951 596 1377 659">SSHKeyRotationLogger</td> </tr> <tr> <td data-bbox="821 659 951 722">11</td> <td data-bbox="951 659 1377 722">SSHKeyRotationPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td data-bbox="553 741 797 804">DisplayName</td> <td data-bbox="797 741 1401 804">A string containing the name of the event handler.</td> </tr> <tr> <td data-bbox="553 804 797 898">UseHandler</td> <td data-bbox="797 804 1401 898">A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="821 533 1377 726"> <thead> <tr> <th data-bbox="821 533 951 596">ID</th> <th data-bbox="951 533 1377 596">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="821 596 951 659">10</td> <td data-bbox="951 596 1377 659">SSHKeyRotationLogger</td> </tr> <tr> <td data-bbox="821 659 951 722">11</td> <td data-bbox="951 659 1377 722">SSHKeyRotationPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell	DisplayName	A string containing the name of the event handler. **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## PUT Alerts Key Rotation

The PUT /Alerts/KeyRotation method is used to update a SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/modify/`

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 92: PUT Alerts Key Rotation Input Parameters

Name	Description
id	An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.
Display Name	<p><b>Required.</b> A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.</p>
Subject	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="272 1073 1403 1272" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}.</p> </div>
Message	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <div data-bbox="272 1451 1403 1738" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <pre>"Hello,\n\nYou requested an SSH key pair almost a year ago with the following information: \n\n&lt;table&gt; \n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value &lt;/th&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt;{username}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt;{fingerprint}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt;&lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt;{server-logons}&lt;/td&gt;&lt;/tr&gt; \n&lt;/table&gt; \n\nCorporate policy requires key rotation every</pre> </div>

Name	Description
	<p><code>year. Please visit the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshMyKey\"&gt; My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href-f=\"https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys\"&gt; Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair.  \n\nThanks!</code></p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Rotation Days	<p>An integer indicating the number of days prior to the end of an SSH key's lifetime the alert should be triggered.</p>

Name

## Description

Reference

An object containing the event handler configuration for the alert, if applicable. Possible values are:

Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" data-bbox="576 598 1377 793"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>10</td> <td>SSHKeyRotationLogger</td> </tr> <tr> <td>11</td> <td>SSHKeyRotationPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell
ID	Event Handler Type						
10	SSHKeyRotationLogger						
11	SSHKeyRotationPowershell						
DisplayName	A string containing the name of the event handler.						
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).						

For more information about event handlers, see *Using Event Handlers* in the *Keyfactor Command Reference Guide*.

Event

An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:

Value	Description
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
Key	A string indicating the reference name of the configured parameter.
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event</li> </ul>

## Description

Value	Description
	<p>should be logged.</p> <ul style="list-style-type: none"> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

For example, for a PowerShell handler:

```

"EventHandlerParameters": [
  {
    "Id": 28,
    "Key": "user",
    "DefaultValue": "username",
    "ParameterType": "Token"
  },
  {
    "Id": 29,
    "Key": "comment",
    "DefaultValue": "comment",
    "ParameterType": "Token"
  },
  {
    "Id": 30,
    "Key": "Text",
    "DefaultValue": "Key Rotation Alert: 3 Days",

```

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### POST Alerts Key Rotation Test

The POST /Alerts/KeyRotation/Test method is used to test a specific SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert or a response of “NoActionTaken” if no keys match the test criteria entered.

**Tip:** Alerts are generated when an SSH key is approaching or has reached its stale date as defined by the timeframe configured in the alert and the SSH key lifetime (the *Key Lifetime (days)* application setting).

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Key Rotation Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/monitoring/alerts/read/  
/monitoring/alerts/test/

Table 94: POST Alerts Key Rotation Test Input Parameters

Parameter	In	Description
AlertId	Body	<b>Required.</b> An integer of the reference ID of the SSH key rotation alert to test.  Use the GET /Alerts/KeyRotation method (see <a href="#">GET Alerts Key Rotation on page 174</a> ) to retrieve a list of all your key rotation alerts to determine the alert Id.
EvaluationDate	Body	<b>Required.</b> A string indicating the start date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).  You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring keys for testing purposes.
PreviousEvaluationDate	Body	<b>Required.</b> A string indicating the end date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 95: POST Alerts Key Rotation Test Response Data

Parameter	Description								
KeyRotationAlerts	<p>An object containing alert details resulting from the test. Expiration alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject</td> <td>A string indicating the subject for the email message, including any replaced substitutable special text.</td> </tr> <tr> <td>Message</td> <td> <p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> </td> </tr> <tr> <td>Recipient</td> <td>A string indicating the recipient for the alert.</td> </tr> </tbody> </table>	Name	Description	Subject	A string indicating the subject for the email message, including any replaced substitutable special text.	Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>	Recipient	A string indicating the recipient for the alert.
Name	Description								
Subject	A string indicating the subject for the email message, including any replaced substitutable special text.								
Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>								
Recipient	A string indicating the recipient for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST Alerts Key Rotation Test All

The POST /Alerts/KeyRotation/TestAll method is used to test all SSH key rotation alerts. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert or a response of “NoActionTaken” if no keys match the test criteria entered.

 **Tip:** Alerts are generated when an SSH key is approaching or has reached its stale date as defined by the timeframe configured in the alert and the SSH key lifetime (the *Key Lifetime (days)* application setting). By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Key Rotation Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you’ll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /monitoring/alerts/read/  
 /monitoring/alerts/test/

Table 96: POST Alerts Key Rotation Test All Input Parameters

Parameter	In	Description
EvaluationDate	Body	<b>Required.</b> A string indicating the start date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).  You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring keys for testing purposes.
PreviousEvaluationDate	Body	<b>Required.</b> A string indicating the end date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 97: POST Alerts Key Rotation Test All Response Data

Parameter	Description								
KeyRotationAlerts	<p>An object containing alert details resulting from the test. Expiration alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject</td> <td>A string indicating the subject for the email message, including any replaced substitutable special text.</td> </tr> <tr> <td>Message</td> <td> <p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> </td> </tr> <tr> <td>Recipient</td> <td>A string indicating the recipient for the alert.</td> </tr> </tbody> </table>	Name	Description	Subject	A string indicating the subject for the email message, including any replaced substitutable special text.	Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>	Recipient	A string indicating the recipient for the alert.
Name	Description								
Subject	A string indicating the subject for the email message, including any replaced substitutable special text.								
Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>								
Recipient	A string indicating the recipient for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.4.5 Alerts Pending

The Alerts Pending component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for certificate requests that require approval based on policy on the CA.

 **Important:** Pending alerts are **not** used to provide email alerts for certificate requests that require approval based on policies configured in Keyfactor Command workflows. These alerts are configured as steps within the workflow (see [Workflow Definitions on page 1610](#)). For more information about the difference between alerting for certificate requests that require manager approval at the CA level and alerting for certificate requests that require manager approval at the Keyfactor Command workflow level, see *Pending Certificate Request Alerts* in the *Keyfactor Command Reference Guide*.

Table 98: Alerts Pending

Endpoint	Method	Description	Link
/Alerts/Pending/{id}	DELETE	Deletes a pending certificate request alert for the specified ID.	<a href="#">DELETE Alerts Pending ID below</a>
/Alerts/Pending/{id}	GET	Retrieves details for a pending certificate request alert for the specified ID.	<a href="#">GET Alerts Pending ID on the next page</a>
/Alerts/Pending	PUT	Updates a pending certificate request alert for a specified ID.	<a href="#">PUT Alerts Pending on page 228</a>
/Alerts/Pending/Schedule	GET	Retrieves details of the schedule for delivery of pending certificate request alerts.	<a href="#">GET Alerts Pending Schedule on page 206</a>
/Alerts/Pending/Schedule	PUT	Updates the schedule for delivery of pending certificate request alerts.	<a href="#">PUT Alerts Pending Schedule on page 208</a>
/Alerts/Pending	GET	Retrieves details for all configured pending certificate request alerts.	<a href="#">GET Alerts Pending on page 211</a>
/Alerts/Pending	POST	Creates a new pending certificate request alert.	<a href="#">POST Alerts Pending on page 217</a>
/Alerts/Pending/Test	POST	Tests all alerts	<a href="#">POST Alerts Pending TestAll on page 240</a>
/Alerts/Pending/Test/{id}	POST	Tests specific alerts	<a href="#">POST Alerts Pending Test on page 238</a>

### DELETE Alerts Pending ID

The DELETE /Alerts/Pending/{id} method is used to delete the pending certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 99: DELETE Alerts Pending {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the pending certificate request alert to be deleted. Use the GET /Alerts/Pending method (see <a href="#">GET Alerts Pending on page 211</a> ) to retrieve a list of all the pending request alerts to determine the alert ID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Pending ID

The GET /Alerts/Pending/{id} method is used to retrieve details for the pending certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified pending certificate request alert.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 100: GET Alerts Pending {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the pending certificate request alert. Use the GET /Alerts/Pending method (see <a href="#">GET Alerts Pending on page 211</a> ) to retrieve a list of all the pending request alerts to determine the alert ID.

Table 101: GET Alerts Pending {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="581 632 1404 898" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} <ul style="list-style-type: none"> <li>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> </li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table border="1" data-bbox="581 464 1398 1205"> <thead> <tr> <th data-bbox="587 472 898 527">Value</th> <th data-bbox="898 472 1391 527">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 527 898 659">Id</td> <td data-bbox="898 527 1391 659">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td data-bbox="587 659 898 821">DisplayName</td> <td data-bbox="898 659 1391 821">A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td> </tr> <tr> <td data-bbox="587 821 898 1108">ForestRoot</td> <td data-bbox="898 821 1391 1108">           A string indicating the forest root of the template.           <div data-bbox="919 926 1377 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div> </td> </tr> <tr> <td data-bbox="587 1108 898 1197">ConfigurationTenant</td> <td data-bbox="898 1108 1391 1197">A string indicating the configuration tenant of the template.</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div data-bbox="919 926 1377 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	A string indicating the forest root of the template. <div data-bbox="919 926 1377 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.           </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DisplayName</td> <td>A string containing the name of the event handler.</td> </tr> <tr> <td>UseHandler</td> <td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell								
ID	Event Handler Type														
8	PendingLogger														
9	PendingPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td>Key</td> <td>A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td>DefaultValue</td> <td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td> </tr> <tr> <td>ParameterType</td> <td>A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget</li> </ul> </td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget</li> </ul>				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).														
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget</li> </ul>

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Pending Schedule

The GET /Alerts/Pending/Schedule method is used to retrieve the schedule for delivery of pending certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for pending certificate request alerts. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 102: GET Alerts Pending Schedule Response Data

Name	Description														
Schedule	<p>An object indicating the schedule for delivery of the pending request alerts. Possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description														
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.										
Name	Description														
Minutes	An integer indicating the number of minutes between each interval.														
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).														

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## PUT Alerts Pending Schedule

The PUT /Alerts/Pending/Schedule method is used to create or update the schedule for delivery of pending certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for pending certificate request alerts.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 103: PUT Alerts Pending Schedule Input Parameters

Name	In	Description								
Schedule	Body	<p>An object indicating the schedule for delivery of the pending request alerts. Possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
		Name	Description							
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.									
Name	Description									
Minutes	An integer indicating the number of minutes between each interval.									
<p>Daily</p> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).									

Table 104: PUT Alerts Pending Schedule Response Data

Name	Description

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).														

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET Alerts Pending

The GET /Alerts/Pending method is used to retrieve details of all pending certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified pending certificate request alerts.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/read/`

Table 105: GET Alerts Pending Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• DisplayName</li> <li>• Message</li> <li>• RegisteredEventHandlerId</li> <li>• ScheduledTaskId</li> <li>• Subject</li> <li>• Template_Id</li> <li>• UseHandler</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 106: GET Alerts Pending Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="581 632 1406 898" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} <ul style="list-style-type: none"> <li>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> </li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table border="1" data-bbox="581 464 1403 1205"> <thead> <tr> <th data-bbox="586 470 898 527">Value</th> <th data-bbox="898 470 1398 527">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="586 527 898 659">Id</td> <td data-bbox="898 527 1398 659">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td data-bbox="586 659 898 821">DisplayName</td> <td data-bbox="898 659 1398 821">A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td> </tr> <tr> <td data-bbox="586 821 898 1108">ForestRoot</td> <td data-bbox="898 821 1398 1108">           A string indicating the forest root of the template.           <div data-bbox="919 926 1382 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.         </div> </td> </tr> <tr> <td data-bbox="586 1108 898 1205">ConfigurationTenant</td> <td data-bbox="898 1108 1398 1205">A string indicating the configuration tenant of the template.</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div data-bbox="919 926 1382 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.         </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	A string indicating the forest root of the template. <div data-bbox="919 926 1382 1087" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.         </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1" data-bbox="581 359 1398 932"> <thead> <tr> <th data-bbox="587 367 808 430">Value</th> <th data-bbox="808 367 1391 430">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 430 808 741">Id</td> <td data-bbox="808 430 1391 741"> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 531 1369 722"> <thead> <tr> <th data-bbox="837 539 987 602">ID</th> <th data-bbox="987 539 1362 602">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 602 987 659">8</td> <td data-bbox="987 602 1362 659">PendingLogger</td> </tr> <tr> <td data-bbox="837 659 987 716">9</td> <td data-bbox="987 659 1362 716">PendingPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td data-bbox="587 741 808 835">DisplayName</td> <td data-bbox="808 741 1391 835">A string containing the name of the event handler.</td> </tr> <tr> <td data-bbox="587 835 808 932">UseHandler</td> <td data-bbox="808 835 1391 932">A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 531 1369 722"> <thead> <tr> <th data-bbox="837 539 987 602">ID</th> <th data-bbox="987 539 1362 602">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 602 987 659">8</td> <td data-bbox="987 602 1362 659">PendingLogger</td> </tr> <tr> <td data-bbox="837 659 987 716">9</td> <td data-bbox="987 659 1362 716">PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="831 531 1369 722"> <thead> <tr> <th data-bbox="837 539 987 602">ID</th> <th data-bbox="987 539 1362 602">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="837 602 987 659">8</td> <td data-bbox="987 602 1362 659">PendingLogger</td> </tr> <tr> <td data-bbox="837 659 987 716">9</td> <td data-bbox="987 659 1362 716">PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell								
ID	Event Handler Type														
8	PendingLogger														
9	PendingPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1" data-bbox="581 1184 1398 1717"> <thead> <tr> <th data-bbox="587 1192 837 1255">Value</th> <th data-bbox="837 1192 1391 1255">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 1255 837 1350">Id</td> <td data-bbox="837 1255 1391 1350">An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td data-bbox="587 1350 837 1444">Key</td> <td data-bbox="837 1350 1391 1444">A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td data-bbox="587 1444 837 1570">DefaultValue</td> <td data-bbox="837 1444 1391 1570">A string indicating the value for the parameter.  **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST Alerts Pending

The POST /Alerts/Pending method is used to create a new pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 107: POST Alerts Pending Input Parameters

Name	Description
Displayname	<p><b>Required.</b> A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.</p>
Subject	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="277 909 1406 1108" style="border: 1px solid #c8e6c9; padding: 10px; margin: 10px 0;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <div data-bbox="277 1285 1406 1698" style="border: 1px solid #e0e0e0; padding: 10px; margin: 10px 0;"> <pre>"Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include: \n\n&lt;table&gt; \n&lt;tr&gt;&lt;th&gt;Certificate Details &lt;/th&gt;&lt;th&gt;Metadata &lt;/th&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt; \n&lt;/table&gt; \n\nPlease review this request and issue the certificate as appropriate by going here: \n\n{apprlink} \n\nThanks! \n\nYour Certificate Management Tool\n"</pre> </div> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

Name	Description
	<p> <b>Note:</b> The <code>\$(requester:givenname)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li><code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> <p> <b>Note:</b> The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"> <li>Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.</li> </ul>
Template ID	<p>An integer indicating the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests.</p> <p>Use the <a href="#">GET /Templates</a> method (see <a href="#">GET Templates on page 1548</a>) to retrieve a list of all the templates to determine the template ID.</p>

Name

## Description

Request

An object containing the event handler configuration for the alert, if applicable. Possible values are:

Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" data-bbox="516 600 1377 793"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell
ID	Event Handler Type						
8	PendingLogger						
9	PendingPowershell						
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).						

For more information about event handlers, see *Using Event Handlers* in the *Keyfactor Command Reference Guide*.

Event

An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:

Value	Description
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
Key	A string indicating the reference name of the configured parameter.
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which</li> </ul>

Value	Description
	<p>event should be logged.</p> <ul style="list-style-type: none"> <li>• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).</li> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

For example, for a PowerShell handler:

```
"EventHandlerParameters": [
  {
    "Id": 28,
    "Key": "cn",
    "DefaultValue": "rcn",
    "ParameterType": "Token"
  },
  {
    "Id": 29,
    "Key": "AppOwnerFirstName",
    "DefaultValue": "metadata:AppOwnerFirstName",
    "ParameterType": "Token"
  },
  {
    "Id": 30,
    "Key": "Text",
    "DefaultValue": "Pending Alert: Enterprise Web Server",
```

Name	Description
	<pre>                 "ParameterType": "Value"             },             {                 "Id": 31,                 "Key": "ApprovalLink",                 "DefaultValue": "apprlink",                 "ParameterType": "Token"             },             {                 "Id": 32,                 "Key": "ScriptName",                 "DefaultValue": "MyScript.ps1",                 "ParameterType": "Script"             }         ]     </pre>
Certificate-Id	A string containing the CA's reference ID for the certificate request.
Common-Name	A string indicating the common name of the certificate.

Name	Description
LogicalName	A string indicating the logical name of the certificate authority.

Table 108: POST Alerts Pending Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="581 632 1404 898" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} <ul style="list-style-type: none"> <li>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> </li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table border="1" data-bbox="581 464 1403 1205"> <thead> <tr> <th data-bbox="581 464 898 527">Value</th> <th data-bbox="898 464 1403 527">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 527 898 659">Id</td> <td data-bbox="898 527 1403 659">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td data-bbox="581 659 898 821">DisplayName</td> <td data-bbox="898 659 1403 821">A string containing the name of the template.  **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## PUT Alerts Pending

The PUT /Alerts/Pending method is used to update a pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 109: PUT Alerts Pending Input Parameters

Name	Description
id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
Display Name	<p><b>Required.</b> A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.</p>
Subject	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="277 1073 1403 1272" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <div data-bbox="277 1451 1403 1728" style="background-color: #f5f5f5; padding: 10px; border-radius: 10px;"> <pre>"Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include: \n\n&lt;table&gt; \n&lt;tr&gt;&lt;th&gt;Certificate Details &lt;/th&gt;&lt;th&gt;Metadata &lt;/th&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:Ap- pOwnerFirstName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt; \n&lt;tr&gt;&lt;t-</pre> </div>

Name	Description
	<pre data-bbox="313 415 1369 512">d&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt; \n&lt;/table&gt; \n\nPlease review this request and issue the certificate as appropriate by going here: \n\n{applink} \n\nThanks! \n\nYour Certificate Management Tool\n"</pre> <p data-bbox="274 556 1385 617">See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> <div data-bbox="289 646 1404 737" style="background-color: #e1f5fe; padding: 5px;">  <b>Note:</b> The <code>\$(requester:givenname)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider. </div>
Recipients	<p data-bbox="274 772 1404 900">An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Template ID	<p data-bbox="274 1255 1404 1352">An integer indicating the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests.</p> <p data-bbox="274 1360 1313 1421">Use the <code>GET /Templates</code> method (see <a href="#">GET Templates on page 1548</a>) to retrieve a list of all the templates to determine the template ID.</p>

Name

## Description

An object containing the event handler configuration for the alert, if applicable. Possible values are:

Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" data-bbox="516 600 1377 793"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell
ID	Event Handler Type						
8	PendingLogger						
9	PendingPowershell						
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).						

For more information about event handlers, see *Using Event Handlers* in the *Keyfactor Command Reference Guide*.

An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:

Value	Description
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
Key	A string indicating the reference name of the configured parameter.
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which</li> </ul>

Value	Description
	<p>event should be logged.</p> <ul style="list-style-type: none"> <li>• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>).</li> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

For example, for a PowerShell handler:

```

"EventHandlerParameters": [
  {
    "Id": 28,
    "Key": "cn",
    "DefaultValue": "rcn",
    "ParameterType": "Token"
  },
  {
    "Id": 29,
    "Key": "AppOwnerFirstName",
    "DefaultValue": "metadata:AppOwnerFirstName",
    "ParameterType": "Token"
  },
  {
    "Id": 30,
    "Key": "Text",
    "DefaultValue": "Pending Alert: Enterprise Web Server",

```

Name

Description

```
    "ParameterType": "Value"
  },
  {
    "Id": 31,
    "Key": "ApprovalLink",
    "DefaultValue": "apprlink",
    "ParameterType": "Token"
  },
  {
    "Id": 32,
    "Key": "ScriptName",
    "DefaultValue": "MyScript.ps1",
    "ParameterType": "Script"
  }
]
```

Table 110: PUT Alerts Pending Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="581 632 1406 898" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} <ul style="list-style-type: none"> <li>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul> </li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table border="1" data-bbox="581 464 1398 1203"> <thead> <tr> <th data-bbox="587 472 898 527">Value</th> <th data-bbox="898 472 1391 527">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 527 898 659">Id</td> <td data-bbox="898 527 1391 659">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td data-bbox="587 659 898 821">DisplayName</td> <td data-bbox="898 659 1391 821">A string containing the name of the template. CARquestId	A string containing the CA's reference ID for the certificate request.				
CommonName	A string indicating the common name of the certificate.				
LogicalName	A string indicating the logical name of the certificate authority.				

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Refer-

ence and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST Alerts Pending Test

The POST /Alerts/Pending/Test method is used to test individual pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated.

 **Tip:** Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent. By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/  
/monitoring/alerts/test/

Table 111: POST Alerts Pending Test Input Parameters

Name	In	Description
AlertId	Body	An integer indicating the Keyfactor Command reference ID for the pending alert.
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true), or not (false).

Table 112: POST Alerts Pending Test Response Data

Parameter	Description														
PendingAlerts	<p>An object containing alert details resulting from the test. Pending alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject</td> <td> <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div style="border: 1px solid #c8e6c9; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> Substitutable special text may be used in the subject line. Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p>														
Recipients	<p>An array of strings containing a list of strings with the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time.</p>														
CARequestId	<p>An string containing the CA's reference ID for the certificate request.</p>														
CommonName	<p>A string indicating the common name of the certificate request.</p>														
LogicalName	<p>A string indicating the logical name of the certificate authority from which the certificate was requested.</p>														
AlertBuildResult	<p>A string indicating the result of pending alerts test (e.g. Success).</p>														

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST Alerts Pending TestAll

The POST /Alerts/Pending/TestAll method is used to test all pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting number of alerts generated.

**Tip:** Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/  
/monitoring/alerts/test/

Table 113: POST Alerts Pending Test All Input Parameters

LogicalName	<p>A string indicating the logical name of the certificate authority from which the certificate was requested.</p>														
AlertBuildResult	<p>An integer indicating the number of pending alerts run by the test.</p>														

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.5 AppSetting

The AppSetting component of the Keyfactor API includes methods necessary to list and update application settings that control the behavior of Keyfactor Command features. For a complete list of available application settings, see Application Settings in the *Keyfactor Command Reference Guide*.

Table 115: AppSetting Endpoints

Endpoint	Method	Description	Link
/	GET	Returns details for all the application settings.	<a href="#">GET AppSetting below</a>
/	PUT	Updates values configured for multiple application settings in a single command.	<a href="#">PUT AppSetting on page 246</a>
/ {id}	GET	Returns details for a single application setting.	<a href="#">GET AppSetting ID on page 244</a>
/ {id}/Set	PUT	Updates the value configured for an application setting based on its reference ID.	<a href="#">PUT AppSetting ID Set on page 248</a>
/ {name}/Set	PUT	Updates the value configured for an application setting based on its reference name.	<a href="#">PUT AppSetting Name Set on page 250</a>

### 2.6.5.1 GET AppSetting

The GET /AppSetting method is used to retrieve the details for all the application settings in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of the application setting details. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

Table 116: GET AppSetting Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	An integer indicating the type for the <i>Value</i> . Possible value types are: <table border="1" data-bbox="446 955 1404 1627"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>String</td> </tr> <tr> <td>1</td> <td>Integer</td> </tr> <tr> <td>2</td> <td>Boolean</td> </tr> <tr> <td>4</td> <td>String (RegEx)</td> </tr> <tr> <td>5</td> <td>String (URL)</td> </tr> <tr> <td>6</td> <td>String (Path)</td> </tr> <tr> <td>7</td> <td>String (CA Name)</td> </tr> <tr> <td>8</td> <td>No longer in use</td> </tr> <tr> <td>9</td> <td>String (Template Name)</td> </tr> <tr> <td>10</td> <td>String (Date)</td> </tr> </tbody> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (RegEx)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (RegEx)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results

returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.5.2 GET AppSetting ID

The GET /AppSetting/{id} method is used to retrieve a single application setting from Keyfactor Command. This method returns HTTP 200 OK on a success with a list of the application setting details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/application\_settings/read/

Table 117: GET AppSetting {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> Integer indicating the Keyfactor Command reference ID of the application setting to retrieve. Use the <i>GET /AppSetting</i> method (see <a href="#">GET Agents on page 17</a> ) to retrieve a list of all the application settings to determine the application setting ID.

Table 118: GET AppSetting {id} Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	An integer indicating the type for the <i>Value</i> . Possible value types are: <table border="1" data-bbox="446 856 1404 1543"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>String</td> </tr> <tr> <td>1</td> <td>Integer</td> </tr> <tr> <td>2</td> <td>Boolean</td> </tr> <tr> <td>4</td> <td>String (Regex)</td> </tr> <tr> <td>5</td> <td>String (URL)</td> </tr> <tr> <td>6</td> <td>String (Path)</td> </tr> <tr> <td>7</td> <td>String (CA Name)</td> </tr> <tr> <td>8</td> <td>No longer in use</td> </tr> <tr> <td>9</td> <td>String (Template Name)</td> </tr> <tr> <td>10</td> <td>String (Date)</td> </tr> </tbody> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Refer-

ence and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.5.3 PUT AppSetting

The PUT /AppSetting method is used to update the values of multiple application settings with a single command. This method returns HTTP 200 OK on a success with information about the updated application settings.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/application\_settings/read/  
/application\_settings/modify/

Table 119: PUT AppSetting Input Parameters

Name	In	Description
Id	Body	<b>Required.</b> Integer indicating the Keyfactor Command reference ID of the application setting. Use the GET /AppSetting method (see <a href="#">GET AppSetting on page 242</a> ) to retrieve a list of all the application settings to determine the application setting ID.
Value	Body	<b>Required.</b> A field indicating the value for the application setting. May be a Boolean, integer, or string.

Table 120: PUT AppSetting Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	An integer indicating the type for the <i>Value</i> . Possible value types are: <table border="1" data-bbox="446 856 1404 1543"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>String</td> </tr> <tr> <td>1</td> <td>Integer</td> </tr> <tr> <td>2</td> <td>Boolean</td> </tr> <tr> <td>4</td> <td>String (Regex)</td> </tr> <tr> <td>5</td> <td>String (URL)</td> </tr> <tr> <td>6</td> <td>String (Path)</td> </tr> <tr> <td>7</td> <td>String (CA Name)</td> </tr> <tr> <td>8</td> <td>No longer in use</td> </tr> <tr> <td>9</td> <td>String (Template Name)</td> </tr> <tr> <td>10</td> <td>String (Date)</td> </tr> </tbody> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Refer-

ence and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.5.4 PUT AppSetting ID Set

The PUT /AppSetting/{id}/Set method is used to update the value of an application setting specified by the reference ID. This method returns HTTP 200 OK on a success with information about the updated application setting.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/application\_settings/read/  
/application\_settings/modify/

Table 121: PUT AppSetting {id} Set Input Parameters

Name	In	Description
id	Path	<b>Required.</b> Integer indicating the Keyfactor Command reference ID of the application setting. Use the GET /AppSetting method (see <a href="#">GET AppSetting on page 242</a> ) to retrieve a list of all the application settings to determine the application setting ID.
Value	Body	<b>Required.</b> A field indicating the value for the application setting. May be a Boolean, integer, or string.

Table 122: PUT AppSetting {id} Set Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	An integer indicating the type for the <i>Value</i> . Possible value types are: <table border="1" data-bbox="446 856 1404 1533"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>String</td> </tr> <tr> <td>1</td> <td>Integer</td> </tr> <tr> <td>2</td> <td>Boolean</td> </tr> <tr> <td>4</td> <td>String (Regex)</td> </tr> <tr> <td>5</td> <td>String (URL)</td> </tr> <tr> <td>6</td> <td>String (Path)</td> </tr> <tr> <td>7</td> <td>String (CA Name)</td> </tr> <tr> <td>8</td> <td>No longer in use</td> </tr> <tr> <td>9</td> <td>String (Template Name)</td> </tr> <tr> <td>10</td> <td>String (Date)</td> </tr> </tbody> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Refer-

ence and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.5.5 PUT AppSetting Name Set

The PUT /AppSetting/{name}/Set method is used to update the value of an application setting specified by the reference name. This method returns HTTP 200 OK on a success with information about the updated application settings.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/application\_settings/read/  
/application\_settings/modify/

Table 123: PUT AppSetting {name} Set Input Parameters

Name	In	Description
name	Path	<b>Required.</b> A string indicating the Keyfactor Command internal reference name ( <i>ShortName</i> ) for the application setting. Use the GET /AppSetting method (see <a href="#">GET AppSetting on page 242</a> ) to retrieve a list of all the application settings to determine the application setting reference name ( <i>ShortName</i> ).
Value	Body	<b>Required.</b> A field indicating the value for the application setting. May be a Boolean, integer, or string.

Table 124: PUT AppSetting {name} Set Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	An integer indicating the type for the <i>Value</i> . Possible value types are: <table border="1" data-bbox="446 856 1404 1543"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>String</td> </tr> <tr> <td>1</td> <td>Integer</td> </tr> <tr> <td>2</td> <td>Boolean</td> </tr> <tr> <td>4</td> <td>String (Regex)</td> </tr> <tr> <td>5</td> <td>String (URL)</td> </tr> <tr> <td>6</td> <td>String (Path)</td> </tr> <tr> <td>7</td> <td>String (CA Name)</td> </tr> <tr> <td>8</td> <td>No longer in use</td> </tr> <tr> <td>9</td> <td>String (Template Name)</td> </tr> <tr> <td>10</td> <td>String (Date)</td> </tr> </tbody> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Refer-

ence and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.6 Audit

The Audit component of the Keyfactor API is used to track changes to the Keyfactor Command operation and configuration.

Table 125: Audit Endpoints

Endpoint	Method	Description	Links
/id}	GET	Returns information about the specified audit log entry.	<a href="#">GET Audit ID below</a>
/id}/Validate	GET	Validates the specified audit log entry.	<a href="#">GET Audit ID Validate on page 258</a>
/	GET	Returns a list of all audit log entries according to the provided filters and input parameters.	<a href="#">GET Audit on page 259</a>
/Download	GET	Returns a comma separated list of audit log entries according to the provided filters and input parameters.	<a href="#">GET Audit Download on page 265</a>
/RelatedEntities	GET	Returns a list of all audit log entries and entries related to this entry according to the provided filters and input parameters.	<a href="#">GET Audit Related Entities on page 269</a>

### 2.6.6.1 GET Audit ID

The GET /Audit/{id} method is used to retrieve details for a specified audit entry. This method returns HTTP 200 OK on a success with audit log details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/auditing/read/

Table 126: GET Audit {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the audit log entry to retrieve. Use the <i>GET /Audit</i> method (see <a href="#">GET Audit on page 259</a> ) to retrieve a list of all the audit log entries to determine the audit log entry ID.

Table 127: GET Audit {id} Response Data

Name	Description																																										
Id	The ID of the specified audit log entry.																																										
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.																																										
Message	XML data on the audit event.																																										
Signature	The signature on the audit entry.																																										
Category	An integer identifying the category of the audit entry. Possible values are: <table border="1" data-bbox="516 655 1403 1696"> <thead> <tr> <th>Value</th> <th>Subcategory Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2001</td> <td>Certificate</td> <td>Certificate</td> </tr> <tr> <td>2001</td> <td>Auditing Certificate Scheduled Replacement</td> <td>Auditing Certificate Scheduled Replacement</td> </tr> <tr> <td>2001</td> <td>Auditing Certificate Request</td> <td>Certificate Request</td> </tr> <tr> <td>2002</td> <td>ApiApplication</td> <td>API Application</td> </tr> <tr> <td>2003</td> <td>Template</td> <td>Template</td> </tr> <tr> <td>2004</td> <td>CertificateQuery</td> <td>Certificate Collection/Query</td> </tr> <tr> <td>2005</td> <td>ExpirationAlert</td> <td>Expiration Alert</td> </tr> <tr> <td>2005</td> <td>Expiration Alert Definition Context Model</td> <td>Expiration Alert</td> </tr> <tr> <td>2006</td> <td>PendingAlert</td> <td>Pending Alert</td> </tr> <tr> <td>2006</td> <td>Pending Alert Definition Context Model</td> <td>Pending Alert</td> </tr> <tr> <td>2007</td> <td>ApplicationSetting</td> <td>Application Setting</td> </tr> <tr> <td>2008</td> <td>IssuedAlert</td> <td>Issued Alert</td> </tr> <tr> <td>2008</td> <td>Issued Alert Definition Context Model</td> <td>Issued Alert</td> </tr> </tbody> </table>	Value	Subcategory Name	Description	2001	Certificate	Certificate	2001	Auditing Certificate Scheduled Replacement	Auditing Certificate Scheduled Replacement	2001	Auditing Certificate Request	Certificate Request	2002	ApiApplication	API Application	2003	Template	Template	2004	CertificateQuery	Certificate Collection/Query	2005	ExpirationAlert	Expiration Alert	2005	Expiration Alert Definition Context Model	Expiration Alert	2006	PendingAlert	Pending Alert	2006	Pending Alert Definition Context Model	Pending Alert	2007	ApplicationSetting	Application Setting	2008	IssuedAlert	Issued Alert	2008	Issued Alert Definition Context Model	Issued Alert

Value	Description																																		
0	Information																																		
1	Warning																																		
2	Failure																																		
User	The user who performed the audit event in DOMAIN\username format.																																		

Name	Description
EntityType	The category of the object being audited (e.g. Template, Certificate).
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.6.2 GET Audit ID Validate

The GET /Audit/{id}/Validate method is used to return whether or not (true or false) the audit log entry is valid. An audit log might become invalidated if it is tampered with. This method returns HTTP 200 OK on a success with a value of true or false.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/auditing/read/

Table 128: GET Audit {id} Validate Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the audit log entry to validate. Use the <i>GET /Audit</i> method (see <a href="#">GET Audit on the next page</a> ) to retrieve a list of all the audit log entries to determine the audit log entry ID.

Table 129: GET Audit {id} Validate Response Data

Name	Description
	A Boolean that indicates whether the audit log entry is valid (true) or not (false). This value is returned without a parameter name.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.6.3 GET Audit

The GET /Audit method returns a list of all audit entries. This method returns HTTP 200 OK on a success with audit log details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/auditing/read/`

Table 130: GET Audit Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Audit Log Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• Name (EntityIdentifier)</li> <li>• Category (EntityType) (see <a href="#">Table 131: GET Audit Response Data</a> for codes)</li> <li>• ImmutableIdentifier</li> <li>• Level (see <a href="#">Table 131: GET Audit Response Data</a> for codes)</li> <li>• Operation (see <a href="#">Table 131: GET Audit Response Data</a> for codes)</li> <li>• PropertyChanged</li> <li>• Timestamp</li> <li>• ActingUser</li> </ul> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> To do a query by category, use the subcategory string (see <i>Category</i> in the response data). For example:  <code>category -contains "Agent"</code></p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

User	The user who performed the audit event in DOMAIN\username format.																																		

Name	Description
EntityType	The category of the object being audited (e.g. Template, Certificate).
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.6.4 GET Audit Download

The GET /Audit/Download method returns a comma-delimited list of all audit entries matching the requested filters appropriate for output to a CSV file. This method returns HTTP 200 OK on a success with the information requested in comma-delimited form with the property names at the start of the list and then the values.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/auditing/read/

Table 132: GET Audit Download Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Audit Log Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• Name (EntityIdentifier)</li> <li>• Category (EntityType) (see <a href="#">Table 131: GET Audit Response Data</a> for codes)</li> <li>• ImmutableIdentifier</li> <li>• Level (see <a href="#">Table 131: GET Audit Response Data</a> for codes)</li> <li>• Operation (see <a href="#">Table 131: GET Audit Response Data</a> for codes)</li> <li>• PropertyChanged</li> <li>• Timestamp</li> <li>• ActingUser</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 133: GET Audit Download Response Data

Name	Description

2	Failure																				
User	The user who performed the audit event in DOMAIN\username format.																				
EntityType	The category of the object being audited (e.g. Template, Certificate). Also known as the <i>Category</i> in some interfaces.																				
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change. Also known as the <i>Name</i> in some interfaces.																				

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.6.5 GET Audit Related Entities

The GET /Audit/RelatedEntities method returns a list of all audit entries and all audit entries related to those audit entries. This method returns HTTP 200 OK on a success with the information requested.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/auditing/read/`

Table 134: GET Audit Related Entities Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Audit Log Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• Name (EntityIdentifier)</li> <li>• Category (EntityType) (see <a href="#">Table 131: GET Audit Response Data</a> for codes)</li> <li>• ImmutableIdentifier</li> <li>• Level (see <a href="#">Table 131: GET Audit Response Data</a> for codes)</li> <li>• Operation (see <a href="#">Table 131: GET Audit Response Data</a> for codes)</li> <li>• PropertyChanged</li> <li>• Timestamp</li> <li>• ActingUser</li> </ul> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> <b>Tip:</b> In order to return related entries, your queryString needs to query for the specific immutable identifier of the audit record for which you wish to see related entries. For example:</p> <p style="text-align: center;"><code>ImmutableIdentifier -eq 707662</code></p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 135: GET Audit Related Entities Response Data

Name	Description																																										
Id	The ID of the specified audit log entry.																																										
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.																																										
Message	XML data on the audit event.																																										
Signature	The signature on the audit entry.																																										
Category	An integer identifying the category of the audit entry. Possible values are: <table border="1" data-bbox="516 655 1403 1696"> <thead> <tr> <th>Value</th> <th>Subcategory Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2001</td> <td>Certificate</td> <td>Certificate</td> </tr> <tr> <td>2001</td> <td>Auditing Certificate Scheduled Replacement</td> <td>Auditing Certificate Scheduled Replacement</td> </tr> <tr> <td>2001</td> <td>Auditing Certificate Request</td> <td>Certificate Request</td> </tr> <tr> <td>2002</td> <td>ApiApplication</td> <td>API Application</td> </tr> <tr> <td>2003</td> <td>Template</td> <td>Template</td> </tr> <tr> <td>2004</td> <td>CertificateQuery</td> <td>Certificate Collection/Query</td> </tr> <tr> <td>2005</td> <td>ExpirationAlert</td> <td>Expiration Alert</td> </tr> <tr> <td>2005</td> <td>Expiration Alert Definition Context Model</td> <td>Expiration Alert</td> </tr> <tr> <td>2006</td> <td>PendingAlert</td> <td>Pending Alert</td> </tr> <tr> <td>2006</td> <td>Pending Alert Definition Context Model</td> <td>Pending Alert</td> </tr> <tr> <td>2007</td> <td>ApplicationSetting</td> <td>Application Setting</td> </tr> <tr> <td>2008</td> <td>IssuedAlert</td> <td>Issued Alert</td> </tr> <tr> <td>2008</td> <td>Issued Alert Definition Context Model</td> <td>Issued Alert</td> </tr> </tbody> </table>	Value	Subcategory Name	Description	2001	Certificate	Certificate	2001	Auditing Certificate Scheduled Replacement	Auditing Certificate Scheduled Replacement	2001	Auditing Certificate Request	Certificate Request	2002	ApiApplication	API Application	2003	Template	Template	2004	CertificateQuery	Certificate Collection/Query	2005	ExpirationAlert	Expiration Alert	2005	Expiration Alert Definition Context Model	Expiration Alert	2006	PendingAlert	Pending Alert	2006	Pending Alert Definition Context Model	Pending Alert	2007	ApplicationSetting	Application Setting	2008	IssuedAlert	Issued Alert	2008	Issued Alert Definition Context Model	Issued Alert

User	The user who performed the audit event in DOMAIN\username format.																																		

Name	Description
EntityType	The category of the object being audited (e.g. Template, Certificate).
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.7 Certificates

The Certificates component of the Keyfactor API supports certificate lifecycle and management tasks, apart from enrollment.

Table 136: Certificates Endpoints

Endpoint	Method	Description	Link
/id/Security	GET	Returns details of the security identities that have been granted permissions to the specified certificate including what the specific permissions are.	<a href="#">GET Certificates ID Security on page 277</a>
/id/Validate	GET	Validates that a certificate chain can be built for the specified certificate.	<a href="#">GET Certificates ID Validate on page 279</a>
/Locations/id	GET	Returns details about the certificates stores in which the certificate is located.	<a href="#">GET Certificates Locations ID on page 284</a>
/IdentityAudit/id	GET	Returns audit identity permissions for certificate.	<a href="#">GET Certificates Identity Audit ID on page 287</a>

Endpoint	Method	Description	Link
/ {id}	DELETE	Deletes a certificate from the Keyfactor Command database by its ID.	<a href="#">DELETE Certificates ID on page 291</a>
/ {id}	GET	Returns certificate details for a specified certificate.	<a href="#">GET Certificates ID on page 292</a>
/Metadata/Compare	GET	Compares the metadata value provided with the metadata value associated with the specified certificate.	<a href="#">GET Certificates Metadata Compare on page 305</a>
/ {id}/History	GET	Returns the certificate operations history for a specified certificate.	<a href="#">GET Certificates ID History on page 306</a>
/	DELETE	Deletes multiple certificates from the Keyfactor Command database, as specified by the IDs in the request body.	<a href="#">DELETE Certificates on page 308</a>
/	GET	Returns all certificates with paging (number of pages to return and number of results per page) and verbosity option to specify detail level.	<a href="#">GET Certificates on page 310</a>
/Metadata	PUT	Updates the metadata for a specified certificate.	<a href="#">PUT Certificates Metadata on page 325</a>
/Metadata/All	PUT	Updates the metadata for an array of certificate IDs.	<a href="#">PUT Certificates Metadata All on page 326</a>
/Import	POST	Imports a certificate into Keyfactor Command.	<a href="#">POST Certificates Import on page 331</a>
/Revoke	POST	Revokes a certificate.	<a href="#">POST Certificates Revoke on page 336</a>
/Analyze	POST	Reads a base-64 encoded PEM certificates and returns it in human-readable form.	<a href="#">POST Certificates Analyze on page 338</a>
/Recover	POST	Returns a recovered certificate as a PFX.	<a href="#">POST Certificates Recover on page 339</a>

Endpoint	Method	Description	Link
/Download	POST	Downloads a certificate.	<a href="#">POST Certificates Download on page 343</a>
/RevokeAll	POST	Revokes all the certificates in the provided query.	<a href="#">POST Certificates Revoke All on page 346</a>
/Query	DELETE	Deletes multiple certificates from the Keyfactor Command database based on search query.	<a href="#">DELETE Certificates Query on page 349</a>
/PrivateKey	DELETE	Deletes the stored private keys of multiple certificates within the Keyfactor Command database.	<a href="#">DELETE Certificates Private Key on page 350</a>
/PrivateKey/{id}	DELETE	Deletes the stored private key(s) of a certificate within the Keyfactor Command database.	<a href="#">DELETE Certificates Private Key ID on page 351</a>

### 2.6.7.1 GET Certificates ID Security

The GET `/Certificates/{id}/Security` method is used to return details of permission granted to a specific certificate with the specified ID. This method returns HTTP 200 OK on a success with security details in the message body. Both global and collection-level permissions are included in the response.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

`/certificates/collections/read/`

`/security/read/`

OR

`/certificates/collections/read/#/` (where # is a reference to a specific certificate collection ID)

`/security/read/`

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 137: GET Certificates {id} Security Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the certificate for which to check security permissions.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 138: GET Certificates {id} Security Response Data

Name	Description						
Roles	<p>An array of objects containing the certificate-specific permissions granted to the named security identity broken down by permission and defined by role. All roles are returned, including those that have no permissions. Role information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short reference name for the security role.</td> </tr> <tr> <td>Permissions</td> <td>An array of strings containing the permissions assigned to the role.</td> </tr> </tbody> </table> <p>For example, the following return snippet shows the response for the <i>Power Users</i> security role:</p> <pre> {   "Name": "Power Users",   "Permissions": [     "Read",     "EditMetadata",     "Recover"   ] } </pre>	Name	Description	Name	A string containing the short reference name for the security role.	Permissions	An array of strings containing the permissions assigned to the role.
Name	Description						
Name	A string containing the short reference name for the security role.						
Permissions	An array of strings containing the permissions assigned to the role.						

**Tip:** See the [Keyfactor API Reference and Utility](#) [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results

returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.2 GET Certificates ID Validate

The GET /Certificates/{id}/Validate method is used to return details for the validity of the X509 certificate chain for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate chain validity details in the message body.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 139: GET Certificates {id} Validate Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the certificate to be validated.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 140: GET Certificates {id} Validate Response Data

Name	Description															
Valid	A Boolean that indicates whether all the validity tests are in a passing state (true) or not (false).															
Results	<p>An object containing the X509 certificate chain validity fields. The included validity fields are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Portal Equivalent</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>NotTimeValid</td> <td>Time Valid</td> <td>A value of <i>Pass</i> indicates that the certificate time value is valid. A time can appear invalid (<i>Fail</i>) for a certificate that has expired.</td> </tr> <tr> <td>NotTimeNested</td> <td>n/a</td> <td>A value of <i>Pass</i> indicates that the CA certificate and issued certificate have nested validity periods. A value of <i>Fail</i> can occur if the CA certificate expires before the issued certificate. This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Revoked</td> <td>Active</td> <td>A value of <i>Pass</i> indicates that the X509 certificate chain is valid for the certificate and contains no revoked certificates or errors.</td> </tr> <tr> <td>NotSignatureValid</td> <td>Signature</td> <td>A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid</td> </tr> </tbody> </table>	Name	Portal Equivalent	Description	NotTimeValid	Time Valid	A value of <i>Pass</i> indicates that the certificate time value is valid. A time can appear invalid ( <i>Fail</i> ) for a certificate that has expired.	NotTimeNested	n/a	A value of <i>Pass</i> indicates that the CA certificate and issued certificate have nested validity periods. A value of <i>Fail</i> can occur if the CA certificate expires before the issued certificate. This is considered deprecated and may be removed in a future release.	Revoked	Active	A value of <i>Pass</i> indicates that the X509 certificate chain is valid for the certificate and contains no revoked certificates or errors.	NotSignatureValid	Signature	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid
Name	Portal Equivalent	Description														
NotTimeValid	Time Valid	A value of <i>Pass</i> indicates that the certificate time value is valid. A time can appear invalid ( <i>Fail</i> ) for a certificate that has expired.														
NotTimeNested	n/a	A value of <i>Pass</i> indicates that the CA certificate and issued certificate have nested validity periods. A value of <i>Fail</i> can occur if the CA certificate expires before the issued certificate. This is considered deprecated and may be removed in a future release.														
Revoked	Active	A value of <i>Pass</i> indicates that the X509 certificate chain is valid for the certificate and contains no revoked certificates or errors.														
NotSignatureValid	Signature	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid														

Name	Description	
		certificate signature.
NotValidForUsage	Usage	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid key usage.
UntrustedRoot	Trusted Root	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an untrusted root certificate.
RevocationStatusUnknown	Revocation Status	A value of <i>Pass</i> indicates that the revocation status can successfully be determined for the certificate. This may be the result of successful access to online certificate revocation lists (CRLs).
Cyclic	Chain Built	A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built.
InvalidExtension	Extensions	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid extension.
InvalidPolicyConstraints	Policy Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid policy constraint.

Name	Description																									
	<table border="1"> <thead> <tr> <th>Name</th> <th>Portal Equivalent</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>InvalidBasicConstraints</td> <td>Basic Constraints</td> <td>A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid basic constraint.</td> </tr> <tr> <td>InvalidNameConstraints</td> <td>Valid Name Constraints</td> <td>A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid name constraint.</td> </tr> <tr> <td>HasNotSupportedNameConstraint</td> <td>Supported Name Constraints</td> <td>A value of <i>Fail</i> indicates that a name constraint for the certificate is unsupported or that the certificate has no supported name constraints.</td> </tr> <tr> <td>HasNotDefinedNameConstraint</td> <td>Defined Name Constraints</td> <td>A value of <i>Fail</i> indicates that a name constraint for the certificate is undefined.</td> </tr> <tr> <td>HasNotPermittedNameConstraint</td> <td>Permitted Name Constraints</td> <td>A value of <i>Fail</i> indicates that a name constraint for the certificate is impermissible.</td> </tr> <tr> <td>HasExcludedNameConstraint</td> <td>Excluded Name Constraints</td> <td>A value of <i>Fail</i> indicates that a name constraint for the certificate has been excluded.</td> </tr> <tr> <td>PartialChain</td> <td>Full Chain</td> <td>A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built up to the root certificate.</td> </tr> </tbody> </table>	Name	Portal Equivalent	Description	InvalidBasicConstraints	Basic Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid basic constraint.	InvalidNameConstraints	Valid Name Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid name constraint.	HasNotSupportedNameConstraint	Supported Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is unsupported or that the certificate has no supported name constraints.	HasNotDefinedNameConstraint	Defined Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is undefined.	HasNotPermittedNameConstraint	Permitted Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is impermissible.	HasExcludedNameConstraint	Excluded Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate has been excluded.	PartialChain	Full Chain	A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built up to the root certificate.	
Name	Portal Equivalent	Description																								
InvalidBasicConstraints	Basic Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid basic constraint.																								
InvalidNameConstraints	Valid Name Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid name constraint.																								
HasNotSupportedNameConstraint	Supported Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is unsupported or that the certificate has no supported name constraints.																								
HasNotDefinedNameConstraint	Defined Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is undefined.																								
HasNotPermittedNameConstraint	Permitted Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is impermissible.																								
HasExcludedNameConstraint	Excluded Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate has been excluded.																								
PartialChain	Full Chain	A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built up to the root certificate.																								

Name	Description		
	Name	Portal Equivalent	Description
	CtIInvalidTimeValid	CTL Time Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) is invalid because of an invalid time value (e.g. the CTL has expired).
	CtIInvalidSignatureValid	CTL Signature Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) contains an invalid signature.
	CtIInvalidForUsage	CTL Usage Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) is not valid for this use.
	HasWeakSignature	Strong Signature	A value of <i>Pass</i> indicates that the certificate has been signed with a secure hashing algorithm. A value of <i>Fail</i> can indicate that a hashing algorithm of MD2 or MD5 was used for the certificate.
	OfflineRevocation	CRL online	A value of <i>Pass</i> indicates that the online certificate revocation list (CRL) the chain relies on is available.
	NoIssuanceChainPolicy	Chain Policy	A value of <i>Pass</i> indicates that there is either no certificate policy by design in the certificate or that if a group policy has specified that all certificates must have a

Name	Description	
		certificate policy, the certificate policy exists in the certificate.
ExplicitDistrust	No Explicit Distrust	A value of <i>Pass</i> indicates that the certificate is not explicitly distrusted.
HasNotSupportedCriticalExtension	Critical Extensions	A value of <i>Pass</i> indicates that the certificate has a critical extension that is supported or has no critical extensions.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.3 GET Certificates Locations ID

The GET /Certificates/Locations/{id} method is used to return details for the certificate store locations in which the certificate with the specified ID is found. This method returns HTTP 200 OK on a success with certificate store location details in the message body.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificates/collections/read/  
 OR  
 /certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)  
 Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 141: GET Certificates Locations {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the certificate for which to retrieve certificate store location details.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 142: GET Certificates Locations {id} Response Data

Name	Description																		
Details	<p>An array of objects containing the certificate stores in which the certificate is found. Certificate store details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreType</td> <td>A string indicating the type of certificate store (e.g. Java Keystore).</td> </tr> <tr> <td>StoreTypeid</td> <td> <p>An integer indicating the Keyfactor Command referenced ID for the type of certificate store.</p> <p>Use the <i>GET CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types on page 699</a>) to retrieve a list of all the certificate store types to see a complete list of types.</p> </td> </tr> <tr> <td>StoreCount</td> <td>An integer indicating the number of stores of the type referenced by StoreType in which the certificate is found.</td> </tr> <tr> <td>Locations</td> <td> <p>An array of objects containing details about the specific certificate stores in which the certificate is found. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> </tbody> </table>	Name	Description	StorePath	A string containing the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Alias	A string containing the alias of the certificate in the certificate store. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a user-provided string, but for an IIS Personal store, this will be the thumbprint of the certificate. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description						
StorePath	A string containing the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Alias	A string containing the alias of the certificate in the certificate store. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a user-provided string, but for an IIS Personal store, this will be the thumbprint of the certificate. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.7.4 GET Certificates Identity Audit ID

The GET /Certificates/IdentityAudit/{id} method is used to return a list of all the users or groups defined in the system that have permission to the certificate ID entered. This method returns HTTP 200 OK on a success with certificate identity audit details in the message body.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the GET /Certificates/IdentityAudit/{id} method redesigns the response to support security claims and environments with either an OAuth identity provider or Active Directory as an identity provider.

Table 143: GET Certificates Identity Audit {id} v2 Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 144: GET Certificates Identity Audit {id} v2 Response Data

Name	Description																		
Identity	<p>An object containing information about the identity. Identity details include:</p> <table border="1"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID for the security claim.</td> </tr> <tr> <td>Description</td> <td>A string indicating a description for the security claim.</td> </tr> <tr> <td>ClaimType</td> <td>A string indicating the type of claim.</td> </tr> <tr> <td>ClaimValue</td> <td>A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).</td> </tr> <tr> <td>Provider</td> <td> <p>An object containing information about the provider assigned to the security claim.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>Name</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Parameter	Description	Id	An integer containing the Keyfactor Command reference ID for the security claim.	Description	A string indicating a description for the security claim.	ClaimType	A string indicating the type of claim.	ClaimValue	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).	Provider	<p>An object containing information about the provider assigned to the security claim.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>Name</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	Name	A string containing the short reference name for the provider (e.g. Active Directory).
Parameter	Description																		
Id	An integer containing the Keyfactor Command reference ID for the security claim.																		
Description	A string indicating a description for the security claim.																		
ClaimType	A string indicating the type of claim.																		
ClaimValue	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																		
Provider	<p>An object containing information about the provider assigned to the security claim.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>Name</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	Name	A string containing the short reference name for the provider (e.g. Active Directory).												
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the provider.																		
Name	A string containing the short reference name for the provider (e.g. Active Directory).																		
Permissions	<p>An array of objects containing the permissions granted to the certificate.</p> <table border="1"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)</td> </tr> </tbody> </table>	Parameter	Description	Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)														
Parameter	Description																		
Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)																		

Name	Description				
	<table border="1"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>GrantedBy</td> <td>A array of strings containing the list of roles or collections that grant the given permission to the entity.</td> </tr> </tbody> </table>	Parameter	Description	GrantedBy	A array of strings containing the list of roles or collections that grant the given permission to the entity.
Parameter	Description				
GrantedBy	A array of strings containing the list of roles or collections that grant the given permission to the entity.				

## Version 1

Version 1 of the GET /Certificates/IdentityAudit/{id} method includes the same functionality as version 2 with similar data in the response but supports only environments using Active Directory as an identity provider.

Table 145: GET Certificates Identity Audit {id} v1 Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 146: GET Certificates Identity Audit {id} v1 Response Data

Name	Description						
Id	An integer containing the Keyfactor Command reference ID of the identity.						
AccountName	A string containing the name of the identity.						
IdentityType	A string that specifies the type of identity the entity is. For Active Directory, this will be a user or a group.						
SID	A string containing the SID of the identity.						
Permissions	An array of objects containing the permissions granted to the certificate. <table border="1" data-bbox="454 651 1404 913"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)</td> </tr> <tr> <td>GrantedBy</td> <td>A array of strings containing the list of roles or collections that grant the given permission to the entity.</td> </tr> </tbody> </table>	Parameter	Description	Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)	GrantedBy	A array of strings containing the list of roles or collections that grant the given permission to the entity.
Parameter	Description						
Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)						
GrantedBy	A array of strings containing the list of roles or collections that grant the given permission to the entity.						

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.5 DELETE Certificates ID

The DELETE /Certificates/{id} method is used to delete an existing certificate with the specified ID from the Keyfactor Command database. If the specified certificate has an associated private key stored in the database, this private key is also removed. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificates/collections/delete/  
 OR  
 /certificates/collections/delte/#/ (where # is a reference to a specific certificate collection ID)

 Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

 **Tip:** Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 147: DELETE Certificates {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the certificate to delete. Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on page 310</a> ) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.6 GET Certificates ID

The *GET /Certificates/{id}* method is used to return details for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate details in the message body.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 148: GET Certificates {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the certificate. Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on page 310</a> ) to retrieve a list of multiple certificates to determine the desired certificate's ID.
includeLocations	Query	A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .
includeMetadata	Query	A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 149: GET Certificates {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate.
Thumbprint	A string indicating the thumbprint of the certificate.
SerialNumber	A string indicating the serial number of the certificate.
IssuedDN	A string indicating the distinguished name of the certificate.
IssuedCN	A string indicating the common name of the certificate.
ImportDate	The date, in UTC, on which the certificate was imported into Keyfactor Command.
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.
NotAfter	The date, in UTC, on which the certificate expires.
IssuerDN	A string indicating the distinguished name of the issuer.
PrincipalId	An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> .
TemplateId	An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.

Name	Description																		
CertState	<p>An integer specifying the state of the certificate. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Active</td> </tr> <tr> <td>2</td> <td>Revoked</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Failed</td> </tr> <tr> <td>5</td> <td>Pending</td> </tr> <tr> <td>6</td> <td>Certificate Authority</td> </tr> <tr> <td>7</td> <td>Parent Certificate Authority</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	Certificate Authority	7	Parent Certificate Authority

0	Unknown																		
1	Active																		
2	Revoked																		
3	Denied																		
4	Failed																		
5	Pending																		
6	Certificate Authority																		
7	Parent Certificate Authority																		
KeySizeInBits	An integer specifying the key size in bits.																		
KeyType	<p>An integer specifying the key type of the certificate. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>RSA</td> </tr> <tr> <td>2</td> <td>DSA</td> </tr> <tr> <td>3</td> <td>ECC</td> </tr> <tr> <td>4</td> <td>DH</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	RSA	2	DSA	3	ECC	4	DH						
Value	Description																		
0	Unknown																		
1	RSA																		
2	DSA																		
3	ECC																		
4	DH																		
RequesterId	An integer indicating the Keyfactor Command reference ID of the identity that requested the certificate. See also <i>RequesterName</i> .																		
IssuedOU	A string indicating the organizational unit of the certificate.																		
IssuedEmail	A string indicating the email address of the certificate.																		
KeyUsage	An integer indicating the total key usage of the certificate. Key usage is																		

Name	Description																																	
	<p>stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1" data-bbox="609 359 1403 1486"> <thead> <tr> <th data-bbox="615 367 771 430">Value</th> <th data-bbox="777 367 1024 430">Function</th> <th data-bbox="1031 367 1396 430">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="615 438 771 491">0</td> <td data-bbox="777 438 1024 491">None</td> <td data-bbox="1031 438 1396 491">No key usage parameters.</td> </tr> <tr> <td data-bbox="615 499 771 583">1</td> <td data-bbox="777 499 1024 583">Encipherment Only</td> <td data-bbox="1031 499 1396 583">The key can be used for encryption only.</td> </tr> <tr> <td data-bbox="615 592 771 718">2</td> <td data-bbox="777 592 1024 718">CRL Signing</td> <td data-bbox="1031 592 1396 718">The key can be used to sign a certificate revocation list (CRL).</td> </tr> <tr> <td data-bbox="615 726 771 810">4</td> <td data-bbox="777 726 1024 810">Key Certificate Signing</td> <td data-bbox="1031 726 1396 810">The key can be used to sign certificates.</td> </tr> <tr> <td data-bbox="615 819 771 1008">8</td> <td data-bbox="777 819 1024 1008">Key Agreement</td> <td data-bbox="1031 819 1396 1008">The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td data-bbox="615 1016 771 1100">16</td> <td data-bbox="777 1016 1024 1100">Data Encipherment</td> <td data-bbox="1031 1016 1396 1100">The key can be used for data encryption.</td> </tr> <tr> <td data-bbox="615 1108 771 1192">32</td> <td data-bbox="777 1108 1024 1192">Key Encipherment</td> <td data-bbox="1031 1108 1396 1192">The key can be used for key encryption.</td> </tr> <tr> <td data-bbox="615 1201 771 1285">64</td> <td data-bbox="777 1201 1024 1285">Nonrepudiation</td> <td data-bbox="1031 1201 1396 1285">The key can be used for authentication.</td> </tr> <tr> <td data-bbox="615 1293 771 1377">128</td> <td data-bbox="777 1293 1024 1377">Digital Signature</td> <td data-bbox="1031 1293 1396 1377">The key can be used as a digital signature.</td> </tr> <tr> <td data-bbox="615 1386 771 1470">32768</td> <td data-bbox="777 1386 1024 1470">Decipherment Only</td> <td data-bbox="1031 1386 1396 1470">The key can be used for decryption only.</td> </tr> </tbody> </table> <p data-bbox="609 1522 1403 1612">For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																																	
CertStateString	A string containing the certificate state. The possible values are: <ul data-bbox="609 1738 787 1770" style="list-style-type: none"> <li>• Unknown (0)</li> </ul>																																	

Name	Description																		
	<ul style="list-style-type: none"> <li>• Active (1)</li> <li>• Revoked (2)</li> <li>• Denied (3)</li> <li>• Failed (4)</li> <li>• Pending (5)</li> <li>• Certificate Authority (6)</li> <li>• Parent Certificate Authority (7)</li> <li>• External Validation (8)</li> </ul>																		
KeyTypeString	A string containing the key type description (e.g. RSA) as per the types and descriptions shown for <i>KeyType</i> .																		
RevocationEffDate	The date, in UTC, on which the certificate was revoked, if applicable.																		
RevocationReason	<p>An integer indicating the reason the certificate was revoked. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unspecified</td> </tr> <tr> <td>1</td> <td>Key Compromised</td> </tr> <tr> <td>2</td> <td>CA Compromised</td> </tr> <tr> <td>3</td> <td>Affiliation Changed</td> </tr> <tr> <td>4</td> <td>Superseded</td> </tr> <tr> <td>5</td> <td>Cessation Of Operation</td> </tr> <tr> <td>6</td> <td>Certificate Hold</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation Of Operation	6	Certificate Hold	999	Unknown
Value	Description																		
0	Unspecified																		
1	Key Compromised																		
2	CA Compromised																		
3	Affiliation Changed																		
4	Superseded																		
5	Cessation Of Operation																		
6	Certificate Hold																		
999	Unknown																		
RevocationComment	An internally used Keyfactor Command field.																		
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.																		
CertificateAuthorityName	A string indicating the certificate authority that issued the certificate.																		
TemplateName	A string indicating the <b>display name</b> of the template that was used when issuing the certificate.																		

Name	Description								
ArchivedKey	A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).								
HasPrivateKey	A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)								
PrincipalName	A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).								
CertRequestId	An integer containing the Keyfactor Command reference ID of the certificate request.								
RequesterName	A string containing the name of the identity that requested the certificate.								
ContentBytes	A string containing the certificate as bytes.								
ExtendedKeyUsages	<p>An array of objects containing the extended key usages associated with the certificate. Extended Key data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the extended key usage.</td> </tr> <tr> <td>Oid</td> <td>A string indicating the OID of the extended key usage.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the name of the extended key usage.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the extended key usage.	Oid	A string indicating the OID of the extended key usage.	DisplayName	A string indicating the name of the extended key usage.
Name	Description								
Id	An integer containing the Keyfactor Command reference ID of the extended key usage.								
Oid	A string indicating the OID of the extended key usage.								
DisplayName	A string indicating the name of the extended key usage.								

Name	Description																																				
SubjectAltNameElements	<p>An array of objects containing the subject alternative name elements of the certificate. SAN data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the SAN Element.</td> </tr> <tr> <td>Type</td> <td> <p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table> </td> </tr> <tr> <td>ValueHash</td> <td>A string indicating a hash of the SAN value.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the SAN Element.	Value	A string indicating the value of the SAN Element.	Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown	ValueHash	A string indicating a hash of the SAN value.
Name	Description																																				
Id	An integer containing the Keyfactor Command reference ID of the SAN Element.																																				
Value	A string indicating the value of the SAN Element.																																				
Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown										
Value	Description																																				
0	Other Name																																				
1	RFC 822 Name																																				
2	DNS Name																																				
3	X400 Address																																				
4	Directory Name																																				
5	Ediparty Name																																				
6	Uniform Resource Identifier																																				
7	IP Address																																				
8	Registered Id																																				
100	MS_NTPrincipalName																																				
101	MS_NTDSReplication																																				
999	Unknown																																				
ValueHash	A string indicating a hash of the SAN value.																																				

Name	Description								
CRLDistributionPoints	<p>An array of objects containing the distribution points for the certificate revocation lists the certificate could be in. CRL distribution point data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the CRL distribution point.</td> </tr> <tr> <td>URL</td> <td>A string indicating the URL of the CRL distribution point.</td> </tr> <tr> <td>URLHash</td> <td>A string indicating a hash of the URL.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.	URL	A string indicating the URL of the CRL distribution point.	URLHash	A string indicating a hash of the URL.
Name	Description								
Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.								
URL	A string indicating the URL of the CRL distribution point.								
URLHash	A string indicating a hash of the URL.								
LocationsCount	<p>An array of objects containing a count of how many certificates are in each location type. This returns a list of type and count combination. For example:</p> <pre> "LocationsCount": [   {     "Type": "IIS",     "Count": 2   },   {     "Type": "F5-SL-REST",     "Count": 1   } ] </pre>								
SSLLocations	<p>An array of objects containing the locations where the certificate is found using SSL discovery. SSL location data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StorePath</td> <td>A string indicating the machine where the certificate was discovered.</td> </tr> <tr> <td>AgentPool</td> <td>A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.</td> </tr> </tbody> </table>	Name	Description	StorePath	A string indicating the machine where the certificate was discovered.	AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.		
Name	Description								
StorePath	A string indicating the machine where the certificate was discovered.								
AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.								

Name	Description									
	<table border="1"> <thead> <tr> <th data-bbox="607 273 847 336">Name</th> <th data-bbox="854 273 1401 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="607 344 847 436">IPAddress</td> <td data-bbox="854 344 1401 436">A string indicating the IP address where the certificate was discovered.</td> </tr> <tr> <td data-bbox="607 445 847 537">Port</td> <td data-bbox="854 445 1401 537">An integer indicating the port on which the certificate was discovered.</td> </tr> <tr> <td data-bbox="607 546 847 701">NetworkName</td> <td data-bbox="854 546 1401 701">A string indicating the name of the SSL network that performed the SSL scan (discovery or monitoring) on the endpoint where the certificate was discovered.</td> </tr> </tbody> </table>		Name	Description	IPAddress	A string indicating the IP address where the certificate was discovered.	Port	An integer indicating the port on which the certificate was discovered.	NetworkName	A string indicating the name of the SSL network that performed the SSL scan (discovery or monitoring) on the endpoint where the certificate was discovered.
Name	Description									
IPAddress	A string indicating the IP address where the certificate was discovered.									
Port	An integer indicating the port on which the certificate was discovered.									
NetworkName	A string indicating the name of the SSL network that performed the SSL scan (discovery or monitoring) on the endpoint where the certificate was discovered.									

Name	Description																																						
Locations	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreMachine</td> <td>A string indicating the machine on which the certificate store is located.</td> </tr> <tr> <td>StorePath</td> <td>A string indicating the path on the machine where the certificate store is located. 1xx	User-defined certificate stores will be given a type ID over 101.																																						

ChainLevel	An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.
------------	--

Name	Description														
Metadata	An object containing the metadata fields populated for the certificate.														
CertificateKeyId	An integer indicating the Keyfactor Command reference ID for the private key, if one exists, and public key of the certificate.														
CARowIndex	<p>An integer containing the CA's reference ID for certificate.</p> <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p> <b>Note:</b> The <i>CARowIndex</i> has been replaced by <i>CARecordId</i>, but will remain for backward compatibility. It will only contain a non-zero value for certificates issued by Microsoft CAs. For Microsoft CA certificates, the <i>CARowIndex</i> will be equal to the <i>CARecordId</i> value parsed to an integer.</p> </div>														
CARecordId	A string containing the CA's reference ID for certificate.														
DetailedKeyUsage	<p>An object containing details of the key usage configured for the certificate. Detailed key usage data includes:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CrlSign</td> <td>A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>DataEncipherment</td> <td>A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>DecipherOnly</td> <td>A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).</td> </tr> <tr> <td>DigitalSignature</td> <td>A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>EncipherOnly</td> <td>A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).</td> </tr> <tr> <td>KeyAgreement</td> <td>A Boolean that indicates whether the certificate is configured for key agree-</td> </tr> </tbody> </table>	Name	Description	CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).	DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).	DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).	DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).	EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).	KeyAgreement	A Boolean that indicates whether the certificate is configured for key agree-
Name	Description														
CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).														
DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).														
DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).														
DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).														
EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).														
KeyAgreement	A Boolean that indicates whether the certificate is configured for key agree-														

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>ment.</td> </tr> <tr> <td>KeyCertSign</td> <td>A Boolean that indicates whether the certificate is configured for certificate signing.</td> </tr> <tr> <td>KeyEncipherment</td> <td>A Boolean that indicates whether the certificate is configured for key encipherment.</td> </tr> <tr> <td>NonRepudiation</td> <td>A Boolean that indicates whether the certificate is configured for non-repudiation.</td> </tr> <tr> <td>HexCode</td> <td>A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i>.</td> </tr> </tbody> </table>	Name	Description		ment.	KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.	KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.	NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.	HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .
Name	Description												
	ment.												
KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.												
KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.												
NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.												
HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .												
KeyRecoverable	A Boolean that indicates whether the certificate key is recoverable (true) or not (false).												
Curve	A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul>												
CertStoreTypeShortNames	An array of comma-separated strings indicating the certificate stores types associated with each certificate.												

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.7 GET Certificates Metadata Compare

The GET /Certificates/Metadata/Compare method is used to compare the value of a metadata field in a certificate stored in Keyfactor Command with a provided value. This can be used to prevent exposing sensitive data while still providing functionality. For example, with this method, a metadata attribute can be used along with the certificate itself as a second authentication factor to a third-party application. This method returns HTTP 200 OK on a success with a response of *true* if the compared values match or *false* if they do not.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 150: GET Certificates Metadata Compare Input Parameters

Name	In	Description
certificateId	Query	<b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate containing the metadata value to be compared.
metadataFieldName	Query	<b>Required.</b> A string containing the name of the metadata field whose value should be compared.
value	Query	<b>Required.</b> A string containing the value for comparison.
collectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.8 GET Certificates ID History

The GET /Certificates/{id}/History method is used to return details for the history of transactions for a certificate with the specified ID. History records are stored for a certificate for a variety of activities including initial import or enrollment, revocation, key recovery, additions or removals from certificate stores, renewals, and certificate discoveries in various certificate stores. For more information about certificate history records, see *Certificate Details* in the *Keyfactor Command Reference Guide*. This method returns HTTP 200 OK on a success with certificate history details in the message body.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 151: GET Certificates {id} History Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>OperationStart</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 152: GET Certificates {id} History Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID of the certificate.
OperationStart	The date, in UTC, on which the operation begin.
OperationEnd	The date, in UTC, on which the operation completed.
Username	The name of the user who initiated the transaction that created the history record (e.g. enrolled for the certificate, revoked the certificate), in DOMAIN\username format.
Comment	A string containing a comment that provides more information about the history record. For example (for a metadata field): <pre>"AppOwnerEmailAddress has been updated from 'john.smith@keyexample.com' to 'martha.jones@keyexample.com'"</pre>
Action	A string naming the action that was taken. For example: <pre>Metadata Updated</pre>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.9 DELETE Certificates

The DELETE /Certificates method is used to delete multiple certificates from the Keyfactor Command database in one request. The certificate IDs should be supplied in the request body as a JSON array of integers. If the specified certificate(s) have associated private key(s) stored in the database, these private keys are also removed. This endpoint returns 204 with no content upon success. IDs of any certificates that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed.

Whenever a certificate is deleted that is a part of a certificate renewal chain. The certificates on either end of the deleted cert(s) will have their certificate histories updated to show that either a certificate before or after the certificate was deleted in the renewal chain of that certificate.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificates/collections/delete/

OR

/certificates/collections/delete/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

**Tip:** Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 153: DELETE Certificates Input Parameters

Name	In	Description
ids	Body	<p><b>Required.</b> An array of integers containing the Keyfactor Command certificate IDs for certificates that should be deleted in the form:</p> <pre>[123, 789, 567]</pre> <p>Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on the next page</a>) to determine the certificate IDs.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.10 GET Certificates

The GET /Certificates method is used to return a list of certificates with certificate details. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the requested certificates, as determined by filtering, and their certificate details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 154: GET Certificates Input Parameters

Name	In	Description
includeLocations	Query	A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .
includeMetadata	Query	A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .
includeHasPrivateKey	Query	A Boolean that sets whether to include the correct value for <i>HasPrivateKey</i> in the response (true) or not (false). If false is selected, the <i>HasPrivateKey</i> field will appear in the response with a value of <i>false</i> regardless of whether the certificate actually has a stored private key or not. The default is <i>false</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
includeRevoked	Query	A Boolean that sets whether to include revoked certificates in the results (true) or not (false). The default is <i>false</i> .
includeExpired	Query	A Boolean that sets whether to include expired certificates in the results (true) or not (false). The default is <i>false</i> .
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• ArchivedKey</li> <li>• CertId</li> <li>• CA</li> </ul>

Name	In	Description
		<ul style="list-style-type: none"> <li>• CertState</li> <li>• CertStoreContainer</li> <li>• CertStoreFQDN (alias: JavaKeystoreFQDN)</li> <li>• CertStorePath (alias: JavaKeystorePath)</li> <li>• CN (alias: IssuedCN)</li> <li>• DN (alias: IssuedDN)</li> <li>• ExpirationDate (alias: NotAfter)</li> <li>• EKU</li> <li>• EKUName</li> <li>• HasPrivateKey</li> <li>• ImportDate</li> <li>• IssuedDate (aliases: NotBefore and EffectiveDate)</li> <li>• IssuerDN</li> <li>• KeySize (alias: KeySizeInBits)</li> <li>• KeyType</li> <li>• KeyUsage</li> <li>• OU</li> <li>• NetBIOSPrincipal (alias: PrincipalName)</li> <li>• PublicKey</li> <li>• NetBIOSRequester (alias: RequesterName)</li> <li>• RevocationDate (alias: RevocationEffDate)</li> <li>• Revoker</li> <li>• RFC2818Compliant</li> <li>• SelfSigned</li> <li>• SerialNumber</li> <li>• SigningAlgorithm</li> <li>• SSLDNSName</li> <li>• SSLIPAddress (alias: SslHostName)</li> <li>• SSLNetworkName</li> <li>• SSLPort</li> <li>• SAN</li> <li>• TemplateDisplayName (alias: TemplateName)</li> <li>• TemplateShortName</li> <li>• Thumbprint</li> </ul> <p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> <li>• <i>CARequestID</i></li> </ul>

Name	In	Description
		<ul style="list-style-type: none"> <li>• <i>CertRequestId</i></li> <li>• <i>IsPfx</i></li> <li>• <i>RequestResolutionDate</i></li> </ul> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 5px; background-color: #e6f2ff; margin-top: 10px;">  <b>Note:</b> Queries may be done using either the primary field name or the field alias(es).         </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 155: GET Certificates Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate.
Thumbprint	A string indicating the thumbprint of the certificate.
SerialNumber	A string indicating the serial number of the certificate.
IssuedDN	A string indicating the distinguished name of the certificate.
IssuedCN	A string indicating the common name of the certificate.
ImportDate	The date, in UTC, on which the certificate was imported into Keyfactor Command.
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.
NotAfter	The date, in UTC, on which the certificate expires.
IssuerDN	A string indicating the distinguished name of the issuer.
PrincipalId	An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> .
TemplateId	An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.

Name	Description																		
CertState	<p>An integer specifying the state of the certificate. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Active</td> </tr> <tr> <td>2</td> <td>Revoked</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Failed</td> </tr> <tr> <td>5</td> <td>Pending</td> </tr> <tr> <td>6</td> <td>Certificate Authority</td> </tr> <tr> <td>7</td> <td>Parent Certificate Authority</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	Certificate Authority	7	Parent Certificate Authority

5	Cessation Of Operation																		
6	Certificate Hold																		
999	Unknown																		
RevocationComment	An internally used Keyfactor Command field.																		
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.																		
CertificateAuthorityName	A string indicating the certificate authority that issued the certificate.																		
TemplateName	A string indicating the <b>display name</b> of the template that was used when issuing the certificate.																		

Name	Description								
ArchivedKey	A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).								
HasPrivateKey	A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)								
PrincipalName	A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).								
CertRequestId	An integer containing the Keyfactor Command reference ID of the certificate request.								
RequesterName	A string containing the name of the identity that requested the certificate.								
ContentBytes	A string containing the certificate as bytes.								
ExtendedKeyUsages	<p>An array of objects containing the extended key usages associated with the certificate. Extended Key data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the extended key usage.</td> </tr> <tr> <td>Oid</td> <td>A string indicating the OID of the extended key usage.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the name of the extended key usage.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the extended key usage.	Oid	A string indicating the OID of the extended key usage.	DisplayName	A string indicating the name of the extended key usage.
Name	Description								
Id	An integer containing the Keyfactor Command reference ID of the extended key usage.								
Oid	A string indicating the OID of the extended key usage.								
DisplayName	A string indicating the name of the extended key usage.								

Name	Description																																				
SubjectAltNameElements	<p>An array of objects containing the subject alternative name elements of the certificate. SAN data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the SAN Element.</td> </tr> <tr> <td>Type</td> <td> <p>An integer containing the type of SAN element. Value	A string indicating the value of the SAN Element.	Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown	ValueHash	A string indicating a hash of the SAN value.
Name	Description																																				
Id	An integer containing the Keyfactor Command reference ID of the SAN Element.																																				
Value	A string indicating the value of the SAN Element.																																				
Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown										
Value	Description																																				
0	Other Name																																				
1	RFC 822 Name																																				
2	DNS Name																																				
3	X400 Address																																				
4	Directory Name																																				
5	Ediparty Name																																				
6	Uniform Resource Identifier																																				
7	IP Address																																				
8	Registered Id																																				
100	MS_NTPrincipalName																																				
101	MS_NTDSReplication																																				
999	Unknown																																				
ValueHash	A string indicating a hash of the SAN value.																																				

Name	Description								
CRLDistributionPoints	<p>An array of objects containing the distribution points for the certificate revocation lists the certificate could be in. CRL distribution point data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the CRL distribution point.</td> </tr> <tr> <td>URL</td> <td>A string indicating the URL of the CRL distribution point.</td> </tr> <tr> <td>URLHash</td> <td>A string indicating a hash of the URL.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.	URL	A string indicating the URL of the CRL distribution point.	URLHash	A string indicating a hash of the URL.
Name	Description								
Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.								
URL	A string indicating the URL of the CRL distribution point.								
URLHash	A string indicating a hash of the URL.								
LocationsCount	<p>An array of objects containing a count of how many certificates are in each location type. This returns a list of type and count combination. For example:</p> <pre> "LocationsCount": [   {     "Type": "IIS",     "Count": 2   },   {     "Type": "F5-SL-REST",     "Count": 1   } ] </pre>								
SSLLocations	<p>An array of objects containing the locations where the certificate is found using SSL discovery. SSL location data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StorePath</td> <td>A string indicating the machine where the certificate was discovered.</td> </tr> <tr> <td>AgentPool</td> <td>A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.</td> </tr> </tbody> </table>	Name	Description	StorePath	A string indicating the machine where the certificate was discovered.	AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.		
Name	Description								
StorePath	A string indicating the machine where the certificate was discovered.								
AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.								

Name	Description	
	<b>Name</b>	<b>Description</b>
	IPAddress	A string indicating the IP address where the certificate was discovered.
	Port	An integer indicating the port on which the certificate was discovered.
NetworkName	A string indicating the name of the SSL network that performed the SSL scan (discovery or monitoring) on the endpoint where the certificate was discovered.	

Name	Description																																						
Locations	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreMachine</td> <td>A string indicating the machine on which the certificate store is located.</td> </tr> <tr> <td>StorePath</td> <td>A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.</td> </tr> <tr> <td>StoreType</td> <td>           An integer indicating the type of certificate store the certificate is located in. Possible values are:           <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr><td>0</td><td>Java Keystore</td></tr> <tr><td>2</td><td>PEM File</td></tr> <tr><td>3</td><td>F5 SSL Profiles</td></tr> <tr><td>4</td><td>IIS Roots</td></tr> <tr><td>5</td><td>NetScaler</td></tr> <tr><td>6</td><td>IIS Personal</td></tr> <tr><td>7</td><td>F5 Web Server</td></tr> <tr><td>8</td><td>IIS Revoked</td></tr> <tr><td>9</td><td>F5 Web Server REST</td></tr> <tr><td>10</td><td>F5 SSL Profiles REST</td></tr> <tr><td>11</td><td>F5 CA Bundles REST</td></tr> <tr><td>100</td><td>Amazon Web Services</td></tr> <tr><td>101</td><td>File Transfer Protocol</td></tr> <tr><td>1xx</td><td>User-defined certificate stores will be given a type ID over 101.</td></tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	StoreMachine	A string indicating the machine on which the certificate store is located.	StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.	StoreType	An integer indicating the type of certificate store the certificate is located in. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr><td>0</td><td>Java Keystore</td></tr> <tr><td>2</td><td>PEM File</td></tr> <tr><td>3</td><td>F5 SSL Profiles</td></tr> <tr><td>4</td><td>IIS Roots</td></tr> <tr><td>5</td><td>NetScaler</td></tr> <tr><td>6</td><td>IIS Personal</td></tr> <tr><td>7</td><td>F5 Web Server</td></tr> <tr><td>8</td><td>IIS Revoked</td></tr> <tr><td>9</td><td>F5 Web Server REST</td></tr> <tr><td>10</td><td>F5 SSL Profiles REST</td></tr> <tr><td>11</td><td>F5 CA Bundles REST</td></tr> <tr><td>100</td><td>Amazon Web Services</td></tr> <tr><td>101</td><td>File Transfer Protocol</td></tr> <tr><td>1xx</td><td>User-defined certificate stores will be given a type ID over 101.</td></tr> </tbody> </table>	Value	Description	0	Java Keystore	2	PEM File	3	F5 SSL Profiles	4	IIS Roots	5	NetScaler	6	IIS Personal	7	F5 Web Server	8	IIS Revoked	9	F5 Web Server REST	10	F5 SSL Profiles REST	11	F5 CA Bundles REST	100	Amazon Web Services	101	File Transfer Protocol	1xx	User-defined certificate stores will be given a type ID over 101.
Name	Description																																						
StoreMachine	A string indicating the machine on which the certificate store is located.																																						
StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.																																						
StoreType	An integer indicating the type of certificate store the certificate is located in. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr><td>0</td><td>Java Keystore</td></tr> <tr><td>2</td><td>PEM File</td></tr> <tr><td>3</td><td>F5 SSL Profiles</td></tr> <tr><td>4</td><td>IIS Roots</td></tr> <tr><td>5</td><td>NetScaler</td></tr> <tr><td>6</td><td>IIS Personal</td></tr> <tr><td>7</td><td>F5 Web Server</td></tr> <tr><td>8</td><td>IIS Revoked</td></tr> <tr><td>9</td><td>F5 Web Server REST</td></tr> <tr><td>10</td><td>F5 SSL Profiles REST</td></tr> <tr><td>11</td><td>F5 CA Bundles REST</td></tr> <tr><td>100</td><td>Amazon Web Services</td></tr> <tr><td>101</td><td>File Transfer Protocol</td></tr> <tr><td>1xx</td><td>User-defined certificate stores will be given a type ID over 101.</td></tr> </tbody> </table>	Value	Description	0	Java Keystore	2	PEM File	3	F5 SSL Profiles	4	IIS Roots	5	NetScaler	6	IIS Personal	7	F5 Web Server	8	IIS Revoked	9	F5 Web Server REST	10	F5 SSL Profiles REST	11	F5 CA Bundles REST	100	Amazon Web Services	101	File Transfer Protocol	1xx	User-defined certificate stores will be given a type ID over 101.								
Value	Description

10	F5 SSL Profiles REST																																						
11	F5 CA Bundles REST																																						
100	Amazon Web Services																																						
101	File Transfer Protocol																																						
1xx	User-defined certificate stores will be given a type ID over 101.																																						
	<table border="1"> <tbody> <tr> <td>Alias</td> <td>A string indicating the alias of the certificate in the certificate store.</td> </tr> <tr> <td>ChainLevel</td> <td>An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.</td> </tr> </tbody> </table>	Alias	A string indicating the alias of the certificate in the certificate store.	ChainLevel	An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.																																		
Alias	A string indicating the alias of the certificate in the certificate store.																																						
ChainLevel	An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.																																						

Name	Description														
Metadata	An object containing the metadata fields populated for the certificate.														
CertificateKeyId	An integer indicating the Keyfactor Command reference ID for the private key, if one exists, and public key of the certificate.														
CARowIndex	<p>An integer containing the CA's reference ID for certificate.</p> <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;">  <b>Note:</b> The <i>CARowIndex</i> has been replaced by <i>CARecordId</i>, but will remain for backward compatibility. It will only contain a non-zero value for certificates issued by Microsoft CAs. For Microsoft CA certificates, the <i>CARowIndex</i> will be equal to the <i>CARecordId</i> value parsed to an integer. </div>														
CARecordId	A string containing the CA's reference ID for certificate.														
DetailedKeyUsage	<p>An object containing details of the key usage configured for the certificate. Detailed key usage data includes:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CrISign</td> <td>A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>DataEncipherment</td> <td>A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>DecipherOnly</td> <td>A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).</td> </tr> <tr> <td>DigitalSignature</td> <td>A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>EncipherOnly</td> <td>A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).</td> </tr> <tr> <td>KeyAgreement</td> <td>A Boolean that indicates whether the certificate is configured for key agree-</td> </tr> </tbody> </table>	Name	Description	CrISign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).	DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).	DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).	DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).	EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).	KeyAgreement	A Boolean that indicates whether the certificate is configured for key agree-
Name	Description														
CrISign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).														
DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).														
DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).														
DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).														
EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).														
KeyAgreement	A Boolean that indicates whether the certificate is configured for key agree-														

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>ment.</td> </tr> <tr> <td>KeyCertSign</td> <td>A Boolean that indicates whether the certificate is configured for certificate signing.</td> </tr> <tr> <td>KeyEncipherment</td> <td>A Boolean that indicates whether the certificate is configured for key encipherment.</td> </tr> <tr> <td>NonRepudiation</td> <td>A Boolean that indicates whether the certificate is configured for non-repudiation.</td> </tr> <tr> <td>HexCode</td> <td>A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i>.</td> </tr> </tbody> </table>	Name	Description		ment.	KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.	KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.	NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.	HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .
Name	Description												
	ment.												
KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.												
KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.												
NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.												
HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .												
KeyRecoverable	A Boolean that indicates whether the certificate key is recoverable (true) or not (false).												
Curve	A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul>												
CertStoreTypeShortNames	An array of comma-separated strings indicating the certificate stores types associated with each certificate.												

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.11 PUT Certificates Metadata

The PUT /Certificates/Metadata method is used to update one or more metadata values for a specified certificate. Any existing values for the metadata fields submitted with this update will be overwritten with the new values provided. For more granular control over updating only metadata fields that do not already contain a value, use the *PUT /Certificates/Metadata/All* method (see [PUT Certificates Metadata All on the next page](#)). This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/metadata/modify/

OR

/certificates/collections/metadata/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 156: PUT Certificates Metadata Input Parameters

Name	In	Description
Id	Body	<b>Required.</b> An integer specifying the Keyfactor Command reference ID for the certificate to update.
Metadata	Body	<p><b>Required.</b> An object containing one or more metadata key value pairs to update for the certificate. These are submitted with the metadata field name in the key and the value in the value. For example:</p> <pre> "Metadata": {   "AppOwnerEmailAddress": "john.smith@keyexample.com", // String field   "SiteCode": 23, // Integer field   "BusinessCritical": true, // Boolean field   "Notes": "Here are some notes about this certificate.", // BigText field   "BusinessUnit": "E-Business", // Multiple Choice field with a pre-defined value   "TicketResolutionDate": "2021-07-23" // Date field in yyyy-mm-dd format } </pre>
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.12 PUT Certificates Metadata All

The PUT /Certificates/Metadata/All method is used to update one or more metadata values for a specified set of certificates. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/metadata/modify/

OR

/certificates/collections/metadata/modify/#!/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 157: PUT Certificates Metadata All Input Parameters

Name	In	Description
Query	Body	<p><b>Required*</b>. A string containing a query to limit the certificates to update (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. A value for one of <i>CertificateIds</i>, <i>Query</i>, or <i>CollectionId</i> is <b>required</b>.</p> <p>The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"><li>• ArchivedKey</li><li>• CertId</li><li>• CA</li><li>• CertState</li><li>• CertStoreContainer</li><li>• CertStoreFQDN (alias: JavaKeystoreFQDN)</li><li>• CertStorePath (alias: JavaKeystorePath)</li><li>• CN (alias: IssuedCN)</li><li>• DN (alias: IssuedDN)</li><li>• ExpirationDate (alias: NotAfter)</li><li>• EKU</li><li>• EKUName</li><li>• HasPrivateKey</li><li>• ImportDate</li><li>• IssuedDate (aliases: NotBefore and EffectiveDate)</li><li>• IssuerDN</li><li>• KeySize (alias: KeySizeInBits)</li><li>• KeyType</li><li>• KeyUsage</li><li>• OU</li></ul>

Name	In	Description
		<ul style="list-style-type: none"> <li>• NetBIOSPrincipal (alias: PrincipalName)</li> <li>• PublicKey</li> <li>• NetBIOSRequester (alias: RequesterName)</li> <li>• RevocationDate (alias: RevocationEffDate)</li> <li>• Revoker</li> <li>• RFC2818Compliant</li> <li>• SelfSigned</li> <li>• SerialNumber</li> <li>• SigningAlgorithm</li> <li>• SSLDNSName</li> <li>• SSLIPAddress (alias: SslHostName)</li> <li>• SSLNetworkName</li> <li>• SSLPort</li> <li>• SAN</li> <li>• TemplateDisplayName (alias: TemplateName)</li> <li>• TemplateShortName</li> <li>• Thumbprint</li> </ul> <p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> <li>• <i>CARequestID</i></li> <li>• <i>CertRequestID</i></li> <li>• <i>IsPfx</i></li> <li>• <i>RequestResolutionDate</i></li> </ul> <div style="background-color: #e6f2ff; padding: 10px; border-radius: 5px; margin-top: 10px;"> <p> <b>Note:</b> Queries may be done using either the primary field name or the field alias(es).</p> </div> <div style="background-color: #e6ffe6; padding: 10px; border-radius: 5px; margin-top: 10px;"> <p> <b>Tip:</b> To exclude revoked certificates from the update, include a query of:  <code>CertState -ne \"2\"</code></p> <p>To exclude expired certificates from the update, include a query of:  <code>ExpirationDate -ge \"%TODAY%\"</code></p> </div>
Certi- ficatelds	Body	<b>Required*</b> . An array of integers indicating the Keyfactor Command certificate IDs to update. A value for one of <i>Certificatelds</i> , <i>Query</i> , or <i>CollectionId</i> is <b>required</b> .
Metadata	Body	<b>Required</b> . An array of objects containing information about the metadata field(s) to

Name	In	Description								
		<p>update. The parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td><b>Required.</b> A string indicating the value that should be set for the metadata field.</td> </tr> <tr> <td>MetadataName</td> <td><b>Required.</b> A string indicating the name of the metadata field that should be updated for the certificates.</td> </tr> <tr> <td>OverwriteExisting</td> <td>A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i>.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "Metadata": [   {     "MetadataName": "AppOwnerEmailAddress", // This is a String     field.     "Value": "john.smith@keyexample.com",     "OverwriteExisting": true   },   {     "MetadataName": "SiteCode", // This is an Integer field.     "Value": 5,     "OverwriteExisting": true   },   {     "MetadataName": "BusinessCritical", // This is a Boolean     field.     "Value": true,     "OverwriteExisting": true   },   { </pre>	Name	Description	Value	<b>Required.</b> A string indicating the value that should be set for the metadata field.	MetadataName	<b>Required.</b> A string indicating the name of the metadata field that should be updated for the certificates.	OverwriteExisting	A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> .
Name	Description									
Value	<b>Required.</b> A string indicating the value that should be set for the metadata field.									
MetadataName	<b>Required.</b> A string indicating the name of the metadata field that should be updated for the certificates.									
OverwriteExisting	A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> .									

Name	In	Description
		<pre> "MetadataName": "Notes", // This is a BigText field. "Value": "Here are some notes about this certificate.", "OverwriteExisting": true }, { "MetadataName": "BusinessUnit", // This is a Multiple Choice field. "Value": "E-Business", // This is a value pre-defined for the field. "OverwriteExisting": true }, { "MetadataName": "TicketResolutionDate", // This is a Date field in yyyy-mm-dd format. "Value": "2021-07-23", "OverwriteExisting": true } ] </pre>
CollectionId	Query	<p><b>Required</b>*. An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This field can also be used to specify the certificate collection containing certificates that should be updated. A value for one of <i>CertificateIds</i>, <i>Query</i>, or <i>CollectionId</i> is <b>required</b>.</p>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.13 POST Certificates Import

The POST /Certificates/Import method is used to import a certificate provided in the request body into Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing information about the import.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificates/import/`

Table 158: POST Certificates Import Input Parameters

Name	In	Description
Certificate	Body	<p><b>Required.</b> A string containing the base-64 encoded contents of the certificate to be imported into Keyfactor Command. This may be a certificate with or without associated private key.</p> <p>With PowerShell, for example, you could use the following commands to convert certificates of various types to the appropriate format (referencing \$b64Cert in the request body <i>Certificate</i> field).</p> <ul style="list-style-type: none"> <li>• PEM-encoded certificate:           <pre data-bbox="553 575 1404 793">           \$crtCert = Get-Content 'C:\MyPath\MyCertificate.crt'           \$b64Cert = [System.Convert]::ToBase64String(             [System.Text.Encoding]::ASCII.GetBytes(\$crtCert)           )           </pre> <div data-bbox="553 814 1404 1014" style="background-color: #e1f5fe; padding: 10px; border-radius: 10px;"> <p> <b>Note:</b> The commands are the same regardless of whether the PEM certificate file contains a private key. The private key is ignored. If the file contains chain certificates, the end entity certificate must precede the chain certificates; only the first certificate in the file is imported for this certificate type.</p> </div> </li> <li>• DER-encoded certificate:           <pre data-bbox="553 1079 1404 1260">           \$derCert = Get-Content 'C:\MyPath\MyCertificate.der' -             Encoding Byte           \$b64Cert = [System.Convert]::ToBase64String(\$derCert)           </pre> </li> <li>• PKCS#12-encoded certificate:           <pre data-bbox="553 1308 1404 1488">           \$pfxCert = Get-Content 'C:\MyPath\MyCertificate.pfx' -             Encoding Byte           \$b64Cert = [System.Convert]::ToBase64String(\$pfxCert)           </pre> <div data-bbox="553 1512 1404 1644" style="background-color: #e1f5fe; padding: 10px; border-radius: 10px;"> <p> <b>Note:</b> Imports of this certificate type require specifying a <i>Password</i> to decrypt the specified file. Both the certificate and private key are imported.</p> </div> </li> <li>• PKCS#7-encoded binary certificate:</li> </ul>

Name	In	Description
		<pre>\$p7bCert = Get-Content 'C:\MyPath\MyCertificate.p7b' - Encoding Byte \$b64Cert = [System.Convert]::ToBase64String(\$p7bCert)</pre> <p> <b>Note:</b> The order of the certificates in the certificate package is not important.</p> <p> <b>Tip:</b> You can use the <i>POST /Certificates/Analyze</i> method (see <a href="#">POST Certificates Analyze on page 338</a>) to confirm that the string you have generated contains the contents that you expect.</p>
Password	Body	<b>Required</b> <sup>*</sup> . A string containing the password used to decrypt the file containing the certificate to be imported. This field is <b>required</b> if a certificate of PKCS#12 format is provided in the <i>Certificate</i> field.
Metadata	Body	An object containing the certificate metadata that will be associated with the certificate once it is imported. This is provided as a set of key value pairs with the metadata field name in the key and the value in the value. For example:
		<pre>"Metadata": {   "AppOwnerFirstName": "John",   "AppOwnerLastName": "Smith" }</pre>
Store Ids	Body	An array of strings indicating the certificate store GUIDs that the imported certificate will be installed into.

Name	In	Description																																						
Store Types	Body	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Store Type Id</td> <td> <p>An integer indicating the ID of the store type being used. There must be one for each type of store ID used. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr><td>0</td><td>Java Keystore</td></tr> <tr><td>2</td><td>PEM File</td></tr> <tr><td>3</td><td>F5 SSL Profiles</td></tr> <tr><td>4</td><td>IIS Roots</td></tr> <tr><td>5</td><td>NetScaler</td></tr> <tr><td>6</td><td>IIS Personal</td></tr> <tr><td>7</td><td>F5 Web Server</td></tr> <tr><td>8</td><td>IIS Revoked</td></tr> <tr><td>9</td><td>F5 Web Server REST</td></tr> <tr><td>10</td><td>F5 SSL Profiles REST</td></tr> <tr><td>11</td><td>F5 CA Bundles REST</td></tr> <tr><td>100</td><td>Amazon Web Services</td></tr> <tr><td>101</td><td>File Transfer Protocol</td></tr> <tr><td>1xx</td><td>User-defined certificate stores will be given a type ID over 101.</td></tr> </tbody> </table> </td> </tr> <tr> <td>Alias</td> <td> <p><b>Required*</b>. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.</p> </td> </tr> <tr> <td>Overwrite</td> <td> <p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being imported (true) or not (false).</p> </td> </tr> </tbody> </table>	Name	Description	Store Type Id	<p>An integer indicating the ID of the store type being used. There must be one for each type of store ID used. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr><td>0</td><td>Java Keystore</td></tr> <tr><td>2</td><td>PEM File</td></tr> <tr><td>3</td><td>F5 SSL Profiles</td></tr> <tr><td>4</td><td>IIS Roots</td></tr> <tr><td>5</td><td>NetScaler</td></tr> <tr><td>6</td><td>IIS Personal</td></tr> <tr><td>7</td><td>F5 Web Server</td></tr> <tr><td>8</td><td>IIS Revoked</td></tr> <tr><td>9</td><td>F5 Web Server REST</td></tr> <tr><td>10</td><td>F5 SSL Profiles REST</td></tr> <tr><td>11</td><td>F5 CA Bundles REST</td></tr> <tr><td>100</td><td>Amazon Web Services</td></tr> <tr><td>101</td><td>File Transfer Protocol</td></tr> <tr><td>1xx</td><td>User-defined certificate stores will be given a type ID over 101.</td></tr> </tbody> </table>	Value	Description	0	Java Keystore	2	PEM File	3	F5 SSL Profiles	4	IIS Roots	5	NetScaler	6	IIS Personal	7	F5 Web Server	8	IIS Revoked	9	F5 Web Server REST	10	F5 SSL Profiles REST	11	F5 CA Bundles REST	100	Amazon Web Services	101	File Transfer Protocol	1xx	User-defined certificate stores will be given a type ID over 101.	Alias	<p><b>Required*</b>. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.</p>																																							
Overwrite	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being imported (true) or not (false).</p>																																							
KEYFACTOR		<p>11.2 Keyfactor Web APIs Reference Guide</p>																																						

Name	In	Description
Schedule	Body	A string containing the time the imported certificate should be scheduled to be installed into the certificate store. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).

Table 159: POST Certificates Import Response Data

Name	Description														
Import Status	An integer indicating the status of the import job indicating, for example, whether the certificate was newly created in Keyfactor Command or already existed in Keyfactor Command and was just updated based on provided private key, metadata, or location information.														
Invaill Key Stores	An array of objects indicating which key store items failed with some information. Included parameters are: <table border="1" data-bbox="376 806 1403 1276"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Keystore Id</td> <td>A string indicating the ID of the store that failed.</td> </tr> <tr> <td>Client Machine</td> <td>A string indicating the client machine of the store that failed.</td> </tr> <tr> <td>Store Path</td> <td>A string indicating the path to the location of the certificate store that failed.</td> </tr> <tr> <td>Alias</td> <td>A string indicating the alias for the certificate in the store that failed.</td> </tr> <tr> <td>Reason</td> <td>An integer indicating the simple reason why it failed.</td> </tr> <tr> <td>Explanation</td> <td>A string indicating a more specific reason for the failure.</td> </tr> </tbody> </table>	Name	Description	Keystore Id	A string indicating the ID of the store that failed.	Client Machine	A string indicating the client machine of the store that failed.	Store Path	A string indicating the path to the location of the certificate store that failed.	Alias	A string indicating the alias for the certificate in the store that failed.	Reason	An integer indicating the simple reason why it failed.	Explanation	A string indicating a more specific reason for the failure.
Name	Description														
Keystore Id	A string indicating the ID of the store that failed.														
Client Machine	A string indicating the client machine of the store that failed.														
Store Path	A string indicating the path to the location of the certificate store that failed.														
Alias	A string indicating the alias for the certificate in the store that failed.														
Reason	An integer indicating the simple reason why it failed.														
Explanation	A string indicating a more specific reason for the failure.														
Job Status	An integer indicating the state of all certificate store jobs.														

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.7.14 POST Certificates Revoke

The POST /Certificates/Revoke method is used to revoke one or more certificates with the specified ID(s). This method returns HTTP 200 OK on a success with a list of the successfully revoked certificate IDs on a success or a list of the failed certificate IDs if any revocations fail.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/revoke/

OR

/certificates/collections/revoke/#!/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Table 160: POST Certificates Revoke Input Parameters

Name	In	Description																				
CertificateIDs	Body	<b>Required.</b> An array of integers containing the list of Keyfactor Command reference IDs for certificates that should be revoked.																				
Reason	Body	<p>An integer containing the specific reason that the certificate is being revoked. Available values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>-1</td> <td>Remove from Hold</td> </tr> <tr> <td>0</td> <td>Unspecified</td> </tr> <tr> <td>1</td> <td>Key Compromised</td> </tr> <tr> <td>2</td> <td>CA Compromised</td> </tr> <tr> <td>3</td> <td>Affiliation Changed</td> </tr> <tr> <td>4</td> <td>Superseded</td> </tr> <tr> <td>5</td> <td>Cessation of Operation</td> </tr> <tr> <td>6</td> <td>Certificate Hold</td> </tr> <tr> <td>7</td> <td>Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold</td> </tr> </tbody> </table> <p>The default is <i>Unspecified</i>.</p>	Value	Description	-1	Remove from Hold	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold	7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold
Value	Description																					
-1	Remove from Hold																					
0	Unspecified																					
1	Key Compromised																					
2	CA Compromised																					
3	Affiliation Changed																					
4	Superseded																					
5	Cessation of Operation																					
6	Certificate Hold																					
7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold																					
Comment	Body	<b>Required.</b> A string containing a freeform reason or comment on why the certificate is being revoked.																				
EffectiveDate	Body	A string containing the date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). The default is the current date and time.																				
CollectionId	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																				

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.15 POST Certificates Analyze

The POST /Certificates/Analyze method is used to parse a raw binary certificate returned from a CA into human-readable list of certificate details. For input data supplied with chain certificates, the output will include analysis of the primary certificate and the chain certificates. This method returns HTTP 200 OK on a success with a list of the contents of the certificate and the certificates in the chain, if applicable.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificates/collections/read/  
 OR  
 /certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)  
 OR  
 /certificates/import/  
 Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 161: POST Certificates Analyze Input Parameters

Name	In	Description
Certificate	Body	<b>Required.</b> A string containing either the PEM-encoded string of the certificate <b>not</b> including the header and footer (e.g. -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----) or the base-64 encoded contents of the certificate. Both certificates with and without private keys are supported for analysis.
Password	Body	A string containing the password used to encrypt the private key of the certificate, if applicable.

Table 162: POST Certificates Analyze Response Data

Name	Description
IssuedDN	A string containing the distinguished name of the certificate.
IssuerDN	A string containing the distinguished name of the issuer of the certificate.
Thumbprint	A string containing the thumbprint of the certificate.
NotAfter	A string containing the date/time, in UTC, on which the certificate expires.
NotBefore	A string containing the date/time, in UTC, on which the certificate was issued by the certificate authority.
Metadata	An object containing the metadata fields populated for the certificate.
IsEndEntity	A Boolean indicating whether the certificate is the end entity of the chain (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.16 POST Certificates Recover

The POST /Certificates/Recover method is used to recover or download a certificate with private key. For certificates that are available for key recovery from the Microsoft CA, the certificate is recovered from the CA. For certificates with a private key stored in Keyfactor Command, the certificate is downloaded from Keyfactor Command. This method returns HTTP 200 OK on a success with a base-64-encoded representation of the certificate and private key, including optional certificate chain, in JKS, PEM or PFX format. For certificates without private keys in DER, PEM or P7B format, use the *POST /Certificates/Download* method (see [POST Certificates Download on page 343](#)).

 **Tip:** CA-level key recovery is supported for Microsoft CAs to allow recovery of private keys for certificates enrolled outside of Keyfactor Command. CA-level key archiving is not supported for enrollments done through Keyfactor Command. CA-level key recovery is not supported for EJBCA CAs. For enrollments done through Keyfactor Command for either Microsoft or EJBCA CAs, use Keyfactor Command private key retention (see *Certificate Template Operations: Details Tab* in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

`/certificates/collections/private_key/read/`

OR

`/certificates/collections/private_key/read/#/` (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 163: POST Certificates Recover Input Parameters

Name	In	Description
Password	Body	<b>Required</b> . The password to set on the certificate.
CertID	Body	<b>Required*</b> . An integer indicating the Keyfactor Command reference ID of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
SerialNumber	Body	<b>Required*</b> . A string indicating the serial number of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
IssuerDN	Body	<b>Required*</b> . A string indicating the distinguished name of the issuer of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
Thumbprint	Body	<b>Required*</b> . A string indicating the thumbprint of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
IncludeChain	Body	A Boolean indicating whether to include the certificate chain with the certificate ( <i>true</i> ) or not ( <i>false</i> ). If you select <i>true</i> , you must select a certificate format of PEM or P7B.
ChainOrder	Body	A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i> . Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user

Name	In	Description
		<p>must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
x-certificateformat	Header	<p>The desired output format for the certificate. Supported options are:</p> <ul style="list-style-type: none"> <li>• JKS Selecting the JKS option allows you to create a Java keystore with the returned PFX value.</li> <li>• PEM Output the certificate in base-64 encoded PEM format along with the private key and any optional chain certificates in a single file.</li> <li>• PFX Selecting the PFX option allows you to create a PKCS#12 (PFX/P12) file with the returned PFX value.</li> </ul>

Table 164: POST Certificates Recover Response Data

Name	Description
PFX	<p>The base-64-encoded representation of the certificate in PEM or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both PEM and PFX. This can be accomplished in a number of ways. For example, using PowerShell and a manually generated file containing just the base-64 string returned in the response (not the full response):</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file'  \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>Using PowerShell within the script where the full response (including two key/value pairs) is returned and placed in the variable \$response:</p> <pre>\$ResponseContent = \$response.Content   ConvertFrom-Json  \$targetFile = 'C:\path_to_target_file\' + \$ResponseContent.FileName  \$bytes = [Convert]::FromBase64String(\$ResponseContent.PFX) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>In the second case, the name provided in FileName is used for the PFX output file.</p>
FileName	The CN of the certificate presented as a file name (e.g. mycertificatekeyexamplecom.pfx).

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.17 POST Certificates Download

The POST /Certificates/Download method is used to download a certificate from Keyfactor Command. This method returns HTTP 200 OK on a success with the base-64-encoded certificate without private key, including optional certificate chain, in DER, PEM or P7B format. For certificates with private keys in PEM or PFX format, use the [POST /Certificates/Recover](#) method (see [POST Certificates Recover on page 339](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 165: POST Certificates Download Input Parameters

Name	In	Description
CertID	Body	<b>Required*</b> . An integer indicating the Keyfactor Command reference ID of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
SerialNumber	Body	<b>Required*</b> . A string indicating the serial number of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
IssuerDN	Body	<b>Required*</b> . A string indicating the distinguished name of the issuer of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
Thumbprint	Body	<b>Required*</b> . A string indicating the thumbprint of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
IncludeChain	Body	A Boolean indicating whether to include the certificate chain with the certificate ( <i>true</i> ) or not ( <i>false</i> ). If you select <i>true</i> , you must select a certificate format of PEM or P7B.
ChainOrder	Body	A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i> . Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate

Name	In	Description
		collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
x-certificateformat	Header	The desired output format for the certificate. Supported options are: <ul style="list-style-type: none"> <li>• DER DER is not supported if IncludeChain is set to <i>true</i>.</li> <li>• PEM Output the certificate in base-64 encoded PEM format along with any optional chain certificates in a single file.</li> <li>• P7B This option is only supported if IncludeChain is set to <i>true</i></li> </ul>

Table 166: POST Certificates Download Response Data

Name	Description
Content	The base-64-encoded certificate in DER, PEM or P7B format with the optional certificate chain.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.18 POST Certificates Revoke All

The POST `/Certificates/RevokeAll` method is used to revoke all the certificates in the specified query and/or collection ID. The endpoint makes use of the *Revoke All Enabled* application setting (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If *Revoke All Enabled* is set to *False*, the endpoint will return an error indicating revoke all is not allowed and not complete the request. This method returns HTTP 200 OK on a success with a list of the successfully revoked certificate IDs on a success or a list of the failed certificate IDs if any revocations fail.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificates/collections/revoke/`

OR

/certificates/collections/ revoke/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Table 167: POST Certificates Revoke All Input Parameters

Name	In	Description																				
Query	Body	<b>Required*</b> . A string containing a query to limit the certificates to revoke (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to Certificate Search Page in the <i>Keyfactor Command Reference Guide</i> . A value for either <i>Query</i> or <i>CollectionId</i> is <b>required</b> . If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.																				
Reason	Body	An integer containing the specific reason that the certificates are being revoked. Available values are: <table border="1" data-bbox="521 674 1403 1297"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>-1</td> <td>Remove from Hold</td> </tr> <tr> <td>0</td> <td>Unspecified</td> </tr> <tr> <td>1</td> <td>Key Compromised</td> </tr> <tr> <td>2</td> <td>CA Compromised</td> </tr> <tr> <td>3</td> <td>Affiliation Changed</td> </tr> <tr> <td>4</td> <td>Superseded</td> </tr> <tr> <td>5</td> <td>Cessation of Operation</td> </tr> <tr> <td>6</td> <td>Certificate Hold</td> </tr> <tr> <td>7</td> <td>Remove from CRL</td> </tr> </tbody> </table> <p>The default is <i>Unspecified</i>.</p>	Value	Description	-1	Remove from Hold	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold	7	Remove from CRL
Value	Description																					
-1	Remove from Hold																					
0	Unspecified																					
1	Key Compromised																					
2	CA Compromised																					
3	Affiliation Changed																					
4	Superseded																					
5	Cessation of Operation																					
6	Certificate Hold																					
7	Remove from CRL																					
Comment	Body	<b>Required</b> . A string containing a freeform reason or comment indicating why the certificates are being revoked.																				
EffectiveDate	Body	The date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z). The default is the current date and time.																				
IncludeRevoked	Body	A Boolean that indicates whether revoked certificates should be included in the revocation (true) or not (false). The default is <i>false</i> .																				
IncludeExpired	Body	A Boolean that indicates whether expired certificates should be included in the																				

Name	In	Description
pired		revocation (true) or not (false). The default is <i>false</i> .
CollectionId	Query	<p><b>Required*</b>. An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field can also be used to specify the certificate collection containing certificates that should be revoked. A value for either <i>Query</i> or <i>CollectionId</i> is <b>required</b>. If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.</p> <p>For example:</p> <pre>https://key- factor.keyexample.- com/KeyfactorAPI/Certificates/RevokeAll?CollectionId=14</pre>

**Note:** This endpoint is not exposed in the Keyfactor API Reference and Utility to reduce accidental usage. You may still make use of it by calling it from your own tool.

### 2.6.7.19 DELETE Certificates Query

The DELETE /Certificates/query method is used to delete a group of certificates from Keyfactor Command that match the criteria provided in the body. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificates/collections/delete/
- OR
- /certificates/collections/delete/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 168: DELETE Certificates Query Input Parameters

Name	In	Description
sq	Body	<p><b>Required.</b> Query to limit the requested set of certificates that should be deleted in the form (without parameter name):</p> <pre>CN -contains "mycertificate.keyexample.com"</pre> <p>See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines to build your body query.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.20 DELETE Certificates Private Key

The DELETE /Certificates/PrivateKey method is used to delete the stored private key of each certificate ID in the list provided in the body from the Keyfactor Command platform. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificates/collections/delete/  
 OR  
 /certificates/collections/delete/#/ (where # is a reference to a specific certificate collection ID)  
 Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 169: DELETE Certificates Private Key Input Parameters

Name	In	Description
ids	Body	<p><b>Required.</b> An array of integers containing the Keyfactor Command reference IDs for certificates for which the associated private keys should be deleted in the form:</p> <pre>[123,789,567]</pre> <p>Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on page 310</a>) to determine the certificate IDs.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.7.21 DELETE Certificates Private Key ID

The DELETE */Certificates/PrivateKey/{id}* method is used to delete the stored private key of the submitted certificate ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
*/certificates/collections/delete/*  
 OR  
*/certificates/collections/delete/#/* (where # is a reference to a specific certificate collection ID)  
 Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 170: DELETE Certificates Private Key {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the certificate whose private key should be deleted. Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on page 310</a> ) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.8 Certificate Authority

The CertificateAuthority component of the Keyfactor API includes methods for listing, creating, updating and deleting certificate authority records in Keyfactor Command as well as for publishing CRLs.

Table 171: Certificate Authority Endpoints

Endpoint	Method	Description	Link
/PublishCRL	POST	Publishes the Certificate Revocation List of the given certificate authority.	<a href="#">POST Certificate Authority PublishCRL on page 449</a>
/	GET	Returns a list of all certificate authorities.	<a href="#">GET Certificate Authority on page 369</a>

Endpoint	Method	Description	Link
/	POST	Creates a new certificate authority record.	<a href="#">POST Certificate Authority on page 384</a>
/	PUT	Updates an existing certificate authority record.	<a href="#">PUT Certificate Authority on page 414</a>
/ {id}	GET	Returns details for the certificate authority identified by the specified ID.	<a href="#">GET Certificate Authority ID on page 355</a>
/ {id}	DELETE	Deletes the certificate authority record for the specified ID.	<a href="#">DELETE Certificate Authority ID on page 355</a>
/Test	POST	Validates that the certificate authority with the provided information can be reached.	<a href="#">POST Certificate Authority Test on page 445</a>
/SourceCount	GET	Retrieve the count of certificate authorities with full or incremental synchronization scans configured.	<a href="#">GET Certificate Authority Source Count on page 449</a>
/AvailableForests	GET	Retrieve the list of forests in Active Directory Keyfactor Command	<a href="#">GET Certificate Authority Available Forests on page 450</a>
/Import	POST	Import into Keyfactor Command any certificate authorities from the provided configuration tenant DNS suffix (e.g. keyexample.com).	<a href="#">POST Certificate Authority Import on page 459</a>
/HealthMonitoring/Schedule	GET	Retrieve the current schedule for the CA health monitoring job.	<a href="#">GET Certificate Authority Health Monitoring Schedule on page 451</a>
/AlertRecipients/CAHealth Recipients	POST	Create new recipients to receive CA health monitoring alerts in Keyfactor Command	<a href="#">POST Certificate Authority Alert Recipients CA Health Recipients on page 452</a>
/AlertRecipients/CAHealth Recipients	GET	Retrieve the list of recipients configured in Keyfactor Command for CA health monitoring alerts.	<a href="#">GET Certificate Authority Alert Recipients CA Health Recipients on page 452</a>

Endpoint	Method	Description	Link
/AlertRecipients/ CAHealth Recipients/ {id}	GET	Retrieve the CA health monitoring recipient configured in Keyfactor Command with the specified ID.	<a href="#">GET Certificate Authority Alert Recipients CA Health Recipients ID on page 453</a>
/AlertRecipients/ CAHealth Recipients/ {id}	PUT	Update the CA health monitoring alert recipient with the specified ID.	<a href="#">PUT Certificate Authority Alert Recipients CA Health Recipients ID on page 455</a>
/AlertRecipients/ CAHealth Recipients/ {id}	DELETE	Delete the CA threshold recipient with the specified Keyfactor Command reference ID.	<a href="#">DELETE Certificate Authority Alert Recipients CA Health Recipients ID on page 454</a>
/AlertRecipients/ CAThreshold Recipients	POST	Create new recipients to receive CA threshold alerts in Keyfactor Command.	<a href="#">POST Certificate Authority Alert Recipients CA Threshold Recipients on page 458</a>
/AlertRecipients/ CAThreshold Recipients	GET	Retrieve the list of recipients configured in Keyfactor Command for CA threshold alerts.	<a href="#">GET Certificate Authority Alert Recipients CA Threshold Recipients on page 456</a>
/AlertRecipients/ CAThreshold Recipients/ {id}	GET	Retrieve the CA threshold recipient configured in Keyfactor Command with the specified ID.	<a href="#">GET Certificate Authority Alert Recipients CA Threshold Recipients ID on page 457</a>
/AlertRecipients/ CAThreshold Recipients/ {id}	PUT	Update the CA threshold alert recipient with the specified ID.	<a href="#">PUT Certificate Authority Alert Recipients CA Threshold Recipients ID on page 459</a>
/AlertRecipients/ CAThreshold Recipients/ {id}	DELETE	Delete the CA threshold recipient with the specified Keyfactor Command reference ID.	<a href="#">DELETE Certificate Authority Alert Recipients CA Threshold Recipients ID on page 456</a>

### 2.6.8.1 DELETE Certificate Authority ID

The DELETE /CertificateAuthority/{id} endpoint is used to delete the certificate authority record with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/modify/

 **Note:** A CA that has active records associated with it (e.g. certificates, certificate requests) cannot be deleted from Keyfactor Command.

Table 172: DELETE Certificate Authority {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the Keyfactor Command reference ID of the certificate authority record to delete.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.2 GET Certificate Authority ID

The POST /CertificateAuthority method is used to retrieve details for a specified certificate authority. This method returns HTTP 200 OK on a success with the details for the certificate authority.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/read/

Table 173: GET Certificate Authority {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the Keyfactor Command ID of the certificate authority record to retrieve.

Table 174: GET Certificate Authority {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a9c9e8; padding: 10px; border-radius: 5px;"> <p> <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	 <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will

Name	Description								
	be included in the threshold monitoring email. This value is unset by default.								
DenialMax	This is considered deprecated and may be removed in a future release.								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div style="border: 1px solid green; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> </div>								
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; background-color: #f5f5f5; text-align: center;"> <code>{"syncExternal\" : true} OR {"syncExternal\" : false}</code> </div>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1" style="width: 100%; border-collapse: collapse; margin: 10px 0;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:								

Name	Description										
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <p> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.										
ExplicitCredentials	A Boolean that sets whether explicit credentials are enabled for this certificate authority ( <i>true</i> ) or not ( <i>false</i> ). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i> . <p> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>										
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .										

Name	Description
	<p> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> <p> <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p>
ExplicitPassword	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> <li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p>

Name	Description
	<p> <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1561</a>).</p>
AllowedRequesters	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre data-bbox="500 1104 1406 1318"> "AllowedRequesters": [   "Power Users",   "Read Only" ] </pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p>

Name	Description												
	<p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p> </div>	Name	Description		<pre data-bbox="688 352 1382 644"> "Monday", "Wednesday", "Friday" ], "Time": "2023-11-27T17:30:00Z" } </pre>

These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</p>						
Name	Description												
Time	<p data-bbox="876 705 1344 863">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>												
Days	<p data-bbox="876 905 1357 1062">An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</p>												

Name	Description																
ThresholdCheck	<p>An object indicating the schedule for threshold monitoring checks on this certificate authority (see <i>MonitorThresholds</i>). The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																

Name	Description										
	<div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 10px; border-radius: 10px;">  <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div>										
CAType	An integer indicating the type of CA: <ul style="list-style-type: none"> <li>• 0—DCOM</li> <li>• 1—HTTPS</li> </ul>										
AuthCertificatePassword	An object indicating the password for the certificate to use to authenticate to the EJBCA CA. Due to its sensitive nature, this value is not returned in responses.										
AuthCertificate	An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates. Authentication certificate values include: <table border="1" data-bbox="500 909 1401 1570" style="margin-top: 10px;"> <thead> <tr> <th data-bbox="506 917 646 972">Value</th> <th data-bbox="646 917 1395 972">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="506 972 646 1251">IssuedDN</td> <td data-bbox="646 972 1395 1251">               A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:               <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre style="color: red;">"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </div> </td> </tr> <tr> <td data-bbox="506 1251 646 1346">IssuerDN</td> <td data-bbox="646 1251 1395 1346">               A string indicating the distinguished name of the EJBCA CA in X.500 format.             </td> </tr> <tr> <td data-bbox="506 1346 646 1440">Thumbprint</td> <td data-bbox="646 1346 1395 1440">               A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.             </td> </tr> <tr> <td data-bbox="506 1440 646 1562">ExpirationDate</td> <td data-bbox="646 1440 1395 1562">               A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.             </td> </tr> </tbody> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre style="color: red;">"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </div>	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre style="color: red;">"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </div>										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	A Boolean that sets whether the unique DN requirement is enforced on the CA ( <i>true</i> ) or not ( <i>false</i> ). Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA										

Name	Description
	<p>with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
AllowOneClick-Renewals	<p>A Boolean that sets whether the CA will allow (true) <i>One-Click Renewal</i> on certificates in this CA or not (false). If you wish to use <i>One-Click Renewal</i> for certificates, the <b>Allow One-Click Renewals</b> option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p>
NewEndEntityOnRenewAndReissue	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (true) or attempt to associate the new certificate with the existing end entity (false). The default is <i>false</i>. This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.</p>
LastScan	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.3 GET Certificate Authority

The GET /CertificateAuthority method is used to retrieve a list of certificate authorities defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for all the defined certificate authorities.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/read/

Table 175: GET Certificate Authority Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 176: GET Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a9c9e8; padding: 10px; border-radius: 5px;"> <p> <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	<div style="background-color: #f9a825; padding: 10px; border-radius: 10px;">  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="background-color: #add8e6; padding: 10px; border-radius: 10px;">  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will

Name	Description								
	be included in the threshold monitoring email. This value is unset by default.								
DenialMax	This is considered deprecated and may be removed in a future release.								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> </div>								
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; background-color: #f0f0f0; text-align: center;"> <code>{"syncExternal\" : true} OR {"syncExternal\" : false}</code> </div>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:								

Name	Description										
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <p> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.										
ExplicitCredentials	A Boolean that sets whether explicit credentials are enabled for this certificate authority ( <i>true</i> ) or not ( <i>false</i> ). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i> . <p> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>										
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .										

Name	Description
	<p> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> <p> <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p>
ExplicitPassword	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> <li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p>

Name	Description
	<p> <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1561</a>).</p>
AllowedRequesters	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre data-bbox="500 1104 1403 1318"> "AllowedRequesters": [   "Power Users",   "Read Only" ] </pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p>

Name	Description												
	<p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="500 846 1396 1682"> <thead> <tr> <th data-bbox="506 854 669 917">Name</th> <th data-bbox="669 854 1390 917">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="506 917 669 980">Off</td> <td data-bbox="669 917 1390 980">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="506 980 669 1581">Interval</td> <td data-bbox="669 980 1390 1581"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p> </div>	Name	Description		<pre data-bbox="690 394 1377 646"> "Monday", "Wednesday", "Friday" ], "Time": "2023-11-27T17:30:00Z" } </pre>

These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</p>						
Name	Description												
Time	<p data-bbox="873 705 1349 863">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>												
Days	<p data-bbox="873 905 1349 1062">An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</p>												

Name	Description																
ThresholdCheck	<p>An object indicating the schedule for threshold monitoring checks on this certificate authority (see <i>MonitorThresholds</i>). The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																

Name	Description										
	<div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 10px; border-radius: 10px;">  <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div>										
CAType	An integer indicating the type of CA: <ul style="list-style-type: none"> <li>• 0—DCOM</li> <li>• 1—HTTPS</li> </ul>										
AuthCertificatePassword	An object indicating the password for the certificate to use to authenticate to the EJBCA CA. Due to its sensitive nature, this value is not returned in responses.										
AuthCertificate	An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates. Authentication certificate values include: <table border="1" data-bbox="500 909 1398 1570" style="margin-top: 10px;"> <thead> <tr> <th data-bbox="506 917 646 972">Value</th> <th data-bbox="646 917 1391 972">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="506 972 646 1251">IssuedDN</td> <td data-bbox="646 972 1391 1251">               A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:               <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre style="color: red;">"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </div> </td> </tr> <tr> <td data-bbox="506 1251 646 1346">IssuerDN</td> <td data-bbox="646 1251 1391 1346">               A string indicating the distinguished name of the EJBCA CA in X.500 format.             </td> </tr> <tr> <td data-bbox="506 1346 646 1440">Thumbprint</td> <td data-bbox="646 1346 1391 1440">               A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.             </td> </tr> <tr> <td data-bbox="506 1440 646 1570">ExpirationDate</td> <td data-bbox="646 1440 1391 1570">               A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.             </td> </tr> </tbody> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre style="color: red;">"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </div>	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre style="color: red;">"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </div>										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	A Boolean that sets whether the unique DN requirement is enforced on the CA ( <i>true</i> ) or not ( <i>false</i> ). Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA										

Name	Description
	<p>with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
AllowOneClick-Renewals	<p>A Boolean that sets whether the CA will allow (true) <i>One-Click Renewal</i> on certificates in this CA or not (false). If you wish to use <i>One-Click Renewal</i> for certificates, the <b>Allow One-Click Renewals</b> option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p>
NewEndEntityOnRenewAndReissue	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (true) or attempt to associate the new certificate with the existing end entity (false). The default is <i>false</i>. This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.</p>
LastScan	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.8.4 POST Certificate Authority

The POST /CertificateAuthority method is used to create a new certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/modify/

Table 177: POST Certificate Authority Input Parameters

Name	In	Description
LogicalName	Body	<b>Required.</b> A string indicating the logical name of the certificate authority.
HostName	Body	<b>Required.</b> A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	Body	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
DelegateEnrollment	Body	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a9c9e9; padding: 10px; border-radius: 5px;"> <p> <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
ConfigurationTenant	Body	<p><b>Required.</b> A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	In	Description
		 <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	Body	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	Body	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	Body	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	Body	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator. The default is <i>false</i>. See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
IssuanceMax	Body	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	In	Description
IssuanceMin	Body	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
DenialMax	Body	This is considered deprecated and may be removed in a future release.
FailureMax	Body	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
RFCEnforcement	Body	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> </div>
Properties	Body	<p><b>Required.</b> A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div style="background-color: #e0e0e0; padding: 5px; border-radius: 5px; margin-top: 5px; text-align: center;"> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre> </div>
AllowedEnrollmentTypes	Body	An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:

Name	In	Description										
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description											
1	PFX Enrollment											
2	CSR Enrollment											
3	PFX and CSR Enrollment											
KeyRetention	Body	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div style="background-color: #e0f2f1; padding: 10px; border: 1px solid #c8e6c9;"> <p> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description											
0	Key Retention Disabled											
1	Indefinite											
2	After Expiration											
3	From Issuance											
KeyRetentionDays	Body	<p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>										
ExplicitCredentials	Body	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i></p>										

Name	In	Description
		<p>fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div data-bbox="548 327 1406 562" style="background-color: #e0f2f1; padding: 10px; border-radius: 5px;"> <p> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>
SubscriberTerms	Body	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div data-bbox="548 709 1406 877" style="background-color: #e0f2f1; padding: 10px; border-radius: 5px;"> <p> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>
ExplicitUser	Body	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div data-bbox="548 1066 1406 1514" style="background-color: #e0f2f1; padding: 10px; border-radius: 5px;"> <p> <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> </div> <div data-bbox="548 1549 1406 1738" style="background-color: #e0f2f1; padding: 10px; border-radius: 5px;"> <p> <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>

Name	In	Description
ExplicitPassword	Body	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> <li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	Body	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> </div> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1561</a>).</p> </div>
AllowedRequesters	Body	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p>

Name	In	Description				
		<pre data-bbox="548 310 878 449">"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre> <p data-bbox="548 495 1406 590">The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p data-bbox="548 604 1406 963">This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p data-bbox="548 978 1406 1073">In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> <p data-bbox="548 1087 1406 1146">The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>				
FullScan	Body	<p data-bbox="548 1182 1406 1241">An object indicating the schedule for the full synchronization of this certificate authority.</p> <p data-bbox="548 1255 1406 1520">Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p data-bbox="548 1535 1052 1560">The following schedule types are supported:</p> <table border="1" data-bbox="548 1583 1406 1709"> <thead> <tr> <th data-bbox="555 1591 717 1654">Name</th> <th data-bbox="717 1591 1399 1654">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="555 1661 717 1709">Off</td> <td data-bbox="717 1661 1399 1709">Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.

You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p> </div>

Minutes	An integer indicating the number of minutes between each interval.																	
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).													
Name	Description																	
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																	

Name	In	Description								
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—Example Value may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>				
Name	Description									
	<p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>									
CAType	Body	<p>An integer indicating the type of CA:</p> <ul style="list-style-type: none"> <li>• 0—DCOM</li> <li>• 1—HTTPS</li> </ul>								
AuthCertificatePassword	Body	<p>An object indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> <li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 1005</a> for more information.</li> </ul> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password used to security the EJBCA CA client authentication certificate.</td> </tr> <tr> <td>Parameters</td> <td>An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td> </tr> <tr> <td>Provider</td> <td>A string indicating the ID of the PAM provider.</td> </tr> </tbody> </table>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider.
Value	Description									
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.									
Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.									
Provider	A string indicating the ID of the PAM provider.									

Name	In	Description				
		<table border="1" data-bbox="553 275 1398 474"> <thead> <tr> <th data-bbox="553 275 776 338">Value</th> <th data-bbox="776 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 338 776 474"></td> <td data-bbox="776 338 1398 474">Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of all the PAM providers to determine the ID.</td> </tr> </tbody> </table> <p data-bbox="548 506 1317 537">For example, the password stored as a Keyfactor secret will look like:</p> <pre data-bbox="548 548 1406 726"> {   "SecretValue": "MySuperSecretPassword" } </pre> <p data-bbox="548 730 1406 856">The password stored as a CyberArk PAM secret will look like (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 1030</a> and the Folder and Object reference the folder name and object name in the CyberArk safe):</p> <pre data-bbox="548 867 1406 1192"> {   "Provider": "1",   "Parameters":{     "Folder": "MyFolderName",     "Object": "MyEJBAClientAuthPassword"   } } </pre> <p data-bbox="548 1197 1406 1323">The password stored as a Delinea PAM secret will look like (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 1030</a> and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p> <pre data-bbox="548 1333 1406 1619"> {   "Provider": "1",   "Parameters":{     "SecretId": "MyEJBAPasswordId"   } } </pre> <p data-bbox="548 1629 1284 1661">Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description		Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of all the PAM providers to determine the ID.
Value	Description					
	Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of all the PAM providers to determine the ID.					
AuthCertificate	Body	An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to				

Name	In	Description
		<p>the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i> with the <i>SecretValue</i>. The <i>SecretValue</i> is set to a string containing the base-64-encoded representation of the certificate with private key (in PKCS#12 format) that will be used to authenticate to the EJBCA CA. For example:</p> <pre> {   "SecretValue": "MIACAQMwgAYJKoZIhvcNAQcBoIAkgASCA+[truncated for display]gQUwRndGMbmlkmwIOuC0MbOY1EyDpACAwGQAAAA" } </pre> <p>Due to its sensitive nature, this value is not returned in this format in responses.</p>
EnforceUniqueDN	Body	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
AllowOneClick-Renewals	Body	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the <b>Allow One-Click Renewals</b> option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p>
NewEndEntityOnRenewAndReissue	Body	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (<i>true</i>) or attempt to associate the new certificate with the existing end entity (<i>false</i>). The default is <i>false</i>.</p> <p>This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.</p>
LastScan	Body	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>

Table 178: POST Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a8d8f9; padding: 10px; border-radius: 5px;"> <p> <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	<div style="background-color: #f9a825; padding: 10px; border-radius: 10px;">  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="background-color: #a8c9e6; padding: 10px; border-radius: 10px;">  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will

Name	Description								
	be included in the threshold monitoring email. This value is unset by default.								
DenialMax	This is considered deprecated and may be removed in a future release.								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> </div>								
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; background-color: #f5f5f5; text-align: center;"> <code>{"syncExternal\" : true} OR {"syncExternal\" : false}</code> </div>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:								

Name	Description										
	<table border="1" data-bbox="500 275 1401 590"> <thead> <tr> <th data-bbox="500 275 816 338">Value</th> <th data-bbox="816 275 1401 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="500 338 816 401">0</td> <td data-bbox="816 338 1401 401">Key Retention Disabled</td> </tr> <tr> <td data-bbox="500 401 816 464">1</td> <td data-bbox="816 401 1401 464">Indefinite</td> </tr> <tr> <td data-bbox="500 464 816 527">2</td> <td data-bbox="816 464 1401 527">After Expiration</td> </tr> <tr> <td data-bbox="500 527 816 590">3</td> <td data-bbox="816 527 1401 590">From Issuance</td> </tr> </tbody> </table> <p data-bbox="500 625 1084 653">Values of 2 and 3 require setting <i>KeyRetentionDays</i>.</p> <p data-bbox="500 663 824 690">This value is unset by default.</p> <div data-bbox="500 716 1401 1052" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p data-bbox="508 730 1393 827"> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> <p data-bbox="573 831 1369 894"><i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3.</p> <p data-bbox="573 898 1369 1026">Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.										
ExplicitCredentials	<p data-bbox="500 1213 1409 1373">A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div data-bbox="500 1398 1401 1629" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p data-bbox="508 1413 1393 1608"> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>										
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .										

Name	Description
	<p> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> <p> <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p>
ExplicitPassword	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> <li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p>

Name	Description
	<p> <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1561</a>).</p>
AllowedRequesters	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre data-bbox="500 1104 1406 1318"> "AllowedRequesters": [   "Power Users",   "Read Only" ] </pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p>

Name	Description												
	<p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="500 275 669 336">Name</th> <th data-bbox="669 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="500 336 669 625"></td> <td data-bbox="669 336 1398 625"> <table border="1"> <thead> <tr> <th data-bbox="695 357 850 420">Name</th> <th data-bbox="850 357 1372 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="695 420 850 625">Time</td> <td data-bbox="850 420 1372 625">The date and time to next run the job. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p> </div>	Name	Description		<pre data-bbox="690 394 1377 646"> "Monday", "Wednesday", "Friday" ], "Time": "2023-11-27T17:30:00Z" } </pre>

ThresholdCheck	<p>An object indicating the schedule for threshold monitoring checks on this certificate authority (see <i>MonitorThresholds</i>). The following schedule types are supported:</p> <table border="1" data-bbox="500 394 1398 1770"> <thead> <tr> <th data-bbox="506 403 669 464">Name</th> <th data-bbox="669 403 1391 464">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="506 464 669 520">Off</td> <td data-bbox="669 464 1391 520">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="506 520 669 1129">Interval</td> <td data-bbox="669 520 1391 1129"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="695 695 1365 856"> <thead> <tr> <th data-bbox="701 703 857 764">Name</th> <th data-bbox="857 703 1359 764">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="701 764 857 848">Minutes</td> <td data-bbox="857 764 1359 848">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="695 932 1365 1115"> "Interval": {   "Minutes": 60 } </pre> </td> </tr> <tr> <td data-bbox="506 1129 669 1770">Daily</td> <td data-bbox="669 1129 1391 1770"> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1" data-bbox="695 1234 1365 1499"> <thead> <tr> <th data-bbox="701 1243 857 1304">Name</th> <th data-bbox="857 1243 1359 1304">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="701 1304 857 1493">Time</td> <td data-bbox="857 1304 1359 1493">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="695 1570 1365 1753"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="695 695 1365 856"> <thead> <tr> <th data-bbox="701 703 857 764">Name</th> <th data-bbox="857 703 1359 764">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="701 764 857 848">Minutes</td> <td data-bbox="857 764 1359 848">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="695 932 1365 1115"> "Interval": {   "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1" data-bbox="695 1234 1365 1499"> <thead> <tr> <th data-bbox="701 1243 857 1304">Name</th> <th data-bbox="857 1243 1359 1304">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="701 1304 857 1493">Time</td> <td data-bbox="857 1304 1359 1493">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="695 1570 1365 1753"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="695 695 1365 856"> <thead> <tr> <th data-bbox="701 703 857 764">Name</th> <th data-bbox="857 703 1359 764">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="701 764 857 848">Minutes</td> <td data-bbox="857 764 1359 848">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="695 932 1365 1115"> "Interval": {   "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1" data-bbox="695 1234 1365 1499"> <thead> <tr> <th data-bbox="701 1243 857 1304">Name</th> <th data-bbox="857 1243 1359 1304">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="701 1304 857 1493">Time</td> <td data-bbox="857 1304 1359 1493">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="695 1570 1365 1753"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																

Name	Description										
	<div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 10px; border-radius: 10px;">  <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div>										
CAType	An integer indicating the type of CA: <ul style="list-style-type: none"> <li>• 0—DCOM</li> <li>• 1—HTTPS</li> </ul>										
AuthCertificatePassword	An object indicating the password for the certificate to use to authenticate to the EJBCA CA. Due to its sensitive nature, this value is not returned in responses.										
AuthCertificate	An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates. Authentication certificate values include: <table border="1" data-bbox="500 909 1398 1570" style="margin-top: 10px;"> <thead> <tr> <th data-bbox="506 917 646 972">Value</th> <th data-bbox="646 917 1391 972">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="506 972 646 1251">IssuedDN</td> <td data-bbox="646 972 1391 1251">           A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:           <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre style="color: red;">"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </div> </td> </tr> <tr> <td data-bbox="506 1251 646 1346">IssuerDN</td> <td data-bbox="646 1251 1391 1346">A string indicating the distinguished name of the EJBCA CA in X.500 format.</td> </tr> <tr> <td data-bbox="506 1346 646 1440">Thumbprint</td> <td data-bbox="646 1346 1391 1440">A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td> </tr> <tr> <td data-bbox="506 1440 646 1570">ExpirationDate</td> <td data-bbox="646 1440 1391 1570">A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td> </tr> </tbody> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre style="color: red;">"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </div>	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre style="color: red;">"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </div>										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	A Boolean that sets whether the unique DN requirement is enforced on the CA ( <i>true</i> ) or not ( <i>false</i> ). Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA										

Name	Description
	<p>with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
AllowOneClick-Renewals	<p>A Boolean that sets whether the CA will allow (true) <i>One-Click Renewal</i> on certificates in this CA or not (false). If you wish to use <i>One-Click Renewal</i> for certificates, the <b>Allow One-Click Renewals</b> option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p>
NewEndEntityOnRenewAndReissue	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (true) or attempt to associate the new certificate with the existing end entity (false). The default is <i>false</i>. This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.</p>
LastScan	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.5 PUT Certificate Authority

The PUT /CertificateAuthority method is used to update a certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected

data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 179: PUT Certificate Authority Input Parameters

Name	In	Description
Id	Body	<b>Required.</b> An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	Body	<b>Required.</b> A string indicating the logical name of the certificate authority.
HostName	Body	<b>Required.</b> A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	Body	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
DelegateEnrollment	Body	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a9c9e8; padding: 10px; border-radius: 5px;"> <p> <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
Config-	Bo-	<b>Required.</b> A string indicating the forest root name or DNS domain name for

Name	In	Description
urationTenant	dy	<p>the certificate authority (e.g. keyexample.com). For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.</p> </div>
Remote	Bo- dy	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	Bo- dy	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	Bo- dy	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	Bo- dy	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator. The default is <i>false</i>. See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="background-color: #a0c4ff; padding: 10px; border-radius: 5px;"> <p> <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>

Name	In	Description
IssuanceMax	Body	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	Body	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
DenialMax	Body	This is considered deprecated and may be removed in a future release.
FailureMax	Body	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
RFCEnforcement	Body	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> </div>
Properties	Body	<p><b>Required.</b> A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div style="border: 1px solid #e0e0e0; border-radius: 10px; padding: 5px; margin-top: 5px; text-align: center;"> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre> </div>
AllowedEnrollmentTypes	Body	An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:

Name	In	Description										
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description											
1	PFX Enrollment											
2	CSR Enrollment											
3	PFX and CSR Enrollment											
KeyRetention	Body	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description											
0	Key Retention Disabled											
1	Indefinite											
2	After Expiration											
3	From Issuance											
KeyRetentionDays	Body	<p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>										
ExplicitCredentials	Body	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i></p>										

Name	In	Description
		<p>fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div data-bbox="548 327 1406 562" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>
SubscriberTerms	Body	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div data-bbox="548 716 1406 877" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>
ExplicitUser	Body	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div data-bbox="548 1066 1406 1514" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> </div> <div data-bbox="548 1541 1406 1738" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>

Name	In	Description
ExplicitPassword	Body	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> <li>• Store the secret information in the Keyfactor secrets table.</li> </ul> <p>A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</p> <ul style="list-style-type: none"> <li>• Load the secret information from a PAM provider.</li> </ul> <p>See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	Body	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> </div> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1561</a>).</p> </div>
AllowedRequesters	Body	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p>

Name	In	Description				
		<pre data-bbox="548 310 878 449">"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre> <p data-bbox="548 495 1406 590">The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p data-bbox="548 604 1406 961">This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p data-bbox="548 976 1406 1071">In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> <p data-bbox="548 1085 1406 1142">The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>				
FullScan	Body	<p data-bbox="548 1182 1406 1239">An object indicating the schedule for the full synchronization of this certificate authority.</p> <p data-bbox="548 1253 1406 1520">Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p data-bbox="548 1535 1052 1558">The following schedule types are supported:</p> <table border="1" data-bbox="548 1583 1406 1713"> <thead> <tr> <th data-bbox="555 1591 717 1654">Name</th> <th data-bbox="717 1591 1399 1654">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="555 1661 717 1707">Off</td> <td data-bbox="717 1661 1399 1707">Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.

You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p> </div>

		<p>the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i> with the <i>SecretValue</i>. The <i>SecretValue</i> is set to a string containing the base-64-encoded representation of the certificate with private key (in PKCS#12 format) that will be used to authenticate to the EJBCA CA. For example:</p> <pre>{   "SecretValue": "MIACAQMwgAYJKoZIhvcNAQcBoIAkgASCA+[truncated for display]gQUwRndGMbmlkmwIOuC0MbOY1EyDpACAwGQAAAA" }</pre> <p>Due to its sensitive nature, this value is not returned in this format in responses.</p>
EnforceUniqueDN	Body	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
AllowOneClick-Renewals	Body	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the <b>Allow One-Click Renewals</b> option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p>
NewEndEntityOnRenewAndReissue	Body	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (<i>true</i>) or attempt to associate the new certificate with the existing end entity (<i>false</i>). The default is <i>false</i>.</p> <p>This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.</p>
LastScan	Body	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>

Table 180: PUT Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a8d8f9; padding: 10px; border-radius: 5px;"> <p> <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	<div style="background-color: #f9a825; padding: 10px; border-radius: 10px;">  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="background-color: #a8c9e6; padding: 10px; border-radius: 10px;">  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will

Name	Description								
	be included in the threshold monitoring email. This value is unset by default.								
DenialMax	This is considered deprecated and may be removed in a future release.								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div style="border: 1px solid green; border-radius: 10px; padding: 10px; background-color: #e0f2f1;"> <p> <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> </div>								
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; background-color: #f5f5f5; text-align: center;"> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre> </div>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:								

Name	Description										
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <p> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.										
ExplicitCredentials	A Boolean that sets whether explicit credentials are enabled for this certificate authority ( <i>true</i> ) or not ( <i>false</i> ). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i> . <p> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>										
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .										

Name	Description
	<p> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> <p> <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p>
ExplicitPassword	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> <li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p>

Name	Description
	<p> <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1561</a>).</p>
AllowedRequesters	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre data-bbox="500 1104 1404 1318"> "AllowedRequesters": [   "Power Users",   "Read Only" ] </pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p>

Name	Description												
	<p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1561</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="500 275 669 336">Name</th> <th data-bbox="669 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="500 336 669 625"></td> <td data-bbox="669 336 1398 625"> <table border="1"> <thead> <tr> <th data-bbox="695 357 850 420">Name</th> <th data-bbox="850 357 1372 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="695 420 850 625">Time</td> <td data-bbox="850 420 1372 625">The date and time to next run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre data-bbox="695 1564 1372 1675"> "Weekly": {   "Days": [ </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").		
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).								
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").								

Name	Description				
	<table border="1" data-bbox="500 275 1401 667"> <thead> <tr> <th data-bbox="505 287 667 338">Name</th> <th data-bbox="667 287 1396 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="505 338 667 659"></td> <td data-bbox="667 338 1396 659"> <pre data-bbox="688 352 1382 644"> "Monday", "Wednesday", "Friday" ], "Time": "2023-11-27T17:30:00Z" } </pre> </td> </tr> </tbody> </table> <div data-bbox="505 695 1401 863"> <p> <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> </div> <div data-bbox="505 884 1401 1486"> <p> <b>Tip:</b> There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p> </div>	Name	Description		<pre data-bbox="688 352 1382 644"> "Monday", "Wednesday", "Friday" ], "Time": "2023-11-27T17:30:00Z" } </pre>

Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																

Name	Description										
	<div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 10px; border-radius: 10px;">  <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div>										
CAType	An integer indicating the type of CA: <ul style="list-style-type: none"> <li>• 0—DCOM</li> <li>• 1—HTTPS</li> </ul>										
AuthCertificatePassword	An object indicating the password for the certificate to use to authenticate to the EJBCA CA. Due to its sensitive nature, this value is not returned in responses.										
AuthCertificate	An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates. Authentication certificate values include: <table border="1" data-bbox="500 909 1398 1570" style="margin-top: 10px;"> <thead> <tr> <th data-bbox="506 917 646 972">Value</th> <th data-bbox="646 917 1391 972">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="506 972 646 1251">IssuedDN</td> <td data-bbox="646 972 1391 1251">               A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:               <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <code>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</code> </div> </td> </tr> <tr> <td data-bbox="506 1251 646 1346">IssuerDN</td> <td data-bbox="646 1251 1391 1346">               A string indicating the distinguished name of the EJBCA CA in X.500 format.             </td> </tr> <tr> <td data-bbox="506 1346 646 1440">Thumbprint</td> <td data-bbox="646 1346 1391 1440">               A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.             </td> </tr> <tr> <td data-bbox="506 1440 646 1562">ExpirationDate</td> <td data-bbox="646 1440 1391 1562">               A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.             </td> </tr> </tbody> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <code>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</code> </div>	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <code>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</code> </div>										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	A Boolean that sets whether the unique DN requirement is enforced on the CA ( <i>true</i> ) or not ( <i>false</i> ). Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA										

Name	Description
	<p>with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
AllowOneClick-Renewals	<p>A Boolean that sets whether the CA will allow (true) <i>One-Click Renewal</i> on certificates in this CA or not (false). If you wish to use <i>One-Click Renewal</i> for certificates, the <b>Allow One-Click Renewals</b> option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p>
NewEndEntityOnRenewAndReissue	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (true) or attempt to associate the new certificate with the existing end entity (false). The default is <i>false</i>. This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.</p>
LastScan	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.6 POST Certificate Authority Test

The POST /CertificateAuthority/Test method is used to validate that a connection can be made to the certificate authority with the provided information. This method returns HTTP 200 OK on a success with details for the success or failure of the CA validation.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/read/

Table 181: POST Certificate Authority Test Input Parameters

Name	In	Description
id	Body	<b>Required.</b> An integer indicating the CA id in the Keyfactor database.
CAType	Body	An integer indicating the type of CA: <ul style="list-style-type: none"> <li>0—DCOM Use this option for Microsoft CAs and CA gateways.</li> <li>1—HTTPS Use this option for EJBCA CAs.</li> </ul> <p>The default is 0.</p>
ExplicitCredentials	Body	A Boolean that sets whether explicit credentials are enabled for this certificate authority ( <i>true</i> ) or not ( <i>false</i> ). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i> . <div style="border: 1px solid green; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>
ExplicitPassword	Body	A string containing either <i>null</i> , or the password for the <i>ExplicitUser</i> , including: <i>SecretValue</i> , parameters, and provider if applicable. <div style="border: 1px solid gray; border-radius: 5px; padding: 10px; margin-top: 10px;"> <pre>xml:space="preserve"&gt;"ExplicitePassword": {   "secretValue": "string",   "parameters": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   },   "provider": 0</pre> </div>
ExplicitUser	Body	A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>Expli-</i>

Name	In	Description
		<p><i>citCredentials</i> is set to <i>true</i>.</p> <div data-bbox="646 327 1406 810" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> </div> <div data-bbox="646 835 1406 1031" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>
AuthCertificate	Body	<p><b>Required</b>*. An object indicating the PKCS#12 client certificate to use to authenticate to the CA using the following format. This certificate is used to authenticate to the CA database for synchronization, enrollment and management of certificates. The certificate is provided in the following format:</p> <pre data-bbox="646 1234 1406 1703"> "AuthCertificate": {   "secretValue": "string",   "parameters": {     "IssuedDN": "CN=superadmindcert",     "IssuerDN": "CN=CorpIssuingCA1, DC=keyexample, DC=com",     "Thumbprint": "913D80B33517DD6F42428664883DA43BB64D0EEE",     "ExpirationDate": "2025-07-17T18:24:23Z"   },   "provider": 0 </pre> <p>This parameter is required for EJBCA CAs.</p>

Name	In	Description
AuthCertificatePassword	Body	<p><b>Required*</b>. An object containing password for the client certificate used to provide authentication to the CA.</p> <pre> "authCertificatePassword": {   "secretValue": "string",   "parameters": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   },   "provider": 0 </pre> <p>This parameter is required for EJBCA CAs.</p>
LogicalName	Body	<p><b>Required</b>. A string indicating the logical name of the certificate authority.</p>
HostName	Body	<p><b>Required</b>. A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).</p>
ConfigurationTenant	Body	<p><b>Required*</b>. A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com). This parameter is required for Microsoft CAs.</p>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>

Table 182: POST Certificate Authority Test Response Data

Name	Description
Success	A Boolean that indicates whether the CA could successfully be reached (True) or not (False).
Message	A string indicating a message about the validation test of the certificate authority.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.7 POST Certificate Authority PublishCRL

The POST /CertificateAuthority/PublishCRL method is used to publish a Certificate Revocation List from a specified Certificate Authority to its defined publication points. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificates/collections/revoke/  
OR  
/certificates/collections/revoke/#/ (where # is a reference to a specific certificate collectionPAM provider ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 183: POST Certificate Authority PublishCRL Input Parameters

Name	In	Description
CertificateAuthorityHostName	Body	The host name of the machine hosting the CA. This field is optional, but is recommended.
CertificateAuthorityLogicalName	Body	<b>Required.</b> The logical name of the CA.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.8 GET Certificate Authority Source Count

The GET /CertificateAuthority/SourceCount method is used to retrieve the count of certificate authorities with full or incremental synchronization scans configured. This method returns HTTP 200

OK on a success with a count. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificate_authorities/read/`

Table 184: GET Certificate Authority Source Count Response Body

Name	Description
n/a	An integer indicating the number of CAs with with full or incremental synchronization scans configured in the Keyfactor Command database.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.9 GET Certificate Authority Available Forests

The GET `/CertificateAuthority/AvailableForests` method is used to retrieve the list of Active Directory forests that are available to Keyfactor Command (the current forest and any forests in a two-way trust with this forest). This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificate_authorities/read/`

Table 185: GET Certificate Authority Available Forests Response Body

Name	Description
n/a	An array of strings containing the list of the available Active Directory forests.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Refer-

ence and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.10 GET Certificate Authority Health Monitoring Schedule

The GET /CertificateAuthority/HealthMonitoring/Schedule method is used to retrieve the current schedule for the CA health monitoring job. This method returns HTTP 200 OK on a success with the list of schedule settings. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/read/

Table 186: GET Certificate Authority Health Monitoring Schedule Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the schedule.
Schedule	A string indicating the schedule for the health monitoring job. Schedules are shown in cron syntax. For an interval schedule, this will look like I_mm where mm is the number of minutes (e.g. I_30 for every 30 minutes). For daily schedules, this will look like D_hh:mm where hh:mm is the time to run the job (e.g. D_14:30 for daily at 2:30 pm).
ScheduleType	An integer indicating the type of schedule. Health monitoring schedules have type 10.
Enabled	A Boolean that indicates whether health monitoring is enabled (true) or not (false).
Name	A string indicating the Keyfactor Command reference name of the health monitoring job. This is the name that appears in log output for the job.
EntityId	An internally used Keyfactor Command field.
LastRun	A string indicating the last run time of the job in ISO 8601 UTC time format (e.g. 2023-05-19T16:23:01Z).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.11 GET Certificate Authority Alert Recipients CA Health Recipients

The GET /CertificateAuthority/AlertRecipients/CAHealthRecipients method is used to retrieve the list of recipients configured in Keyfactor Command for CA health monitoring alerts. This method returns HTTP 200 OK on a success with the list of CA health recipients. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/read/

Table 187: GET Certificate Authority Alert Recipients CA Health Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.12 POST Certificate Authority Alert Recipients CA Health Recipients

The POST /CertificateAuthority/AlertRecipients/CAHealthRecipients method is used to create new recipients to receive CA health monitoring alerts in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the health monitoring recipients.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/modify/

Table 188: POST Certificate Authority Alert Recipients CA Health Recipients Input Body

Name	In	Description
Emails	Body	<p><b>Required.</b> An object containing a set of strings with the email address of each recipient. For example:</p> <pre> {   "Emails": [     "Recipient1@keyexample.com", "Recipient3@keyexample.com"   ] } </pre>

Table 189: POST Certificate Authority Alert Recipients CA Health Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	<p>A string indicating the email address of the recipient.</p> <p> <b>Note:</b> Only recipients created with the POST request are returned in the response. Any pre-existing recipients are not included in the response.</p>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.13 GET Certificate Authority Alert Recipients CA Health Recipients ID

The GET /CertificateAuthority/AlertRecipients/CAHealthRecipients/{id} method is used to retrieve the CA health monitoring recipient configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details for the recipient.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/read/

Table 190: GET Certificate Authority Alert Recipients CA Health Recipients {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the Keyfactor Command reference ID of the certificate authority health monitoring recipient record to retrieve. Use the <a href="#">GET /CertificateAuthority/AlertRecipients/CAHealthRecipients</a> method (see <a href="#">GET Certificate Authority Alert Recipients CA Health Recipients on page 452</a> ) to retrieve the ID.

Table 191: GET Certificate Authority Alert Recipients CA Health Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.8.14 DELETE Certificate Authority Alert Recipients CA Health Recipients ID

The DELETE /CertificateAuthority/AlertRecipients/CAHealthRecipients/{id} endpoint is used to delete the CA health monitoring recipient with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims](#) in the [Keyfactor Command Reference Guide](#)) are required to use this feature:  
`/certificate_authorities/modify/`

Table 192: DELETE Certificate Authority Alert Recipients CA Health Recipients {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the Keyfactor Command reference ID of the certificate authority health monitoring recipient record to delete. Use the <a href="#">GET /CertificateAuthority/AlertRecipients/CAHealthRecipients</a> method (see <a href="#">GET Certificate Authority Alert Recipients CA Health Recipients on page 452</a> ) to retrieve the ID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.15 PUT Certificate Authority Alert Recipients CA Health Recipients ID

The PUT /CertificateAuthority/AlertRecipients/CAHealthRecipients/{id} method is used to update the CA health monitoring alert recipient with the specified ID. This method returns HTTP 200 OK on a success with the details submitted.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/modify/

Table 193: PUT Certificate Authority Alert Recipients CA Health Recipients {id} Input Body

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the CA health monitoring recipient.  Use the <i>GET /CertificateAuthority/AlertRecipients/CAHealthRecipients</i> method (see <a href="#">GET Certificate Authority Alert Recipients CA Health Recipients on page 452</a> ) to retrieve the ID.
Email	Body	<b>Required.</b> A string indicating the updated email address of the recipient.

Table 194: PUT Certificate Authority Alert Recipients CA Health Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the new email address of the recipient.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.16 DELETE Certificate Authority Alert Recipients CA Threshold Recipients ID

The DELETE /CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id} endpoint is used to delete the CA threshold recipient with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/modify/

Table 195: DELETE Certificate Authority Alert Recipients CA Threshold Recipient {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the Keyfactor Command reference ID of the certificate authority threshold recipient record to delete. Use the <a href="#">GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients</a> method (see <a href="#">GET Certificate Authority Alert Recipients CA Threshold Recipients below</a> ) to retrieve the ID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.17 GET Certificate Authority Alert Recipients CA Threshold Recipients

The GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients method is used to retrieve the list of recipients configured in Keyfactor Command for CA threshold alerts. This method returns HTTP 200 OK on a success with the list of threshold alert recipients. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/read/

Table 196: GET Certificate Authority Alert Recipients CA Threshold Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.18 GET Certificate Authority Alert Recipients CA Threshold Recipients ID

The GET `/CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id}` method is used to retrieve the CA threshold recipient configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details of the CA threshold recipient.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificate_authorities/read/`

Table 197: GET Certificate Authority Alert Recipients CA Threshold Recipients {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the reference ID of the certificate authority threshold recipient record to retrieve.  Use the <i>GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients</i> method (see <a href="#">GET Certificate Authority Alert Recipients CA Threshold Recipients on the previous page</a> ) to retrieve the ID.

Table 198: GET Certificate Authority Alert Recipients CA Threshold Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the CA threshold recipient.
Email	A string indicating the email address of the CA threshold recipient.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.8.19 POST Certificate Authority Alert Recipients CA Threshold Recipients

The POST /CertificateAuthority/AlertRecipients/CAThresholdRecipients method is used to create new recipients to receive CA threshold alerts in Keyfactor Command This method returns HTTP 200 OK on a success with the details of the threshold recipients.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/modify/

Table 199: POST Certificate Authority Alert Recipients CA Threshold Recipients Input Body

Name	In	Description
Emails	Body	<b>Required.</b> An object containing a set of strings with the email address of each recipient. For example: <pre>{   "Emails": [     "Recipient1@keyexample.com", "Recipient3@keyexample.com"   ] }</pre>

Table 200: POST Certificate Authority Alert Recipients CA Threshold Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.  <b>Note:</b> Only recipients created with the POST request are returned in the response. Any pre-existing recipients are not included in the response.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## 2.6.8.20 PUT Certificate Authority Alert Recipients CA Threshold Recipients ID

The PUT /CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id} method is used to update the CA threshold alert recipient with the specified ID. This method returns HTTP 200 OK on a success with the details submitted.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/modify/

Table 201: PUT Certificate Authority Alert Recipients CA Threshold Recipients {id} Input Body

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the CA threshold recipient. Use the <a href="#">GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients</a> method (see <a href="#">GET Certificate Authority Alert Recipients CA Threshold Recipients on page 456</a> ) to retrieve the ID.
Email	Body	<b>Required.</b> A string indicating the updated email address of the recipient.

Table 202: PUT Certificate Authority Alert Recipients CA Threshold Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the CA threshold recipient.
Email	A string indicating the new email address of the CA threshold recipient.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.8.21 POST Certificate Authority Import

The POST /CertificateAuthority/Import method is used to import into Keyfactor Command any certificate authorities from the provided configuration tenant DNS suffix (e.g. keyexample.com). This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_authorities/modify/

Table 203: POST Certificate Authority Import Input Parameters

Name	In	Description
dns	Query	<p><b>Required.</b> The DNS suffix of the configuration tenant to query for CAs to import. For example:</p> <pre>https://key-factor.keyexample.-com/KeyfactorAPI/CertificateAuthority/Import?dns=keyother.com</pre>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.9 Certificate Collections

The Certificate Collections component of the Keyfactor API is used to create, edit, list, and set permissions on certificate collections.

Table 204: Certificate Collections Endpoints

Endpoint	Method	Description	Link
/	GET	Returns all certificate collections with details about the collection configuration.	<a href="#">GET Certificate Collections on the next page</a>
/	POST	Creates a new certificate collection.	<a href="#">POST Certificate Collections on page 464</a>
/	PUT	Updates an existing certificate collection.	<a href="#">PUT Certificate Collections on page 470</a>

Endpoint	Method	Description	Link
/id	GET	Returns the certificate collection with the specified ID.	<a href="#">GET Certificate Collections ID on page 474</a>
/id	DELETE	Deletes the certificate collection with the specified ID.	<a href="#">DELETE Certificate Collection ID on page 476</a>
/name	GET	Returns the certificate collection with the specified name.	<a href="#">GET Certificate Collections Name on page 477</a>
/Copy	POST	Creates a new certificate collection based on an existing collection.	<a href="#">POST Certificate Collections Copy on page 479</a>
/NavItems	GET	Returns the list of <i>favorite</i> certificate collections (that have been set to <i>Show in Navigator</i> ).	<a href="#">GET Certificate Collection Nav Items on page 485</a>
/id/Favorite	PUT	Updates the <i>favorite</i> setting for the collection specified.	<a href="#">PUT Certificate Collection ID Favorite on page 485</a>
/CollectionList	GET	Returns information about the definitions for all collections, including the de-duplication setting.	<a href="#">GET Certificate Collections List on page 486</a>

### 2.6.9.1 GET Certificate Collections

The GET /CertificateCollections method is used to return a list of all certificate collections. This method returns HTTP 200 OK on a success with details about each defined certificate collection. This method allows URL parameters to specify paging and the level of information detail.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 205: GET Certificate Collections Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• Name</li> <li>• Query</li> <li>• Favorite</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 206: GET Certificate Collections Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Automated	An internally used Keyfactor Command field.												
Content	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.9.2 POST Certificate Collections

The POST /CertificateCollections method is used to create a new saved collection of certificates or update an existing collection. This method returns HTTP 200 OK on a success with details about the certificate collection.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/  
/certificates/collections/modify/  
OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/certificates/collections/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 207: POST Certificate Collections Input Parameters

Name	In	Description												
Name	Body	<b>Required.</b> The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection drop-downs, the name should be fairly short.												
Description	Body	<b>Required.</b> The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .												
Query	Body	<b>Required.</b> A string containing the search criteria for the collection. For example: <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines. See also <i>CopyFromId</i> .												
DuplicationField	Body	An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table border="1" data-bbox="516 1297 1404 1675"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description													
0	None													
1	Common Name													
2	Distinguished Name													
3	Principal Name													
4	Keyfactor Renewal													
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or												

Name	In	Description
		not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false). The default is <i>false</i> .
CopyFromId	Body	<p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 461</a>) to locate the ID of the collection whose query you wish to copy. When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <i>Query</i> or <i>Description</i> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <i>Read</i> permissions for certificates. If the requesting user is granted <i>Read</i> permissions to the collection via collection-level security rather than global security, the <i>Query</i> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div style="background-color: #fff9c4; padding: 10px; border: 1px solid #ccc;"> <p> <b>Example:</b> Gina wants to create a new collection using the <i>CopyFromId</i> option. She first uses <i>GET /CertificateCollections/{id}</i> to list the collection she plans to copy from and sees the following results:</p> <pre style="background-color: #fff9c4; padding: 10px; border: 1px solid #ccc;"> {   "Id": 10,   "Name": "Keyexample Collection",   "Description": "Certificates in the Keyexample Domain",   "Automated": false,   "Content": "CN -contains \"keyexample.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true } </pre> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <i>Read</i>, <i>Edit Metadata</i>, and <i>Download with Private Key</i> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the <i>Power Users</i> role do not have global certificate <i>Read</i> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <i>Read</i> permis-</p> </div>

Name	In	Description
		<p>  sions. Users with the Power Users role have <i>Modify</i> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the Power Users role and is not a full administrator.         </p> <p>           Gina uses POST /CertificateCollections/Copy (or POST /CertificateCollections—the behavior and output would be the same) to create a new certificate collection using the <i>CopyFromId</i> option with the following command:         </p> <pre data-bbox="594 569 1398 963"> {   "CopyFromId": 10,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Query": "CN -contains \"keyother.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true } </pre> <p>In the response, Gina sees the following:</p> <pre data-bbox="594 1005 1398 1539"> {   "Id": 15,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Automated": false,   "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true } </pre> <p>           Notice that Gina has not achieved her desired goal. The new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view.         </p>

Name	In	Description
		<p data-bbox="526 289 1390 449">🔍 Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p data-bbox="591 464 1065 491">In the response, Martha sees the following:</p> <pre data-bbox="591 506 1398 968">{   "Id": 16,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Automated": false,   "Content": "(CN -contains \"keyother.com\")",   "Query": "(CN -contains \"keyother.com\")",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p data-bbox="591 974 1349 1001">Notice that when Martha runs the command, Gina's goal is achieved.</p>

Table 208: POST Certificate Collections Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
Query	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.9.3 PUT Certificate Collections

The PUT /CertificateCollections method is used to update an existing saved collection of certificates. This method returns HTTP 200 OK on a success with details about the certificate collection.

**Note:** Certificate collections that are configured for *Certificate Entered Collection* or *Certificate Left Collection* workflows (see Workflow Definition Operations in the *Keyfactor Command Reference Guide*) cannot be edited. This is done to prevent triggering a large number of entered/left workflows.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

/certificates/collections/modify/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/certificates/collections/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 209: PUT Certificate Collections Input Parameters

Name	In	Description				
ID	Body	<b>Required.</b> The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command. Use the <a href="#">GET /CertificateCollections</a> method (see <a href="#">GET Certificate Collections on page 461</a> ) to locate the ID of the collection you wish to update.				
Name	Body	<b>Required.</b> The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.				
Description	Body	<b>Required.</b> The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.				
Query	Body	<p><b>Required.</b> A string containing the search criteria for the collection. For example:</p> <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> <p>See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines.</p>				
DuplicationField	Body	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. The default is 0. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> </tbody> </table>	Value	Description	0	None
Value	Description					
0	None

4	Keyfactor Renewal											
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false). The default is <i>false</i> .										
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false). The default is <i>false</i> .										

Table 210: PUT Certificate Collections Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
Query	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.9.4 GET Certificate Collections ID

The GET `/CertificateCollections/{id}` method is used to retrieve details for a certificate collection with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate collection.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificates/collections/read/`  
 OR  
`/certificates/collections/read/#/` (where # is a reference to a specific certificate collection ID)  
 Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 211: GET Certificate Collections {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the ID of the certificate collection to retrieve. Use the <code>GET /CertificateCollections</code> method (see <a href="#">GET Certificate Collections on page 461</a> ) to retrieve a list of all the certificate collections to determine the certificate collection ID.

Table 212: GET Certificate Collections {id} Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Automated	An internally used Keyfactor Command field.												
Content	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.9.5 DELETE Certificate Collection ID

The DELETE /CertificateCollections/{id} method is used to delete the certificate collection with the specified ID from the Keyfactor Command database. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificates/collections/modify/  
OR  
/certificates/collections/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 213: DELETE Certificate Collection {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the certificate collection to delete. Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 461</a> ) to retrieve a list of certificate collections to determine the collection ID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.9.6 GET Certificate Collections Name

The GET /CertificateCollections/{name} method is used to retrieve details for a certificate collection with the specified name. This method returns HTTP 200 OK on a success with details for the certificate collection.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificates/collections/read/  
OR  
/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)  
Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 214: GET Certificate Collections Name Input Parameters

Name	In	Description
name	Path	<p><b>Required.</b> A string indicating the name of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificates on page 310</a>) to retrieve a list of all the certificate collections to determine the certificate collection name.</p> <p><b>Tip:</b> When using the Keyfactor API Reference and Utility, provide this name without quotation marks.</p>

Table 215: GET Certificate Collections ID Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Automated	An internally used Keyfactor Command field.												
Content	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.9.7 POST Certificate Collections Copy

The POST /CertificateCollections/Copy method is used to copy an existing saved collection of certificates in order to create a new collection. The permissions, query and description of the existing collection are copied to the new collection. Providing the *Query* or *Description* parameter in the request overrides the copied value and replaces it with the value provided in the request. This method returns HTTP 200 OK on a success with details about the new certificate collection.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/  
/certificates/collections/modify/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/certificates/collections/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 216: POST Certificate Collections Copy Input Parameters

Name	In	Description												
Name	Body	<b>Required.</b> The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection drop-downs, the name should be fairly short.												
Description	Body	<b>Required.</b> The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .												
Query	Body	<b>Required.</b> A string containing the search criteria for the collection. For example: <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines. See also <i>CopyFromId</i> .												
DuplicationField	Body	An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table border="1" data-bbox="516 1297 1404 1675"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description													
0	None													
1	Common Name													
2	Distinguished Name													
3	Principal Name													
4	Keyfactor Renewal													
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or												

Name	In	Description
		not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false). The default is <i>false</i> .
CopyFromId	Body	<p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 461</a>) to locate the ID of the collection whose query you wish to copy. When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <i>Query</i> or <i>Description</i> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <i>Read</i> permissions for certificates. If the requesting user is granted <i>Read</i> permissions to the collection via collection-level security rather than global security, the <i>Query</i> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div style="border: 1px solid #ccc; padding: 10px; background-color: #fff9c4;"> <p> <b>Example:</b> Gina wants to create a new collection using the <i>CopyFromId</i> option. She first uses <i>GET /CertificateCollections/{id}</i> to list the collection she plans to copy from and sees the following results:</p> <pre style="margin: 10px 0;">{   "Id": 10,   "Name": "Keyexample Collection",   "Description": "Certificates in the Keyexample Domain",   "Automated": false,   "Content": "CN -contains \"keyexample.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <i>Read</i>, <i>Edit Metadata</i>, and <i>Download with Private Key</i> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the Power Users role do not have global certificate <i>Read</i> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <i>Read</i> permis-</p> </div>

Name	In	Description
		<p>  sions. Users with the Power Users role have <i>Modify</i> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the Power Users role and is not a full administrator.         </p> <p>           Gina uses POST /CertificateCollections/Copy (or POST /CertificateCollections—the behavior and output would be the same) to create a new certificate collection using the <i>CopyFromId</i> option with the following command:         </p> <pre data-bbox="594 569 1398 961"> {   "CopyFromId": 10,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Query": "CN -contains \"keyother.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true } </pre> <p>In the response, Gina sees the following:</p> <pre data-bbox="594 1003 1398 1539"> {   "Id": 15,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Automated": false,   "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true } </pre> <p>           Notice that Gina has not achieved her desired goal. The new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view.         </p>

Name	In	Description
		<p> Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p>In the response, Martha sees the following:</p> <pre data-bbox="594 501 1398 968">{   "Id": 16,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Automated": false,   "Content": "(CN -contains \"keyother.com\")",   "Query": "(CN -contains \"keyother.com\")",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>Notice that when Martha runs the command, Gina's goal is achieved.</p>

Table 217: POST Certificate Collections Copy Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
Query	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.9.8 GET Certificate Collection Nav Items

The GET /CertificateCollection/NavItems method is used to return a list of the collections that have been set as favorites to *Show in Navigator*. This method returns HTTP 200 OK on a success with the collection names and IDs. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificates/collections/read/  
OR  
/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Table 218: GET Certificate Collection Nav Items Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate collection.
Name	A string indicating the name of the certificate collection.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.9.9 PUT Certificate Collection ID Favorite

The PUT /CertificateCollection/{id}/Favorite method is used to update the *Favorite / Show in Navigator* setting for a collection. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/modify/  
OR

/certificates/collections/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 219: PUT Certificate Collection{id} Favorite Input Body

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the certificate collection.  Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 461</a> ) to retrieve a list of certificate collections to determine the collection ID.
ShowInNavigator	Body	A Boolean indicating whether the certificate collection should appear on the menu (true) or not(false). For example:  <pre>{   "ShowInNavigator": true }</pre>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.9.10 GET Certificate Collections List

The GET /CertificateCollections/CollectionList method is used to return the definitions for all certificate collections. This method returns HTTP 200 OK on a success with details for each certificate collection, including the de-duplication setting.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificates/collections/read/  
OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 220: GET Certificate Collections List Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Collection Manager Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• Name</li><li>• Query</li></ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 221: GET Certificate Collections List Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
DuplicationField	A string indicating the type of de-duplication (a.k.a. <i>ignore renewed certificate results by</i> ) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i> . Possible values are: <table border="1" data-bbox="548 961 1404 1346"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
Favorite	A Boolean that indicates whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												
ShowOnDashboard	A Boolean that indicates whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
HasQueryPermissions	A Boolean that indicates whether the user has query permissions (true) or not (false).												

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.10 Certificate Stores

The CertificateStores component of the Keyfactor API (formerly known as the JKS API) provides a set of methods to support management of certificate locations.

Through different remote Keyfactor orchestrators, Keyfactor Command can inventory, install, and remove certificates for each of the store types. For certain store types, additional actions are supported as well. The CertificateStores component provides a way to programmatically schedule jobs for these stores. For more information about certificate stores and their support within Keyfactor Command, see the [Keyfactor Command Reference Guide](#) and [Keyfactor Command Orchestrator Installation and Configuration Guide](#), or contact your Keyfactor representative. The set of methods in this API component that can be used to manage certificate stores and their scheduled jobs is listed in [Table 222: Certificate Stores Endpoints](#).

Table 222: Certificate Stores Endpoints

Endpoint	Method	Description	
/	DELETE	Deletes multiple certificate stores specified in the request body.	<a href="#">DELETE Certificate Stores on page 491</a>
/	GET	Returns all certificate stores with paging and option to specify detail level.	<a href="#">GET Certificate Stores on page 492</a>
/	POST	Creates a new certificate store if valid parameters are supplied.	<a href="#">POST Certificate Stores on page 503</a>
/	PUT	Updates an existing certificate store.	<a href="#">PUT Certificate Stores on page 529</a>
/ {id}	DELETE	Deletes a certificate store by its GUID.	<a href="#">DELETE Certificate Stores ID on page 556</a>
/ {id}	GET	Returns certificate store details for the specified certificate store.	<a href="#">GET Certificate Stores ID on page 557</a>

Endpoint	Method	Description	
/id/Inventory	GET	Returns certificate inventory for the specified certificate store.	<a href="#">GET Certificate Stores ID Inventory on page 573</a>
/Server (*deprecated)	GET	Returns a list of certificate store servers.	<a href="#">GET Certificate Stores Server on page 576</a>
/Server (*deprecated)	POST	Creates a new certificate store server.	<a href="#">POST Certificate Stores Server on page 579</a>
/Server (*deprecated)	PUT	Updates an existing certificate store server.	<a href="#">PUT Certificate Stores Server on page 584</a>
/Password	PUT	Updates the password for a certificate store.	<a href="#">PUT Certificate Stores Password on page 590</a>
/DiscoveryJob	PUT	Creates a job to find certificate stores.	<a href="#">PUT Certificate Stores Discovery Job on page 592</a>
/AssignContainer	PUT	Assigns a certificate store to a container.	<a href="#">PUT Certificate Stores Assign Container on page 598</a>
/Approve	POST	Approves an array of pending certificate stores.	<a href="#">POST Certificate Stores Approve on page 608</a>
/Schedule	POST	Creates an inventory schedule for a certificate store.	<a href="#">POST Certificate Stores Schedule on page 619</a>
/Reenrollment	POST	Schedules a reenrollment of a certificate into a certificate store.	<a href="#">POST Certificate Stores Reenrollment on page 622</a>
/Certificates/Add	POST	Configures a management job to add a certificate to one or more stores with the provided schedule.	<a href="#">POST Certificate Stores Certificates Add on page 624</a>

Endpoint	Method	Description	
/Certificates/Remove	POST	Configures a management job to remove a certificate from one or more stores with the provided schedule.	<a href="#">POST Certificate Stores Certificates Remove on page 630</a>

### 2.6.10.1 DELETE Certificate Stores

The DELETE /CertificateStores method is used to delete multiple certificate stores in one request. The certificate store GUIDs should be supplied in the request body as a JSON array of strings. This endpoint returns 204 with no content upon success. GUIDs of any certificate stores that could not be deleted are returned in the response body. Delete operations will continue until the entire array of GUIDs has been processed.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificate\_stores/modify/  
 OR  
 /certificate\_stores/modify/#/ (where # is a reference to a specific certificate store container ID)  
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 223: DELETE Certificate Stores Input Parameters

Name	In	Description
IDs	Body	<p><b>Required.</b> An array of strings indicating Keyfactor Command certificate store GUIDs for certificate stores that should be deleted in the form:</p> <pre>[52fe526d-9914-4239-b74b-b47d0607cf7c,8ec160d9-3242-4eb4-956b-a7651af6c542]</pre> <p>Use the <a href="#">GET /CertificateStores</a> method (see <a href="#">GET Certificate Stores on the next page</a>) to retrieve a list of all the certificate stores to determine the certificate store GUIDs.</p>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.10.2 GET Certificate Stores

The GET /CertificateStores method is used to return a list of all certificate stores defined in Keyfactor Command. The results include both approved certificates stores and certificates stores found on discovery but not yet approved. This method allows URL parameters to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the certificate store(s).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate\_stores/read/

OR

/certificate\_stores/read/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 224: GET Certificate Stores Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Certificate Store Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• AddSupported (True, False)</li> <li>• AgentAvailable (True, False)</li> <li>• AgentId</li> <li>• Approved (True, False)</li> <li>• Category (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)</li> <li>• CertificateId</li> <li>• ClientMachine</li> <li>• Container (ContainerName)</li> <li>• ContainerId</li> <li>• HasInventoryScheduled (True, False)</li> <li>• PrivateKeyAllowed (0-Forbidden, 1-Optional, 2-Required)</li> <li>• RemoveSupported (True, False)</li> <li>• StorePath</li> </ul> <div style="border: 1px solid #4CAF50; border-radius: 10px; padding: 10px; margin-top: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Use the following query to limit the results to only active certificate stores and not include discovery results: approved -eq true</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ClientMachine</i> .

Name	In	Description
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 225: GET Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a> ).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
Cert Store Inventory JobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
Cert Store Type	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
Create If Missing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the</p>

Name	Description
	<p>contents of this field might be:</p> <pre data-bbox="391 310 1404 527"> {   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="391 638 1404 854"> {   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="391 932 1404 1253"> {   \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\j-smith\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 1030</a>):</p> <pre data-bbox="391 1360 1404 1682"> {   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p> <b>Note:</b> There are three standard properties that are used for certificate store types</p>

Name	Description												
	<div style="background-color: #e1f5fe; padding: 10px; border-radius: 10px;">  that require server credentials (e.g. F5):           <ul style="list-style-type: none"> <li>ServerUsername</li> <li>ServerPassword</li> <li>ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
Agent Assigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
Container Name	A string indicating the name of the certificate store's associated container, if applicable.												
Inventory Schedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" data-bbox="391 1003 1403 1738" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th data-bbox="391 1003 586 1073">Name</th> <th data-bbox="586 1003 1403 1073">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="391 1073 586 1136">Off</td> <td data-bbox="586 1073 1403 1136">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="391 1136 586 1350">Immediate</td> <td data-bbox="586 1136 1403 1350">           A Boolean that indicates a job scheduled to run immediately (true) or not (false).           <div style="background-color: #e8f5e9; padding: 5px; border-radius: 10px; margin-top: 10px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.           </div> </td> </tr> <tr> <td data-bbox="391 1350 586 1738">Interval</td> <td data-bbox="586 1350 1403 1738">           A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Options	A string containing a comma-separated list of multiple choice options for this entry parameter.	<div data-bbox="630 1020 1382 1734" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>• Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case,</li> </ul> </div>
Name	Description									
	used to configure one custom parameter to display only if another custom parameter contains a value.									
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .									
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.									

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>  the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). </td> </tr> </tbody> </table>	Name	Description		 the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
Name	Description				
	 the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
Set New Password Allowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.3 POST Certificate Stores

The POST /CertificateStores method is used to create new certificate stores in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the certificate store created.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificate\_stores/modify/  
 OR  
 /certificate\_stores/modify/#/ (where # is a reference to a specific certificate store container ID)  
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 226: POST Certificate Stores Input Parameters

Name	In	Description
ContainerId	Body	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a> ).
ClientMachine	Body	<b>Required.</b> A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	Body	<b>Required.</b> A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
Cert Store Inventory JobId	Body	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
Cert Store Type	Body	<b>Required.</b> An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	Body	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .
Create If Missing	Body	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .
Properties	Body	<b>Required.</b> Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on</a>

Name	In	Description
		<p><a href="#">page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="467 495 1406 709"> {   \"privateKeyPath\": \"/opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="467 821 1406 1035"> {   \"privateKeyPath\": {\"value\": \"/opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="467 1110 1406 1430"> {   \"ServerUsername\": {\"value\":   {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 1030</a>):</p> <pre data-bbox="467 1577 1406 1730"> {   \"ServerUsername\": {\"value\":   {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}},</pre>

Name	In	Description						
		<pre>       \ "ServerPassword\":{\ "value\":       {\ "Provider\":"1\", \ "Parameters\":       {\ "SecretId\":"MyPasswordID\"}},       \ "ServerUseSsl\":{\ "value\":"true\"}     }" </pre> <p> <b>Note:</b> There are three standard properties that are used for certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p>						
AgentId	Body	<b>Required.</b> A string indicating the Keyfactor Command GUID of the orchestrator for this store.						
Agent Assigned	Body	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .						
Container Name	Body	A string indicating the name of the certificate store's associated container, if applicable.						
Inventory Schedule	Body	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</td> </tr> </tbody> </table> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).
Name	Description							
Off	Turn off a previously configured schedule.							
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).							

Name	In	Description								
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description									
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.									
Name	Description									
Minutes	An integer indicating the number of minutes between each interval.									
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. Set New Password Allowed	Body	A Boolean that indicates whether the store password can be changed (true) or not (false). The default is <i>false</i> .				
Password	Body	<p>An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on Citrix NetScaler and F5 devices and set at the server level, not the certificate store level (see <a href="#">POST Certificate Stores on page 503</a>).</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> <li>Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</li> <li>Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 1005</a> for more information.</li> </ul>

Name	In	Description						
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rId</td> <td>PAM provider.</td> </tr> <tr> <td>IsManaged</td> <td>A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.</td> </tr> </tbody> </table>	Name	Description	rId	PAM provider.	IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.
Name	Description							
rId	PAM provider.							
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.							

Table 227: POST Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a> ).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
Cert Store Inventory JobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
Cert Store Type	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
Create If Missing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the</p>

Name	Description
	<p>contents of this field might be:</p> <pre data-bbox="391 310 1404 527"> {   \"privateKeyPath\": \"/opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="391 638 1404 854"> {   \"privateKeyPath\": {\"value\": \"/opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="391 932 1404 1253"> {   \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\j-smith\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 1030</a>):</p> <pre data-bbox="391 1360 1404 1682"> {   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p> <b>Note:</b> There are three standard properties that are used for certificate store types</p>

Name	Description												
	<p> that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
Agent Assigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
Container Name	A string indicating the name of the certificate store's associated container, if applicable.												
Inventory Schedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description												
Off	Turn off a previously configured schedule.												
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> </tbody> </table>	Name	Description		<pre>"Interval": {   "Minutes": 60 }</pre>
Name	Description				
	<pre>"Interval": {   "Minutes": 60 }</pre>				
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).				
Exactly Once	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. Name	Description																	
	used to configure one custom parameter to display only if another custom parameter contains a value.																	
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																	
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																	
Name	Description																	
	used to configure one custom parameter to display only if another custom parameter contains a value.																	
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																	
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																	

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>  the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). </td> </tr> </tbody> </table>	Name	Description		 the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
Name	Description				
	 the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
Set New Password Allowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.10.4 PUT Certificate Stores

The PUT /CertificateStores method is used to update an existing certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing the certificate store.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificate\_stores/modify/  
 OR  
 /certificate\_stores/modify/#/ (where # is a reference to a specific certificate store container ID)  
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 228: PUT Certificate Stores Input Parameters

Name	In	Description
Id	Body	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	Body	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a> ).
ClientMachine	Body	<b>Required.</b> A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	Body	<b>Required.</b> A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
Cert Store Inventory JobId	Body	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
Cert Store Type	Body	<b>Required.</b> An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmaonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	Body	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .
Create If Missing	Body	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .

Name	In	Description
Properties	Body	<p><b>Required.</b> Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="467 596 1403 810"> {   \"privateKeyPath\": \"/opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="467 919 1403 1134"> {   \"privateKeyPath\": {\"value\": \"/opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="467 1213 1403 1528"> {   \"ServerUsername\": {\"value\":   {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 1030</a>):</p>

Name	In	Description						
		<pre> {   "ServerUsername": {"value": {"Provider": "1", "Parameters": {"SecretId": "MyUserID"}},   "ServerPassword": {"value": {"Provider": "1", "Parameters": {"SecretId": "MyPasswordID"}},   "ServerUseSsl": {"value": "true"} } </pre> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px; background-color: #e6f2ff;"> <p> <b>Note:</b> There are three standard properties that are used for certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>						
AgentId	Body	<b>Required.</b> A string indicating the Keyfactor Command GUID of the orchestrator for this store.						
Agent Assigned	Body	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .						
Container Name	Body	A string indicating the name of the certificate store's associated container, if applicable.						
Inventory Schedule	Body	An object indicating the inventory schedule for this certificate store. The following schedule types are supported: <table border="1" style="margin-top: 10px; border-radius: 10px; width: 100%;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).
Name	Description							
Off	Turn off a previously configured schedule.							
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).

Provider Type Param Values	An array of objects containing the values for the provider types specified by <i>ProviderTypeParams</i> . See the previous level of <i>Provider-TypeParamValues</i> for details.																			
Secured Area Id	An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.  This is considered deprecated and may be removed in a future release.																			
Remote	A Boolean indicating whether the <i>Remote Provider</i> checkbox is checked when adding a new PAM provider (true), or not (false). See <i>PAM Provider Configuration in Keyfactor Command</i> in the

Name	Description																					
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Provider-TypeParams</td> <td>Unused field</td> </tr> </tbody> </table>	Name	Description	Name	A string indicating the internal name for the PAM provider type parameter.	Provider-TypeParams	Unused field															
Name	Description																					
Name	A string indicating the internal name for the PAM provider type parameter.																					
Provider-TypeParams	Unused field																					
ProviderId		An integer indicating the Keyfactor Command reference ID for the PAM provider.																				
IsManaged		A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																				

Table 229: PUT Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a> ).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
Cert Store Inventory JobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
Cert Store Type	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
Create If Missing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the</p>

Name	Description
	<p>contents of this field might be:</p> <pre data-bbox="391 310 1404 527"> {   \"privateKeyPath\": \"/opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" } </pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="391 638 1404 854"> {   \"privateKeyPath\": {\"value\": \"/opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} } </pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="391 932 1404 1253"> {   \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\j-smith\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}},   \"ServerUseSsl\": {\"value\": \"true\"} } </pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 1030</a>):</p> <pre data-bbox="391 1360 1404 1682"> {   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} } </pre> <p> <b>Note:</b> There are three standard properties that are used for certificate store types</p>

Name	Description												
	<p> that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
Agent Assigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
Container Name	A string indicating the name of the certificate store's associated container, if applicable.												
Inventory Schedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description												
Off	Turn off a previously configured schedule.												
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> </tbody> </table>	Name	Description		<pre>"Interval": {   "Minutes": 60 }</pre>
Name	Description				
	<pre>"Interval": {   "Minutes": 60 }</pre>				
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).				
Exactly Once	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).

Name	Description				
	 the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
Set New Password Allowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.5 DELETE Certificate Stores ID

The DELETE `/CertificateStores/{id}` method is used to delete an existing certificate store with the specified GUID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificate_stores/modify/`  
OR  
`/certificate_stores/modify/#/` (where # is a reference to a specific certificate store container ID)  
Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 230: DELETE Certificate Stores Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the certificate store to delete. Use the <a href="#">GET /CertificateStores</a> method (see <a href="#">GET Certificate Stores on page 492</a> ) to retrieve a list of all the certificate stores to determine the certificate store GUID.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.6 GET Certificate Stores ID

The `GET /CertificateStores/{id}` method is used to return details for the certificate store with the specified ID. This method returns HTTP 200 OK on a success with a message body containing certificate store details.

 **Tip:** The following permissions (see [Security Roles and Claims](#) in the [Keyfactor Command Reference Guide](#)) are required to use this feature:  
`/certificate_stores/read/`  
 OR  
`/certificate_stores/read/#/` (where # is a reference to a specific certificate store container ID)  
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions](#) in the [Keyfactor Command Reference Guide](#) for more information about global vs container permissions.

Table 231: GET Certificate Stores {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the certificate store within Keyfactor Command. Use the <a href="#">GET /CertificateStore</a> method (see <a href="#">GET Certificate Stores on page 492</a> ) to retrieve a list of all the certificate stores to determine the certificate store GUID.

Table 232: GET Certificate Stores {id} Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a> ).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
Cert Store Inventory JobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
Cert Store Type	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
Create If Missing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the</p>

For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>• Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case,</li> </ul> </div>	Name	Description		used to configure one custom parameter to display only if another custom parameter contains a value.	DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Options	A string containing a comma-separated list of multiple choice options for this entry parameter.
Name	Description								
	used to configure one custom parameter to display only if another custom parameter contains a value.								
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .								
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.								

Name	Description				
	<table border="1"> <thead> <tr> <th data-bbox="391 275 605 338">Name</th> <th data-bbox="605 275 1403 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="391 338 605 579"></td> <td data-bbox="605 338 1403 579">  the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). </td> </tr> </tbody> </table>	Name	Description		 the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
Name	Description				
	 the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
Set New Password Allowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	<p>An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on Citrix NetScaler and F5 devices and set at the server level, not the certificate store level (see <a href="#">POST Certificate Stores on page 503</a>).</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> <li>• Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</li> <li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 1005</a> for more information.</li> </ul> <p>The possible values are:</p> <table border="1"> <thead> <tr> <th data-bbox="391 1409 540 1472">Name</th> <th data-bbox="540 1409 1403 1472">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="391 1472 540 1577">Secret Value</td> <td data-bbox="540 1472 1403 1577">A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</td> </tr> </tbody> </table> <p> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:</p>	Name	Description	Secret Value	A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.
Name	Description				
Secret Value	A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.

Name	A string indicating the internal name for the PAM provider type parameter.	Provider-TypeParams	Unused field												
Name	Description																				
	Command reference GUID for the PAM provider type parameter.																				
Name	A string indicating the internal name for the PAM provider type parameter.																				
Provider-TypeParams	Unused field																				
ProviderId	An integer indicating the Keyfactor Command reference ID for the PAM provider.																				
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																				

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.7 GET Certificate Stores ID Inventory

The GET /CertificateStores/{id}/Inventory method is used to return a list of all the certificates found in the selected certificate store based on an inventory done using Keyfactor Command an approved orchestrator. The results include both end entity certificates and chain certificates found in the store. This method allows URL parameters to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the certificates in the store.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_stores/read/  
OR  
/certificate\_stores/read/#/ (where # is a reference to a specific certificate store container ID)  
Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 233: GET Certificate Stores {id} Inventory Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the certificate store within Keyfactor Command.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 234: GET Certificate Stores {id} Inventory Response Data

Name	Description																				
Name	A string indicating the alias for the certificate in the certificate store. The format for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																				
Certificates	<p>An array of objects indicating the certificates (end entity and chain) found in the certificate store. Certificate details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the certificate.</td> </tr> <tr> <td>IssuedDN</td> <td>A string indicating the distinguished name of the certificate.</td> </tr> <tr> <td>SerialNumber</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>NotBefore</td> <td>A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.</td> </tr> <tr> <td>NotAfter</td> <td>A string indicating the date, in UTC, on which the certificate expires.</td> </tr> <tr> <td>SigningAlgorithm</td> <td>A string indicating the algorithm used to sign the certificate.</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the distinguished name of the issuer.</td> </tr> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the certificate.</td> </tr> <tr> <td>CertStoreInventoryItemId</td> <td>An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	IssuedDN	A string indicating the distinguished name of the certificate.	SerialNumber	A string indicating the serial number of the certificate.	NotBefore	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.	NotAfter	A string indicating the date, in UTC, on which the certificate expires.	SigningAlgorithm	A string indicating the algorithm used to sign the certificate.	IssuerDN	A string indicating the distinguished name of the issuer.	Thumbprint	A string indicating the thumbprint of the certificate.	CertStoreInventoryItemId	An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.
Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the certificate.																				
IssuedDN	A string indicating the distinguished name of the certificate.																				
SerialNumber	A string indicating the serial number of the certificate.																				
NotBefore	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.																				
NotAfter	A string indicating the date, in UTC, on which the certificate expires.																				
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																				
IssuerDN	A string indicating the distinguished name of the issuer.																				
Thumbprint	A string indicating the thumbprint of the certificate.																				
CertStoreInventoryItemId	An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.																				
CertStoreInventoryItemId	An integer indicating the Keyfactor Command reference ID of the certificate in the certificate store.																				
Parameters	An object containing the entry parameters associated with the certificate																				

Name	Description
	in the certificate store. Expected entry parameters will vary depending on the configuration of the certificate store type. See <a href="#">POST Certificate Store Types on page 705</a> for more information about entry parameters.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.8 GET Certificate Stores Server

The GET /CertificateStores/Server method is used to retrieve all servers for certificate stores. Only select types of certificate stores have an associated server. These include F5, IIS, Citrix\NetScaler, and any other custom method you've defined to support this. This method returns HTTP 200 OK on a success with details for each server.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificate\_stores/read/  
 OR  
 /certificate\_stores/read/#/ (where # is a reference to a specific certificate store container ID)  
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

 **Note:** This method has been deprecated and will be removed from the Keyfactor API in release 12. Certificate store server information is now found in the Properties field of the certificate store (see [GET Certificate Stores on page 492](#)).

Table 235: GET Certificate Stores Server Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Certificate Store Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• Id</li> <li>• Name</li> <li>• ServerType</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 236: GET Certificate Stores Server Response Data

Name	Description														
Id	The ID of the server.														
Username	<p>The username used to connect to the certificate store.</p> <p> <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>														
Password	<p>The password used to connect to the certificate store.</p> <p> <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>														
UseSSL	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the server (true) or not (false).														
ServerType	<p>An integer indicating the type of server. Possible values include (plus any custom values):</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>F5 Web Server &amp; F5 SSL Profiles (Deprecated)</td> </tr> <tr> <td>1</td> <td>NetScaler (Deprecated)</td> </tr> <tr> <td>2</td> <td>FTP (Deprecated)</td> </tr> <tr> <td>3</td> <td>F5 Web Server REST</td> </tr> <tr> <td>4</td> <td>F5 SSL Profiles REST</td> </tr> <tr> <td>5</td> <td>F5 CA Bundles REST</td> </tr> </tbody> </table>	Value	Description	0	F5 Web Server & F5 SSL Profiles (Deprecated)	1	NetScaler (Deprecated)	2	FTP (Deprecated)	3	F5 Web Server REST	4	F5 SSL Profiles REST	5	F5 CA Bundles REST
Value	Description														
0	F5 Web Server & F5 SSL Profiles (Deprecated)														
1	NetScaler (Deprecated)														
2	FTP (Deprecated)														
3	F5 Web Server REST														
4	F5 SSL Profiles REST														
5	F5 CA Bundles REST														
Name	The host name of the server.														

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.9 POST Certificate Stores Server

The POST /CertificateStores/Server method is used to create a new server record for a certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the newly created server record.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate\_stores/modify/

OR

/certificate\_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. Creating new certificate store server records requires permissions at the global level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Note:** This method has been deprecated and will be removed from the Keyfactor API in a future release. This method is retained until that time for backwards compatibility. Continuing to use this endpoint with the latest Keyfactor Command functionality could cause serious data issues. Certificate store server information is now found in the Properties field of the certificate store (see [POST Certificate Stores on page 503](#)).

**Tip:** If a certificate store that requires a server is missing a server definition within the store record, the certificate store server created with this method will be used. If no credentials are supplied in the request and no certificate store server exists, an error is returned and the request fails.

*Table 237: POST Certificate Stores Server Input Parameters*

Name	In	Description								
Username	Body	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the username. This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</td> </tr> <tr> <td>Provider</td> <td>An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This value only needs to be supplied if you're storing your username using a PAM provider.</td> </tr> <tr> <td>Parameters</td> <td>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be: <pre> "Username": {   "Provider": 2,   "Parameters": {     "SecretId": 4   } }, </pre> For CyberArk, this might be: <pre> "Username": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Username"   } }, </pre> </td> </tr> </tbody> </table>	Name	Description	SecretValue	A string containing the username. This value only needs to be supplied if you're storing your username in the Keyfactor Command database.	Provider	An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This value only needs to be supplied if you're storing your username using a PAM provider.	Parameters	The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be: <pre> "Username": {   "Provider": 2,   "Parameters": {     "SecretId": 4   } }, </pre> For CyberArk, this might be: <pre> "Username": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Username"   } }, </pre>
Name	Description									
SecretValue	A string containing the username. This value only needs to be supplied if you're storing your username in the Keyfactor Command database.									
Provider	An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This value only needs to be supplied if you're storing your username using a PAM provider.									
Parameters	The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be: <pre> "Username": {   "Provider": 2,   "Parameters": {     "SecretId": 4   } }, </pre> For CyberArk, this might be: <pre> "Username": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Username"   } }, </pre>									

Name	In	Description								
Password	Body	<p><b>Required.</b> The password used to connect to the certificate store. Password parameters include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.</td> </tr> <tr> <td>Provider</td> <td>An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.</td> </tr> <tr> <td>Parameters</td> <td> <p>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea, this might be:</p> <pre> "Password": {   "Provider": 2,   "Parameters": {     "SecretId": 5   } }, </pre> <p>For CyberArk, this might be:</p> <pre> "Password": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Password"   } } </pre> </td> </tr> </tbody> </table>	Name	Description	SecretValue	A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.	Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.	Parameters	<p>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea, this might be:</p> <pre> "Password": {   "Provider": 2,   "Parameters": {     "SecretId": 5   } }, </pre> <p>For CyberArk, this might be:</p> <pre> "Password": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Password"   } } </pre>
Name	Description									
SecretValue	A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.									
Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.									
Parameters	<p>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. 5	F5 CA Bundles REST														
Name	The host name of the server.														

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.10 PUT Certificate Stores Server

The PUT /CertificateStores/Server method is used to update the server record for a certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the server record.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_stores/modify/  
OR  
OR

/certificate\_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. Updating certificate store server records requires permissions at the global level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Note:** This method has been deprecated and will be removed from the Keyfactor API in a future release. This method is retained until that time for backwards compatibility. Continuing to use this endpoint with the latest Keyfactor Command functionality could cause serious data issues such as, for instance, overwriting all certificate stores on the server. Certificate store server information is now found in the Properties field of the certificate store (see [PUT Certificate Stores on page 529](#)). This endpoint has additional functionality, such as being able to set different credentials for different stores on the same server.

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 239: PUT Certificate Stores Server Input Parameters

Name	In	Description
Id	Body	The ID of the server.

Name	In	Description								
Username	Body	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td> <p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command data-base.</p> </td> </tr> <tr> <td>Provider</td> <td> <p>An integer that identifies the PAM provider used to store the username. **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.11 PUT Certificate Stores Password

The PUT /CertificateStores/Password method is used to update a password for a certificate store that supports this functionality. This updates the password stored in Keyfactor Command for the certificate store but does not update the certificate store itself. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_stores/modify/

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 241: PUT Certificate Stores Password Input Parameters

Name	Type	Description								
CertStoreID	Body	<b>Required.</b> A string indicating the GUID of the certificate store. Use the <i>GET CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 492</a> ) to retrieve a list of all your certificate stores to determine the GUID of the store.								
NewPassword	Body	<p><b>Required.</b> A object that sets the password used by Keyfactor Command to access the certificate store. It does not impact the certificate store itself, just Keyfactor Command’s definition of it. Password settings include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password. This value only needs to be supplied if you’re storing your password in the Keyfactor Command data-base.</td> </tr> <tr> <td>Provider</td> <td>An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.  This value only needs to be supplied if you’re storing your password using a PAM provider.</td> </tr> <tr> <td>Parameters</td> <td>An object containing the parameters required by your PAM provider, including the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be: <pre> "NewPassword": {   "Provider": 2,   "Parameters": { </pre> </td> </tr> </tbody> </table>	Name	Description	SecretValue	A string containing the password. This value only needs to be supplied if you’re storing your password in the Keyfactor Command data-base.	Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.  This value only needs to be supplied if you’re storing your password using a PAM provider.	Parameters	An object containing the parameters required by your PAM provider, including the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be: <pre> "NewPassword": {   "Provider": 2,   "Parameters": { </pre>
Name	Description									
SecretValue	A string containing the password. This value only needs to be supplied if you’re storing your password in the Keyfactor Command data-base.									
Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.  This value only needs to be supplied if you’re storing your password using a PAM provider.

		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Password"   } } },</pre> <p>For a password stored in the Keyfactor Command database, this might be:</p> <pre>"NewPassword": {   "SecretValue": "P@ssw0rd" } }</pre> </td> </tr> </tbody> </table>	Name	Description		<pre>"SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Password"   } } },</pre> <p>For a password stored in the Keyfactor Command database, this might be:</p> <pre>"NewPassword": {   "SecretValue": "P@ssw0rd" } }</pre>
Name	Description					
	<pre>"SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Password"   } } },</pre> <p>For a password stored in the Keyfactor Command database, this might be:</p> <pre>"NewPassword": {   "SecretValue": "P@ssw0rd" } }</pre>					

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.12 PUT Certificate Stores Discovery Job

The PUT /CertificateStores/DiscoveryJob method is used to schedule a discovery job for certificate stores. The certificate store discovery feature is used to scan machines and devices for existing certificates and certificate stores, which can then be configured for management in Keyfactor Command. Certificate store discovery is supported for:

- PEM and Java certificate stores discovered by the Keyfactor Java Agent. Only stores to which the service account running the Keyfactor Java Agent has at least read permissions will be returned on a discover job.

- PEM, Java, F5, F5 bundle and SSL certificates discovered by the Keyfactor Universal Orchestrator with an appropriate custom extension. For more information about the Keyfactor Universal Orchestrator and custom extensions, see *Universal Orchestrator* in the *Keyfactor Orchestrators Installation and Configuration Guide*.
- Any custom certificate store types configured to support this function.

This endpoint returns 204 with no content upon success. The method schedules the discovery job through the orchestrator. The results of the discovery job are determined separately (see [POST Certificate Stores Approve on page 608](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate\_stores/modify/

OR

/certificate\_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 242: PUT Certificate Stores Discovery Job Input Parameters

Name	In	Description
ClientMachine	Body	<b>Required.</b> A string indicating the name in Keyfactor Command of the client machine that will do the discovery. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.
AgentId	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the orchestrator for this store.
Type	Body	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+. The default is 0 for a JKS discovery using the Keyfactor Java Agent.
JobExecutionTimestamp	Body	The date and time at which the discovery job should run. If no date is provided, the job will be scheduled to run immediately. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Dirs	Body	<b>Required.</b> A string containing the directory or directories to search during the discovery job. Multiple directories should be separated by commas. <ul style="list-style-type: none"> <li>• <b>Java</b> For Java discovery, enter at a minimum either “/” for a Linux server or “c:\” for a Windows server.</li> <li>• <b>PEM</b> For PEM discovery, enter at a minimum either “/” for a Linux server or “c:\” for a Windows server.</li> <li>• <b>F5</b> For F5 discovery, enter “/”.</li> </ul>
IgnoredDirs	Body	A string containing the directories that should not be included in the search. Multiple directories should be separated by commas.
Extensions	Body	A string containing the file extensions for which to search. For

Name	In	Description
		example, search for files with the extension <i>jks</i> in order to exclude files with other extensions such as <i>txt</i> . Use <i>noext</i> to search file files without extensions. The dot should not be included when specifying extensions.
NamePatterns	Body	A string against which to compare the file names of certificate store files and return only those that contain the specified string (e.g. <i>myjks</i> ).
SymLinks	Body	A Boolean that sets whether the job should follow symbolic links on Linux and UNIX operating systems and report both the actual location of a found certificate store file in addition to the symbolic link pointing to the file. This option is ignored on Windows.
Compatibility	Body	A Boolean that sets whether the job will run using the compatibility mode introduced in Java version 1.8 to locate both JKS and PKCS12 type files (true) or not (false). This option applies only to Java keystore discover jobs.

Name	In	Description								
ServerUsername	Body	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the username. This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</td> </tr> <tr> <td>Provider</td> <td>An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information.  This value only needs to be supplied if you're storing your username using a PAM provider.</td> </tr> <tr> <td>Parameters</td> <td>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.  For example, for Delinea (formerly Thycotic), this might be: <pre> "ServerUsername": {   "Provider": 2,   "Parameters": {     "SecretId": 4   } }, </pre>  For CyberArk, this might be: <pre> "ServerUsername": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Username"   } }, </pre> </td> </tr> </tbody> </table>	Name	Description	SecretValue	A string containing the username. This value only needs to be supplied if you're storing your username in the Keyfactor Command database.	Provider	An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information.  This value only needs to be supplied if you're storing your username using a PAM provider.	Parameters	The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.  For example, for Delinea (formerly Thycotic), this might be: <pre> "ServerUsername": {   "Provider": 2,   "Parameters": {     "SecretId": 4   } }, </pre> For CyberArk, this might be: <pre> "ServerUsername": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Username"   } }, </pre>
Name	Description									
SecretValue	A string containing the username. This value only needs to be supplied if you're storing your username in the Keyfactor Command database.									
Provider	An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information.  This value only needs to be supplied if you're storing your username using a PAM provider.									
Parameters	The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.  For example, for Delinea (formerly Thycotic), this might be: <pre> "ServerUsername": {   "Provider": 2,   "Parameters": {     "SecretId": 4   } }, </pre> For CyberArk, this might be: <pre> "ServerUsername": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Username"   } }, </pre>									

Name	In	Description								
ServerPassword	Body	<p><b>Required</b>*. The password used to connect to the certificate store server. Password parameters include:</p> <table border="1" data-bbox="711 363 1403 1713"> <thead> <tr> <th data-bbox="716 369 938 426">Name</th> <th data-bbox="938 369 1398 426">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="716 426 938 590">SecretValue</td> <td data-bbox="938 426 1398 590">A string containing the password. 		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Parameters": {   "Folder": "Root",   "Object": "F5Password" } },</pre> </td> </tr> </tbody> </table> <p> <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p> <p>This field is <b>required</b> only for select certificate store types that require authentication at the server level. These include F5, Citrix/NetScaler, IIS, and any custom method you've defined to support this.</p>	Name	Description		<pre>"Parameters": {   "Folder": "Root",   "Object": "F5Password" } },</pre>
Name	Description					
	<pre>"Parameters": {   "Folder": "Root",   "Object": "F5Password" } },</pre>					
ServerUseSsl	Body	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the certificate store server (true) or not (false). The default is <i>false</i> .				

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.13 PUT Certificate Stores Assign Container

The PUT /CertificateStores/AssignContainer method is used to assign one or more certificate stores to a container. This method returns HTTP 200 OK on a success with the certificate stores that were just assigned to a container.

If you are creating a new container and assigning stores to it in one action, you should include the following fields:

- NewContainerName
- NewContainerType
- KeystoreIds

If you are assigning stores to an already existing container, you should include the following fields:

- CertStoreContainerId
- KeystoreIds

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificate\_stores/modify/  
 OR  
 /certificate\_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)  
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 243: PUT Certificate Stores Assign Container Input Parameters

Name	In	Description
CertStoreContainerId	Body	<b>Required*</b> . An integer that identifies the container into which you want to place the certificate store or stores. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertStoreContainerId</i></li> <li>• <i>NewContainerName</i> and <i>NewContainerType</i></li> </ul>
KeystoreIds	Body	<b>Required</b> . An array of strings indicating the certificate store GUIDs for the stores you want to place into the container.
NewContainerName	Body	<b>Required*</b> . A string that sets the name of the container if you would like to create a new container while assigning store(s) to it. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertStoreContainerId</i></li> <li>• <i>NewContainerName</i> and <i>NewContainerType</i></li> </ul>
NewContainerType	Body	<b>Required*</b> . An integer for the container type if you would like to create a new container while assigning store(s) to it. Container types match certificate store types. Use the <i>GET /CertificateStoreTypes</i> method with a query (e.g. <i>storetype -eq 7</i> ) or <i>GET /CertificateStoreTypes/{id}</i> method to determine what a particular certificate store type ID maps to. For example, type 2 maps to <i>PEM File</i> and type 10 maps to <i>F5 SSL Profiles REST</i> . One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertStoreContainerId</i></li> <li>• <i>NewContainerName</i> and <i>NewContainerType</i></li> </ul>

Table 244: PUT Certificate Stores Assign Container Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 633</a> ).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
Cert Store Inventory JobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
Cert Store Type	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
Create If Missing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the</p>

Name	Description
	<p>contents of this field might be:</p> <pre data-bbox="391 310 1404 527"> {   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="391 638 1404 854"> {   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="391 930 1404 1251"> {   \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\j-smith\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 1030</a>):</p> <pre data-bbox="391 1362 1404 1684"> {   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p> <b>Note:</b> There are three standard properties that are used for certificate store types</p>

Name	Description												
	<p> that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
Agent Assigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
Container Name	A string indicating the name of the certificate store's associated container, if applicable.												
Inventory Schedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description												
Off	Turn off a previously configured schedule.												
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> </tbody> </table>	Name	Description		<pre>"Interval": {   "Minutes": 60 }</pre>
Name	Description				
	<pre>"Interval": {   "Minutes": 60 }</pre>				
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).				
Exactly Once	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).

DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Options	A string containing a comma-separated list of multiple choice options for this entry parameter.	<div data-bbox="630 1020 1382 1734" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>• Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case,</li> </ul> </div>
Name	Description									
	used to configure one custom parameter to display only if another custom parameter contains a value.									
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .									
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.									

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>  the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). </td> </tr> </tbody> </table>	Name	Description		 the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
Name	Description				
	 the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
Set New Password Allowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.10.14 POST Certificate Stores Approve

The POST /CertificateStores/Approve method is used to approve one or more certificate stores currently in the pending state—having been discovered using the certificate store discover option (see [PUT Certificate Stores Discovery Job on page 592](#)). If more than one certificate store is included in the array, all stores must be of the same store type (e.g. Java keystore). This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificate\_stores/modify/  
 OR  
 /certificate\_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)  
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 245: POST Certificate Stores Approve Input Parameters

Name	In	Description
Id	Body	<p><b>Required.</b> The GUID of the pending certificate store.</p> <p>Use the <a href="#">GET /CertificateStores</a> method (see <a href="#">GET Certificate Stores on page 492</a>) with a query of “Approved -eq false” to retrieve a list of all your unapproved certificate stores to determine the GUID of the store.</p>
ContainerId	Body	<p>An integer that identifies the container in which the certificate store should be placed on approval. Use the <a href="#">GET /CertificateStores/Containers</a> method (see <a href="#">GET Certificate Store Containers on page 633</a>) to retrieve a list of your defined certificate store containers to determine the container ID to use.</p>
CertStoreType	Body	<p><b>Required.</b> An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.</p>
Properties	Body	<p><b>Required*</b>. Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre style="background-color: #f0f0f0; padding: 10px;">"{   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre style="background-color: #f0f0f0; padding: 10px;">{   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store</p>

Name	In	Description
		<p>would contain:</p> <pre data-bbox="446 310 1404 632"> {   "ServerUsername": {"value": {"SecretValue": "KEYEXAMPLE\\j-smith"}},   "ServerPassword": {"value": {"SecretValue": "MySuperSecretPassword"}},   "ServerUseSsl": {"value": "true"} } </pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the Id value from <a href="#">GET PAM Providers on page 1030</a>):</p> <pre data-bbox="446 772 1404 1094"> {   "ServerUsername": {"value": {"Provider": "1", "Parameters": {"SecretId": "MyUserID"}}},   "ServerPassword": {"value": {"Provider": "1", "Parameters": {"SecretId": "MyPasswordID"}}},   "ServerUseSsl": {"value": "true"} } </pre> <div data-bbox="446 1129 1404 1549" style="background-color: #e0f0ff; padding: 10px;"> <p> <b>Note:</b> There are three standard properties that are used for certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <p>This field is <b>required</b> for certificate store types that store additional properties in this parameter.</p>
Pass-word	Body	<p><b>Required.</b> An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command</p>

Name	In	Description				
		<p>uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores in Windows certificate stores and on Citrix NetScaler and F5 devices and set at the server level, not the certificate store level.</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> <li>• Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</li> <li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 1005</a> for more information.</li> </ul> <p>The possible values are:</p> <table border="1" data-bbox="446 871 1404 1705"> <thead> <tr> <th data-bbox="451 879 703 942">Name</th> <th data-bbox="703 879 1399 942">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="451 942 703 1696">SecretValue</td> <td data-bbox="703 942 1399 1696"> <p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div data-bbox="722 1039 1380 1680" style="border: 1px solid #c8e6c9; padding: 10px; margin: 10px 0;"> <p> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:</p> <pre data-bbox="803 1155 1364 1333">"Password": {   "SecretValue": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. IsManaged		A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.
Name	Description																							
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>meter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Provider-TypeParams</td> <td>Unused field</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>meter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Provider-TypeParams</td> <td>Unused field</td> </tr> </tbody> </table>	Name	Description		meter.	Name	A string indicating the internal name for the PAM provider type parameter.	Provider-TypeParams	Unused field											
Name	Description																							
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>meter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Provider-TypeParams</td> <td>Unused field</td> </tr> </tbody> </table>	Name	Description		meter.	Name	A string indicating the internal name for the PAM provider type parameter.	Provider-TypeParams	Unused field															
Name	Description																							
	meter.																							
Name	A string indicating the internal name for the PAM provider type parameter.																							
Provider-TypeParams	Unused field																							
Provider		An integer indicating the Keyfactor Command reference ID for the PAM provider.																						
IsManaged		A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																						

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development.

It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.15 POST Certificate Stores Schedule

The POST /CertificateStores/Schedule method is used to create and assign a schedule to one or more certificate stores in Keyfactor Command. The POST request must contain an array of certificate store GUIDs and the properties that make up the schedule to attach to the store(s). This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate\_stores/schedule/

OR

/certificate\_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 246: POST Certificate Stores Schedule Input Parameters

Name	In	Description														
Storelds	Body	<b>Required.</b> An array of strings providing the certificate store GUIDs to schedule.														
Schedule	Body	<p><b>Required.</b> An object indicating the inventory schedule for the certificate store(s). Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).   <div style="border: 1px solid green; border-radius: 10px; padding: 5px; background-color: #e0f2f1;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="background-color: #f5f5f5; padding: 10px; border: 1px solid #ccc;"> "Interval": {   "Minutes": 60 } </pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).  <div style="border: 1px solid green; border-radius: 10px; padding: 5px; background-color: #e0f2f1;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="background-color: #f5f5f5; padding: 10px; border: 1px solid #ccc;"> "Interval": {   "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description															
Off	Turn off a previously configured schedule.															
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).  <div style="border: 1px solid green; border-radius: 10px; padding: 5px; background-color: #e0f2f1;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>															
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="background-color: #f5f5f5; padding: 10px; border: 1px solid #ccc;"> "Interval": {   "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.											
Name	Description															
Minutes	An integer indicating the number of minutes between each interval.															
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:

Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).									

Name	In	Description
		 <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—Example Value may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.16 POST Certificate Stores Reenrollment

The POST /CertificateStores/Reenrollment method is used to schedule an existing certificate store for reenrollment. The reenrollment method is available for:

- PEM certificate stores managed by the Native Agent.
- PEM and Java certificate stores managed by Java and Android Agents.
- Any custom certificate store types created to support this functionality.

This endpoint returns 204 with no content upon success. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 978](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

```

/certificates/enrollment/csr/
/certificate_stores/modify/
OR
/certificates/enrollment/csr/
/certificate_stores/modify/#/ (where # is a reference to a specific certificate store container ID)

```

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

In addition, either the user scheduling the reenrollment job or the user configured to provide authentication to the CA (see Authorization Methods Tab in the *Keyfactor Command Reference Guide*) must have enrollment permissions configured on the CA and template.

Table 247: POST Certificates Stores Reenrollment Input Parameters

Name	In	Description
KeystoreId	Body	<p><b>Required.</b> The GUID of the certificate store to schedule for reenrollment.</p> <p>Use the <a href="#">GET /CertificateStores</a> method (see <a href="#">GET Certificate Stores on page 492</a>) to retrieve a list of your certificate stores to determine the GUID of the store.</p>
SubjectName	Body	<p><b>Required.</b> A string containing the reenrollment subject name using X.500 format. For example:</p> <pre>"SubjectName": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>
AgentGuid	Body	<p><b>Required.</b> The GUID of the orchestrator that is registered with the certificate store.</p> <p>Use the <a href="#">GET /CertificateStores</a> method (see <a href="#">GET Certificate Stores on page 492</a>) to retrieve a list of your certificate stores to determine the GUID of the orchestrator associated with the store.</p>
Alias	Body	<p><b>Required.</b> The alias of the certificate in the certificate store.</p>
JobProperties	Body	<p>An object indicating the unique parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <a href="#">GET CertificateStoreTypes</a> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <a href="#">GET CertificateStoreTypes</a> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [ {"NetscalerVserver": "MyVirtualServerName"} ]</pre> <p> <b>Note:</b> The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-</p>

Name	In	Description
		 certificate basis in the store is NetScaler, which does not support reenrollment. You may have custom certificate store types that make use of this functionality.
CertificateAuthority	Body	A string indicating the certificate authority to which to direct the enrollment request. If this parameter is not provided, the value set in the <i>Certificate Authority For Submitted CSRs</i> application setting will be used (see Application Settings: Agents Tab in the <i>Keyfactor Command Reference Guide</i> ).
CertificateTemplate	Body	A string indicating the certificate template to use for the enrollment request. If this parameter is not provided, the value set in the <i>Template For Submitted CSRs</i> application setting will be used (see Application Settings: Agents Tab in the <i>Keyfactor Command Reference Guide</i> ).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.17 POST Certificate Stores Certificates Add

The POST `/CertificateStores/Certificates/Add` method is used to add a certificate to one or more certificate stores. This method returns HTTP 200 OK on a success with an array of GUIDs for the add jobs. Use the GET `/OrchestratorJobs/JobHistory` method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 978](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- `/certificates/collections/read/`
- `/certificate_stores/schedule/`
- OR
- `/certificates/collections/read/#/` (where # is a reference to a specific certificate collection ID)
- `/certificate_stores/schedule/#/` (where # is a reference to a specific certificate store container ID)

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. You can use a mixture with, for example, global certificate permissions and container-level certificate store permissions. See

*Certificate Permissions* and *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection and container permissions.

Table 248: POST Certificate Stores Certificates Add Input Parameters

Name	In	Description												
CertificateId	Body	<b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate to be added to the certificate store(s).												
Certificate Stores	Body	<p><b>Required.</b> An array of objects indicating the certificate store GUIDs to identify the certificate stores to which the certificate should be added and provide appropriate reference information for the certificate in the store. Parameters include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Certificate Store Ids</td> <td><b>Required.</b> A string containing the GUID for the certificate store to which the certificate should be added.</td> </tr> <tr> <td>Alias</td> <td><b>Required*</b> A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.</td> </tr> <tr> <td>Job Fields</td> <td>An object that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.</td> </tr> <tr> <td>Overwrite</td> <td>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). The default is <i>false</i>. Use the <a href="#">GET /Certificates/Locations/{id}</a> method (see <a href="#">GET Certificates Locations ID on page 284</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</td> </tr> <tr> <td>Entry Password</td> <td>An object containing the password to set on the entry within the certificate store, if applicable. Only select certificate stores support entry passwords (e.g. Java keystores). Entry password values include:</td> </tr> </tbody> </table>	Name	Description	Certificate Store Ids	<b>Required.</b> A string containing the GUID for the certificate store to which the certificate should be added.	Alias	<b>Required*</b> A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.	Job Fields	An object that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.	Overwrite	A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). The default is <i>false</i> . Use the <a href="#">GET /Certificates/Locations/{id}</a> method (see <a href="#">GET Certificates Locations ID on page 284</a> ) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.	Entry Password	An object containing the password to set on the entry within the certificate store, if applicable. Only select certificate stores support entry passwords (e.g. Java keystores). Entry password values include:
Name	Description													
Certificate Store Ids	<b>Required.</b> A string containing the GUID for the certificate store to which the certificate should be added.													
Alias	<b>Required*</b> A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. Name	Description									
Secret Value	A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.									
Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.									
Parameters	<p>An object containing the parameters required by your PAM provider, including the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea (formerly Thycotic), this might be:</p> <pre> "EntryPassword": {   "Provider": 2,   "Parameters": {     "SecretId": 5   } }, </pre> <p>For CyberArk, this might be:</p>									

Name	In	Description														
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre> "EntryPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Pass- word"   } }, </pre> </td> </tr> </tbody> </table> </td> </tr> <tr> <td>Pfx Password</td> <td></td> <td>A string that sets the password to use when saving a certificate with its private key in the certificate store. This is only relevant if there's a private key being added along with the certificate.</td> </tr> <tr> <td>Include Private Key</td> <td></td> <td>A Boolean that sets whether to include the private key of the certificate in the certificate store if private keys are optional for the given certificate store (true) or not (false). The default is <i>false</i>.</td> </tr> </tbody> </table> <p>For example, to add to one IIS personal store and one NetScaler store without overwriting an existing certificate:</p> <pre> "CertificateStores": [   {     "Alias": "MyCertificate.pfx",     "CertificateStoreId": "fde12aa7-6643-43db-88e8-5c91c5ce78b3",     "IncludePrivateKey": true   },   {     "Alias": "C2107973A928859C21330E566B299CD4A0705AE8",     "CertificateStoreId": "322e12ea-43b2-4aab-80ae-c4ad4569b4e7",     "IncludePrivateKey": true   } ] </pre>	Name	Description		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre> "EntryPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Pass- word"   } }, </pre> </td> </tr> </tbody> </table>	Name	Description		<pre> "EntryPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Pass- word"   } }, </pre>	Pfx Password		A string that sets the password to use when saving a certificate with its private key in the certificate store. This is only relevant if there's a private key being added along with the certificate.	Include Private Key		A Boolean that sets whether to include the private key of the certificate in the certificate store if private keys are optional for the given certificate store (true) or not (false). The default is <i>false</i> .
Name	Description															
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre> "EntryPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Pass- word"   } }, </pre> </td> </tr> </tbody> </table>	Name	Description		<pre> "EntryPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Pass- word"   } }, </pre>											
Name	Description															
	<pre> "EntryPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Pass- word"   } }, </pre>															
Pfx Password		A string that sets the password to use when saving a certificate with its private key in the certificate store. This is only relevant if there's a private key being added along with the certificate.														
Include Private Key		A Boolean that sets whether to include the private key of the certificate in the certificate store if private keys are optional for the given certificate store (true) or not (false). The default is <i>false</i> .														

Name	In	Description												
		<pre> } ]</pre>												
Schedule	Body	<p><b>Required.</b> An object indicating the inventory schedule for the add job. Possible schedule values include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).   <div style="background-color: #e0f2f1; padding: 5px; border-radius: 5px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td>Exactly Once</td> <td>A dictionary that indicates a job scheduled to run at the time specified with the parameter:   <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre> "ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" }</pre> <div style="background-color: #e0f2f1; padding: 5px; border-radius: 5px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).  <div style="background-color: #e0f2f1; padding: 5px; border-radius: 5px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Exactly Once	A dictionary that indicates a job scheduled to run at the time specified with the parameter:  <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre> "ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" }</pre> <div style="background-color: #e0f2f1; padding: 5px; border-radius: 5px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description													
Off	Turn off a previously configured schedule.													
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).  <div style="background-color: #e0f2f1; padding: 5px; border-radius: 5px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>													
Exactly Once	A dictionary that indicates a job scheduled to run at the time specified with the parameter:  <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre> "ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" }</pre> <div style="background-color: #e0f2f1; padding: 5px; border-radius: 5px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).									
Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).													

 **Note:** Although the Keyfactor API Reference and Utility—Swagger—Example Value may show examples of various other schedules, only the

Name	In	Description
		 schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CollectionId	Body	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user’s certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.10.18 POST Certificate Stores Certificates Remove

The POST /CertificateStores/Certificates/Remove method is used to remove a certificate from one or more certificate stores. The POST request must contain an array of certificate store GUIDs and the certificate properties that identify the certificate to remove. This method returns HTTP 200 OK on a success with an array of GUIDs for the removal jobs. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 978](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificates/collections/read/
- /certificate\_stores/schedule/
- OR
- /certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)
- /certificate\_stores/schedule/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. You can use a mixture with, for example, global certificate permissions and container-level certificate store permissions. See *Certificate Permissions* and *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection and container permissions.

Table 249: POST Certificate Stores Certificates Remove Input Parameters

Name	In	Description								
Certificate Stores	Body	<p><b>Required.</b> An array of objects indicating the certificate store GUIDs and related information to identify the certificate to remove from the certificate store(s). Certificate store detail includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Alias</td> <td><b>Required.</b> A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the <a href="#">GET /Certificates/{id}</a> method (see <a href="#">GET Certificates ID on page 292</a>) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.</td> </tr> <tr> <td>Certificate Store Ids</td> <td><b>Required.</b> A string containing the GUID for the certificate store from which the certificate should be removed.</td> </tr> <tr> <td>JobFields</td> <td>An object that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.</td> </tr> </tbody> </table> <p>For example, to remove from one IIS personal store and one NetScaler store:</p> <pre> "CertificateStores": [   {     "Alias": "MyCertificate.pfx",     "CertificateStoreId": "fde12aa7-6643-43db-88e8-5c91c5ce78b3"   },   {     "Alias": "C2107973A928859C21330E566B299CD4A0705AE8",     "CertificateStoreId": "322e12ea-43b2-4aab-80ae-c4ad4569b4e7"   } ] </pre>	Name	Description	Alias	<b>Required.</b> A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the <a href="#">GET /Certificates/{id}</a> method (see <a href="#">GET Certificates ID on page 292</a> ) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.	Certificate Store Ids	<b>Required.</b> A string containing the GUID for the certificate store from which the certificate should be removed.	JobFields	An object that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.
Name	Description									
Alias	<b>Required.</b> A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the <a href="#">GET /Certificates/{id}</a> method (see <a href="#">GET Certificates ID on page 292</a> ) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.									
Certificate Store Ids	<b>Required.</b> A string containing the GUID for the certificate store from which the certificate should be removed.									
JobFields	An object that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.									
Schedule	Body	<p><b>Required.</b> An object indicating the inventory schedule for the removal job. Supported schedules are:</p>								

Name	In	Description												
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>           A Boolean that indicates a job scheduled to run immediately (true) or not (false).           <div style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.           </div> </td> </tr> <tr> <td>Exactly Once</td> <td>           A dictionary that indicates a job scheduled to run at the time specified with the parameter:           <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>               The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).             </td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> "ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" } </pre> <div style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.           </div> </td> </tr> </tbody> </table> <div style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; margin-top: 10px;">  <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.         </div>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.           </div>	Exactly Once	A dictionary that indicates a job scheduled to run at the time specified with the parameter: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>               The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).             </td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> "ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" } </pre> <div style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.           </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description													
Off	Turn off a previously configured schedule.													
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.           </div>													
Exactly Once	A dictionary that indicates a job scheduled to run at the time specified with the parameter: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>               The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).             </td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> "ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" } </pre> <div style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.           </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).									
Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).													
Collection Id	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of												

Name	In	Description
		the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.11 Certificate Store Containers

The CertificateStoreContainers component of the Keyfactor API provides a set of methods to support management of certificate store containers.

Table 250: Certificate Store Containers Endpoints

Endpoint	Method	Description	Link
/	GET	Returns a list of certificate store containers.	<a href="#">GET Certificate Store Containers below</a>
/	POST	Adds a certificate store container.	<a href="#">POST Certificate Store Containers on page 636</a>
/id	DELETE	Deletes a certificate store container.	<a href="#">DELETE Certificate Store Containers ID on page 664</a>
/id	GET	Returns details for the specified certificate store container.	<a href="#">GET Certificate Store Containers ID on page 665</a>
/id	PUT	Edits a certificate store container.	<a href="#">PUT Certificate Store Containers on page 641</a>

### 2.6.11.1 GET Certificate Store Containers

The GET /CertificateStoreContainers method is used to retrieve all certificate store containers. This method returns HTTP 200 OK on a success with container details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate\_stores/read/

OR

/certificate\_stores/read/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 251: GET Certificate Store Containers Input Parameters

Name	In	Description
PerformRoleCheck	Query	This parameter is not used.
RoleIdList	Query	This parameter is not used.
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: <i>Using the Containers Search Feature in the Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• CertStoreType (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)</li> <li>• HasSchedule (True, False)</li> <li>• Id</li> <li>• Name (Short Name)</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 252: GET Certificate Stores Containers Response Data

Name	Description
Id	An integer indicating the ID of the container.
Name	A string indicating the name of the container.
Overwrite Schedules	A Boolean indicating whether the schedule set on the container will overwrite schedules set individually on the certificate stores (true) or not (false).
Schedule	A string containing the inventory schedule set for the container. Schedules are shown in cron syntax. For an interval schedule, this will look like I_mm where mm is the number of minutes (e.g. I_30 for every 30 minutes). For daily schedules, this will look like D_hh:mm where hh:mm is the time to run the job (e.g. D_14:30 for daily at 2:30 pm).
Cert Store Type	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
StoreCount	An integer indicating the number of stores of the type referenced by CertStoreType in the container.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.11.2 POST Certificate Store Containers

The POST /CertificateStoreContainers method is used to add a new certificate store container. This method returns HTTP 200 OK on a success with container details.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificate\_stores/modify/  
 OR  
 /certificate\_stores/modify/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 253: POST Certificate Stores Containers Input Parameters

Name	In	Description																
Name	Body	<b>Required.</b> A string indicating the name of the container.																
Schedule	Body	<p>An object containing the inventory schedule set for the container. Schedules are shown in cron syntax. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval. Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—Example Value may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>
Name	Description				
	<pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>				
Cert Store Type	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.				

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.11.3 PUT Certificate Store Containers

The PUT /CertificateStoreContainers method is used to edit the specified certificate store container. This method returns HTTP 200 OK on a success with container details.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificate\_stores/modify/  
 OR  
 /certificate\_stores/modify/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 255: PUT Certificate Store Containers Input Parameters

Name	In	Description																
Id	Path	<b>Required.</b> An integer indicating the ID of the container.																
Name	Body	<b>Required.</b> A string indicating the name of the container.

Only some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> </td> </tr> </tbody> </table>	Name	Description		a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.	CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.	Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.	Create If Missing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.	Properties	<p>A string containing additional properties for the container. Only some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. 	 made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).								
Set New Password Allowed	A Boolean that indicates whether the store password can be changed (true) or not (false).								
Password	<p>An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on Citrix NetScaler and F5 devices and set at the server level, not the certificate store level (see <a href="#">POST Certificate Stores Server on page 579</a>).</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> <li>• Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</li> <li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 1005</a> for more information.</li> </ul> <p>The possible values are:</p>

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>secrets table (false). This value is automatically set by Keyfactor Command.</td> </tr> </tbody> </table> <p> <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>	Name	Description		secrets table (false). This value is automatically set by Keyfactor Command.
Name	Description				
	secrets table (false). This value is automatically set by Keyfactor Command.				

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.11.4 DELETE Certificate Store Containers ID

The DELETE `/CertificateStoreContainers/{id}` method is used to delete the certificate store container with the specified ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificate_stores/modify/`  
 OR  
`/certificate_stores/modify/{#}/` (where # is a reference to a specific certificate store container ID)  
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 257: DELETE Certificate Store Containers {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string containing the ID of the certificate store container to delete. Use the <code>GET /CertificateStoreContainers</code> method (see <a href="#">GET Certificate Store Containers on page 633</a> ) to retrieve a list of all the certificate store containers to determine the certificate store container ID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.11.5 GET Certificate Store Containers ID

The GET `/CertificateStoreContainers/{id}` method is used to retrieve the certificate store container with the specified ID. This method returns HTTP 200 OK on a success with container details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificate_stores/read/`  
 OR  
`/certificate_stores/read/#/` (where # is a reference to a specific certificate store container ID)  
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 258: GET Certificate Store Containers {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string containing the ID of the certificate store container. Use the <code>GET /CertificateStoreContainers</code> method (see <a href="#">GET Certificate Store Containers on page 633</a> ) to retrieve a list of all the certificate store containers to determine the certificate store container ID.

Table 259: GET Certificate Stores Containers {id} Response Data

Name	Description												
Id	An integer indicating the ID of the container.												
Name	A string indicating the name of the container.												
Schedule	A string containing the inventory schedule set for the container. Schedules are shown in cron syntax. For an interval schedule, this will look like I_mm where mm is the number of minutes (e.g. I_30 for every 30 minutes). For daily schedules, this will look like D_hh:mm where hh:mm is the time to run the job (e.g. D_14:30 for daily at 2:30 pm).												
Cert Store Type	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.												
Certificate Stores	An array of objects indicating the certificate store data for the certificate stores within this container. Certificate store details include: <table border="1" data-bbox="341 924 1404 1711"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the GUID of the certificate store within Keyfactor Command.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name of the certificate store.</td> </tr> <tr> <td>Container Id</td> <td>An integer indicating the ID of the certificate store's associated certificate store container.</td> </tr> <tr> <td>Client Machine</td> <td>A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Store-path</td> <td>A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the GUID of the certificate store within Keyfactor Command.	Display Name	A string indicating the display name of the certificate store.	Container Id	An integer indicating the ID of the certificate store's associated certificate store container.	Client Machine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Store-path	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description												
Id	A string indicating the GUID of the certificate store within Keyfactor Command.												
Display Name	A string indicating the display name of the certificate store.												
Container Id	An integer indicating the ID of the certificate store's associated certificate store container.												
Client Machine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Store-path	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												

Name	Description
CertStore Inventory JobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStore Type	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
Create If Missing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>A string containing additional properties for the container. Only some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 699</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre> {   "privateKeyPath": "/opt/app/mystore.key",   "separatePrivateKey": "true" } </pre> <p>However, the syntax used when updating the properties sets the value as a</p>

Name	Description				
	<table border="1"> <thead> <tr> <th data-bbox="344 262 490 325">Name</th> <th data-bbox="490 262 1408 325">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="344 325 490 1661"></td> <td data-bbox="490 325 1408 1661"> <p>key value pair using <i>value</i> as the key. AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.								

Name	Description										
Agent Assigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).										
Container Name	A string indicating the name of the certificate store's associated container.										
Inventory Schedule	An object containing the inventory schedule for this certificate store.										
Reenrollment Status	An object that indicates whether the certificate store can use the re-enrollment function with accompanying data about the re-enrollment job. Reenrollment status information includes: <table border="1" data-bbox="511 865 1377 1675"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Data</td> <td>A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).</td> </tr> <tr> <td>AgentId</td> <td>A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.</td> </tr> <tr> <td>Message</td> <td>A string indicating the reason the certificate store cannot re-enroll, if applicable.</td> </tr> <tr> <td>Job Properties</td> <td>An object containing the unique entry parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for CitrixAdc, the key name that is optionally used to associate the certificate with a virtual server is <i>virtualServerName</i> and is returned by <i>GET CertificateStoreTypes</i> like so: <pre>"JobProperties": [ "sniCert",</pre> </td> </tr> </tbody> </table>	Name	Description	Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).	AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.	Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.	Job Properties	An object containing the unique entry parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for CitrixAdc, the key name that is optionally used to associate the certificate with a virtual server is <i>virtualServerName</i> and is returned by <i>GET CertificateStoreTypes</i> like so: <pre>"JobProperties": [ "sniCert",</pre>
