Set New Password Allowed	A Boolean that indicates whether the store password can be changed (true) or not (false).								

Name	Description				
Pass-word	<p>An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on Citrix NetScaler and F5 devices and set at the server level, not the certificate store level (see <a href="#">POST Certificate Stores Server on page 579</a>).</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> <li>• Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</li> <li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 1005</a> for more information.</li> </ul> <p>The possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Secret Value</td> <td> <p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div data-bbox="665 1291 1356 1669" data-label="Complex-Block"> <p> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. Name	Description																		
Name	A string indicating the internal name for the PAM provider type parameter.																		
Provider-TypeParams	Unused field																		
ProviderId	An integer indicating the Keyfactor Command reference ID for the PAM provider.																		
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																		

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.12 Certificate Store Types

CertificateStoreTypes define constraints and properties of different kinds of certificates stores. Keyfactor Command contains default certificate store types and also allows users to define certificate store types for custom certificate stores.

Table 260: Certificate Store Type Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a certificate store type using StoreType number.	<a href="#">DELETE Certificate Store Types ID below</a>
/id}	GET	Returns certificate store type details for the specified certificate store type using StoreType number.	<a href="#">GET Certificate Store Types ID on the next page</a>
/Name/{name}	GET	Returns certificate store type details for the specified certificate store type using ShortName.	<a href="#">GET CertificateStoreTypes Name Name on page 691</a>
/	DELETE	Delete multiple certificate store types using StoreType number.	<a href="#">DELETE Certificate Store Types on page 698</a>
/	GET	Returns all certificate store types with paging and options to the specified detail level.	<a href="#">GET Certificate Store Types on page 699</a>
/	POST	Creates a new certificate store type.	<a href="#">POST Certificate Store Types on page 705</a>
/	PUT	Updates a certificate store type using StoreType number.	<a href="#">PUT Certificate Store Types on page 720</a>

### 2.6.12.1 DELETE Certificate Store Types ID

The DELETE /CertificateStoreTypes/{id} method is used to delete an existing certificate store type with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_stores/modify/

Table 261: DELETE Certificate Store Types {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the certificate store type to delete. Use the <i>GET /CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types on page 699</a> ) to retrieve a list of all the certificate store types to determine the certificate store type ID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.12.2 GET Certificate Store Types ID

The *GET /CertificateStoreTypes/{id}* method is used to return the certificate store type with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_stores/read/ OR container permission

Table 262: GET Certificate Store Types {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the certificate store type. Use the <i>GET /CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types on page 699</a> ) to retrieve a list of all the certificate store types to determine the certificate store type ID.

Table 263: GET Certificate Store Types {id} Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>								
Properties	An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include: <table border="1" data-bbox="545 1346 1403 1709"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the property.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the property.</td> </tr> <tr> <td>Type</td> <td>A string containing the type of the property: <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> </td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	A string containing the type of the property: <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>
Name	Description								
Name	A string containing the short name of the property.								
DisplayName	A string containing the full display name of the property.								
Type	A string containing the type of the property: <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>								

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <ul style="list-style-type: none"> <li>MultipleChoice</li> <li>Secret</li> </ul> </td> </tr> <tr> <td>DependsOn</td> <td>A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.</td> </tr> <tr> <td>DefaultValue</td> <td>A string containing the default value(s) of the parameter. If <i>Type</i> is <i>Multiple Choice</i>, this field should contain a comma-separated list of multiple choice options for this parameter. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td> </tr> <tr> <td>Required</td> <td>A Boolean that indicates whether the parameter is required (true) or not (false).</td> </tr> </tbody> </table> <p> <b>Note:</b> There are three standard properties that are used for certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>ServerUsername</li> <li>ServerPassword</li> <li>ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p>	Name	Description		<ul style="list-style-type: none"> <li>MultipleChoice</li> <li>Secret</li> </ul>	DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.	DefaultValue	A string containing the default value(s) of the parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a comma-separated list of multiple choice options for this parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Required	A Boolean that indicates whether the parameter is required (true) or not (false).
Name	Description										
	<ul style="list-style-type: none"> <li>MultipleChoice</li> <li>Secret</li> </ul>										
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value(s) of the parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a comma-separated list of multiple choice options for this parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Required	A Boolean that indicates whether the parameter is required (true) or not (false).										
PasswordOptions	<p>An object indicating options for the password in the certificate store type. Password options include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EntrySupported</td> <td>A Boolean that indicates whether entry of a password for the certificate in the certificate store is</td> </tr> </tbody> </table>	Name	Description	EntrySupported	A Boolean that indicates whether entry of a password for the certificate in the certificate store is						
Name	Description										
EntrySupported	A Boolean that indicates whether entry of a password for the certificate in the certificate store is										

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>allowed (true) or not (false).</td> </tr> <tr> <td>StoreRequired</td> <td>A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).</td> </tr> <tr> <td>Style</td> <td>           A string containing the style of password:           <ul style="list-style-type: none"> <li>• <i>Default</i>: Keyfactor Command will randomly generate a password.</li> <li>• <i>Custom</i>: Allow a password to be entered and authenticated when enrolling for a certificate through Keyfactor Command when installing to a store of this type. The Custom option can be selected only if the <i>Allow Custom Password</i> in the Application Settings, is equal to <i>True</i>. For more details, see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</li> </ul> </td> </tr> </tbody> </table>	Name	Description		allowed (true) or not (false).	StoreRequired	A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).	Style	A string containing the style of password: <ul style="list-style-type: none"> <li>• <i>Default</i>: Keyfactor Command will randomly generate a password.</li> <li>• <i>Custom</i>: Allow a password to be entered and authenticated when enrolling for a certificate through Keyfactor Command when installing to a store of this type. The Custom option can be selected only if the <i>Allow Custom Password</i> in the Application Settings, is equal to <i>True</i>. For more details, see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</li> </ul>
Name	Description								
	allowed (true) or not (false).								
StoreRequired	A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).								
Style	A string containing the style of password: <ul style="list-style-type: none"> <li>• <i>Default</i>: Keyfactor Command will randomly generate a password.</li> <li>• <i>Custom</i>: Allow a password to be entered and authenticated when enrolling for a certificate through Keyfactor Command when installing to a store of this type. The Custom option can be selected only if the <i>Allow Custom Password</i> in the Application Settings, is equal to <i>True</i>. For more details, see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</li> </ul>								
StorePathValue	A string containing the value(s) for the certificate store path.								
PrivateKeyAllowed	A string containing the option for private key requirements for certificates stored in stores with this certificate store type: <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: Private key is not required; generally, applies to trust stores (e.g. Root CA certificates).</li> <li>• <i>Optional</i>: Private key is optional; applies to store types that could represent either a Trust Store or End-Entity Store.</li> <li>• <i>Required</i>: Private key is required; applies to stores that hold an End-Entity Certificate (server or client authorization).</li> </ul>								
JobProperties	An array of strings defining properties that are required when performing management jobs on a certificate store of this type. <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;">  <b>Note:</b> The <i>JobProperties</i> parameter has been deprecated and replaced by <i>EntryParameters</i>. New implementations should use <i>EntryParameters</i>. <i>JobProperties</i> is retained to maintain backwards compatibility.           </div>								
ServerRequired	A Boolean that indicates whether server access is required for adding certificate stores for this certificate store type (true) or not (false). If set to true, a user will be prompted for a username and password to connect to the remote								

Name	Description										
	server.										
PowerShell	A Boolean that indicates whether jobs for the store type are implemented using PowerShell (true) instead of a .NET class or not (false).										
BlueprintAllowed	A Boolean that indicates whether certificate stores of this type will be included when creating or applying blueprints. For more details, see <i>Orchestrator Blueprints</i> in the <i>Keyfactor Command Reference Guide</i> .										
CustomAliasAllowed	<p>A string containing the selected certificate store type alias option:</p> <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: A custom alias is not required and cannot be supplied.</li> <li>• <i>Optional</i>: A custom alias is optional.</li> <li>• <i>Required</i>: A custom alias is required.</li> </ul> <p>The certificate store alias serves as an identifier for the certificate in the store. Depending on the type of store, it may be a file name, a certificate thumbprint, a string reference, or some other information. Some types of stores may not support associating an alias with the certificate (e.g. IIS trusted root).</p>										
EntryParameters	<p>An array of objects indicating unique parameters that are required when performing management jobs on a certificate store of this type. Entry parameter options include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the entry parameter.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the entry parameter.</td> </tr> <tr> <td>Type</td> <td> <p>A string containing the type of the entry parameter:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul> </td> </tr> <tr> <td>RequiredWhen</td> <td>An object containing Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are:</td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the entry parameter.	DisplayName	A string containing the full display name of the entry parameter.	Type	<p>A string containing the type of the entry parameter:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul>	RequiredWhen	An object containing Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are:
Name	Description										
Name	A string containing the short name of the entry parameter.										
DisplayName	A string containing the full display name of the entry parameter.										
Type	<p>A string containing the type of the entry parameter:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul>										
RequiredWhen	An object containing Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are:										

Name	Description										
	<table border="1"> <thead> <tr> <th data-bbox="548 275 797 338">Name</th> <th data-bbox="797 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="548 338 797 957"></td> <td data-bbox="797 338 1398 957"> <ul style="list-style-type: none"> <li>• <b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li>• <b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li>• <b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li>• <b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul> </td> </tr> <tr> <td data-bbox="548 957 797 1220">DependsOn</td> <td data-bbox="797 957 1398 1220">A string containing the name of the parameter on which this parameter depends. DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary</li> </ul>										

Name	Description
	 <p>node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</p> <ul style="list-style-type: none"> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.12.3 GET CertificateStoreTypes Name Name

The GET /CertificateStoreTypes/Name/{name} method is used to return the certificate store type with the specified short name. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificate_stores/read/`

Table 264: GET Certificate Store Types Name {Name} Input Parameters

Name	In	Description
name	Path	<b>Required.</b> The short name of the certificate store type. Use the <code>GET /CertificateStoreTypes</code> method (see <a href="#">GET Certificate Store Types on page 699</a> ) to retrieve a list of all the certificate store types to determine the certificate store type short name.

Table 265: GET Certificate Store Types Name {Name} Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.

JobProperties	An array of strings defining properties that are required when performing management jobs on a certificate store of this type. <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;">  <b>Note:</b> The <i>JobProperties</i> parameter has been deprecated and replaced by <i>EntryParameters</i>. New implementations should use <i>EntryParameters</i>. <i>JobProperties</i> is retained to maintain backwards compatibility.           </div>								
ServerRequired	A Boolean that indicates whether server access is required for adding certificate stores for this certificate store type (true) or not (false). If set to true, a user will be prompted for a username and password to connect to the remote								

Name	Description										
	server.										
PowerShell	A Boolean that indicates whether jobs for the store type are implemented using PowerShell (true) instead of a .NET class or not (false).										
BlueprintAllowed	A Boolean that indicates whether certificate stores of this type will be included when creating or applying blueprints. For more details, see <i>Orchestrator Blueprints</i> in the <i>Keyfactor Command Reference Guide</i> .										
CustomAliasAllowed	<p>A string containing the selected certificate store type alias option:</p> <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: A custom alias is not required and cannot be supplied.</li> <li>• <i>Optional</i>: A custom alias is optional.</li> <li>• <i>Required</i>: A custom alias is required.</li> </ul> <p>The certificate store alias serves as an identifier for the certificate in the store. Depending on the type of store, it may be a file name, a certificate thumbprint, a string reference, or some other information. Some types of stores may not support associating an alias with the certificate (e.g. IIS trusted root).</p>										
EntryParameters	<p>An array of objects indicating unique parameters that are required when performing management jobs on a certificate store of this type. Entry parameter options include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the entry parameter.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the entry parameter.</td> </tr> <tr> <td>Type</td> <td> <p>A string containing the type of the entry parameter:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul> </td> </tr> <tr> <td>RequiredWhen</td> <td>An object containing Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are:</td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the entry parameter.	DisplayName	A string containing the full display name of the entry parameter.	Type	<p>A string containing the type of the entry parameter:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul>	RequiredWhen	An object containing Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are:
Name	Description										
Name	A string containing the short name of the entry parameter.										
DisplayName	A string containing the full display name of the entry parameter.										
Type	<p>A string containing the type of the entry parameter:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul>										
RequiredWhen	An object containing Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are:										

Name	Description										
	<table border="1"> <thead> <tr> <th data-bbox="548 275 797 338">Name</th> <th data-bbox="797 275 1403 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="548 338 797 957"></td> <td data-bbox="797 338 1403 957"> <ul style="list-style-type: none"> <li>• <b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li>• <b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li>• <b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li>• <b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul> </td> </tr> <tr> <td data-bbox="548 957 797 1224">DependsOn</td> <td data-bbox="797 957 1403 1224">A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.	DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Options	A string containing a comma-separated list of multiple choice options for this entry parameter.
Name	Description										
	<ul style="list-style-type: none"> <li>• <b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li>• <b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li>• <b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li>• <b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul>										
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary</li> </ul>										

Name	Description
	 <p>node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</p> <ul style="list-style-type: none"> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.12.4 DELETE Certificate Store Types

The DELETE /CertificateStoreTypes method is used to delete multiple certificate store types in one request. IDs of any certificate store types that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_stores/modify/

Table 266: DELETE Certificate Store Types Input Parameters

Name	In	Description
ids	Body	<p><b>Required.</b> An array of integers indicating the Keyfactor Command certificate store type IDs for certificate store types that should be deleted in the form (without parameter name):</p> <pre>[106,108,109]</pre> <p>Use the <i>GET /CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types below</a>) to retrieve a list of all the certificate store types to determine the certificate store type IDs.</p>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.12.5 GET Certificate Store Types

The GET /CertificateStoreTypes method is used to retrieve a list of all certificate store types. This method returns HTTP 200 OK on a success with details of the certificate store types.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_stores/read/ OR container permission

Table 267: GET Certificate Store Types Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 268: GET Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>								
Properties	An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include: <table border="1" data-bbox="544 1346 1403 1709"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the property.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the property.</td> </tr> <tr> <td>Type</td> <td>A string containing the type of the property: <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> </td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	A string containing the type of the property: <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>
Name	Description								
Name	A string containing the short name of the property.								
DisplayName	A string containing the full display name of the property.								
Type	A string containing the type of the property: <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>								

Name	Description										
	<table border="1" data-bbox="545 275 1401 968"> <thead> <tr> <th data-bbox="553 285 776 338">Name</th> <th data-bbox="776 285 1393 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 338 776 443"></td> <td data-bbox="776 338 1393 443"> <ul style="list-style-type: none"> <li>MultipleChoice</li> <li>Secret</li> </ul> </td> </tr> <tr> <td data-bbox="553 443 776 674">DependsOn</td> <td data-bbox="776 443 1393 674">A string containing the name of the parameter on which this parameter depends. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Options	A string containing a comma-separated list of multiple choice options for this entry parameter.
Name	Description										
	<ul style="list-style-type: none"> <li>• <b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li>• <b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li>• <b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li>• <b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul>										
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary</li> </ul>										

Name	Description
	 <p>node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</p> <ul style="list-style-type: none"> <li>• Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.12.6 POST Certificate Store Types

The POST /CertificateStoresTypes method is used to create certificate store types in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificate_stores/modify/`

Table 269: POST Certificate Store Types Input Parameters

Name	In	Description								
Name	Body	<b>Required.</b> A string containing the full name of the certificate store type. A unique value must be supplied.								
ShortName	Body	<b>Required.</b> A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.								
Capability	Body	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
LocalStore	Body	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .								
SupportedOperations	Body	An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> <li>Add</li> <li>Create</li> <li>Discovery</li> <li>Enrollment</li> <li>Remove</li> </ul> The default for each value is <i>false</i> .								
Properties	Body	An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include: <table border="1" data-bbox="618 1268 1403 1734"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td><b>Required.</b> A string containing the short name of the property. If you choose to define a property, this field is <b>required</b>.</td> </tr> <tr> <td>DisplayName</td> <td><b>Required.</b> A string containing the full display name of the property. If you choose to define a property, this field is <b>required</b>.</td> </tr> <tr> <td>Type</td> <td><b>Required.</b> A string containing the type of the property: <ul style="list-style-type: none"> <li>String</li> </ul> </td> </tr> </tbody> </table>	Name	Description	Name	<b>Required.</b> A string containing the short name of the property. If you choose to define a property, this field is <b>required</b> .	DisplayName	<b>Required.</b> A string containing the full display name of the property. If you choose to define a property, this field is <b>required</b> .	Type	<b>Required.</b> A string containing the type of the property: <ul style="list-style-type: none"> <li>String</li> </ul>
Name	Description									
Name	<b>Required.</b> A string containing the short name of the property. If you choose to define a property, this field is <b>required</b> .									
DisplayName	<b>Required.</b> A string containing the full display name of the property. If you choose to define a property, this field is <b>required</b> .									
Type	<b>Required.</b> A string containing the type of the property: <ul style="list-style-type: none"> <li>String</li> </ul>									

Name	In	Description										
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <ul style="list-style-type: none"> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul> <p>If you choose to define a property, this field is <b>required</b>.</p> <p> <b>Note:</b> This field cannot be modified on an edit.</p> </td> </tr> <tr> <td>DependsOn</td> <td>A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.</td> </tr> <tr> <td>DefaultValue</td> <td>A string containing the default value(s) of the parameter. If <i>Type</i> is <i>Multiple Choice</i>, this field should contain a comma-separated list of multiple choice options for this parameter. The Custom option can be selected only if the <i>Allow Custom Password</i> in the Application Settings, is equal to <i>True</i>. For more</li> </ul> </td> </tr> </tbody> </table>	Name	Description	EntrySupported	A Boolean that indicates whether entry of a password for the certificate in the certificate store is allowed (true) or not (false). The default is <i>false</i> .	StoreRequired	A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false). The default is <i>false</i> .	Style	A string containing the style of password: <ul data-bbox="911 1346 1377 1682" style="list-style-type: none"> <li>• <i>Default</i>: Keyfactor Command will randomly generate a password.</li> <li>• <i>Custom</i>: Allow a password to be entered and authenticated when enrolling for a certificate through Keyfactor Command when installing to a store of this type. The Custom option can be selected only if the <i>Allow Custom Password</i> in the Application Settings, is equal to <i>True</i>. For more</li> </ul>
Name	Description									
EntrySupported	A Boolean that indicates whether entry of a password for the certificate in the certificate store is allowed (true) or not (false). The default is <i>false</i> .									
StoreRequired	A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false). The default is <i>false</i> .									
Style	A string containing the style of password: <ul data-bbox="911 1346 1377 1682" style="list-style-type: none"> <li>• <i>Default</i>: Keyfactor Command will randomly generate a password.</li> <li>• <i>Custom</i>: Allow a password to be entered and authenticated when enrolling for a certificate through Keyfactor Command when installing to a store of this type. The Custom option can be selected only if the <i>Allow Custom Password</i> in the Application Settings, is equal to <i>True</i>. For more</li> </ul>									

Name	In	Description				
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p>details, see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</p> <p>The default value is <i>Default</i>.</p> </td> </tr> </tbody> </table>	Name	Description		<p>details, see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</p> <p>The default value is <i>Default</i>.</p>
Name	Description					
	<p>details, see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</p> <p>The default value is <i>Default</i>.</p>					
StorePathType	Body	<p>A string containing the selected store type:</p> <ul style="list-style-type: none"> <li><i>Freeform</i>: Users are required to enter a path defining the certificate store location.</li> <li><i>Fixed</i>: A store path does not apply, generally one store per device (e.g. IIS).</li> <li><i>MultipleChoice</i>: Allow a comma separated list of options to be entered that users will be able to select from when defining the certificate store location.</li> </ul> <p>This value is unset by default.</p>				
StorePathValue	Body	<p>A string containing the value(s) for the certificate store path if the <i>StorePathType</i> is set to <i>Fixed</i> or <i>Multiple Choice</i>.</p> <p>Multiple choice values should be provided in a comma-delimited list like so:</p> <pre>"StorePathValue": "Apple,Cherry,Peach,Pear"</pre> <p>This value is unset by default.</p>				
PrivateKeyAllowed	Body	<p>A string containing the option for private key requirements for certificates stored in stores with this certificate store type:</p> <ul style="list-style-type: none"> <li><i>Forbidden</i>: Private key is not required; generally, applies to trust stores (e.g. Root CA certificates).</li> <li><i>Optional</i>: Private key is optional; applies to store types that could represent either a Trust Store or End-Entity Store.</li> <li><i>Required</i>: Private key is required; applies to stores that hold an End-Entity Certificate (server or client authorization).</li> </ul> <p>The default value is <i>Forbidden</i>.</p>				
JobProperties	Body	<p>An array of strings defining properties that are required when performing management jobs on a certificate store of this type.</p> <p> <b>Note:</b> The <i>JobProperties</i> parameter has been deprecated and replaced by <i>EntryParameters</i>. New implementations should use</p>				

Name	In	Description						
		 <i>EntryParameters. JobProperties</i> is retained to maintain backwards compatibility.						
ServerRequired	Body	A Boolean that indicates whether server access is required for adding certificate stores for this certificate store type (true) or not (false). If set to true, a user will be prompted for a username and password to connect to the remote server. The default is <i>false</i> .						
PowerShell	Body	A Boolean that indicates whether jobs for the store type are implemented using PowerShell (true) instead of a .NET class or not (false). The default is <i>false</i> .						
BlueprintAllowed	Body	A Boolean that indicates whether certificate stores of this type will be included when creating or applying blueprints. For more details, see <i>Orchestrator Blueprints</i> in the <i>Keyfactor Command Reference Guide</i> . The default is <i>false</i> .						
CustomAliasAllowed	Body	<p>A string containing the selected certificate store type alias option:</p> <ul style="list-style-type: none"> <li><i>Forbidden</i>: A custom alias is not required and cannot be supplied.</li> <li><i>Optional</i>: A custom alias is optional.</li> <li><i>Required</i>: A custom alias is required.</li> </ul> <p>The certificate store alias serves as an identifier for the certificate in the store. Depending on the type of store, it may be a file name, a certificate thumbprint, a string reference, or some other information. Some types of stores may not support associating an alias with the certificate (e.g. IIS trusted root). The default value is <i>Forbidden</i>.</p>						
EntryParameters	Body	<p>An array of objects indicating unique parameters that are required when performing management jobs on a certificate store of this type. Entry parameter options include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td><b>Required.</b> A string containing the short name of the entry parameter. If you choose to define an entry parameter, this field is <b>required</b>. For more details, see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</li> </ul>
Name	Description								
	allowed (true) or not (false).								
StoreRequired	A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).								
Style	A string containing the style of password: <ul style="list-style-type: none"> <li>• <i>Default</i>: Keyfactor Command will randomly generate a password.</li> <li>• <i>Custom</i>: Allow a password to be entered and authenticated when enrolling for a certificate through Keyfactor Command when installing to a store of this type. The Custom option can be selected only if the <i>Allow Custom Password</i> in the Application Settings, is equal to <i>True</i>. For more details, see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</li> </ul>								
StorePathValue	A string containing the value(s) for the certificate store path.								
PrivateKeyAllowed	A string containing the option for private key requirements for certificates stored in stores with this certificate store type: <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: Private key is not required; generally, applies to trust stores (e.g. Root CA certificates).</li> <li>• <i>Optional</i>: Private key is optional; applies to store types that could represent either a Trust Store or End-Entity Store.</li> <li>• <i>Required</i>: Private key is required; applies to stores that hold an End-Entity Certificate (server or client authorization).</li> </ul>								
JobProperties	An array of strings defining properties that are required when performing management jobs on a certificate store of this type. <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 10px;">  <b>Note:</b> The <i>JobProperties</i> parameter has been deprecated and replaced by <i>EntryParameters</i>. New implementations should use <i>EntryParameters</i>. <i>JobProperties</i> is retained to maintain backwards compatibility.           </div>								
ServerRequired	A Boolean that indicates whether server access is required for adding certificate stores for this certificate store type (true) or not (false). If set to true, a user will be prompted for a username and password to connect to the remote								

Name	Description										
	server.										
PowerShell	A Boolean that indicates whether jobs for the store type are implemented using PowerShell (true) instead of a .NET class or not (false).										
BlueprintAllowed	A Boolean that indicates whether certificate stores of this type will be included when creating or applying blueprints. For more details, see <i>Orchestrator Blueprints</i> in the <i>Keyfactor Command Reference Guide</i> .										
CustomAliasAllowed	<p>A string containing the selected certificate store type alias option:</p> <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: A custom alias is not required and cannot be supplied.</li> <li>• <i>Optional</i>: A custom alias is optional.</li> <li>• <i>Required</i>: A custom alias is required.</li> </ul> <p>The certificate store alias serves as an identifier for the certificate in the store. Depending on the type of store, it may be a file name, a certificate thumbnail, a string reference, or some other information. Some types of stores may not support associating an alias with the certificate (e.g. IIS trusted root).</p>										
EntryParameters	<p>An array of objects indicating unique parameters that are required when performing management jobs on a certificate store of this type. Entry parameter options include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the entry parameter.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the entry parameter.</td> </tr> <tr> <td>Type</td> <td> <p>A string containing the type of the entry parameter:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul> </td> </tr> <tr> <td>RequiredWhen</td> <td>An object containing Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are:</td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the entry parameter.	DisplayName	A string containing the full display name of the entry parameter. DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary</li> </ul>										

Name	Description
	 <p>node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</p> <ul style="list-style-type: none"> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.12.7 PUT Certificate Store Types

The PUT /CertificateStoreTypes method is used to update a certificate store type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificate_stores/modify/`

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

**Note:** Certificate store types can only be updated in a very limited way if they are actively in use (there are any certificate stores defined for them). Updates to the Name, ShortName and adding a job type are supported in this case as are additions to the SupportedOperations, but no other updates can be saved.

Table 271: PUT Certificate Store Types Input Parameters

Name	In	Description				
StoreType	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the certificate store type.				
Name	Body	<b>Required.</b> A string containing the full name of the certificate store type. A unique value must be supplied.				
ShortName	Body	<b>Required.</b> A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.				
Capability	Body	<p>A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).</p> <div style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> <b>Note:</b> The <i>Capability</i> cannot be changed on an edit if an orchestrator has registered with Keyfactor Command, been approved, and included the certificate store type in its capability list.</p> </div>				
LocalStore	Body	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .				
SupportedOperations	Body	<p>An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul> <p>The default for each value is <i>false</i>.</p>				
Properties	Body	<p>An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table border="1" style="margin-left: auto; margin-right: auto; border-radius: 15px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreTypeID</td> <td><b>Required.</b> An integer identifying the certificate store type. This is the same</td> </tr> </tbody> </table>	Name	Description	StoreTypeID	<b>Required.</b> An integer identifying the certificate store type. This is the same

Name	Description							
	a password on the certificate store as a whole is required (true) or not (false). The default is <i>false</i> .							
Style	<p>A string containing the style of password:</p> <ul style="list-style-type: none"> <li><i>Default</i>: Keyfactor Command will randomly generate a password.</li> <li><i>Custom</i>: Allow a password to be entered and authenticated when enrolling for a certificate through Keyfactor Command when installing to a store of this type. The Custom option can be selected only if the <i>Allow Custom Password</i> in the Application Settings, is equal to <i>True</i>. For more details, see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</li> </ul> <p>The default value is <i>Default</i>.</p>							
StorePathType	Body	<p>A string containing the selected store type:</p> <ul style="list-style-type: none"> <li><i>Freeform</i>: Users are required to enter a path defining the certificate store location.</li> <li><i>Fixed</i>: A store path does not apply, generally one store per device (e.g. IIS).</li> <li><i>MultipleChoice</i>: Allow a comma separated list of options to be entered that users will be able to select from when defining the certificate store location.</li> </ul> <p>This value is unset by default.</p>						
StorePathValue	Body	<p>A string containing the value(s) for the certificate store path if the <i>StorePathType</i> is set to Fixed or Multiple Choice.</p> <p>Multiple choice values should be provided in a comma-delimited list like so:</p> <pre>"StorePathValue": "Apple,Cherry,Peach,Pear"</pre> <p>This value is unset by default.</p>						
PrivateKeyAllowed	Body	A string containing the option for private key requirements for certi-						

Name	In	Description
		<p>ificates stored in stores with this certificate store type:</p> <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: Private key is not required; generally, applies to trust stores (e.g. Root CA certificates).</li> <li>• <i>Optional</i>: Private key is optional; applies to store types that could represent either a Trust Store or End-Entity Store.</li> <li>• <i>Required</i>: Private key is required; applies to stores that hold an End-Entity Certificate (server or client authorization).</li> </ul> <p>The default value is <i>Forbidden</i>.</p>
JobProperties	Body	<p>An array of strings defining properties that are required when performing management jobs on a certificate store of this type.</p> <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;"> <p> <b>Note:</b> The <i>JobProperties</i> parameter has been deprecated and replaced by <i>EntryParameters</i>. New implementations should use <i>EntryParameters</i>. <i>JobProperties</i> is retained to maintain backwards compatibility.</p> </div>
ServerRequired	Body	<p>A Boolean that indicates whether server access is required for adding certificate stores for this certificate store type (true) or not (false). If set to true, a user will be prompted for a username and password to connect to the remote server. The default is <i>false</i>.</p>
PowerShell	Body	<p>A Boolean that indicates whether jobs for the store type are implemented using PowerShell (true) instead of a .NET class or not (false). The default is <i>false</i>.</p>
BlueprintAllowed	Body	<p>A Boolean that indicates whether certificate stores of this type will be included when creating or applying blueprints. For more details, see <i>Orchestrator Blueprints</i> in the <i>Keyfactor Command Reference Guide</i>. The default is <i>false</i>.</p>
CustomAliasAllowed	Body	<p>A string containing the selected certificate store type alias option:</p> <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: A custom alias is not required and cannot be supplied.</li> <li>• <i>Optional</i>: A custom alias is optional.</li> <li>• <i>Required</i>: A custom alias is required.</li> </ul> <p>The certificate store alias serves as an identifier for the certificate in the store. Depending on the type of store, it may be a file name, a certificate thumbprint, a string reference, or some other information. Some types of stores may not support associating an alias with the certificate (e.g. IIS trusted root).</p> <p>The default value is <i>Forbidden</i>.</p>

Name	In	Description												
EntryParameters	Body	<p>An array of objects indicating unique parameters that are required when performing management jobs on a certificate store of this type. Entry parameter options include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreTypeID</td> <td><b>Required.</b> An integer identifying the certificate store type. This is the same ID referenced by the StoreType parameter, above. If you are updating a certificate store type, this field is <b>required</b>.</td> </tr> <tr> <td>Name</td> <td><b>Required.</b> A string containing the short name of the entry parameter. If you choose to define an entry parameter, this field is <b>required</b>. The name should be entered without spaces.</td> </tr> <tr> <td>DisplayName</td> <td><b>Required.</b> A string containing the full display name of the entry parameter. Name	In	Description
		 management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).

Table 272: PUT Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>								
Properties	An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include: <table border="1" data-bbox="544 1344 1404 1711"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the property.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the property.</td> </tr> <tr> <td>Type</td> <td>A string containing the type of the property: <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> </td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	A string containing the type of the property: <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>
Name	Description								
Name	A string containing the short name of the property.								
DisplayName	A string containing the full display name of the property.								
Type	A string containing the type of the property: <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>								

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <ul style="list-style-type: none"> <li>MultipleChoice</li> <li>Secret</li> </ul> </td> </tr> <tr> <td>DependsOn</td> <td>A string containing the name of the parameter on which this parameter depends. Name	Description										
	<ul style="list-style-type: none"> <li>• <b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li>• <b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li>• <b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li>• <b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul>										
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary</li> </ul>										

Name	Description
	 <p>node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</p> <ul style="list-style-type: none"> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.13 Component Installation

The Component Installation methods are used to list the servers that various Keyfactor Command components have been installed on or to decommission a Keyfactor Command server that is no longer in use.

Table 273: Component Installation Endpoints

Endpoint	Method	Description	Link
/	GET	Return a list of all the Keyfactor Command servers in the current implementation including the components installed on each, with paging (number of pages to return and number of results per page) and sorting options.	<a href="#">GET Component Installation on the next page</a>
/id	DELETE	Delete the Keyfactor Command server with the specified ID from the Keyfactor Command database.	<a href="#">DELETE Component Installation ID below</a>

### 2.6.13.1 DELETE Component Installation ID

The DELETE /ComponentInstallation/{id} method is used to delete the Keyfactor Command server with the specified ID and all its components from the Keyfactor Command database. This endpoint returns 204 with no content upon success.

 **Important:** Servers should not be deleted if they are serving any active role in the Keyfactor Command environment, as this operation cannot be undone.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/system\_settings/modify/

Table 274: DELETE Component Installation {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the Keyfactor Command server to delete.  Use the <i>GET /ComponentInstallation</i> method (see <a href="#">GET Component Installation on the next page</a> ) to determine the ID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.13.2 GET Component Installation

The GET /ComponentInstallation method is used to return a list of all the Keyfactor Command components installed for the current implementation. This method returns HTTP 200 OK on a success with details about the installed components on each server. This method allows URL parameters to specify paging and the level of information detail.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/system_settings/read/`

Table 275: GET Component Installation Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• Machine</li><li>• Version</li></ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 276: GET Component Installation Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the server installation.
Machine	A string containing the FQDN of the server.
Version	A string containing the version of Keyfactor Command installed on the server.
Components	<p>A string containing a comma-separated list of the components installed on the server. Possible components include:</p> <ul style="list-style-type: none"> <li>• Console The server with this role provides the web-based administration interface (the Management Portal) that is used to view and report on certificates issued in the environment and enroll for certificates. This role is required on all Keyfactor Command servers.</li> <li>• Logi The server with this role hosts the Logi Analytics Platform for reporting. This role is required on all Keyfactor Command servers.</li> <li>• Agents The server with this role hosts the back-end service for receiving requests from and sending requests to Keyfactor agents and orchestrators. This role is optional.</li> <li>• KeyfactorAPI The server with this role hosts the newer Keyfactor API. This role is required on all Keyfactor Command servers.</li> <li>• Service The server with this role hosts back-end services required to support Keyfactor Command. This includes the Keyfactor Command Service, which is used for all periodic tasks throughout Keyfactor Command, including CA synchronization, monitoring alerts, and report automation. This role is required on all Keyfactor Command servers.</li> </ul>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.14 CSR Generation

The CSR Generation component of the Keyfactor API includes methods necessary to generate certificate signing requests and determine which ones are pending.

Table 277: CSR Generation Endpoints

Endpoint	Method	Description	Link
/Pending/{id}	DELETE	Deletes a pending CSR by ID.	<a href="#">DELETE CSR Generation Pending ID below</a>
/Pending/{id}	GET	Returns the details of a specific CSR request based on the ID number.	<a href="#">GET CSR Generation Pending ID on the next page</a>
/Pending	DELETE	Deletes multiple pending CSRs.	<a href="#">DELETE CSR Generation Pending on the next page</a>
/Pending	GET	Returns a list of all pending CSRs.	<a href="#">GET CSR Generation Pending on page 742</a>
/Generate	POST	Generate and configure a CSR request.	<a href="#">POST CSR Generation Generate on page 743</a>

### 2.6.14.1 DELETE CSR Generation Pending ID

The DELETE /CSRGeneration/Pending/{id} method is used to delete a certificate signing request with the defined ID that has not yet been enrolled. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificates/requests/manage/

Table 278: DELETE CSR Generation Pending {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the certificate signing request for the CSR that should be deleted. Use the <i>GET /CSRGeneration/Pending</i> method (see <a href="#">GET CSR Generation Pending on page 742</a> ) to retrieve a list of all the pending CSRs to determine the CSR IDs.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.14.2 GET CSR Generation Pending ID

The GET /CSRGeneration/Pending/{id} method is used to return a generated CSR with the defined ID that has not yet been enrolled. This method returns HTTP 200 OK on a success with the CSR in PEM format. This method does not return the parsed subject name or CSR request time. If you need that information, use the [GET /CSRGeneration/Pending](#) method (see [GET CSR Generation Pending on the next page](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificates/requests/manage/

Table 279: GET CSR Generation Pending {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the CSR that should be retrieved.

Table 280: GET CSR Generation Pending {id} Response Data

Name	Description
CSRFilePath	The proposed file name for the CSR file. This is considered deprecated and may be removed in a future release.
CSR	The text of the CSR in PEM format.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.14.3 DELETE CSR Generation Pending

The DELETE /CSRGeneration/Pending method is used to delete multiple certificate signing requests that have not yet been enrolled in one request. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificates/requests/manage/

Table 281: DELETE CSR Generation Pending Input Parameters

Name	In	Description
ids	Body	<p><b>Required.</b> An array of integers indicating the Keyfactor Command certificate signing request IDs for CSRs that should be deleted in the form (without parameter name):</p> <pre>[8,14,27]</pre> <p>Use the <a href="#">GET /CSRGeneration/Pending</a> method (see <a href="#">GET CSR Generation Pending below</a>) to retrieve a list of all the pending CSRs to determine the CSR IDs.</p>

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.14.4 GET CSR Generation Pending

The GET /CSRGeneration/Pending method is used to return details for generated CSRs that have not yet been enrolled. This method returns HTTP 200 OK on a success with details of the pending CSRs with details.

**Tip:** The following permissions (see [Security Roles and Claims](#) in the [Keyfactor Command Reference Guide](#)) are required to use this feature:  
/certificates/requests/manage/

Table 282: GET CSR Generation Pending Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 283: GET CSR Generation Pending Response Data

Name	Description
Id	A unique integer for the CSR generated.
CSR	A string containing the text of the CSR in PEM format.
RequestTime	A string containing the date and time that the CSR was generated in UTC time.
Subject	An array or strings containing the subject of the certificate including the certificate subject information, the subject alternative names, the key length, and the hash algorithm.

**Tip:** See the [Keyfactor API Reference and Utility](#) [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.14.5 POST CSR Generation Generate

The POST /CSRGeneration/Generate method is used to generate and configure a CSR. This method returns HTTP 200 OK on a success with a message body containing the text of the CSR file created.

This method generates a private key and stores it in the Keyfactor Command database. When you use the CSR resulting from this method to enroll for a certificate through Keyfactor Command (see [POST Enrollment CSR on page 807](#)), the resulting certificate is married together with the stored private key and may then be download with private key (see [POST Certificates Recover on page 339](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificates/enrollment/csr/generation/`

**Note:** This endpoint no longer includes the `CSRFilePath` return value in the response from the API call. Code separate from the API should be used to handle receipt of the CSR and placement on the file system.

Table 284: POST CSR Generation Generate Input Parameters

Name	In	Description								
Curve	Body	<p>A string indicating the elliptic curve for the requested key. ECC curves may be specified using the well-known OIDs for ECC algorithms. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>1.2.840.10045.3.1.7 = P-256/prime256v1/ secp256r1</li> <li>1.3.132.0.34 = P-384/secp384r1</li> <li>1.3.132.0.35 = P-521/secp521r1</li> </ul>								
Key Length	Body	<p><b>Required*</b>. An integer indicating the desired key size of the certificate. Supported key sizes are:</p> <ul style="list-style-type: none"> <li>255</li> <li>256</li> <li>384</li> <li>448</li> <li>521</li> <li>2048</li> <li>3072</li> <li>4096</li> <li>8192</li> </ul> <p>This value is <b>required</b> only if <i>KeyType</i> = RSA.</p>								
KeyType	Body	<p><b>Required</b>. A string indicating the desired key encryption of the certificate. Supported key types are:</p> <ul style="list-style-type: none"> <li>RSA</li> <li>ECC</li> <li>Ed448</li> <li>Ed25519</li> </ul>								
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> <tr> <td>directory</td> <td>Directory Name</td> </tr> </tbody> </table>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name
Value	Description									
rfc822	RFC 822 Name									
dns	DNS Name									
directory	Directory Name									

Name	In	Description														
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>uri</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>ip4</td> <td>IP v4 Address</td> </tr> <tr> <td>ip6</td> <td>IP v6 Address</td> </tr> <tr> <td>registered id</td> <td>Registered ID (an OID)</td> </tr> <tr> <td>ms_ ntpincipal name</td> <td>MS_ NTPincipal Name (a string)</td> </tr> <tr> <td>ms_ ntds replication</td> <td>MS_ NTDS Replication (a GUID)</td> </tr> </tbody> </table> <p>For example:</p> <pre> {   "SANS": {     "dns": [       "dnssan1.keyexample.com",       "dnssan2.keyexample.com",       "dnssan3.keyexample.com"     ],     "ip4": [       "192.168.2.73"     ]   } } </pre>	Value	Description	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registered id	Registered ID (an OID)	ms_ ntpincipal name	MS_ NTPincipal Name (a string)	ms_ ntds replication	MS_ NTDS Replication (a GUID)
Value	Description															
uri	Uniform Resource Identifier															
ip4	IP v4 Address															
ip6	IP v6 Address															
registered id	Registered ID (an OID)															
ms_ ntpincipal name	MS_ NTPincipal Name (a string)															
ms_ ntds replication	MS_ NTDS Replication (a GUID)															
Subject	Body	<p><b>Required.</b> A string containing the subject name for the certificate using X.500 format for the full distinguished name (DN). For example:</p> <pre> "Subject": "CN=websrvr14.keyexample.com, OU=IT, O=\"Key Example, Inc.\", L=Independence, ST=OH, C=US" </pre> <p>Supported subject name fields are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Abbreviation</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Common Name</td> <td>CN</td> <td><b>Required*</b>. The desired common name of the certificate to be requested with the CSR.</td> </tr> </tbody> </table>	Name	Abbreviation	Description	Common Name	CN	<b>Required*</b> . The desired common name of the certificate to be requested with the CSR.								
Name	Abbreviation	Description														
Common Name	CN	<b>Required*</b> . The desired common name of the certificate to be requested with the CSR.														

Name	In	Description																								
		<table border="1"> <thead> <tr> <th>Name</th> <th>Abbreviation</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td></td> <td>This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Organization</td> <td>O</td> <td>The desired organization of the certificate to be requested with the CSR.</td> </tr> <tr> <td>Organizational Unit</td> <td>OU</td> <td>The desired organizational unit of the certificate to be requested with the CSR.</td> </tr> <tr> <td>Locality</td> <td>L</td> <td>The desired city of the certificate to be requested with the CSR.</td> </tr> <tr> <td>State</td> <td>ST</td> <td>The desired state of the certificate to be requested with the CSR.</td> </tr> <tr> <td>Country</td> <td>C</td> <td>The desired country (two characters) of the certificate to be requested with the CSR.</td> </tr> <tr> <td>Email</td> <td>E</td> <td>The desired email address of the certificate to be requested with the CSR.</td> </tr> </tbody> </table>	Name	Abbreviation	Description			This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i> . See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Organization	O	The desired organization of the certificate to be requested with the CSR.	Organizational Unit	OU	The desired organizational unit of the certificate to be requested with the CSR.	Locality	L	The desired city of the certificate to be requested with the CSR.	State	ST	The desired state of the certificate to be requested with the CSR.	Country	C	The desired country (two characters) of the certificate to be requested with the CSR.	Email	E	The desired email address of the certificate to be requested with the CSR.
Name	Abbreviation	Description																								
		This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i> . See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																								
Organization	O	The desired organization of the certificate to be requested with the CSR.																								
Organizational Unit	OU	The desired organizational unit of the certificate to be requested with the CSR.																								
Locality	L	The desired city of the certificate to be requested with the CSR.																								
State	ST	The desired state of the certificate to be requested with the CSR.																								
Country	C	The desired country (two characters) of the certificate to be requested with the CSR.																								
Email	E	The desired email address of the certificate to be requested with the CSR.																								
Template	Body	<p>A string indicating the desired template to be used for the certificate to be requested with the CSR. The template must have been configured in Keyfactor Command to support CSR generation. This field is optional.</p> <div style="border: 1px solid orange; padding: 10px; background-color: #f9cb9c;"> <p> <b>Important:</b> The template will not be included in the CSR. The template is referenced in order to retrieve key and other information to help populate the CSR. In addition, the CSR generation function supports template-level regular expressions for both subject parts and SANs. If system-wide and template-level regular expressions exists for the same field and you select a template, the template-level regular expression is applied.</p> <p>If you choose to select a template during CSR generation, you will need to choose the same template during CSR Enrollment, because the CSR file will contain elements from the template which may conflict with other template configurations.</p> </div>																								

Table 285: POST CSR Generation Generate Response Data

Name	Description
CSR	The text of the CSR in PEM format.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## 2.6.15 Custom Job Types

The Custom Job Types component of the Keyfactor API includes methods necessary to create, update, list and delete custom orchestrator job types. Custom job types are intended to execute jobs on an orchestrator built using the AnyAgent framework that are outside the standard list of job functions built into Keyfactor Command. This powerful feature can execute just about any job that requires processing on the orchestrator and submitting data back to Keyfactor Command. The data submitted by custom jobs to Keyfactor Command is stored as a string and is limited to 2 MB.

Table 286: Custom Job Types Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the custom job type for the specified ID.	<a href="#">DELETE Custom Job Types ID below</a>
/id}	GET	Returns details for the custom job type for the specified ID.	<a href="#">GET Custom Job Types ID on the next page</a>
/	GET	Returns all the custom job types.	<a href="#">GET Custom Job Types on page 751</a>
/	POST	Creates a custom job type.	<a href="#">POST Custom Job Types on page 753</a>
/	PUT	Updates an existing custom job type.	<a href="#">PUT Custom Job Types on page 757</a>

### 2.6.15.1 DELETE Custom Job Types ID

The DELETE /JobTypes/Custom/{id} method is used to delete an existing custom job type with the specified GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/modify/

Table 287: DELETE JobTypes Custom {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID of the custom job type. Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 751</a> ) to retrieve a list of all the custom job types to determine the job type GUID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.15.2 GET Custom Job Types ID

The *GET /JobTypes/Custom/{id}* method is used to return a custom job type with the specified GUID. This method returns HTTP 200 OK on a success with details for the custom job type.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/

Table 288: GET JobTypes Custom {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID of the custom job type. Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 751</a> ) to retrieve a list of all the custom job types to determine the job type GUID.

Table 289: GET JobTypes Custom {id} Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
Job Type Name	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
Job Type Fields	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string that indicates the name for the job type field.</td> </tr> <tr> <td>Type</td> <td> <p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Default Value</td> <td>A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td> </tr> <tr> <td>Required</td> <td>A Boolean that sets whether the job type field is required (true) or not (false).</td> </tr> </tbody> </table>	Name	Description	Name	A string that indicates the name for the job type field.	Type	<p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	Default Value	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Required	A Boolean that sets whether the job type field is required (true) or not (false).
Name	Description																									
Name	A string that indicates the name for the job type field.																									
Type	<p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean										
Integer Value	Enum Value	Description																								
1	String	String																								
2	Int	Integer																								
3	DateTime	Date																								
4	Bool	Boolean																								
Default Value	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.15.3 GET Custom Job Types

The GET /JobTypes/Custom method is used to retrieve a list of all custom job types. This method returns HTTP 200 OK on a success with details for each job type.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/agents/management/read/`

Table 290: GET Job Types Custom Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 291: GET Job Types Custom Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
Job Type Name	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
Job Type Fields	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string that indicates the name for the job type field.</td> </tr> <tr> <td>Type</td> <td> <p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Default Value</td> <td>A string containing the default value of the job type field. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.15.4 POST Custom Job Types

The POST /JobTypes/Custom method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of custom job type details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/modify/

Table 292: POST JobTypes Custom Input Parameters

Name	In	Description																									
Job Type Name	Body	<b>Required.</b> A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.																									
Description	Body	A string containing a description for the custom job type.																									
Job Type Fields	Body	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td><b>Required.</b> A string that indicates the name for the job type field.</td> </tr> <tr> <td>Type</td> <td> <p><b>Required.</b> A value that indicates the data type of the job type field.</p> <p>It may be entered as either an integer or the matching enum value. Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Default Value</td> <td> <p><b>Required*</b>. A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>. This field is <b>required</b> if the <i>Required</i> parameter is set to <i>true</i>.</p> </td> </tr> <tr> <td>Required</td> <td>A Boolean that sets whether the job type field is required (true) or not (false). The default is <i>false</i>.</td> </tr> </tbody> </table> <p>For example:</p>	Name	Description	Name	<b>Required.</b> A string that indicates the name for the job type field.	Type	<p><b>Required.</b> A value that indicates the data type of the job type field.</p> <p>It may be entered as either an integer or the matching enum value. Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	Default Value	<p><b>Required*</b>. A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>. This field is <b>required</b> if the <i>Required</i> parameter is set to <i>true</i>.</p>	Required	A Boolean that sets whether the job type field is required (true) or not (false). The default is <i>false</i> .
Name	Description																										
Name	<b>Required.</b> A string that indicates the name for the job type field.																										
Type	<p><b>Required.</b> A value that indicates the data type of the job type field.</p> <p>It may be entered as either an integer or the matching enum value. Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean											
Integer Value	Enum Value	Description																									
1	String	String																									
2	Int	Integer																									
3	DateTime	Date																									
4	Bool	Boolean																									
Default Value	<p><b>Required*</b>. A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>. This field is <b>required</b> if the <i>Required</i> parameter is set to <i>true</i>.</p>																										
Required	A Boolean that sets whether the job type field is required (true) or not (false). The default is <i>false</i> .																										

Name	In	Description
		<pre>"JobTypeFields": [   {     "Name": "Favorite Type of Pet",     "Type": "String",     "DefaultValue": "Cat",     "Required": true   },   {     "Name": "Model Year of First Car",     "Type": "Int"   },   {     "Name": "Mother's Birthday",     "Type": "DateTime"   } ]</pre>

Table 293: POST JobTypes Custom Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
Job Type Name	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
Job Type Fields	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.15.5 PUT Custom Job Types

The PUT /JobTypes/Custom method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/modify/

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 294: PUT JobTypes Custom Input Parameters

Name	In	Description																									
Id	Body	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
Job Type Name	Body	<b>Required.</b> A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.																									
Description	Body	A string containing a description for the custom job type.																									
Job Type Fields	Body	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.16 Enrollment

The Enrollment component of the Keyfactor API includes methods necessary to enroll certificate signing requests (CSRs) and personal information exchanges (PFxs).

Table 296: Enrollment Endpoints

Endpoint	Method	Description	Link
/Settings/{Id}	GET	Returns the template settings to use during enrollment.	<a href="#">GET Enrollment Settings ID on the next page</a>
/CSR/Context/My	GET	Returns the templates available for CSR enrollment by the current user.	<a href="#">GET Enrollment CSR Content My on page 769</a>
/PFX/Context/My	GET	Returns the templates available for PFX enrollment by the current user.	<a href="#">GET Enrollment PFX Content My on page 786</a>
/AvailableRenewal/Id/{id}	GET	Returns the type of renewals available for the referenced certificate ID.	<a href="#">GET Enrollment Available Renewal ID on page 803</a>
/AvailableRenewal/Thumbprint/{thumbprint}	GET	Returns the type of renewals available for the referenced certificate thumbprint.	<a href="#">GET Enrollment Available Renewal Thumbprint on page 805</a>
/CSR	POST	Performs a CSR enrollment.	<a href="#">POST Enrollment CSR on page 807</a>
/PFX	POST	Performs a PFX enrollment.	<a href="#">POST Enrollment PFX on page 812</a>
/CSR/Parse	POST	Returns information found in a CSR in a human friendly form.	<a href="#">POST Enrollment CSR Parse on page 829</a>
/PFX/Deploy	POST	Adds a certificate into a certificate store following a PFX enrollment or certificate renewal.	<a href="#">POST Enrollment PFX Deploy on page 831</a>
/PFX/Replace	POST	Replaces a certificate in a certificate store following a PFX enrollment.	<a href="#">POST Enrollment PFX Replace on page 837</a>

Endpoint	Method	Description	Link
/Renew	POST	Performs a certificate renewal.	<a href="#">POST Enrollment Renew on page 840</a>

### 2.6.16.1 GET Enrollment Settings ID

The GET /Enrollment/Settings/{id} method is used to return the template settings to use during enrollment for a given template. The response will be the resolved values for the template settings (based on whether they are global or template-specific). This method returns HTTP 200 OK on a success with details of the template regular expressions, defaults, and policy. If there is a template-specific setting, the template-specific setting will be shown in the response. If there is not a template-specific setting, the global settings will be shown in the response.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /certificates/enrollment/csr/  
 OR  
 /certificates/enrollment/pfx/  
 OR  
 /certificates/enrollment/csr/generation/

Table 297: GET Enrollment Settings {id} Input Parameters

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the enrollment template. Use the <i>GET /Templates</i> method (see <a href="#">GET Templates on page 1548</a> ) to retrieve a list of all the templates to determine the template ID.

Table 298: GET Enrollment Settings {id} Response Data

Name	Description												
Template Regexes	<p>An array of objects containing the regular expressions resolved for the template. Regular expression details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject Part</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td>RegEx</td> <td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> <tr> <td>O (Organization)</td> <td>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”,</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Subject Part	A string indicating the portion of the subject the regular expression applies to (e.g. CN). Ed25519	An object containing two arrays: <ul style="list-style-type: none"> <li>bit_lengths: An array of integers indicating the key sizes supported for enrollment through Keyfactor Command.</li> <li>curves: There are no curves for this type of key.</li> </ul>														

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.16.2 GET Enrollment CSR Content My

The GET /Enrollment/CSR/Context/My method is used to check the templates and CAs available for CSR enrollment for the current user. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)). It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for CSR enrollment in Keyfactor Command.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificates/enrollment/csr/`

Table 299: GET Enrollment CSR Content My Response Data

Name	Description																		
Templates	<p>An array of objects containing the templates available for enrollment by the user. Each object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the certificate template.</td> </tr> <tr> <td>Name</td> <td>A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td> </tr> <tr> <td>Display Name</td> <td>A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td> </tr> <tr> <td>Requires Approval</td> <td>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (true) or not (false).</td> </tr> <tr> <td>RFC Enforcement</td> <td>A Boolean indicating whether certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN (true) or not (false). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level and may be overridden on a template-by-template basis.</td> </tr> <tr> <td>CAs</td> <td> <p>An array of objects indicating the certificate authorities that allow enrollment for the template and the requesting user. The template must be available for enrollment on the CA, the template and CA must be configured for enrollment in Keyfactor Command, and the requesting user must have enrollment permissions. Information about the CA includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string indicating the full name of the CA, made up of the DNS hostname of the certificate authority (e.g.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate template. Name	Description								
Key Size	A string indicating the minimum supported key size of the template.								
Curve	A string indicating the OID of the elliptical curve algorithm configured for the template, for ECC templates.								
Standalone CAs	<p>An array of objects containing enrollment information for standalone certificate authorities available for enrollment for the current user. Information about the CA includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.-com\\CorpStandaloneCA1.</td> </tr> <tr> <td>RFC Enforcement</td> <td>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.</td> </tr> <tr> <td>Subscriber Terms</td> <td>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>).</td> </tr> </tbody> </table> <div style="border: 1px solid green; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>	Name	Description	Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.-com\\CorpStandaloneCA1.	RFC Enforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN ( <i>true</i> ) or not ( <i>false</i> ). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.	Subscriber Terms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ).
Name	Description								
Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.-com\\CorpStandaloneCA1.								
RFC Enforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN ( <i>true</i> ) or not ( <i>false</i> ). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.								
Subscriber Terms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ).								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.16.3 GET Enrollment PFX Content My

The GET /Enrollment/PFX/Context/My method is used to check the templates and CAs available for PFX enrollment for the current user. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)). It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for PFX enrollment in Keyfactor Command.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificates/enrollment/pfx/`

Table 300: GET Enrollment PFX Content My Response Data

Name	Description																		
Templates	<p>An array of objects containing the templates available for enrollment by the user. Each object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the certificate template.</td> </tr> <tr> <td>Name</td> <td>A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td> </tr> <tr> <td>Display Name</td> <td>A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td> </tr> <tr> <td>Requires Approval</td> <td>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (true) or not (false).</td> </tr> <tr> <td>RFC Enforcement</td> <td>A Boolean indicating whether certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN (true) or not (false). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level and may be overridden on a template-by-template basis.</td> </tr> <tr> <td>CAs</td> <td> <p>An array of objects indicating the certificate authorities that allow enrollment for the template and the requesting user. The template must be available for enrollment on the CA, the template and CA must be configured for enrollment in Keyfactor Command, and the requesting user must have enrollment permissions. Information about the CA includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string indicating the full name of the CA, made up of the DNS hostname of the certificate authority (e.g.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate template. Value	Description										
	on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.										
Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression ( <i>Validation</i> field).										

Name	Description												
Regexes	<p>An array of objects containing the global template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Regular expression details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Template Id</td> <td>In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> <tr> <td>Subject Part</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td>RegEx</td> <td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Template Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.	Subject Part	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>.</td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i> .
Name	Description												
Template Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.												
Subject Part	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>.</td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i> .								
Subject Part	Example												
CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i> .

Name	Description																		
	<table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>(Subject Alternative Name: User Principal Name)</td> <td> <p>number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly “@keyexample.com”:</p> <pre>^[a-zA-Z0-9'_.\-\ ]*@keyexample\-\ .com\$</pre> </td> </tr> </tbody> </table>	Subject Part	Example	(Subject Alternative Name: User Principal Name)	<p>number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly “@keyexample.com”:</p> <pre>^[a-zA-Z0-9'_.\-\ ]*@keyexample\-\ .com\$</pre>														
Subject Part	Example																		
(Subject Alternative Name: User Principal Name)	<p>number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly “@keyexample.com”:</p> <pre>^[a-zA-Z0-9'_.\-\ ]*@keyexample\-\ .com\$</pre>																		
Error	<p>A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression.</p> <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p> <b>Note:</b> The error message already includes a leading string with the subject part (e.g. “Common Name:” or “Invalid CN provided:” depending on the interface used). Your custom message follows this.</p> </div>																		
Extended Key Usages	Currently not in use.																		
Enrollment Template Policy	<p>An object containing the individual template-level template policy settings. Template policies defined on a template apply to enrollments made with that template only. Template-level policies, if defined, take precedence over system-wide template policies. For more information about system-wide template policies, see <a href="#">GET Templates Settings on page 1524</a>. The template policy object contains the following parameters:</p>																		

Name	Description														
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Key Info</td> <td> <p>An object containing the supported key types for the template along with the bit lengths and/or curves for the key types as appropriate.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ECDSA</td> <td> <p>An object containing two arrays:</p> <ul style="list-style-type: none"> <li>• bit_lengths: An array of integers indicating the key sizes supported for enrollment through Keyfactor Command.</li> <li>• curves: An array of strings indicating the elliptic curve algorithms that are supported for enrollment through Keyfactor Command.</li> </ul> <p>ECC curves may be specified using the well-known OIDs for ECC algorithms or by friendly name. RFC Enforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN ( <i>true</i> ) or not ( <i>false</i> ). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.	Subscriber Terms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ).
Name	Description								
Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.-com\\CorpStandaloneCA1.								
RFC Enforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN ( <i>true</i> ) or not ( <i>false</i> ). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.								
Subscriber Terms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ).								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.16.4 GET Enrollment Available Renewal ID

The GET /Enrollment/AvailableRenewal/ID/{id} method is used to check a specific certificate by ID to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/Thumbprint method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the note under the *CollectionId* input parameter, below.

Table 301: GET Enrollment Available Renewal ID {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer specifying the Keyfactor Command reference ID of the certificate on which to check the renewal status.  Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 302: GET Enrollment Available Renewal ID {id} Response Data

Name	Description								
AvailableRenewalType	<p>An integer indicating the supported renewal type. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None—renewal is not supported for this certificate.</td> </tr> <tr> <td>1</td> <td>Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.</td> </tr> <tr> <td>2</td> <td> <p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>• The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>• The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul> </td> </tr> </tbody> </table> <p> <b>Tip:</b> If the <i>AvailableRenewalType</i> is 2, 1 is also supported for the certificate.</p>	Value	Description	0	None—renewal is not supported for this certificate.	1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.	2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>• The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>• The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul>
Value	Description								
0	None—renewal is not supported for this certificate.								
1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.								
2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>• The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>• The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul>								
Message	A message providing more details about the available renewal type result (e.g. “One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.”).								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.16.5 GET Enrollment Available Renewal Thumbprint

The GET /Enrollment/AvailableRenewal/Thumbprint/{thumbprint} method is used to check a specific certificate by thumbprint to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/ID method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the note under the *CollectionId* input parameter, below.

Table 303: GET Enrollment Available Renewal Thumbprint {thumbprint} Input Parameters

Name	In	Description
thumbprint	Path	<b>Required.</b> The thumbprint of the certificate on which to check the renewal status. Use the <i>GET /Certificates</i> method to determine the certificate thumbprint. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 304: GET Enrollment Available Renewal Thumbprint {thumbprint} Response Data

Name	Description								
AvailableRenewalType	<p>An integer indicating the supported renewal type. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None—renewal is not supported for this certificate.</td> </tr> <tr> <td>1</td> <td>Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.</td> </tr> <tr> <td>2</td> <td> <p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>• The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>• The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul> </td> </tr> </tbody> </table> <p> <b>Tip:</b> If the <i>AvailableRenewalType</i> is 2, 1 is also supported for the certificate.</p>	Value	Description	0	None—renewal is not supported for this certificate.	1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.	2	<p>One-click renewal is supported. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul>
Value	Description								
0	None—renewal is not supported for this certificate.								
1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.								
2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>• The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>• The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul>								
Message	A message providing more details about the available renewal type result (e.g. “One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.”).								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.16.6 POST Enrollment CSR

The POST /Enrollment/CSR method is used to enroll for a certificate using a certificate signing request (CSR). This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificates/enrollment/csr/`

**Tip:** Use the GET /Enrollment/CSR/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Table 305: POST Enrollment CSR Input Parameters

Name	In	Description
CSR	Body	<b>Required.</b> The base-64 encoded CSR that will be passed in for enrollment.
PrivateKey	Body	A string containing the base-64 encoded private key that corresponds to the CSR to be saved with the enrollment. This is done to support private key retention in Keyfactor Command for requests made through CSR enrollment. The key should be provided in unencrypted PKCS#8 format. The private key option is only supported for enrollments done using templates configured in Keyfactor Command for private key retention.
Timestamp	Body	<b>Required.</b> The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Template	Body	<b>Required*</b> A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is <b>required</b> unless the enrollment is being done against a standalone CA.
CertificateAuthority	Body	<p><b>Required*</b> A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; background-color: #f9f9f9; margin: 10px 0;"> <p>corpca01.keyexample.com\\CorplIssuingCA1 <b>OR</b> Corpls- suingCA1</p> </div> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>. This field is optional unless the enrollment is being done against a standalone CA, in which case it is <b>required</b>.</p>
IncludeChain	Body	A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>false</i> .
Metadata	Body	<p>An object of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; background-color: #f9f9f9; margin: 10px 0;"> <pre>"Metadata": {   "AppOwnerFirstName": "William", // This is a String   field.   "AppOwnerLastName": "Smith",</pre> </div>

Name	In	Description																				
		<pre> "AppOwnerEmailAddress": "william.smith@keyexample.com", "BusinessCritical": "true",      // This is a Boolean field. "BusinessUnit": "E-Business",    // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3,                  // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. } </pre> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>																				
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p> <table border="1" data-bbox="561 1024 1401 1644"> <thead> <tr> <th data-bbox="561 1024 906 1083">Value</th> <th data-bbox="906 1024 1401 1083">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="561 1083 906 1150">rfc822</td> <td data-bbox="906 1083 1401 1150">RFC 822 Name</td> </tr> <tr> <td data-bbox="561 1150 906 1218">dns</td> <td data-bbox="906 1150 1401 1218">DNS Name</td> </tr> <tr> <td data-bbox="561 1218 906 1285">directory</td> <td data-bbox="906 1218 1401 1285">Directory Name</td> </tr> <tr> <td data-bbox="561 1285 906 1352">uri</td> <td data-bbox="906 1285 1401 1352">Uniform Resource Identifier</td> </tr> <tr> <td data-bbox="561 1352 906 1419">ip4</td> <td data-bbox="906 1352 1401 1419">IP v4 Address</td> </tr> <tr> <td data-bbox="561 1419 906 1486">ip6</td> <td data-bbox="906 1419 1401 1486">IP v6 Address</td> </tr> <tr> <td data-bbox="561 1486 906 1554">registered id</td> <td data-bbox="906 1486 1401 1554">Registered ID (an OID)</td> </tr> <tr> <td data-bbox="561 1554 906 1621">ms_ ntpincipal name</td> <td data-bbox="906 1554 1401 1621">MS_ NTPincipal Name (a string)</td> </tr> <tr> <td data-bbox="561 1621 906 1688">ms_ ntds replication</td> <td data-bbox="906 1621 1401 1688">MS_ NTDS Replication (a GUID)</td> </tr> </tbody> </table> <p>For example:</p>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registered id	Registered ID (an OID)	ms_ ntpincipal name	MS_ NTPincipal Name (a string)	ms_ ntds replication	MS_ NTDS Replication (a GUID)
Value	Description

Request Disposition	A string indicating the state of the request (e.g. ISSUED).	Disposition Message	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	Enrollment Context	An internally used Keyfactor Command field.
Value	Description										
Request Id	ence ID of the request.										
Request Disposition	A string indicating the state of the request (e.g. ISSUED).										
Disposition Message	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).										
Enrollment Context	An internally used Keyfactor Command field.										
Metadata	<p>An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>MetadataFieldName</td> <td>A string containing the name of the metadata field in Keyfactor Command.</td> </tr> <tr> <td>Value</td> <td>The value of the metadata.</td> </tr> </tbody> </table> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Name	Description	MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.				
Name	Description										
MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.										
Value	The value of the metadata.										

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.16.7 POST Enrollment PFX

The POST /Enrollment/PFX method is used to enroll for a certificate by supplying data in the desired fields. This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificates/enrollment/pfx/`

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store (see the [x-Certificate Format on page 826](#) parameter) using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 831](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 837](#)).

**Tip:** Use the GET /Enrollment/PFX/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the POST /Enrollment/PFX method redesigns how enrollment flow works to handle require approval functionality in a Keyfactor Command workflow with support for delivery into certificate stores. Users who are planning to use require approval workflow functionality *and* deliver enrolled certificates into certificate stores must use version 2 of this endpoint.

**Note:** The supported key algorithms for a certificate template are determined based on global template policy, individual template policy, and the template's supported algorithm. When configuring template-level policies for key information, only key sizes that are valid for the algorithm will be available, according to the global template policy, the template policy, and the supported key sizes. For PFX and CSR enrollment, you must select a valid Key Length and Key Type for the enrollment.

**Note:** The *PopulateMissingValuesFromAD* parameter has been removed from the version 2 endpoint.

Table 307: POST Enrollment PFX v2 Input Parameters

Name	In	Description
Additional Enrollment Fields	Body	<p>An object that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre> "AdditionalEnrollmentFields": {   "CustomStringOne": "MyValue",   "CustomMultiChoiceOne": "ValueTwo" } </pre> <p>See <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Certificate Authority	Body	<p><b>Required*</b>. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\CorplIssuingCA1 OR CorplIssuingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>. This field is optional unless the enrollment is being done against a standalone CA, in which case it is <b>required</b>.</p>
Chain Order	Body	<p>A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i>. Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i>.</p>
Curve	Body	<p>A string indicating the elliptic curve for the requested key. ECC curves may be specified using the well-known OIDs for ECC algorithms. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>1.3.132.0.34 = P-384/secp384r1</li> <li>1.3.132.0.35 = P-521/secp521r1</li> </ul>
Custom Friendly Name	Body	<p><b>Required*</b>. A string that sets a custom friendly name for the certificate. This field is <b>required</b> if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Include Chain	Body	<p>A Boolean that sets whether to include the certificate chain in the response (<i>true</i>) or not (<i>false</i>). The default is <i>true</i>.</p>
Install	Body	<p>A Boolean that sets whether to deploy the certificate to certificate stores (<i>true</i>) or</p>

Name	In	Description
Into Existing Certificate Stores		not (false). The default is <i>true</i> . The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIntoExistingCertificateStores</i> is <i>true</i> , the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.
Key Length	Body	A string indicating the key size for the requested key. Supported key sizes are: <ul style="list-style-type: none"> <li>• 255</li> <li>• 256</li> <li>• 384</li> <li>• 448</li> <li>• 521</li> <li>• 2048</li> <li>• 3072</li> <li>• 4096</li> <li>• 8192</li> </ul>
KeyType	Body	A string indicating the algorithm for the request. Supported values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECC</li> <li>• Ed448</li> <li>• Ed25519</li> </ul>
Metadata	Body	An object that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. For example: <pre> "Metadata": {   "AppOwnerFirstName": "William", // This is a String field.   "AppOwnerLastName": "Smith",   "AppOwnerEmailAddress": "william.smith@keyexample.com",   "BusinessCritical": "true", // This is a Boolean field.   "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value.   "Notes": "Here are some notes.", // This is a BigText field.   "SiteCode": 3, // This is an integer field.   "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. } </pre> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more</p>

Name	In	Description										
		information.										
Password	Body	<b>Required.</b> A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is <i>12</i> . See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Renewal Certificate Id	Body	An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal. The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIntoExistingCertificateStores</i> is <i>true</i> , the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.										
Stores	Body	An array of objects indicating the certificate stores to which the certificate should be distributed. Store details include: <table border="1" data-bbox="472 856 1404 1711"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreId</td> <td>A string indicating the GUID of the certificate store to which the certificate should be deployed. Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 492</a>) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</td> </tr> <tr> <td>Alias</td> <td>A string containing the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Overwrite</td> <td>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>. Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 284</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</td> </tr> <tr> <td>Properties</td> <td>An object indicating the unique parameters defined for the</td> </tr> </tbody> </table>	Name	Description	StoreId	A string indicating the GUID of the certificate store to which the certificate should be deployed. Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 492</a> ) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).	Alias	A string containing the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Overwrite	A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i> . Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 284</a> ) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.	Properties	An object indicating the unique parameters defined for the
Name	Description											
StoreId	A string indicating the GUID of the certificate store to which the certificate should be deployed. Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 492</a> ) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).											
Alias	A string containing the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.											
Overwrite	A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i> . Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 284</a> ) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.											
Properties	An object indicating the unique parameters defined for the											

Name	In	Description				
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p>certificate store type that need to be populated for the certificate. Name	Description					
	<p>certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": {   "NetscalerVserver": "MyVirtualServerName" }</pre> <p> <b>Note:</b> The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p>					
Subject	Body	<p><b>Required</b>*. A string containing the subject name using X.500 format. For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>				
Timestamp	Body	<p><b>Required</b>. A string indicating the current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>				

Name	In	Description																				
Template	Body	<b>Required</b> *. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is <b>required</b> unless the enrollment is being done against a standalone CA.																				
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> <tr> <td>directory</td> <td>Directory Name</td> </tr> <tr> <td>uri</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>ip4</td> <td>IP v4 Address</td> </tr> <tr> <td>ip6</td> <td>IP v6 Address</td> </tr> <tr> <td>registered id</td> <td>Registered ID (an OID)</td> </tr> <tr> <td>ms_ntprincipal name</td> <td>MS_ NTPrincipal Name (a string)</td> </tr> <tr> <td>ms_ntds replication</td> <td>MS_ NTDS Replication (a GUID)</td> </tr> </tbody> </table> <p>For example:</p> <pre> {   "SANs": {     "dns": [       "dnssan1.keyexample.com",       "dnssan2.keyexample.com",       "dnssan3.keyexample.com"     ],     "ip4": [       "192.168.2.73"     ]   } } </pre>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registered id	Registered ID (an OID)	ms_ntprincipal name	MS_ NTPrincipal Name (a string)	ms_ntds replication	MS_ NTDS Replication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registered id	Registered ID (an OID)																					
ms_ntprincipal name	MS_ NTPrincipal Name (a string)																					
ms_ntds replication	MS_ NTDS Replication (a GUID)																					
Use Legacy	Body	A Boolean that sets whether legacy encryption should be used in generating the PKCS#12 file resulting from the enrollment request (true) or not (false). Legacy																				

Name	In	Description
Encryption		encryption algorithms include PBE-SHA1-RC2-40 and PBE-SHA1-3DES. When legacy is not selected, encryption algorithms include AES-256-CBC, PBES2 with PBKDF2, and PBE-SHA1-3DES. The default is <i>false</i> .
x-Certificate Format	Header	<p><b>Required.</b> A string containing the desired output format for the certificate. Available options are:</p> <ul style="list-style-type: none"> <li>• JKS Select the JKS option when you intend to create a Java keystore with the returned PKCS12Blob.</li> <li>• PEM Select the PEM option when you intend to create a PEM file with the returned PKCS12Blob.</li> <li>• PFX Select the PFX option when you intend to create a PKCS#12 (PFX/P12) file with the returned PKCS12Blob.</li> <li>• Replace The Replace option is designed to be used when pushing an updated certificate to a certificate store (see <a href="#">POST Enrollment PFX Replace on page 837</a>). Selecting this item causes data to be staged in preparation for the replace step.</li> <li>• Store The Store option is designed to be used when pushing a newly obtained certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 831</a>). Selecting this item causes data to be staged in preparation for the deploy step.</li> <li>• Zip Select the Zip option when you intend to output the returned PKCS12Blob as separate PEM-encoded certificate, private key, and optional chain certificate files wrapped together in a zip file.</li> </ul>

Table 308: POST Enrollment PFX v2 Response Data

Value	Description														
Successful Stores	An array of strings containing a comma delimited list of certificate stores, referenced by certificate store GUID, to which the certificate was successfully scheduled for deployment.														
Certificate Information	<p>An object containing information about the certificate that was requested. Certificate information includes:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Serial Number</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>Issuer DN</td> <td>A string indicating the issuer DN of the certificate.</td> </tr> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the certificate.</td> </tr> <tr> <td>Keyfactor ID</td> <td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td> </tr> <tr> <td>PKCS12 Blob</td> <td> <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> <b>\$b64 = Get-Content 'C:\path\to\source\file'</b> <b>\$targetFile = 'C:\path\to\target\file'</b>  <b>\$bytes = [Convert]::FromBase64String(\$b64)</b> <b>[IO.File]::WriteAllBytes(\$targetFile, \$bytes)</b> </pre> <p> <b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 831</a>).</p> </td> </tr> <tr> <td>Password</td> <td>An internally used Keyfactor Command field.</td> </tr> </tbody> </table>	Value	Description	Serial Number	A string indicating the serial number of the certificate.	Issuer DN	A string indicating the issuer DN of the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.	Keyfactor ID	An integer indicating the Keyfactor Command reference ID of the issued certificate.	PKCS12 Blob	<p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> <b>\$b64 = Get-Content 'C:\path\to\source\file'</b> <b>\$targetFile = 'C:\path\to\target\file'</b>  <b>\$bytes = [Convert]::FromBase64String(\$b64)</b> <b>[IO.File]::WriteAllBytes(\$targetFile, \$bytes)</b> </pre> <p> <b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 831</a>).</p>	Password	An internally used Keyfactor Command field.
Value	Description														
Serial Number	A string indicating the serial number of the certificate.														
Issuer DN	A string indicating the issuer DN of the certificate.														
Thumbprint	A string indicating the thumbprint of the certificate.														
Keyfactor ID	An integer indicating the Keyfactor Command reference ID of the issued certificate.														
PKCS12 Blob	<p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> <b>\$b64 = Get-Content 'C:\path\to\source\file'</b> <b>\$targetFile = 'C:\path\to\target\file'</b>  <b>\$bytes = [Convert]::FromBase64String(\$b64)</b> <b>[IO.File]::WriteAllBytes(\$targetFile, \$bytes)</b> </pre> <p> <b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 831</a>).</p>														
Password	An internally used Keyfactor Command field.														

Value	Description														
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Workflow Instance Id</td> <td> <p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <p> <b>Tip:</b> Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p> </td> </tr> <tr> <td>Workflow Reference Id</td> <td> <p>An integer containing the Keyfactor Command reference ID of the workflow instance.</p> <p> <b>Tip:</b> Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p> </td> </tr> <tr> <td>Keyfactor Request Id</td> <td>An integer indicating the Keyfactor Command reference ID of the request.</td> </tr> <tr> <td>Request Disposition</td> <td>A string indicating the state of the request (e.g. ISSUED).</td> </tr> <tr> <td>Disposition Message</td> <td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td> </tr> <tr> <td>Enrollment Context</td> <td>An internally used Keyfactor Command field.</td> </tr> </tbody> </table>	Value	Description	Workflow Instance Id	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <p> <b>Tip:</b> Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p>	Workflow Reference Id	<p>An integer containing the Keyfactor Command reference ID of the workflow instance.</p> <p> <b>Tip:</b> Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p>	Keyfactor Request Id	An integer indicating the Keyfactor Command reference ID of the request.	Request Disposition	A string indicating the state of the request (e.g. ISSUED).	Disposition Message	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	Enrollment Context	An internally used Keyfactor Command field.
Value	Description														
Workflow Instance Id	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <p> <b>Tip:</b> Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p>														
Workflow Reference Id	<p>An integer containing the Keyfactor Command reference ID of the workflow instance.</p> <p> <b>Tip:</b> Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p>														
Keyfactor Request Id	An integer indicating the Keyfactor Command reference ID of the request.														
Request Disposition	A string indicating the state of the request (e.g. ISSUED).														
Disposition Message	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).														
Enrollment Context	An internally used Keyfactor Command field.														
Metadata	<p>An object containing the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Metadata FieldType Name</td> <td>A string containing the name of the metadata field in Keyfactor Command.</td> </tr> <tr> <td>Value</td> <td>The value of the metadata.</td> </tr> </tbody> </table>	Name	Description	Metadata FieldType Name	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.								
Name	Description														
Metadata FieldType Name	A string containing the name of the metadata field in Keyfactor Command.														
Value	The value of the metadata.														

Value	Description
	See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

## Version 1

Version 1 of the POST /Enrollment/PFX method includes the same capabilities as version 2 except when used in conjunction with Keyfactor Command workflows that require approval with an intended end goal of delivering the resulting certificate into a certificate store. In this specific case, version 2 must be used.

Table 309: POST Enrollment PFX v1 Input Parameters

Name	In	Description
Additional Enrollment Fields	Body	<p>An object that provides values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre> “AdditionalEnrollmentFields”: { “CustomStringOne”: “MyValue”, “CustomMultiChoiceOne”: “ValueTwo” } </pre> <p>See <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Certificate Authority	Body	<p><b>Required*</b>. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre> corpca01.keyexample.com\CorpIssuingCA1 OR CorpIssuingCA1 </pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>. This field is optional unless the enrollment is being done against a standalone CA, in which case it is <b>required</b>.</p>
ChainOrder	Body	<p>A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i>. Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i>.</p>
Custom Friendly Name	Body	<p><b>Required*</b>. A string that sets a custom friendly name for the certificate. This field is <b>required</b> if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Curve	Body	<p>A string indicating the elliptic curve for the requested key. ECC curves may be specified using the well-known OIDs for ECC algorithms. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul>
Include Chain	Body	<p>A Boolean that sets whether to include the certificate chain in the response (<i>true</i>) or not (<i>false</i>). The default is <i>true</i>.</p>
Key Length	Body	<p>A string indicating the key size for the requested key.</p>
KeyType	Body	<p>A string indicating the algorithm for the request. Supported values are:</p>

Name	In	Description
		<ul style="list-style-type: none"> <li>• RSA</li> <li>• ECC</li> <li>• Ed448</li> <li>• Ed25519</li> </ul>
Metadata	Body	<p>An object that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre> "Metadata": {   "AppOwnerFirstName": "William", // This is a String field.   "AppOwnerLastName": "Smith",   "AppOwnerEmailAddress": "william.smith@keyexample.com",   "BusinessCritical": "true", // This is a Boolean field.   "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value.   "Notes": "Here are some notes.", // This is a BigText field.   "SiteCode": 3, // This is an integer field.   "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. } </pre> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Password	Body	<p><b>Required.</b> A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is <i>12</i>. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Populate Missing Values From AD	Body	<p>A Boolean that sets whether to populate the information in the subject from Active Directory (true) or not (false). The default is <i>false</i>.</p>
Renewal Certificate Id	Body	<p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p>
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p>

Name	In	Description																				
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> <tr> <td>directory</td> <td>Directory Name</td> </tr> <tr> <td>uri</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>ip4</td> <td>IP v4 Address</td> </tr> <tr> <td>ip6</td> <td>IP v6 Address</td> </tr> <tr> <td>registered id</td> <td>Registered ID (an OID)</td> </tr> <tr> <td>ms_ntprincipal name</td> <td>MS_ NTPrincipal Name (a string)</td> </tr> <tr> <td>ms_ntds replication</td> <td>MS_ NTDS Replication (a GUID)</td> </tr> </tbody> </table> <p>For example:</p> <pre> {   "SANS": {     "dns": [       "dnssan1.keyexample.com",       "dnssan2.keyexample.com",       "dnssan3.keyexample.com"     ],     "ip4": [       "192.168.2.73"     ]   } } </pre>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registered id	Registered ID (an OID)	ms_ntprincipal name	MS_ NTPrincipal Name (a string)	ms_ntds replication	MS_ NTDS Replication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registered id	Registered ID (an OID)																					
ms_ntprincipal name	MS_ NTPrincipal Name (a string)																					
ms_ntds replication	MS_ NTDS Replication (a GUID)																					
Subject	Body	<p><b>Required</b>*. A string containing the subject name using X.500 format. For example:</p> <pre> "Subject": "CN=webservr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US" </pre> <p>This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <code>.*</code>. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>																				
Template	Body	<p><b>Required</b>*. A string that sets the name of the certificate template that should be</p>																				

Name	In	Description
		used to issue the certificate. The template short name should be used. This field is <b>required</b> unless the enrollment is being done against a standalone CA.
Timestamp	Body	<b>Required.</b> A string indicating the current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Use Legacy Encryption	Body	A Boolean that sets whether legacy encryption should be used in generating the PKCS#12 file resulting from the enrollment request (true) or not (false). Legacy encryption algorithms include PBE-SHA1-RC2-40 and PBE-SHA1-3DES. When legacy is not selected, encryption algorithms include AES-256-CBC, PBES2 with PBKDF2, and PBE-SHA1-3DES. The default is <i>false</i> .
x-Certificate Format	Header	<b>Required.</b> A string containing the desired output format for the certificate. Available options are: <ul style="list-style-type: none"> <li>• JKS Select the JKS option when you intend to create a Java keystore with the returned PKCS12Blob.</li> <li>• PEM Select the PEM option when you intend to create a PEM file with the returned PKCS12Blob.</li> <li>• PFX Select the PFX option when you intend to create a PKCS#12 (PFX/P12) file with the returned PKCS12Blob.</li> <li>• Replace The Replace option is designed to be used when pushing an updated certificate to a certificate store (see <a href="#">POST Enrollment PFX Replace on page 837</a>). Selecting this item causes data to be staged in preparation for the replace step.</li> <li>• Store The Store option is designed to be used when pushing a newly obtained certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 831</a>). Selecting this item causes data to be staged in preparation for the deploy step.</li> <li>• Zip Select the Zip option when you intend to output the returned PKCS12Blob as separate PEM-encoded certificate, private key, and optional chain certificate files wrapped together in a zip file.</li> </ul>

Table 310: POST Enrollment PFX v1 Response Data

Value	Description																
Certificate Information	An object containing information about the certificate that was requested. Certificate information includes: <table border="1" data-bbox="358 411 1403 1730"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Serial Number</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>Issuer DN</td> <td>A string indicating the issuer DN of the certificate.</td> </tr> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the certificate.</td> </tr> <tr> <td>Keyfactor ID</td> <td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td> </tr> <tr> <td>PKCS12 Blob</td> <td>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:               <pre data-bbox="526 1016 1378 1266"> <b>\$b64 = Get-Content 'C:\path\to\source\file'</b> <b>\$targetFile = 'C:\path\to\target\file'</b>  <b>\$bytes = [Convert]::FromBase64String(\$b64)</b> <b>[IO.File]::WriteAllBytes(\$targetFile, \$bytes)</b> </pre> <div data-bbox="526 1289 1378 1455" style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p> <b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 831</a>).</p> </div> </td> </tr> <tr> <td>Password</td> <td>An internally used Keyfactor Command field.</td> </tr> <tr> <td>Workflow Instance Id</td> <td>A string containing the Keyfactor Command reference GUID of the workflow instance.</td> </tr> </tbody> </table>	Value	Description	Serial Number	A string indicating the serial number of the certificate.	Issuer DN	A string indicating the issuer DN of the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.	Keyfactor ID	An integer indicating the Keyfactor Command reference ID of the issued certificate.	PKCS12 Blob	A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell: <pre data-bbox="526 1016 1378 1266"> <b>\$b64 = Get-Content 'C:\path\to\source\file'</b> <b>\$targetFile = 'C:\path\to\target\file'</b>  <b>\$bytes = [Convert]::FromBase64String(\$b64)</b> <b>[IO.File]::WriteAllBytes(\$targetFile, \$bytes)</b> </pre> <div data-bbox="526 1289 1378 1455" style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p> <b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 831</a>).</p> </div>	Password	An internally used Keyfactor Command field.	Workflow Instance Id	A string containing the Keyfactor Command reference GUID of the workflow instance.
Value	Description																
Serial Number	A string indicating the serial number of the certificate.																
Issuer DN	A string indicating the issuer DN of the certificate.																
Thumbprint	A string indicating the thumbprint of the certificate.																
Keyfactor ID	An integer indicating the Keyfactor Command reference ID of the issued certificate.																
PKCS12 Blob	A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell: <pre data-bbox="526 1016 1378 1266"> <b>\$b64 = Get-Content 'C:\path\to\source\file'</b> <b>\$targetFile = 'C:\path\to\target\file'</b>  <b>\$bytes = [Convert]::FromBase64String(\$b64)</b> <b>[IO.File]::WriteAllBytes(\$targetFile, \$bytes)</b> </pre> <div data-bbox="526 1289 1378 1455" style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p> <b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 831</a>).</p> </div>																
Password	An internally used Keyfactor Command field.																
Workflow Instance Id	A string containing the Keyfactor Command reference GUID of the workflow instance.																

Value	Description														
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>  <b>Tip:</b> Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer. </td> </tr> <tr> <td>Workflow Reference Id</td> <td>           An integer containing the Keyfactor Command reference ID of the workflow instance.               <b>Tip:</b> Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer. </td> </tr> <tr> <td>Keyfactor Request Id</td> <td>An integer indicating the Keyfactor Command reference ID of the request.</td> </tr> <tr> <td>Request Disposition</td> <td>A string indicating the state of the request (e.g. ISSUED).</td> </tr> <tr> <td>Disposition Message</td> <td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td> </tr> <tr> <td>Enrollment Context</td> <td>An internally used Keyfactor Command field.</td> </tr> </tbody> </table>	Value	Description		 <b>Tip:</b> Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer. Keyfactor Request Id	An integer indicating the Keyfactor Command reference ID of the request.	Request Disposition	A string indicating the state of the request (e.g. ISSUED).	Disposition Message	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	Enrollment Context	An internally used Keyfactor Command field.
Value	Description														
	 <b>Tip:</b> Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.														
Workflow Reference Id	An integer containing the Keyfactor Command reference ID of the workflow instance.   <b>Tip:</b> Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.														
Keyfactor Request Id	An integer indicating the Keyfactor Command reference ID of the request.														
Request Disposition	A string indicating the state of the request (e.g. ISSUED).														
Disposition Message	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).														
Enrollment Context	An internally used Keyfactor Command field.														
Metadata	<p>An object containing the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Metadata Field Type Name</td> <td>A string containing the name of the metadata field in Keyfactor Command.</td> </tr> <tr> <td>Value</td> <td>The value of the metadata.</td> </tr> </tbody> </table> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Name	Description	Metadata Field Type Name	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.								
Name	Description														
Metadata Field Type Name	A string containing the name of the metadata field in Keyfactor Command.														
Value	The value of the metadata.														

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.16.8 POST Enrollment CSR Parse

The POST /Enrollment/CSR/Parse method takes a CSR in the body, parses it, and returns all elements that were found in the CSR. This method returns HTTP 200 OK on a success with the parsed CSR contents.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
None

Table 311: POST Enrollment CSR Parse Input Parameters

Name	In	Description
CSR	Body	<b>Required.</b> Base-64-encoded CSR with the Begin and End Certificate Request tags.

Table 312: POST Enrollment CSR Parse Response Data

Name	Description																																				
(CSR Contents)	An array of strings in the form Name=Value containing all the elements in the CSR. Possible values include:																																				
<table border="1"> <thead> <tr> <th data-bbox="412 411 732 466">Name</th> <th data-bbox="737 411 1395 466">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="412 472 732 569">Key Length</td> <td data-bbox="737 472 1395 569">An integer indicating the desired key size of the certificate.</td> </tr> <tr> <td data-bbox="412 575 732 663">Key Type</td> <td data-bbox="737 575 1395 663">A string indicating the desired key encryption of the certificate.</td> </tr> <tr> <td data-bbox="412 669 732 724">CN</td> <td data-bbox="737 669 1395 724">The common name of the certificate.</td> </tr> <tr> <td data-bbox="412 730 732 785">O</td> <td data-bbox="737 730 1395 785">The organization of the certificate.</td> </tr> <tr> <td data-bbox="412 791 732 846">OU</td> <td data-bbox="737 791 1395 846">The organizational unit of the certificate.</td> </tr> <tr> <td data-bbox="412 852 732 907">L</td> <td data-bbox="737 852 1395 907">The city of the certificate.</td> </tr> <tr> <td data-bbox="412 913 732 968">ST</td> <td data-bbox="737 913 1395 968">The state of the certificate.</td> </tr> <tr> <td data-bbox="412 974 732 1029">C</td> <td data-bbox="737 974 1395 1029">The country (two characters) of the certificate.</td> </tr> <tr> <td data-bbox="412 1035 732 1089">E</td> <td data-bbox="737 1035 1395 1089">The email address of the certificate.</td> </tr> <tr> <td data-bbox="412 1096 732 1150">DNS Name</td> <td data-bbox="737 1096 1395 1150">A SAN value containing a DNS name.</td> </tr> <tr> <td data-bbox="412 1157 732 1211">IP Address</td> <td data-bbox="737 1157 1395 1211">A SAN value containing an IP v4 or IP v6 address.</td> </tr> <tr> <td data-bbox="412 1218 732 1272">RFC822 Name</td> <td data-bbox="737 1218 1395 1272">A SAN value containing an email message.</td> </tr> <tr> <td data-bbox="412 1278 732 1333">URL</td> <td data-bbox="737 1278 1395 1333">A SAN value containing a uniform resource identifier.</td> </tr> <tr> <td data-bbox="412 1339 732 1394">Directory Name</td> <td data-bbox="737 1339 1395 1394">A SAN value containing a directory name.</td> </tr> <tr> <td data-bbox="412 1400 732 1455">Registered ID</td> <td data-bbox="737 1400 1395 1455">A SAN value containing a registered ID.</td> </tr> <tr> <td data-bbox="412 1461 732 1558">Other name:Principal Name</td> <td data-bbox="737 1461 1395 1558">A SAN value containing a user principal name (UPN) value.</td> </tr> <tr> <td data-bbox="412 1564 732 1640">Other name:DS Object Guid</td> <td data-bbox="737 1564 1395 1640">A SAN value containing the MS_NTDSReplication value.</td> </tr> </tbody> </table>		Name	Description	Key Length	An integer indicating the desired key size of the certificate.	Key Type	A string indicating the desired key encryption of the certificate.	CN	The common name of the certificate.	O	The organization of the certificate.	OU	The organizational unit of the certificate.	L	The city of the certificate.	ST	The state of the certificate.	C	The country (two characters) of the certificate.	E	The email address of the certificate.	DNS Name	A SAN value containing a DNS name.	IP Address	A SAN value containing an IP v4 or IP v6 address.	RFC822 Name	A SAN value containing an email message.	URL	A SAN value containing a uniform resource identifier.	Directory Name	A SAN value containing a directory name.	Registered ID	A SAN value containing a registered ID.	Other name:Principal Name	A SAN value containing a user principal name (UPN) value.	Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.
Name	Description																																				
Key Length	An integer indicating the desired key size of the certificate.																																				
Key Type	A string indicating the desired key encryption of the certificate.																																				
CN	The common name of the certificate.																																				
O	The organization of the certificate.																																				
OU	The organizational unit of the certificate.																																				
L	The city of the certificate.																																				
ST	The state of the certificate.																																				
C	The country (two characters) of the certificate.																																				
E	The email address of the certificate.																																				
DNS Name	A SAN value containing a DNS name.																																				
IP Address	A SAN value containing an IP v4 or IP v6 address.																																				
RFC822 Name	A SAN value containing an email message.																																				
URL	A SAN value containing a uniform resource identifier.																																				
Directory Name	A SAN value containing a directory name.																																				
Registered ID	A SAN value containing a registered ID.																																				
Other name:Principal Name	A SAN value containing a user principal name (UPN) value.																																				
Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.																																				
 <b>Note:</b> Some of these fields cannot be added to a CSR generated within Keyfactor																																					

Name	Description
	 Command (e.g. URL) and will only be found in CSRs generated outside Keyfactor Command.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.16.9 POST Enrollment PFX Deploy

The POST /Enrollment/PFX/Deploy method is used to put a certificate into a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 812](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificate\_stores/schedule/
- /certificates/enrollment/pfx/
- OR
- /certificate\_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)
- /certificates/enrollment/pfx/

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

 **Tip:** The POST /Enrollment/PFX/Deploy method must be used within 5 minutes of acquiring a certificate with the POST /Enrollment/PFX or POST /Enrollment/Renew method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 313: POST Enrollment PFX Deploy Input Parameters

Name	Type	Description										
Stores	Body	<p><b>Required*</b>. An array of objects indicating the certificate stores to which the certificate should be deployed with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. Store parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreId</td> <td> <p>A string indicating the GUID of the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 492</a>) with a query of “Approved - eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p> </td> </tr> <tr> <td>Alias</td> <td> <p>A string indicating the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </td> </tr> <tr> <td>Overwrite</td> <td> <p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 284</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p> </td> </tr> <tr> <td>Properties</td> <td> <p>An object containing the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET</i></p> </td> </tr> </tbody> </table>	Name	Description	StoreId	<p>A string indicating the GUID of the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 492</a>) with a query of “Approved - eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>	Alias	<p>A string indicating the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Overwrite	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 284</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>	Properties	<p>An object containing the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET</i></p>
Name	Description											
StoreId	<p>A string indicating the GUID of the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 492</a>) with a query of “Approved - eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>											
Alias	<p>A string indicating the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>											
Overwrite	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 284</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>											
Properties	<p>An object containing the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET</i></p>											

Name	Type	Description				
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p><i>CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": {   "NetscalerVserver": "MyVirtualServerName" }</pre> <p> <b>Note:</b> The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p> </td> </tr> </tbody> </table> <p>This replaces the <i>StoresIDs</i> and <i>StoreTypes</i> parameters as of Keyfactor Command version 9.4.</p>	Name	Description		<p><i>CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": {   "NetscalerVserver": "MyVirtualServerName" }</pre> <p> <b>Note:</b> The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p>
Name	Description					
	<p><i>CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": {   "NetscalerVserver": "MyVirtualServerName" }</pre> <p> <b>Note:</b> The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p>					
Password	Body	<b>Required</b> *. A string with a password used to secure the certificate in the certificate store. This field is <b>required</b> for store types that require an entry password, such as PEM stores.				
CertificateId	Body	<b>Required</b> *. The integer for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorId</i> .				
		<p> <b>Note:</b> For enrollments that do not require manager approval (where the certificate is issued immediately), the <i>CertificateId</i> is <b>required</b>. The <i>RequestId</i> may be provided but is not required in this case. For enrollments that do require manager approval (where the certificate is not issued immediately), only the <i>KeyfactorRequestId</i> will be returned on the enrollment and the <i>RequestId</i> is required for deployment.</p>				
RequestId	Body	<b>Required</b> *. The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorRequestId</i> .				

Name	Type	Description														
		See the note under <i>CertificateId</i> regarding when this field is required and when it is not.														
JobTime	Body	A string containing the date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.														
StoreIds	Body	An array of strings containing the certificate store GUIDs for the stores to which the certificate should be added.  The <b>StoreIds</b> parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the <b>Stores</b> parameter. It is still supported for backward compatibility, but no longer required.														
StoreTypes	Body	An array of objects indicating the store types used with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate.  The <b>StoreTypes</b> parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the <b>Stores</b> parameter. It is still supported for backward compatibility, but is no longer required.  Store type parameters are: <table border="1" data-bbox="532 1066 1404 1612"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreTypeId</td> <td>An integer indicating the type of certificate store the certificate is being deployed to. Table 314: POST Enrollment PFX Deploy Response Data

Name	Description
SuccessfulStores	<p>An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div style="border: 1px solid #add8e6; padding: 10px; margin-top: 10px;"> <p> <b>Note:</b> Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store.</p> </div>
FailedStores	<p>An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.</p>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.16.10 POST Enrollment PFX Replace

The POST /Enrollment/PFX/Replace method is used to replace a certificate in a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Replace* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 812](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificate\_stores/schedule/
- /certificates/enrollment/pfx/
- OR
- /certificate\_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)
- /certificates/enrollment/pfx/

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Note:** You could achieve the same end using the `POST /Enrollment/PFX/Deploy` method, but in that case you would need to provide the certificate store GUID(s), the alias of the current certificate in the certificate store(s), the certificate store type(s), and set the overwrite flag to true (as well as the certificate ID of the new certificate). To achieve a replacement with the `POST /Enrollment/PFX/Replace` method you only need to provide the certificate IDs of the certificate being replaced and the new certificate. All the rest of the work is done for you. The certificate will be replaced in all locations in which the certificate is found. If you want to replace the certificate in only some of the locations in which it is found, you will need to use the `POST /Enrollment/PFX/Deploy` method (see [POST Enrollment PFX Deploy on page 831](#)).

**Tip:** The `POST /Enrollment/PFX/Replace` method must be used within 5 minutes of acquiring a certificate with the `POST /Enrollment/PFX` or `POST /Enrollment/Renew` method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 315: POST Enrollment PFX Replace Input Parameters

Name	In	Description
ExistingCertificateId	Body	<b>Required</b> . The integer of the certificate that will be replaced that is already in the store(s). A management job will be created to replace the certificate in all stores in which it is found. Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CertificateId	Body	<b>Required*</b> . The integer for the certificate that needs to be deployed. This is returned in the response to the POST /Enrollment/PFX request. Either the <i>CertificateId</i> or the <i>RequestId</i> is <b>required</b> but not both.
RequestId	Body	<b>Required*</b> . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the POST /Enrollment/PFX request. Either the <i>CertificateId</i> or the <i>RequestId</i> is <b>required</b> but not both.
Password	Body	<b>Required*</b> . A string with a password used to secure the certificate in the certificate store. This field is <b>required</b> for store types that require an entry password, such as PEM stores.
JobTime	Body	A string containing the date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.

Table 316: POST Enrollment PFX Replace Response Data

Name	Description
SuccessfulStores	<p>An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div style="border: 1px solid #add8e6; padding: 10px; margin-top: 10px;"> <p> <b>Note:</b> Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store.</p> </div>
FailedStores	<p>An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.</p>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.16.11 POST Enrollment Renew

The POST /Enrollment/Renew method is used to enroll for a certificate renewal for a certificate that exists in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new certificate. For certificates in a certificates store, this method does not automatically deploy the new certificate to the certificate store. In this case, the renew request should be followed by a call to either the POST /Enrollment/PFX/Deploy method or POST /Enrollment/PFX/Replace method to deploy the new certificate to the certificate store.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificates/collections/read/
- /certificates/enrollment/pfx/
- OR
- /certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)
- /certificates/enrollment/pfx/

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 831](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 837](#)).

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Table 317: POST Enrollment Renew Input Parameters

Name	In	Description
CertificateId	Body	<b>Required*</b> . The integer for the certificate in Keyfactor Command that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is <b>required</b> but not both.
Thumbprint	Body	<b>Required*</b> . The thumbprint for the certificate that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is <b>required</b> but not both.
Timestamp	Body	<b>Required</b> . The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).
CertificateAuthority	Body	<b>Required*</b> . A string that sets the name of the certificate authority that will be used to enroll against. The certificate authority name should be provided in <i>hostname\logical name</i> format. For example: <pre>corpca01.keyexample.com\CorpIssuingCA1</pre> This field is <b>required</b> if one-click renewal is not supported for the certificate (see <a href="#">GET Enrollment Available Renewal ID on page 803</a> or <a href="#">GET Enrollment Available Renewal Thumbprint on page 805</a> ).
Template	Body	<b>Required*</b> . A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is <b>required</b> if one-click renewal is not supported for the certificate (see <a href="#">GET Enrollment Available Renewal ID on page 803</a> or <a href="#">GET Enrollment Available Renewal Thumbprint on page 805</a> ).

Table 318: POST Enrollment Renew Response Data

Name	Description
KeyfactorID	ID of the certificate in Keyfactor Command.
KeyfactorRequestID	ID of the request in Keyfactor Command.
Thumbprint	Thumbprint of the certificate.
SerialNumber	Serial number of the certificate.
IssuerDN	Issuer DN of the certificate.
RequestDisposition	State of the request (e.g. issued).
DispositionMessage	Enrollment message (e.g. The private key was successfully retained.).
Password	A password generated for convenience for use on installation to a certificate store. This password may be used when deploying the certificate to a certificate store using the POST /Enrollment/Deploy method, though an alternate password may be used. The passwords do not need to match.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.17 Event Handler Registration

EventHandlerRegistration endpoints includes methods necessary to list, add, edit and delete event handler registrations for Alerts in Keyfactor Command.

Table 319: EventHandlerRegistration Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes an event handler.	<a href="#">DELETE Event Handler Registration ID on page 849</a>
/id}	GET	Returns a registered event handler that matches the provided ID.	<a href="#">GET Event Handler Registration ID on page 846</a>
/id}	PUT	Updates a registered event handler's information.	<a href="#">PUT Event Handler Registration ID on page 848</a>
/	GET	Returns all registered event handlers according to the provided filter and output parameters.	<a href="#">GET Event Handler Registration below</a>
/	POST	Registers an event handler.	<a href="#">POST Event Handler Registration on page 845</a>

### 2.6.17.1 GET Event Handler Registration

The GET /EventHandlerRegistration method is used to retrieve a list of the Event Handler Registrations in Keyfactor Command (see *Event Handler Registration* in the *Keyfactor Command Reference Guide*). This method returns HTTP 200 OK on a success with details of the event handler. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/handlers/registration/read/

Table 320: GET Event Handler Registration Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• <i>DisplayName</i></li> <li>• <i>Enabled</i></li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 321: GET Event Handler Registration Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <i>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</i> ).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	A string indicating which application events the event handler supports. Built-in events include: <ul style="list-style-type: none"> <li>• Certificate Expiration Handler</li> <li>• Denied Certificate Request Handler</li> <li>• Issued Certificate Handler</li> <li>• Key Rotation Handler</li> <li>• Pending Certificate Handler</li> </ul>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.17.2 POST Event Handler Registration

The POST /Event Handler Registration method is used to register an event handler (see *Event Handler Registration* in the *Keyfactor Command Reference Guide*). This method returns HTTP 200 OK on a success with details of the added event handler(s).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/handlers/registration/modify/

Table 322: POST Event Handler Registration Input Parameters

Name	In	Description
AssemblyName	Body	<b>Required.</b> A string containing the assembly name of the event handler to register. The handler file must be in the configured extensions directory on the machine running the Management Portal (see <i>Application Settings: Console Tab</i> in the <i>Keyfactor Command Reference Guide</i> ).

Table 323: POST Event Handler Registration Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <i>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</i> ).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	A string indicating which application events the event handler supports. Built-in events include: <ul style="list-style-type: none"> <li>• Certificate Expiration Handler</li> <li>• Denied Certificate Request Handler</li> <li>• Issued Certificate Handler</li> <li>• Key Rotation Handler</li> <li>• Pending Certificate Handler</li> </ul>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.17.3 GET Event Handler Registration ID

The GET `/EventHandlerRegistration/{id}` method is used to retrieve a registered event handler that matches the provided ID in Keyfactor Command (see *Event Handler Registration* in the *Keyfactor Command Reference Guide*). This method returns HTTP 200 OK on a success with details of the specified event handler.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/handlers/registration/read/

Table 324: GET Event Handler Registration {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the event handler. Use the <i>GET /EventHandlerRegistration</i> method (see <a href="#">GET Event Handler Registration on page 843</a> ) to retrieve a list of all the event handlers to determine the ID.

Table 325: GET Event Handler Registration Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <i>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</i> ).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	A string indicating which application events the event handler supports. Built-in events include: <ul style="list-style-type: none"> <li>• Certificate Expiration Handler</li> <li>• Denied Certificate Request Handler</li> <li>• Issued Certificate Handler</li> <li>• Key Rotation Handler</li> <li>• Pending Certificate Handler</li> </ul>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.17.4 PUT Event Handler Registration ID

The PUT `/EventHandlerRegistration/{id}` method is used to update the indicated registered event handler's `DisplayName` or `Enabled` status (see *Event Handler Registration* in the *Keyfactor Command Reference Guide*). This method returns HTTP 200 OK on a success with details of the updated event handler.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/handlers/registration/modify/`

Table 326: PUT Event Handler Registration {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the event handler. Use the <code>GET /EventHandlerRegistration</code> method (see <a href="#">GET Event Handler Registration on page 843</a> ) to retrieve a list of all the event handlers to determine the ID.
DisplayName	Body	A string indicating the display name of the event handler.
Enabled	Body	A Boolean indicating whether the event handler is enabled (true) or not (false).

Table 327: PUT Event Handler Registration {id} Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <code>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</code> ).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	A string indicating which application events the event handler supports. Built-in events include: <ul style="list-style-type: none"><li>• Certificate Expiration Handler</li><li>• Denied Certificate Request Handler</li><li>• Issued Certificate Handler</li><li>• Key Rotation Handler</li><li>• Pending Certificate Handler</li></ul>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.17.5 DELETE Event Handler Registration ID

The DELETE `/EventHandlerRegistration/{id}` method is used to delete the event handler with the provided ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/handlers/registration/modify/`

Table 328: DELETE Event Handler Registration {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the event handler. Use the <code>GET /EventHandlerRegistration</code> method (see <a href="#">GET Event Handler Registration on page 843</a> ) to retrieve a list of all the event handlers to determine the ID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.18 Extensions Scripts

The Extensions Scripts component of the Keyfactor API includes methods necessary to create, update, retrieve and delete scripts configured for certificate requests, SSH alerts, and workflows. The Extensions Scripts endpoints are new as of Keyfactor Command version 11 and replace previous functionality which stored scripts for alert event handlers and workflow PowerShell steps in files in the directory structure on the server. The new method of storing the scripts in the database ensures they are stored safely and accessed only with appropriate permissions. Also see PowerShell Scripts in the *Keyfactor Command Reference Guide* for important information about working with scripts in Keyfactor Command.

**Important:** When upgrading from a version of Keyfactor Command prior to version 11, the upgrade process will search the file location defined in the *Application settings > Console Tab > Extension Handler Path* setting and add all the files found in that directory to the database with the naming convention of *foldername (\_subfolder name, if applicable)\_filename* so it is clear which scripts were imported from which location (e.g., *net6.0\_Workflow\_CustomPowerShellExample*). The upgrade process will also identify which, if any, of the categories the script is configured for and add that information to the database with the script.

Table 329: Extensions Scripts Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a script.	<a href="#">DELETE Extensions Scripts ID below</a>
/id}	GET	Returns a single script that matches the provided ID.	<a href="#">GET Extensions Scripts ID on the next page</a>
/	GET	Returns all scripts according to the provided filter and output parameters.	<a href="#">GET Extensions Scripts on page 852</a>
/	POST	Adds a new script.	<a href="#">POST Extensions Scripts on page 854</a>
/	PUT	Updates a script.	<a href="#">PUT Extensions Scripts on page 858</a>

### 2.6.18.1 DELETE Extensions Scripts ID

The DELETE `/Extensions/Scripts/{id}` method is used to delete a script. Scripts cannot be deleted if configured for an alert or workflow. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/scripts/modify/`

Table 330: DELETE Extensions Scripts Input Parameters

Name	In	Description
id	Path	<b>Required.</b> In integer indicating the Keyfactor Command reference ID for the script to be deleted. Use the <code>GET /Extensions/Scripts</code> method (see <a href="#">GET Extensions Scripts on page 852</a> ) to retrieve a list of all the scripts to determine the ID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.18.2 GET Extensions Scripts ID

The GET /Extensions/Scripts/{id} method is used to return the details of the script that matches the provided ID. This method returns HTTP 200 OK on a success with details of the specified script record.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/scripts/read/

Table 331: GET Extensions Scripts {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the script to be retrieved. Use the <i>GET /Extensions/Scripts</i> method (see <a href="#">GET Extensions Scripts on the next page</a> ) to retrieve a list of all the scripts to determine the ID.

Table 332: GET Extensions Scripts {id} Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	A JSON-escaped string containing the contents of the script on a single line.														
Categories	<p>An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are:</p> <table border="1"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.18.3 GET Extensions Scripts

The GET /Extensions/Scripts method is used to return a list of all scripts configured in Keyfactor Command according to the provided filter and output parameters. This method returns HTTP 200 OK on a success with details of the script records.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/scripts/read/

Table 333: GET Extensions Scripts Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Name</i></li> <li>• <i>Category</i></li> </ul> <p>Use the equal (-eq) operator; the -ne operator is not supported. For example: <i>Category -eq "Expiration"</i> will return any scripts that have Expiration in their categories.</p>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 334: GET Extensions Scripts Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Categories	An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are: <table border="1" data-bbox="423 600 1403 1041"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.18.4 POST Extensions Scripts

The POST /Extensions/Scripts method is used to add a new script to the database. This method returns HTTP 200 OK on a success with details of the newly created script record.

 **Important:** This is the only means to add a script to the database. There is no UI equivalent for security reasons. (Upgrading from a version previous to version 11 will import existing scripts into the database as the only other means of adding scripts to the database).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/scripts/modify/

Table 335: POST Extensions Scripts Input Parameters

Name	In	Description														
Name	Body	<b>Required.</b> A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	Body	<b>Required.</b> A JSON-escaped string containing the contents of the script on a single line. <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> See below for examples of creating and handling this string. </div>														
Categories	Body	<b>Required.</b> An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are: <table border="1" style="margin-top: 10px; border-radius: 10px;"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name															
1	Expiration															
2	Pending															
3	Denied															
4	Issued															
5	KeyRotation															
6	Workflow															

### Two Approaches to Importing Scripts to the Database

To create a string value for the *Contents* field, you need to take your script, turn it into a string, and JSON-escape the string so that CR/LFs, tabs and the like will be encoded appropriately and the string will be on a single line. For example, the following string contains escaped CR/LFs (\r\n):

```
$MyVar = \"Hello, World!\"\\r\\n\\r\\nWrite-Host $MyVar
```

One approach to doing this uses a PowerShell script similar to the following, which takes the script to be uploaded as input and creates an output file with the JSON-escaped string:

```

# Path to the input file
$filePath = "C:\Stuff\UpdateSubjectSANS.ps1"

# Get the contents of the input file as a string (as opposed to an array of strings) into
a variable
$fileContent = Get-Content -Path $filePath -Raw

# Set variables for the other body parameters - for multiple categories, use commas (e.g.
2,3,4)
$ScriptName = "UpdateSubjectSANS"
[int32[]]$Categories = 6

# Build the body
$body = @{
    "Name" = $ScriptName
    "Contents" = $fileContent.ToString()
    "Categories" = $Categories
}

# JSON escape the body elements
$jsonbody = ConvertTo-JSON $body

# Output the body elements including the escaped Contents string to a file
Set-Content -Value $jsonbody -Path C:\Stuff\MyOutFile.txt

```

The contents of the output file will look something like (the Contents field is shown truncated here):

```

{
  "Categories": [
    6
  ],
  "Contents": "# Declare your parameters at the beginning ($CSRSubject, $CSRSANS)\r\n-
param(\r\n [string]$CSRSubject,\r\n [string]$CSRSANS,\r\n",
  "Name": "UpdateSubjectSANS"
}

```

You can then open the output file, display the content without line wrapping the Contents field, and copy either the entire body or the JSON-escaped Contents string for pasting into your API command. Any line wraps that display on the screen in the Contents field will be interpreted by copy/paste as CR/LF, which will cause the API command to fail. If your script is long, you will need to be sure to use a text editor to open the file that can display the entire length of the Contents string as a single line. The built-in Windows Notepad application will display a maximum of 1024 characters on a line before wrapping even if word wrap is disabled. A tool such as the third-party Notepad++ is much less limited.

Alternately, you can do the JSON-escaping and update to the Keyfactor Command database in a single PowerShell script and skip the file output with copy/paste. The following script will JSON-escape a script and add it to the database:

```
# Prompt for credentials to authenticate to the Keyfactor API
$cred = Get-Credential

# Encode credentials (assumes the Keyfactor API is using Basic authentication)
$pair = "$($cred.Username): $($cred.GetNetworkCredential().Password)"
$encodedCreds = [System.Convert]::ToBase64String([System.Text.Encoding]::ASCII.GetBytes($pair))
$basicAuthValue = "Basic $encodedCreds"

Table 336: POST Extensions Scripts Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	A JSON-escaped string containing the contents of the script on a single line.														
Categories	An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are: <table border="1"><thead><tr><th>Code</th><th>Category Name</th></tr></thead><tbody><tr><td>1</td><td>Expiration</td></tr><tr><td>2</td><td>Pending</td></tr><tr><td>3</td><td>Denied</td></tr><tr><td>4</td><td>Issued</td></tr><tr><td>5</td><td>KeyRotation</td></tr><tr><td>6</td><td>Workflow</td></tr></tbody></table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.18.5 PUT Extensions Scripts

The PUT /Extensions/Scripts method is used to update a script. This method returns HTTP 200 OK on a success with details of the updated script record.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/scripts/modify/`

**Note:** You cannot change the name of a script once it has been created, so that field is not available as an input parameter to the PUT method.

Table 337: PUT Extensions Scripts Input Parameters

Name	In	Description														
id	Body	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID for the script. Use the <a href="#">GET /Extensions/Scripts</a> method (see <a href="#">GET Extensions Scripts on page 852</a>) to retrieve a list of all the scripts to determine the ID.</p>														
Contents	Body	<p>A JSON-escaped string containing the contents of the script on a single line. If the contents field is not provided or is an empty string, the field will be ignored. (The contents of a script in the database cannot be cleared.)</p> <p> <b>Tip:</b> See <a href="#">POST Extensions Scripts on page 854</a> for examples of creating and handling this string.</p>														
Categories	Body	<p><b>Required.</b> An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are:</p> <table border="1" data-bbox="565 888 1404 1329"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table> <p> <b>Tip:</b> The list of categories provided will completely replace any previously supported categories for the script. However, you cannot remove a category if the script is configured to be used by that category. You can add additional categories to a script that is already in use by select categories by including the existing categories in the parameter entry and adding any others as desired.</p>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name															
1	Expiration															
2	Pending															
3	Denied															
4	Issued															
5	KeyRotation															
6	Workflow															

Table 338: PUT Extensions Scripts Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	A JSON-escaped string containing the contents of the script on a single line.														
Categories	<p>An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are:</p> <table border="1"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration</td> </tr> <tr> <td>2</td> <td>Pending</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Issued</td> </tr> <tr> <td>5</td> <td>KeyRotation</td> </tr> <tr> <td>6</td> <td>Workflow</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.19 Identity Providers

The Identity Providers component of the Keyfactor API includes methods necessary to programmatically edit and retrieve identity providers within Keyfactor Command.

Table 339: Identity Providers Endpoint

Endpoint	Method	Description	Link
/id}	GET	Returns the identity provider with the specified	<a href="#">GET Identity</a>

Endpoint	Method	Description	Link
		ID.	<a href="#">Providers ID on the next page</a>
/id}	PUT	Updates the identity provider with the specified ID.	<a href="#">PUT Identity Providers ID on page 873</a>
/	GET	Returns all identity providers defined within Keyfactor Command with filtering and output options.	<a href="#">GET Identity Providers on page 896</a>
/Types	GET	Returns details for all the identities provider types defined within Keyfactor Command.	<a href="#">GET Identity Providers Types on page 908</a>

### 2.6.19.1 GET Identity Providers ID

The GET /Identity/Providers/{id} method is used to return an identity provider by ID. This method returns HTTP 200 OK on a success with details for the specified identity provider.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/identity\_providers/read/

Table 340: GET Identity Providers{id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the identity provider to retrieve. Use the <i>GET /Identity/Providers</i> method (see <a href="#">GET Identity Providers on page 896</a> ) to retrieve a list of all the identity providers to determine the provider's ID.

Table 341: GET Identity Providers {id} Response Data

Name	Description												
Id	A string containing the Keyfactor Command reference GUID for the identity provider.												
Authentication Scheme	A string indicating the authentication scheme for the identity provider.												
Display Name	A string indicating the display name for the identity provider.												
TypeId	A string indicating the Keyfactor Command reference GUID for the type of identity provider. Possible values are: <ul style="list-style-type: none"> <li>DFB94650-E4EB-402A- B807-4F3CC91F712D (Active Directory)</li> <li>F96B6464-11B7-4499- BEA7-B5AA6BA1571D (Generic—select this for Keyfactor Identity Provider)</li> <li>5AA04122-CD7C-48BA- AC11-F39E30AE8720 (Auth0)</li> </ul>												
Parameters	<p>An array of objects containing information for each parameter set for the identity provider. Parameter details are shown below.</p> <p>Each parameter (<a href="#">Table 342: Identity Provider Parameters</a>) contains the data shown in <a href="#">Table 343: Identity Provider Response Parameter Structure</a>.</p> <p><i>Table 342: Identity Provider Parameters</i></p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Admin Querying Client Id</td> <td>1 - String</td> <td>Command-API-Query</td> <td> <p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>). Keyfactor recommends that you use a different client for this purpose than the client used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>).</p> <p>This parameter is required.</p> </td> </tr> <tr> <td>Admin Querying</td> <td>1 - String</td> <td></td> <td>The client secret of the service account that Keyfactor Command uses to make</td> </tr> </tbody> </table>	Name	Type	Example	Description	Admin Querying Client Id	1 - String	Command-API-Query	<p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>). Keyfactor recommends that you use a different client for this purpose than the client used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>).</p> <p>This parameter is required.</p>	Admin Querying	1 - String		The client secret of the service account that Keyfactor Command uses to make
Name	Type	Example	Description										
Admin Querying Client Id	1 - String	Command-API-Query	<p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>). Keyfactor recommends that you use a different client for this purpose than the client used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>).</p> <p>This parameter is required.</p>										
Admin Querying	1 - String		The client secret of the service account that Keyfactor Command uses to make										

Name	Description		
Name	Type	Example	Description
Client Secret	g		<p>API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p> <p>This parameter is required.</p>
OIDC Audience	1 - String	Command-OIDC-Client	<p>The audience value for the identity provider.</p> <p>For Keyfactor Identity Provider, this should be set to the same value as the <i>Client Id</i>. For example:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">Command-OIDC-Client</div> <p>This parameter is required.</p>
Auth0 API URL	1 - String		<p>The unique identifier defined in Auth0 or a similar identity provider for the API.</p> <p>This parameter only appears if <i>Auth0</i> is selected as the type and is required in that case.</p>
Authority	1 - String	<a href="https://my-keyidp-server.keyexample.com/realms/Keyfactor">https://my-keyidp-server.keyexample.com/realms/Keyfactor</a>	<p>The issuer/authority endpoint URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.</p> <p>This parameter is required.</p>

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="380 275 532 373">Name</th> <th data-bbox="537 275 643 373">Type</th> <th data-bbox="643 275 873 373">Example</th> <th data-bbox="873 275 1403 373">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="380 373 532 1738"></td> <td data-bbox="537 373 643 1738"></td> <td data-bbox="643 373 873 1738"></td> <td data-bbox="873 373 1403 1738"> <div data-bbox="894 394 1382 1709" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> When you add or update an identity provider, the provider's discovery document is validated based on this authority URL. 	OIDC Scope	1-String		<p>One or more scopes that are requested during the OIDC protocol when Keyfactor Command is the relying party. Multiple scopes should be separated by spaces.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
	SignOut URL	1-String	<a href="https://my-auth0-instance.us.auth0.com/oidc/logout">https://my-auth0-instance.us.auth0.com/oidc/logout</a>	<p>The signout URL for the identity provider.</p> <p>This parameter only appears if <i>Auth0</i> is selected as the type and is required in that case.</p>
	Timeout	1-String	60	<p>The number of seconds a request to the identity provider is allowed to process before timing out with an error.</p>
	Token Audience	1-String		<p>An audience value to be included in token requests delivered to the identity provider when making a token request where Keyfactor Command is acting as the OAuth client.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
	Token Endpoint	1-String	<a href="https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-">https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-</a>	<p>The token endpoint URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found</p>

Name	Description		
Name	Type	Example	Description
		connect /token	on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i> ). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct. This parameter is required.
Token Scope	1-String		One or more scopes that should be included in token requests delivered to the identity provider when making a token request where Keyfactor Command is acting as the OAuth client. Multiple scopes should be separated by spaces.  This value is not used for Keyfactor Identity Provider.
Unique Claim Type	1-String	sub	The value used to reference the type of claim used for users in the identity provider. For Keyfactor Identity Provider, this should be (for subject):  <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block;">sub</div>  This parameter is required.
User Info Endpoint	1-String	https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/certs	The user info endpoint URL for the identity provider.  For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i> ). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.

Name	Description
<i>Table 343: Identity Provider Response Parameter Structure</i>	
Name	Description
Id	An integer indicating the Keyfactor Command reference ID for the parameter.
Name	A string indicating the short reference name for the parameter (e.g. NameClaimType).
Display Name	A string indicating the display name for the parameter (e.g. Name Claim Type).
Required	A Boolean indicating whether the parameter is required (true) or not (false).
Data Type	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> <li>• 1 - String</li> <li>• 2 - Secret</li> <li>• 3 - Boolean</li> </ul>
Value	A string indicating the value set for the parameter, for parameters of type 1 or 3.
Secret Value	A string indicating the value set for the parameter, for parameters of type 2. Due to its sensitive nature, this value is not returned in responses.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.19.2 PUT Identity Providers ID

The PUT /Identity/Providers/{id} method is used to update an identity provider in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the identity provider.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/identity_providers/modify/`

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 344: PUT Identity Providers {id} Input Parameters

Name	In	Description												
Id	Path	<b>Required.</b> A string containing the Keyfactor Command reference GUID for the identity provider.												
Authentication Scheme	Body	<b>Required.</b> A string indicating the authentication scheme for the identity provider.												
Display Name	Body	<b>Required.</b> A string indicating the display name for the identity provider.												
TypeId	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the type of identity provider. Possible values are: <ul style="list-style-type: none"> <li>DFB94650-E4EB-402A- B807-4F3CC91F712D (Active Directory)</li> <li>F96B6464-11B7-4499- BEA7-B5AA6BA1571D (Generic—select this for Keyfactor Identity Provider)</li> <li>5AA04122-CD7C-48BA- AC11-F39E30AE8720 (Auth0)</li> </ul>												
Parameters	Body	<p><b>Required.</b> An object containing information for each parameter set for the identity provider. Parameter details are shown below.</p> <p><i>Table 345: Identity Provider Parameters</i></p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Admin Querying Client Id</td> <td>1-String</td> <td>Command-API-Query</td> <td> <p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts in the Keyfactor Command Server Installation Guide</i>). Keyfactor recommends that you use a different client for this purpose than the client used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>).</p> <p>This parameter is required.</p> </td> </tr> <tr> <td>Admin Querying Client Secret</td> <td>1-String</td> <td></td> <td>The client secret of the service account that Keyfactor Command uses to make</td> </tr> </tbody> </table>	Name	Type	Example	Description	Admin Querying Client Id	1-String	Command-API-Query	<p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts in the Keyfactor Command Server Installation Guide</i>). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.</p>

Table 346: PUT Identity Providers {id} Response Data

Name	Description												
Id	A string containing the Keyfactor Command reference GUID for the identity provider.												
Authentication Scheme	A string indicating the authentication scheme for the identity provider.												
Display Name	A string indicating the display name for the identity provider.												
TypeId	A string indicating the Keyfactor Command reference GUID for the type of identity provider. Possible values are: <ul style="list-style-type: none"> <li>DFB94650-E4EB-402A- B807-4F3CC91F712D (Active Directory)</li> <li>F96B6464-11B7-4499- BEA7-B5AA6BA1571D (Generic—select this for Keyfactor Identity Provider)</li> <li>5AA04122-CD7C-48BA- AC11-F39E30AE8720 (Auth0)</li> </ul>												
Parameters	<p>An array of objects containing information for each parameter set for the identity provider. Parameter details are shown below.</p> <p>Each parameter (<a href="#">Table 345: Identity Provider Parameters</a>) contains the data shown in <a href="#">Table 348: Identity Provider Response Parameter Structure</a>.</p> <p><i>Table 347: Identity Provider Parameters</i></p> <table border="1"> <thead> <tr> <th>Name</th> <th>Type</th> <th>Example</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Admin Querying Client Id</td> <td>1 - String</td> <td>Command-API-Query</td> <td> <p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>). Keyfactor recommends that you use a different client for this purpose than the client used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>).</p> <p>This parameter is required.</p> </td> </tr> <tr> <td>Admin Querying</td> <td>1 - String</td> <td></td> <td>The client secret of the service account that Keyfactor Command uses to make</td> </tr> </tbody> </table>	Name	Type	Example	Description	Admin Querying Client Id	1 - String	Command-API-Query	<p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>). Keyfactor recommends that you use a different client for this purpose than the client used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>).</p> <p>This parameter is required.</p>	Admin Querying	1 - String		The client secret of the service account that Keyfactor Command uses to make
Name	Type	Example	Description										
Admin Querying Client Id	1 - String	Command-API-Query	<p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>). Keyfactor recommends that you use a different client for this purpose than the client used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>).</p> <p>This parameter is required.</p>										
Admin Querying	1 - String		The client secret of the service account that Keyfactor Command uses to make										

Name	Description		
Name	Type	Example	Description
Client Secret	g		<p>API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p> <p>This parameter is required.</p>
OIDC Audience	1 - String	Command-OIDC-Client	<p>The audience value for the identity provider.</p> <p>For Keyfactor Identity Provider, this should be set to the same value as the <i>Client Id</i>. For example:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">Command-OIDC-Client</div> <p>This parameter is required.</p>
Auth0 API URL	1 - String		<p>The unique identifier defined in Auth0 or a similar identity provider for the API.</p> <p>This parameter only appears if <i>Auth0</i> is selected as the type and is required in that case.</p>
Authority	1 - String	<a href="https://my-keyidp-server.keyexample.com/realms/Keyfactor">https://my-keyidp-server.keyexample.com/realms/Keyfactor</a>	<p>The issuer/authority endpoint URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.</p> <p>This parameter is required.</p>

Name	Description			
	Name	Type	Example	<div data-bbox="894 394 1382 1709" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> When you add or update an identity provider, the provider's discovery document is validated based on this authority URL. The discovery document is also validated periodically in the background. The following are validated:</p> <ul style="list-style-type: none"> <li>• That the discovery document is reachable using the Authority value provided and can be parsed into a valid discovery document.</li> <li>• That the Authority URL matches the Issuer returned in the discovery document.</li> <li>• That all the URLs on the discovery document are using HTTPS.</li> <li>• That the JSONWebKeySetUri value is included on the discovery document.</li> <li>• That any endpoint configuration values (Authorization Endpoint, Token Endpoint, UserInfo Endpoint, JSONWebKeySetUri) that have been saved or are being saved match—including case—the values returned in the discovery document. The UserInfo Endpoint is not a required configuration field, but if a value is provided, it must match what's in the discovery document.</li> </ul> <p>If any of these validation tests fail, any identity provider changes in process will not be saved and an error will be displayed or logged.</p> </div>

Name	Description			
	<b>Name</b>	<b>Type</b>	<b>Example</b>	<b>Description</b>
Authorization Endpoint	1-String	<code>https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/auth</code>	<p>The authorization endpoint URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct. This parameter is required.</p>	
Client Id	1-String	Command-OIDC-Client	<p>The ID of the client application created in the identity provider for primary application use.</p> <p>For Keyfactor Identity Provider, this should be:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">Command-OIDC-Client</div> <p>For more information, see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>.</p> <p>This parameter is required.</p>	
Client Secret	2-Secret		<p>The secret for the client application created in the identity provider for primary application use.</p> <p>For Keyfactor Identity Provider, see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i> for help locating this. It is automatically returned by the <i>Discovery Docu-</i></p>

Name	Type	Example	Description				
			<table border="1"> <thead> <tr> <th data-bbox="898 407 1110 464">Value</th> <th data-bbox="1110 407 1403 464">Description</th> </tr> </thead> <tbody> <tr> <td></td> <td data-bbox="1127 474 1386 747">           Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a>) to retrieve a list of all the PAM providers to determine the ID.         </td> </tr> </tbody> </table>	Value	Description		Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of all the PAM providers to determine the ID.
Value	Description						
	Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of all the PAM providers to determine the ID.						
			<p>For example, a username stored as a Keyfactor secret will look like:</p>				
			<pre data-bbox="930 909 1370 1045"> {   "SecretValue":   "KEYEXAMPLE\svc_MyServiceName" } </pre>				
			<p>For example, a password stored as a Keyfactor secret will look like:</p>				
			<pre data-bbox="930 1203 1370 1339"> {   "SecretValue": "MySuperSecretPassword" } </pre>				
			<p>A secret stored as a CyberArk PAM secret will look like (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 1030</a> and the Safe, Folder, and Object reference the information in the CyberArk safe needed for this record):</p>				

Name	Description		
			<pre data-bbox="894 394 1382 751"> {   "Provider": "1",   "Parameters": {     "Safe": "MySafeName",     "Folder": "MyFolderName",     "Object": "MyObjectName"   } } </pre> <p data-bbox="894 758 1382 989">A secret stored as a Delinea PAM secret will look like (where the Provider value—2 in this example—is the Id value from <a href="#">GET PAM Providers on page 1030</a> and the SecretId and SecretFieldName contain the information created in the Delinea secret server for this purpose):</p> <pre data-bbox="894 1003 1382 1360"> {   "Provider": "2",   "Parameters": {     "SecretId": "MyId"     "SecretFieldName": "MyReferenceName"   } } </pre> <p data-bbox="894 1367 1382 1402">This parameter is required.</p>
Discovery Document Endpoint	1 - String	<a href="https://my-keyidp-server.keyexample.com/realms/Keyfactor/.well-known/openid-configuration">https://my-keyidp-server.keyexample.com/realms/Keyfactor/.well-known/openid-configuration</a>	<p data-bbox="894 1423 1382 1486">The discovery URL for the identity provider.</p> <p data-bbox="894 1493 1382 1724">For Keyfactor Identity Provider, this is the link to the OpenID Endpoint Configuration page, which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>). Popu-</p>

Name	Description		
			<p>late this value and click <b>Fetch</b> to populate the remainder of the fields in this section, if desired.</p> <p>If you opt not to populate this field or if the discovery document does not return a valid response, the remainder of the fields in this section of the configuration will need to be configured manually. This value is not stored in the database.</p>
Fallback Unique Claim Type	1 - String	cid	<p>A backup value used to reference the type of claim used for users in the identity provider in case the primary referenced name does not contain a value. This parameter is required.</p>
JSON Web Key Set Uri	1 - String	https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/certs	<p>The JWKS (JSON Web Key Set) URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct. This parameter is required.</p>
Name Claim Type	1 - String	preferred_username	<p>The name used to reference the type of user claim for the identity provider.</p> <p>For Keyfactor Identity Provider, this should be:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">preferred_username</div> <p>This parameter is required.</p>

Name	Description			
	<b>Name</b>	<b>Type</b>	<b>Example</b>	<b>Description</b>
	Role Claim Type	1-String	groups	<p>The value used to reference the type of group claim for the identity provider.</p> <p>For Keyfactor Identity Provider, this should be:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">groups</div> <p>This parameter is required.</p>
	OIDC Scope	1-String		<p>One or more scopes that are requested during the OIDC protocol when Keyfactor Command is the relying party. Multiple scopes should be separated by spaces.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
	SignOut URL	1-String	<a href="https://my-auth0-instance.us.auth0.com/oidc/logout">https://my-auth0-instance.us.auth0.com/oidc/logout</a>	<p>The signout URL for the identity provider.</p> <p>This parameter only appears if <i>Auth0</i> is selected as the type and is required in that case.</p>
	Timeout	1-String	60	<p>The number of seconds a request to the identity provider is allowed to process before timing out with an error.</p>
	Token Audience	1-String		<p>An audience value to be included in token requests delivered to the identity provider when making a token request where Keyfactor Command is acting as the OAuth client.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
	Token Endpoint	1-String	<a href="https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-">https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-</a>	<p>The token endpoint URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found</p>

Name	Description		
Name	Type	Example	Description
		connect /token	on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i> ). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct. This parameter is required.
Token Scope	1-String		One or more scopes that should be included in token requests delivered to the identity provider when making a token request where Keyfactor Command is acting as the OAuth client. Multiple scopes should be separated by spaces.  This value is not used for Keyfactor Identity Provider.
Unique Claim Type	1-String	sub	The value used to reference the type of claim used for users in the identity provider. For Keyfactor Identity Provider, this should be (for subject):  <div style="border: 1px solid #ccc; border-radius: 10px; padding: 2px 10px; display: inline-block;">sub</div>  This parameter is required.
User Info Endpoint	1-String	https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/certs	The user info endpoint URL for the identity provider.  For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i> ). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.

Name	Description
<i>Table 348: Identity Provider Response Parameter Structure</i>	
Name	Description
Id	An integer indicating the Keyfactor Command reference ID for the parameter.
Name	A string indicating the short reference name for the parameter (e.g. NameClaimType).
Display Name	A string indicating the display name for the parameter (e.g. Name Claim Type).
Required	A Boolean indicating whether the parameter is required (true) or not (false).
Data Type	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> <li>• 1 - String</li> <li>• 2 - Secret</li> <li>• 3 - Boolean</li> </ul>
Value	A string indicating the value set for the parameter, for parameters of type 1 or 3.
Secret Value	A string indicating the value set for the parameter, for parameters of type 2. Due to its sensitive nature, this value is not returned in responses.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.19.3 GET Identity Providers

The GET /Identity/Providers method is used to return the list of security identity providers configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the identity providers.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
SecuritySettings: Read

Table 349: GET Identity Providers Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Identity Provider Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• DisplayName</li><li>• Name</li><li>• Private</li><li>• ProviderTypes</li></ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Provider</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 350: GET Identity Provider Response Data

Name	Description												
Id	A string containing the Keyfactor Command reference GUID for the identity provider.												
Authentication Scheme	A string indicating the authentication scheme for the identity provider.												
Display Name	A string indicating the display name for the identity provider.												
TypeId	A string indicating the Keyfactor Command reference GUID for the type of identity provider. Possible values are: <ul style="list-style-type: none"> <li>DFB94650-E4EB-402A- B807-4F3CC91F712D (Active Directory)</li> <li>F96B6464-11B7-4499- BEA7-B5AA6BA1571D (Generic—select this for Keyfactor Identity Provider)</li> <li>5AA04122-CD7C-48BA- AC11-F39E30AE8720 (Auth0)</li> </ul>												
Parameters	<p>An array of objects containing information for each parameter set for the identity provider. Keyfactor recommends that you use a different client for this purpose than the client used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>).</p> <p>This parameter is required.</p>	Admin Querying	1 - String		The client secret of the service account that Keyfactor Command uses to make
Name	Type	Example	Description										
Admin Querying Client Id	1 - String	Command-API-Query	<p>The client ID of the service account that Keyfactor Command uses to make API calls to the identity provider.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>). Keyfactor recommends that you use a different client for this purpose than the client used for the main connection from Keyfactor Command to the identity provider (see <i>Client Id</i>).</p> <p>This parameter is required.</p>										
Admin Querying	1 - String		The client secret of the service account that Keyfactor Command uses to make										

Name	Description		
Name	Type	Example	Description
Client Secret	String		API calls to the identity provider. For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i> ). This parameter is required.
OIDC Audience	1 - String	Command-OIDC-Client	The audience value for the identity provider. For Keyfactor Identity Provider, this should be set to the same value as the <i>Client Id</i> . For example: <code>Command-OIDC-Client</code> This parameter is required.
Auth0 API URL	1 - String		The unique identifier defined in Auth0 or a similar identity provider for the API. This parameter only appears if <i>Auth0</i> is selected as the type and is required in that case.
Authority	1 - String	<code>https://my-keyidp-server.keyexample.com/realms/Keyfactor</code>	The issuer/authority endpoint URL for the identity provider. For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i> ). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct. This parameter is required.

Name	Description			
	Name	Type	Example	<div data-bbox="894 394 1382 1711" style="background-color: #e0f2f1; padding: 10px; border: 1px solid #c8e6c9;"> <p> <b>Tip:</b> When you add or update an identity provider, the provider's discovery document is validated based on this authority URL. The discovery document is also validated periodically in the background. The following are validated:</p> <ul style="list-style-type: none"> <li>• That the discovery document is reachable using the Authority value provided and can be parsed into a valid discovery document.</li> <li>• That the Authority URL matches the Issuer returned in the discovery document.</li> <li>• That all the URLs on the discovery document are using HTTPS.</li> <li>• That the JSONWebKeySetUri value is included on the discovery document.</li> <li>• That any endpoint configuration values (Authorization Endpoint, Token Endpoint, UserInfo Endpoint, JSONWebKeySetUri) that have been saved or are being saved match—including case—the values returned in the discovery document. The UserInfo Endpoint is not a required configuration field, but if a value is provided, it must match what's in the discovery document.</li> </ul> <p>If any of these validation tests fail, any identity provider changes in process will not be saved and an error will be displayed or logged.</p> </div>

Name	Description			
	<b>Name</b>	<b>Type</b>	<b>Example</b>	<b>Description</b>
	Authorization Endpoint	1-String	<code>https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/auth</code>	<p>The authorization endpoint URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct. This parameter is required.</p>
	Client Id	1-String	Command-OIDC-Client	<p>The ID of the client application created in the identity provider for primary application use.</p> <p>For Keyfactor Identity Provider, this should be:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">Command-OIDC-Client</div> <p>For more information, see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>.</p> <p>This parameter is required.</p>
	Client Secret	2-Secret		<p>The secret for the client application created in the identity provider for primary application use.</p> <p>For Keyfactor Identity Provider, see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i> for help locating this. It is automatically returned by the <i>Discovery Docu-</i></p>

This value is not stored in the database.</p>
Fallback Unique Claim Type	1 - String	cid	<p>A backup value used to reference the type of claim used for users in the identity provider in case the primary referenced name does not contain a value. This parameter is required.</p>
JSON Web Key Set Uri	1 - String	<code>https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/certs</code>	<p>The JWKS (JSON Web Key Set) URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct. This parameter is required.</p>
Name Claim Type	1 - String	preferred_username	<p>The name used to reference the type of user claim for the identity provider.</p> <p>For Keyfactor Identity Provider, this should be:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">preferred_username</div> <p>This parameter is required.</p>

Name	Description			
	<b>Name</b>	<b>Type</b>	<b>Example</b>	<b>Description</b>
	Role Claim Type	1-String	groups	<p>The value used to reference the type of group claim for the identity provider.</p> <p>For Keyfactor Identity Provider, this should be:</p> <div style="border: 1px solid #ccc; border-radius: 15px; padding: 5px; display: inline-block; margin: 10px 0;">groups</div> <p>This parameter is required.</p>
	OIDC Scope	1-String		<p>One or more scopes that are requested during the OIDC protocol when Keyfactor Command is the relying party. Multiple scopes should be separated by spaces.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
	SignOut URL	1-String	<a href="https://my-auth0-instance.us.auth0.com/oidc/logout">https://my-auth0-instance.us.auth0.com/oidc/logout</a>	<p>The signout URL for the identity provider.</p> <p>This parameter only appears if <i>Auth0</i> is selected as the type and is required in that case.</p>
	Timeout	1-String	60	<p>The number of seconds a request to the identity provider is allowed to process before timing out with an error.</p>
	Token Audience	1-String		<p>An audience value to be included in token requests delivered to the identity provider when making a token request where Keyfactor Command is acting as the OAuth client.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
	Token Endpoint	1-String	<a href="https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-">https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-</a>	<p>The token endpoint URL for the identity provider.</p> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found</p>

Name	Description		
Name	Type	Example	Description
		connect /token	on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i> ). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct. This parameter is required.
Token Scope	1-String		One or more scopes that should be included in token requests delivered to the identity provider when making a token request where Keyfactor Command is acting as the OAuth client. Multiple scopes should be separated by spaces.  This value is not used for Keyfactor Identity Provider.
Unique Claim Type	1-String	sub	The value used to reference the type of claim used for users in the identity provider. For Keyfactor Identity Provider, this should be (for subject):  <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block;">sub</div>  This parameter is required.
User Info Endpoint	1-String	https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/certs	The user info endpoint URL for the identity provider.  For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i> ). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.

Name	Description
<i>Table 352: Identity Provider Response Parameter Structure</i>	
Name	Description
Id	An integer indicating the Keyfactor Command reference ID for the parameter.
Name	A string indicating the short reference name for the parameter (e.g. NameClaimType).
Display Name	A string indicating the display name for the parameter (e.g. Name Claim Type).
Required	A Boolean indicating whether the parameter is required (true) or not (false).
Data Type	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> <li>• 1 - String</li> <li>• 2 - Secret</li> <li>• 3 - Boolean</li> </ul>
Value	A string indicating the value set for the parameter, for parameters of type 1 or 3.
Secret Value	A string indicating the value set for the parameter, for parameters of type 2. Due to its sensitive nature, this value is not returned in responses.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.19.4 GET Identity Providers Types

The GET /Identity/Providers/Types method is used to list the types of identity providers defined in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the identity provider types and their type parameters. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/identity\_providers/read/

Table 353: GET Identity Providers Types Response Data

Name	Description												
Id	A string containing the Keyfactor Command reference GUID for the identity provider type.												
Name	A string containing the name for the identity provider type.												
TypeParameters	An object containing information about the identity provider types. Identity provider type information includes: <table border="1" data-bbox="483 730 1404 1396"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the identity provider type.</td> </tr> <tr> <td>Name</td> <td>A string containing the short reference name for the identity provider type.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the display name for the identity provider type.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the data type of the identity provider type. Possible values are:               <ul style="list-style-type: none"> <li>• 1 - String</li> <li>• 2 - Secret</li> <li>• 3 - Boolean</li> </ul> </td> </tr> <tr> <td>Required</td> <td>A Boolean that indicates whether the identity provider type has been marked as required (true) or not (false).</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the identity provider type.	Name	A string containing the short reference name for the identity provider type.	DisplayName	A string containing the display name for the identity provider type.	DataType	An integer indicating the data type of the identity provider type. Possible values are: <ul style="list-style-type: none"> <li>• 1 - String</li> <li>• 2 - Secret</li> <li>• 3 - Boolean</li> </ul>	Required	A Boolean that indicates whether the identity provider type has been marked as required (true) or not (false).
Name	Description												
Id	An integer containing the Keyfactor Command identifier for the identity provider type.												
Name	A string containing the short reference name for the identity provider type.												
DisplayName	A string containing the display name for the identity provider type.												
DataType	An integer indicating the data type of the identity provider type. Possible values are: <ul style="list-style-type: none"> <li>• 1 - String</li> <li>• 2 - Secret</li> <li>• 3 - Boolean</li> </ul>												
Required	A Boolean that indicates whether the identity provider type has been marked as required (true) or not (false).												

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.20 License

The License component of the Keyfactor API is primarily intended to view the current license through the API with the GET /License Method.

Table 354: License Endpoint

Endpoint	Method	Description	Link
/	GET	Returns the current license.	<a href="#">GET License below</a>

### 2.6.20.1 GET License

The GET /License method is used to view the current license. This method returns HTTP 200 OK on a success with the license details. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)). For more information regarding licensing, see *Licensing* in the *Keyfactor Command Reference Guide*.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
SystemSettings > Read

Table 355: GET License Response Data

Name	Description												
Keyfactor Version	A string indicating the Keyfactor Command version number in the format: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin-top: 5px;">                     majorversion.incrementalversion.patchnumber                 </div>												
License Data	<p>An object containing your Keyfactor customer information. License data details are:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Licenseld</td> <td>A string indicating the internal reference GUID of your Keyfactor license.</td> </tr> <tr> <td>Customer</td> <td>An object containing identifying information about your organization.</td> </tr> </tbody> </table> <table border="1" style="margin-left: 40px; margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing your company name as per your Keyfactor account.</td> </tr> <tr> <td>Id</td> <td>An integer containing your Keyfactor account number.</td> </tr> </tbody> </table>	Name	Description	Licenseld	A string indicating the internal reference GUID of your Keyfactor license.	Customer	An object containing identifying information about your organization.	Name	Description	Name	A string containing your company name as per your Keyfactor account.	Id	An integer containing your Keyfactor account number.
Name	Description												
Licenseld	A string indicating the internal reference GUID of your Keyfactor license.												
Customer	An object containing identifying information about your organization.												
Name	Description												
Name	A string containing your company name as per your Keyfactor account.												
Id	An integer containing your Keyfactor account number.												
Issued Date	A string indicating the valid issue date of the license, in UTC.												
Expiration Date	A string indicating the valid expiration date of the license, in UTC.												
Licensed Products	<p>An array of objects containing details of the products and features included in the license. License product and feature details are:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Product Id</td> <td>A string indicating the Keyfactor Command product GUID for the product(s) included in the license.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the name of the licensed product. For Keyfactor Command, this is “Certificate Management System”.</td> </tr> <tr> <td>MajorRev</td> <td>A string indicating the valid major release version of the license.</td> </tr> </tbody> </table>	Name	Description	Product Id	A string indicating the Keyfactor Command product GUID for the product(s) included in the license.	Display Name	A string indicating the name of the licensed product. For Keyfactor Command, this is “Certificate Management System”.	MajorRev	A string indicating the valid major release version of the license.				
Name	Description												
Product Id	A string indicating the Keyfactor Command product GUID for the product(s) included in the license.												
Display Name	A string indicating the name of the licensed product. For Keyfactor Command, this is “Certificate Management System”.												
MajorRev	A string indicating the valid major release version of the license.												

Name	Description												
MinorRev	A string indicating the valid incremental release version of the license.												
Licensed Features	<p>An array of objects containing the Keyfactor Command features included in the license.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Feature ID</td> <td>A string indicating the ID code of feature.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the name of the feature as displayed on the license page in the Management Portal.</td> </tr> <tr> <td>Enabled</td> <td>A Boolean that indicates whether the feature is enabled (true) or not (false).</td> </tr> <tr> <td>Quantity</td> <td> <p>An integer indicating one of:</p> <ul style="list-style-type: none"> <li>How many of the elements you are licensed for.</li> <li>For those features which have no licensing limits, <i>null</i>.</li> </ul> <p>Unlimited is indicated by 999999999.</p> </td> </tr> <tr> <td>Expiration Date</td> <td>This field is unused and will always return <i>null</i>.</td> </tr> </tbody> </table>	Name	Description	Feature ID	A string indicating the ID code of feature.	Display Name	A string indicating the name of the feature as displayed on the license page in the Management Portal.	Enabled	A Boolean that indicates whether the feature is enabled (true) or not (false).	Quantity	<p>An integer indicating one of:</p> <ul style="list-style-type: none"> <li>How many of the elements you are licensed for.</li> <li>For those features which have no licensing limits, <i>null</i>.</li> </ul> <p>Unlimited is indicated by 999999999.</p>	Expiration Date	This field is unused and will always return <i>null</i> .
Name	Description												
Feature ID	A string indicating the ID code of feature.												
Display Name	A string indicating the name of the feature as displayed on the license page in the Management Portal.												
Enabled	A Boolean that indicates whether the feature is enabled (true) or not (false).												
Quantity	<p>An integer indicating one of:</p> <ul style="list-style-type: none"> <li>How many of the elements you are licensed for.</li> <li>For those features which have no licensing limits, <i>null</i>.</li> </ul> <p>Unlimited is indicated by 999999999.</p>												
Expiration Date	This field is unused and will always return <i>null</i> .												

 **Tip:** Currently there is only one licensed product offered, which is Keyfactor Command.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.21 MacEnrollment

The MacEnrollment component of the Keyfactor API includes methods to edit and retrieve the configuration for Mac auto-enrollment.

Table 356: MacEnrollment Endpoints

Endpoint	Method	Description	Link
/	GET	Returns the current Mac auto-enrollment configuration.	<a href="#">GET MacEnrollment below</a>
/	PUTT	Updates the Mac auto-enrollment configuration.	<a href="#">PUT MacEnrollment on the next page</a>

### 2.6.21.1 GET MacEnrollment

The GET /MacEnrollment method is used to retrieve details for the Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/agents/management/mac/auto-enrollment/management/read/`

Table 357: GET MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.21.2 PUT MacEnrollment

The PUT /MacEnrollment method is used to update the existing Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/mac/auto-enrollment/management/modify/

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 358: PUT MacEnrollment input Parameters

Name	In	Description
Id	Body	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	Body	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	Body	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	Body	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See for more information about metadata fields.
MetadataField	Body	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	Body	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Table 359: PUT MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.22 MetadataFields

MetadataFields contains definitions for metadata that can be associated with certificates in Keyfactor Command.

Table 360: MetadataFields Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes an existing metadata field.	<a href="#">DELETE Metadata Fields ID on the next page</a>

Endpoint	Method	Description	Link
/ {id}	GET	Returns detailed information for the specified metadata field.	<a href="#">GET Metadata Fields ID on the next page</a>
/ {name}	GET	Returns detailed information for the specified metadata field.	<a href="#">GET Metadata Fields Name on page 921</a>
/ {id}/InUse	GET	Returns a Boolean stating whether the metadata type is associated with a certificate.	<a href="#">GET Metadata Fields ID In Use on page 925</a>
/	DELETE	Deletes multiple metadata fields specified in the request body.	<a href="#">DELETE Metadata Fields on page 926</a>
/	GET	Returns all metadata field types with paging (number of pages to return and number of results per page) options.	<a href="#">GET Metadata Fields on page 927</a>
/	POST	Creates a new metadata field using values supplied in the request body.	<a href="#">POST Metadata Fields on page 931</a>
/	PUT	Updates an existing metadata field using values supplied in the request body.	<a href="#">PUT Metadata Fields on page 938</a>

### 2.6.22.1 DELETE Metadata Fields ID

The DELETE /MetadataFields/{id} method is used to delete a metadata field by ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/metadata/types/modify/

Table 361: DELETE Metadata Fields {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the metadata field to be deleted. Use the <i>GET /MetadataFields</i> method (see <a href="#">GET Metadata Fields on page 927</a> ) to retrieve a list of all the metadata fields to determine the metadata field's ID.
Force	Query	A Boolean that sets whether to force deletion of the metadata field even if it is in use by one or more certificates (true) or not (false). The default is <i>false</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see <a href="#">GET Metadata Fields ID In Use on page 925</a> ) to determine whether a metadata field is in use.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.22.2 GET Metadata Fields ID

The *GET /MetadataFields/{id}* method is used to return details for the metadata field with a specified unique ID. This method returns HTTP 200 OK on a success with details for the requested metadata field.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
*/metadata/types/read/*

Table 362: GET Metadata Fields {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see <a href="#">GET Metadata Fields on page 927</a> ) to retrieve a list of all the metadata fields to determine the metadata field's ID.

Table 363: GET Metadata Fields {id} Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.																
Description	A string indicating the description for the metadata field.																
DataType	An integer indicating the data type of the metadata field. Possible values are: <table border="1" data-bbox="462 730 1404 1234"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> <tr> <td>7</td> <td>Email</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text	7	Email
Value	Description																
1	String																
2	Integer																
3	Date																
4	Boolean																
5	Multiple Choice																
6	Big Text																
7	Email																
Hint	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .																
Validation	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed</p>																

Name	Description								
	<p>by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div data-bbox="464 369 1406 537" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="464 653 1406 1171"> <thead> <tr> <th data-bbox="464 653 626 716">Value</th> <th data-bbox="626 653 1406 716">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="464 716 626 846">0</td> <td data-bbox="626 716 1406 846">Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td data-bbox="464 846 626 1005">1</td> <td data-bbox="626 846 1406 1005">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td data-bbox="464 1005 626 1171">2</td> <td data-bbox="626 1005 1406 1171">Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <div data-bbox="464 1203 1406 1371" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation field</i>).</p> <div data-bbox="464 1524 1406 1692" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p>								

Name	Description
	<p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.22.3 GET Metadata Fields Name

The GET /MetadataFields/{name} method is used to return details for the metadata field with the specified unique name. This method returns HTTP 200 OK on a success with details for the requested metadata field.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/metadata/types/read/`

Table 364: GET Metadata Fields {name} Input Parameters

Name	In	Description
name	Path	<b>Required.</b> A string that indicates the name of the metadata field. This value is not case sensitive.

Table 365: GET Metadata Fields {name} Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.																
Description	A string indicating the description for the metadata field.																
DataType	An integer indicating the data type of the metadata field. Possible values are: <table border="1" data-bbox="462 730 1404 1234"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> <tr> <td>7</td> <td>Email</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text	7	Email
Value	Description																
1	String																
2	Integer																
3	Date																
4	Boolean																
5	Multiple Choice																
6	Big Text																
7	Email																
Hint	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .																
Validation	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed</p>																

Name	Description								
	<p>by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div data-bbox="462 367 1404 535" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="462 651 1404 1165"> <thead> <tr> <th data-bbox="469 659 626 716">Value</th> <th data-bbox="626 659 1398 716">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="469 716 626 846">0</td> <td data-bbox="626 716 1398 846">Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td data-bbox="469 846 626 1005">1</td> <td data-bbox="626 846 1398 1005">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td data-bbox="469 1005 626 1165">2</td> <td data-bbox="626 1005 1398 1165">Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <div data-bbox="462 1207 1404 1365" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation field</i>).</p> <div data-bbox="462 1522 1404 1680" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p>								

Name	Description
	<p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.22.4 GET Metadata Fields ID In Use

The GET /MetadataFields/{id}/InUse method is used to return a Boolean indicating whether the specified metadata field contains any data for any of the certificates in Keyfactor Command. This is useful to determine before attempting to delete a metadata field. This method returns HTTP 200 OK on a success with a value of true or false.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/metadata/types/read/

Table 366: GET Metadata Fields {id} In Use Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see <a href="#">GET Metadata Fields on the next page</a> ) to retrieve a list of all the metadata fields to determine the metadata field's ID.

Table 367: GET Metadata Fields {id} In Use Response Data

Name	Description
	A Boolean that indicates whether the specified metadata field contains data for any certificates within Keyfactor Command (true) or not (false). This value is returned without a parameter name.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.22.5 DELETE Metadata Fields

The DELETE /MetadataFields method is used to delete multiple metadata fields in one request. Delete operations will continue until the entire array of IDs has been processed. Note that metadata fields that are in use for any certificate cannot be deleted unless the force=true parameter is included in the request. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/metadata/types/modify/

Table 368: DELETE Metadata Fields Input Parameters

Name	In	Description
ids	Body	<b>Required.</b> An array of integers indicating the Keyfactor Command reference IDs for the metadata fields to be deleted. Use the <i>GET /MetadataFields</i> method (see <a href="#">GET Metadata Fields below</a> ) to retrieve a list of all the metadata fields to determine the metadata field IDs.
Force	Query	A Boolean that sets whether to force deletion of the metadata fields even if they are in use (true) or not (false). The default is <i>False</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see <a href="#">GET Metadata Fields ID In Use on page 925</a> ) to determine whether a metadata field is in use.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.22.6 GET Metadata Fields

The *GET /MetadataFields* method is used to return a list of all metadata fields. This method returns HTTP 200 OK on a success with details for the metadata fields.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/metadata/types/read/`

Table 369: GET Metadata Fields Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Logons Search</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>Name</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayOrder</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 370: GET Metadata Fields Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.																
Description	A string indicating the description for the metadata field.																
DataType	An integer indicating the data type of the metadata field. Possible values are: <table border="1" data-bbox="462 730 1404 1234"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> <tr> <td>7</td> <td>Email</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text	7	Email
Value	Description																
1	String																
2	Integer																
3	Date																
4	Boolean																
5	Multiple Choice																
6	Big Text																
7	Email																
Hint	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .																
Validation	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed</p>																

Name	Description								
	<p>by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div data-bbox="464 369 1406 537" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="464 653 1406 1171"> <thead> <tr> <th data-bbox="464 653 626 716">Value</th> <th data-bbox="626 653 1406 716">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="464 716 626 846">0</td> <td data-bbox="626 716 1406 846">Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td data-bbox="464 846 626 1005">1</td> <td data-bbox="626 846 1406 1005">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td data-bbox="464 1005 626 1171">2</td> <td data-bbox="626 1005 1406 1171">Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <div data-bbox="464 1203 1406 1371" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation field</i>).</p> <div data-bbox="464 1524 1406 1692" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p>								

Name	Description
	<p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.22.7 POST Metadata Fields

The POST /MetadataFields method is used to create a new metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new metadata field.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/metadata/types/modify/

Table 371: POST Metadata Fields Input Parameters

Name	In	Description																
Name	Body	<b>Required.</b> A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.																
Description	Body	<b>Required.</b> A string indicating the description for the metadata field.																
DataType	Body	<p><b>Required.</b> An integer indicating the data type of the metadata field. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> <tr> <td>7</td> <td>Email</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text	7	Email
Value	Description

The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation field</i>).</p> <div data-bbox="462 1522 1404 1680" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p>								

Name	Description
	<p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.22.8 PUT Metadata Fields

The PUT /MetadataFields method is used to update an existing metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the updated metadata field.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/metadata/types/modify/`

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 373: PUT Metadata Fields Input Parameters

Name	In	Description																
ID	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.																
Name	Body	<b>Required.</b> A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.																
Description	Body	<b>Required.</b> A string indicating the description for the metadata field.																
DataType	Body	<p><b>Required.</b> An integer indicating the data type of the metadata field. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> <tr> <td>7</td> <td>Email</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text	7	Email
Value	Description																	
1	String																	
2	Integer																	
3	Date																	
4	Boolean																	
5	Multiple Choice																	
6	Big Text																	
7	Email																	
Hint	Body	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>																
Validation	Body	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:																

Name	In	Description								
		<pre data-bbox="662 285 1382 317">^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p data-bbox="597 359 1393 520">This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, under-scores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p data-bbox="597 531 1349 562">This field is only supported for metadata fields with data type <i>string</i>.</p> <div data-bbox="602 583 1406 783" style="border: 1px solid #c8e6c9; padding: 10px;"> <p> <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>								
Enrollment	Body	<p data-bbox="597 814 1398 877">An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="602 898 1406 1486"> <thead> <tr> <th data-bbox="602 905 764 968">Value</th> <th data-bbox="764 905 1406 968">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="602 968 764 1094">0</td> <td data-bbox="764 968 1406 1094"> <p data-bbox="781 989 1360 1083">Optional Users have the option to either enter a value or not enter a value in the field.</p> </td> </tr> <tr> <td data-bbox="602 1094 764 1283">1</td> <td data-bbox="764 1094 1406 1283"> <p data-bbox="781 1115 1333 1272">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p> </td> </tr> <tr> <td data-bbox="602 1283 764 1486">2</td> <td data-bbox="764 1283 1406 1486"> <p data-bbox="781 1304 1373 1461">Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p> </td> </tr> </tbody> </table> <p data-bbox="597 1524 854 1545">The default is <i>optional</i>.</p> <div data-bbox="602 1570 1406 1770" style="border: 1px solid #c8e6c9; padding: 10px;"> <p> <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>	Value	Description	0	<p data-bbox="781 989 1360 1083">Optional Users have the option to either enter a value or not enter a value in the field.</p>	1	<p data-bbox="781 1115 1333 1272">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p>	2	<p data-bbox="781 1304 1373 1461">Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p>
Value	Description									
0	<p data-bbox="781 989 1360 1083">Optional Users have the option to either enter a value or not enter a value in the field.</p>									
1	<p data-bbox="781 1115 1333 1272">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p>									
2	<p data-bbox="781 1304 1373 1461">Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p>									

Name	In	Description
Message	Body	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <p> <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
Options	Body	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is <b>required</b> for metadata fields with data type <i>multiple choice</i>. For other data types, it will be ignored.</p> <p> <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
DefaultValue	Body	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
AllowAPI	Body	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	Body	This is considered deprecated and may be removed in a future release.
DisplayOrder	Body	<b>Required.</b> An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

Table 374: PUT Metadata Fields Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.																
Description	A string indicating the description for the metadata field.																
DataType	An integer indicating the data type of the metadata field. Possible values are: <table border="1" data-bbox="462 730 1404 1234"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> <tr> <td>7</td> <td>Email</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text	7	Email
Value	Description																
1	String																
2	Integer																
3	Date																
4	Boolean																
5	Multiple Choice																
6	Big Text																
7	Email																
Hint	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .																
Validation	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <pre>[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed</p>																

Name	Description								
	<p>by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div data-bbox="462 367 1404 535" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1" data-bbox="462 651 1404 1165"> <thead> <tr> <th data-bbox="469 659 626 716">Value</th> <th data-bbox="626 659 1398 716">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="469 716 626 846">0</td> <td data-bbox="626 716 1398 846">Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td data-bbox="469 846 626 1005">1</td> <td data-bbox="626 846 1398 1005">Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <div data-bbox="462 1207 1404 1365" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation field</i>).</p> <div data-bbox="462 1522 1404 1680" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p> </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p>								

Name	Description
	<p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <p> <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1508</a>).</p>
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

## 2.6.23 Monitoring

The Monitoring component of the Keyfactor API provides a set of methods to support management of CRL and OCSP monitoring locations.

Table 375: Monitoring Endpoints

Endpoint	Method	Description	Link
/Revocation/	POST	Creates a new revocation monitoring location.	<a href="#">POST Monitoring Revocation on page 956</a>
/Revocation/	PUT	Edits the revocation monitoring location with the specified ID.	<a href="#">PUT Monitoring Revocation on page 964</a>
/Revocation/	GET	Returns details for all revocation monitoring location according to the provided filter and output parameters.	<a href="#">GET Monitoring Revocation on page 951</a>
/ResolveOSCP	POST	Resolves the given OCSP certificate authority.	<a href="#">POST Monitoring Resolve OSCP on page 972</a>
/Revocation/{id}	GET	Returns details for the revocation monitoring location with the specified ID.	<a href="#">GET Monitoring Revocation ID on the next page</a>
/Revocation/{id}	DELETE	Deletes the revocation monitoring location with the specified ID.	<a href="#">DELETE Monitoring Revocation ID below</a>
/Revocation/Test	POST	Tests the revocation monitoring alert with the specified ID.	<a href="#">POST Monitoring Revocation Test on page 973</a>
/Revocation/TestAll	POST	Tests the revocation monitoring alerts.	<a href="#">POST Monitoring Revocation Test All on page 974</a>

### 2.6.23.1 DELETE Monitoring Revocation ID

The DELETE Monitoring/Revocation/{id} method is used to delete the revocation monitoring location with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 376: DELETE Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see <a href="#">GET Monitoring Revocation on page 951</a> ) to retrieve a list of all the revocation monitoring locations to determine the ID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.23.2 GET Monitoring Revocation ID

The *GET /Monitoring/Revocation/{id}* method is used to retrieve the revocation monitoring location with the specified ID. This method returns HTTP 200 OK on a success with details of the location.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 377: GET Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see <a href="#">GET Monitoring Revocation on page 951</a> ) to retrieve a list of all the revocation monitoring locations to determine the ID.

Table 378: GET Monitoring Revocation {id} Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
Endpoint Type	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Enable Reminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>Warning Days</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	Warning Days	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description								
Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
Warning Days	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.								
Dashboard	<p>An object indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>Warning Hours</td> <td>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is</td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	Warning Hours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
Warning Hours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is								

Name	Description																
	<table border="1"> <thead> <tr> <th data-bbox="430 275 609 338">Value</th> <th data-bbox="609 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="430 338 609 520"></td> <td data-bbox="609 338 1398 520"> <p><i>CRL.</i></p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td> </tr> </tbody> </table>	Value	Description		<p><i>CRL.</i></p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>												
Value	Description																
	<p><i>CRL.</i></p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>																
Schedule	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table border="1"> <thead> <tr> <th data-bbox="430 638 602 701">Name</th> <th data-bbox="602 638 1398 701">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="430 701 602 764">Off</td> <td data-bbox="602 701 1398 764">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="430 764 602 1339">Interval</td> <td data-bbox="602 764 1398 1339"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Value	Description														
Certificate Authority Id	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p>														
Authority Name	<p>A string indicating the distinguished name of the CA. For example:</p> <pre data-bbox="708 1230 1373 1272"> CN=CorpIssuingCA1, DC=keyexample, DC=com </pre>														
Authority Name Id	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>														
Authority Key Id	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>														
Sample Serial Number	<p>A string indicating the serial number of the certificate used to identify the CA.</p>														
File Name	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.</p>														

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.23.3 GET Monitoring Revocation

The GET /Monitoring/Revocation method is used to retrieve all revocation monitoring locations. This method returns HTTP 200 OK on a success with details of both OCSP and CRL revocation endpoint configurations.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/monitoring/alerts/read/`

Table 379: GET Monitoring Revocation Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• DashboardWarningValue (WarningHours value)</li> <li>• DisplayName (Name)</li> <li>• EndpointType (1-CRL, 2-OCSP)</li> <li>• SendWarning (emailreminder) (true, false)</li> <li>• ShowOnDashboard (true, false)</li> <li>• Url</li> <li>• WarningDays</li> </ul> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> To return all revocation monitoring locations of type CRL, use the following query:</p> <p style="text-align: center;"><code>EndpointType -eq 1</code></p> <p>To return locations of type OCSP, use this query:</p> <p style="text-align: center;"><code>EndpointType -eq 2</code></p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 380: GET Monitoring Revocation Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
Endpoint Type	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Enable Reminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>Warning Days</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	Warning Days	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description								
Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
Warning Days	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.								
Dashboard	<p>An object indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>Warning Hours</td> <td>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is</td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	Warning Hours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
Warning Hours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is								

Name	Description																
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p><i>CRL.</i></p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td> </tr> </tbody> </table>	Value	Description		<p><i>CRL.</i></p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>												
Value	Description																
	<p><i>CRL.</i></p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>																
Schedule	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.23.4 POST Monitoring Revocation

The POST /Monitoring/Revocation method is used to add a revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 381: POST Monitoring Revocation Input Parameters

Name	In	Description								
Id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	<b>Required.</b> A string indicating the name of the revocation monitoring location.								
Endpoint Type	Body	<b>Required.</b> A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p><b>Required.</b> A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div style="border: 1px solid #f4a460; padding: 10px; margin: 10px 0;"> <p> <b>Important:</b> Because a “+” (plus sign) in a URL can represent either a space or a “+” Keyfactor Command has chosen to read “+” as a space. For CRL URLs that require a “+” (plus sign), rather than a space, replace plus signs in your CRL’s URL with “%2B”. Only replace the plus signs you don’t wish to be treated as a space.</p> </div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	Body	<p><b>Required*</b>. for CRL endpoints. An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1" style="margin: 10px auto; border-radius: 15px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Enable Reminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td> </tr> <tr> <td>Warning Days</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	Warning Days	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description									
Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
Warning Days	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.									
Dashboard	Body	<b>Required.</b> An object indicating the configuration for display on the dashboard. Dashboard details are:								

Name	In	Description										
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td><b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.</td> </tr> <tr> <td>Warning Hours</td> <td><b>Required*</b>. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>. <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>. If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td> </tr> </tbody> </table>	Value	Description	Show	<b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.	Warning Hours	<b>Required*</b> . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.				
Value	Description											
Show	<b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.											
Warning Hours	<b>Required*</b> . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.											
Schedule	Body	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60</pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description											
Off	Turn off a previously configured schedule.											
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.							
Name	Description											
Minutes	An integer indicating the number of minutes between each interval.

Value	Description															
Authority Id	<p>ence ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 369</a>) to retrieve a list of all the CAs to determine the ID.</p>															
Authority Name	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see <a href="#">POST Monitoring Resolve OSCP on page 972</a>) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>															
Authority Name Id	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see <a href="#">POST Monitoring Resolve OSCP on page 972</a>) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>															
Authority Key Id	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see <a href="#">POST Monitoring Resolve OSCP on page 972</a>) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>															
Sample Serial Number	<p>A string indicating the serial number of the certificate used to identify the CA.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see <a href="#">POST Monitoring Resolve OSCP on page 972</a>) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>															
File Name	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p>															

Table 382: POST Monitoring Revocation Response Data

Name	Description								
Name	A string indicating the name of the revocation monitoring location.								
Endpoint Type	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Enable Reminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>Warning Days</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	Warning Days	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description								
Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
Warning Days	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.								
Dashboard	<p>An object indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>Warning Hours</td> <td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	Warning Hours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
Warning Hours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>								

Name	Description																
Schedule	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Value	Description														
Certificate Authority Id	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p>														
Authority Name	<p>A string indicating the distinguished name of the CA. For example:</p> <p><code>CN=CorpIssuingCA1, DC=keyexample, DC=com</code></p>														
Authority Name Id	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>														
Authority Key Id	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>														
Sample Serial Number	<p>A string indicating the serial number of the certificate used to identify the CA.</p>														
File Name	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.</p>														

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.23.5 PUT Monitoring Revocation

The PUT /Monitoring/Revocation method is used to modify the revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 383: PUT Monitoring Revocation {id} Input Parameters

Name	In	Description								
Id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	<b>Required.</b> A string indicating the name of the revocation monitoring location.								
Endpoint Type	Body	<b>Required.</b> A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p><b>Required.</b> A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div style="border: 1px solid #f4a460; padding: 10px; margin: 10px 0;"> <p> <b>Important:</b> Because a “+” (plus sign) in a URL can represent either a space or a “+” Keyfactor Command has chosen to read “+” as a space. For CRL URLs that require a “+” (plus sign), rather than a space, replace plus signs in your CRL’s URL with “%2B”. Only replace the plus signs you don’t wish to be treated as a space.</p> </div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	Body	<p><b>Required*</b>. for CRL endpoints. An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1" style="margin: 10px 0;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Enable Reminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td> </tr> <tr> <td>Warning Days</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	Warning Days	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description									
Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
Warning Days	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.									
Dashboard	Body	<b>Required.</b> An object indicating the configuration for display on the dashboard. Dashboard details are:								

Name	In	Description										
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td><b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.</td> </tr> <tr> <td>Warning Hours</td> <td><b>Required*</b>. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>. <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>. If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td> </tr> </tbody> </table>	Value	Description	Show	<b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.	Warning Hours	<b>Required*</b> . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.				
Value	Description											
Show	<b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.											
Warning Hours	<b>Required*</b> . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.											
Schedule	Body	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60</pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description											
Off	Turn off a previously configured schedule.											
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.							
Name	Description											
Minutes	An integer indicating the number of minutes between each interval.											

Name	In	Description										
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>} }</td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> <b>Note:</b> Although the Keyfactor API Reference and Utility–Swagger–<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		} }	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see <a href="#">POST Monitoring Resolve OSCP on page 972</a>) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>	Sample Serial Number	<p>A string indicating the serial number of the certificate used to identify the CA.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see <a href="#">POST Monitoring Resolve OSCP on page 972</a>) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>	File Name	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p>
Value	Description															
Authority Id	<p>ence ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 369</a>) to retrieve a list of all the CAs to determine the ID.</p>															
Authority Name	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see <a href="#">POST Monitoring Resolve OSCP on page 972</a>) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>															
Authority Name Id	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see <a href="#">POST Monitoring Resolve OSCP on page 972</a>) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>															
Authority Key Id	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see <a href="#">POST Monitoring Resolve OSCP on page 972</a>) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>															
Sample Serial Number	<p>A string indicating the serial number of the certificate used to identify the CA.</p> <p>Use the <i>POST /Monitoring/ResolveOCSP</i> method (see <a href="#">POST Monitoring Resolve OSCP on page 972</a>) with the <i>CertificateAuthorityId</i> or <i>CertificateContents</i> to resolve this value.</p>															
File Name	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p>															

Table 384: PUT Monitoring Revocation {id} Response Data

Name	Description								
Name	A string indicating the name of the revocation monitoring location.								
Endpoint Type	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Enable Reminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>Warning Days</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings indicating the email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	Warning Days	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description								
Enable Reminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
Warning Days	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.								
Dashboard	<p>An object indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>Warning Hours</td> <td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	Warning Hours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
Warning Hours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>								

Name	Description																
Schedule	<p>An object containing the inventory schedule set for the revocation monitoring location. Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																

Name	Description														
	<p> <i>Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>														
OCSP Parameters	<p>For OCSP endpoints only, an object indicating the OCSP endpoint configuration. OCSP endpoint details are:</p> <table border="1" data-bbox="431 527 1406 1398"> <thead> <tr> <th data-bbox="431 527 634 590">Value</th> <th data-bbox="634 527 1406 590">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="431 590 634 758">Certificate Authority Id</td> <td data-bbox="634 590 1406 758"> <p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p> </td> </tr> <tr> <td data-bbox="431 758 634 905">Authority Name</td> <td data-bbox="634 758 1406 905"> <p>A string indicating the distinguished name of the CA. For example:</p> <p><code>CN=CorpIssuingCA1, DC=keyexample, DC=com</code></p> </td> </tr> <tr> <td data-bbox="431 905 634 1010">Authority Name Id</td> <td data-bbox="634 905 1406 1010"> <p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p> </td> </tr> <tr> <td data-bbox="431 1010 634 1136">Authority Key Id</td> <td data-bbox="634 1010 1406 1136"> <p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p> </td> </tr> <tr> <td data-bbox="431 1136 634 1230">Sample Serial Number</td> <td data-bbox="634 1136 1406 1230"> <p>A string indicating the serial number of the certificate used to identify the CA.</p> </td> </tr> <tr> <td data-bbox="431 1230 634 1398">File Name</td> <td data-bbox="634 1230 1406 1398"> <p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.</p> </td> </tr> </tbody> </table>	Value	Description	Certificate Authority Id	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p>	Authority Name	<p>A string indicating the distinguished name of the CA. For example:</p> <p><code>CN=CorpIssuingCA1, DC=keyexample, DC=com</code></p>	Authority Name Id	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>	Authority Key Id	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>	Sample Serial Number	<p>A string indicating the serial number of the certificate used to identify the CA.</p>	File Name	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.</p>
Value	Description														
Certificate Authority Id	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p>														
Authority Name	<p>A string indicating the distinguished name of the CA. For example:</p> <p><code>CN=CorpIssuingCA1, DC=keyexample, DC=com</code></p>														
Authority Name Id	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>														
Authority Key Id	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>														
Sample Serial Number	<p>A string indicating the serial number of the certificate used to identify the CA.</p>														
File Name	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.</p>														

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.23.6 POST Monitoring Resolve OSCP

The POST /Monitoring/ResolveOCSP method is used to resolve the given OCSP certificate authority. This method returns HTTP 200 OK on a success with details of the location.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 385: POST Monitoring Resolve OCSP Input Parameters

Name	In	Description
CertificateContents	Body	<b>Required*</b> . A string indicating the certificate contents of a base-64 encoded PEM issued by the CA that you wish to resolve. One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.
CertificateAuthorityId	Body	<b>Required*</b> . An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 369</a> ) to retrieve a list of all the CAs to determine the ID. One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.

Table 386: POST Monitoring Resolve OCSP Response Data

Name	Description
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.
AuthorityName	A string indicating the resolved certificate authority's name in X.500 format.
AuthorityNameId	A string indicating the hash of the certificate authority's name in hex format.
AuthorityKeyId	A string indicating the public key of the certificate authority's certificate.
SampleSerialNumber	A string indicating the serial number of the certificate authority's certificate.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.23.7 POST Monitoring Revocation Test

The POST /Monitoring/Revocation/Test method is used to test email alerts for a single configured revocation monitoring endpoint. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

**Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /monitoring/alerts/read/  
 /monitoring/alerts/test/

Table 387: POST Monitoring Revocation Test Input Parameters

Name	Description
AlertId	<b>Required.</b> An integer indicating the reference ID of revocation monitoring alert to test.
EvaluationDate	<b>Required.</b> A string indicating the evaluation date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).  You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.
SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 388: POST Monitoring Revocation Test Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An array of objects containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject</td> <td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td> </tr> <tr> <td>Message</td> <td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings containing the recipient(s) for the alert.</td> </tr> </tbody> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An array of strings containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An array of strings containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.23.8 POST Monitoring Revocation Test All

The POST /Monitoring/Revocation/Test method is used to test email alerts for all configured revocation monitoring endpoints. Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting or when an OCSP endpoint is unreachable. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

 **Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't

be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/monitoring/alerts/read/  
/monitoring/alerts/test/

Table 389: POST Monitoring Revocation Test All Input Parameters

Name	Description
EvaluationDate	<p><b>Required.</b> A string indicating the evaluation date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p> <p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p>
SendAlerts	<p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p>

Table 390: POST Monitoring Revocation Test All Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An array of objects containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject</td> <td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td> </tr> <tr> <td>Message</td> <td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td> </tr> <tr> <td>Recipients</td> <td>An array of strings containing the recipient(s) for the alert.</td> </tr> </tbody> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An array of strings containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An array of strings containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.24 Orchestrator Jobs

The Orchestrator Jobs component of the Keyfactor API includes methods necessary to schedule orchestrator jobs and view the results of jobs.

Table 391: Orchestrator Jobs Endpoints

Endpoint	Method	Description	Link
/JobStatus/Data	GET	Retrieves the results of a custom job using the provided information.	<a href="#">GET Orchestrator Jobs Job Status Data on the next page</a>
/JobHistory	GET	Returns the details of history records on orchestrator jobs, including in-process jobs.	<a href="#">GET Orchestrator Jobs Job History on page 978</a>

Endpoint	Method	Description	Link
/ScheduledJobs	GET	Returns the details of active scheduled jobs, including in-process jobs.	<a href="#">GET Orchestrator Jobs Scheduled Jobs on page 984</a>
/Custom	POST	Schedules a custom job on the orchestrator using the provided information.	<a href="#">POST Orchestrator Jobs Custom on page 988</a>
/Reschedule	POST	Reschedules a failed orchestrator job.	<a href="#">POST Orchestrator Jobs Reschedule on page 993</a>
/Unschedule	POST	Unscheduled an active orchestrator job.	<a href="#">POST Orchestrator Jobs Unschedule on page 995</a>
/Acknowledge	POST	Sets the status of a failed orchestrator job to acknowledged.	<a href="#">POST Orchestrator Jobs Acknowledge on page 997</a>
/Custom/Bulk	POST	Schedules a custom job on multiple orchestrator using the provided information.	<a href="#">POST Orchestrator Jobs Reschedule on page 993</a>

### 2.6.24.1 GET Orchestrator Jobs Job Status Data

The GET /OrchestratorJobs/JobStatus/Data method is used to return the data generated from a completed custom orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with up to 2 MB of data from the job results.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/

 **Tip:** This method is used to return the log results from a Fetch Logs job initiated for the Keyfactor Universal Orchestrator. When used to return results for a Fetch Logs job, the last 2 MB of data from the orchestrator's log file are returned as a string in the Data field.

 **Tip:** If jobs for the Keyfactor Universal Orchestrator fail with messages similar to the following:  
2021-08-05 10:47:23.1940  
Keyfactor.Orchestrators.JobExecutors.OrchestratorJobExecutor [Debug] - Response

status code does not indicate success: 413 (Request Entity Too Large).

```
at System.Net.Http.HttpResponseMessage.EnsureSuccessStatusCode() in /_
/src/System.Net.Http/src/System/Net/Http/HttpResponseMessage.cs:line 172
```

```
at Keyfactor.Orchestrators.Services.HttpService.SendPostAsync[T](String uri,
Object requestData, Dictionary`2 headers) in F:\BuildAgents\Default1\
work\24\s\src\OrchestratorServices\HttpService.cs:line 38
```

This indicates that the amount of data being returned on the job is greater than IIS on the Keyfactor Command server is configured to accept. You will need to make modifications to the IIS settings on your Keyfactor Command server to allow it to accept larger incoming pieces of content. See *Orchestrator Management Operations: Fetch Logs* in the *Keyfactor Command Reference Guide* for more information.

Table 392: GET Orchestrator Jobs Job Status Data Input Parameters

Name	In	Description
jobHistoryId	Query	<b>Required.</b> The Keyfactor Command reference ID of the orchestrator job. Use the GET /OrchestratorJobs/JobHistory method (see <a href="#">GET Orchestrator Jobs Job History below</a> ) to retrieve a list of jobs to determine the job's history ID.

Table 393: GET Orchestrator Jobs Job Status Data Response Data

Name	Description
JobHistoryId	An integer indicate the Keyfactor Command reference ID used to track progress during orchestrator jobs.
Data	A string containing up to 2 MB of data returned from the custom job.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.24.2 GET Orchestrator Jobs Job History

The GET /OrchestratorJobs/JobHistory method is used to retrieve the status of an in progress or completed orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with details of the requested orchestrator jobs.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/

Table 394: GET Orchestrator Jobs Job History Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Job History Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• AgentId (The GUID of the orchestrator. Run <a href="#">GET Agents on page 17</a> to find the ID.)</li> <li>• Agent (ClientMachine)</li> <li>• JobId</li> <li>• Result (Job result: 4-Failure, 3-Warning, 2-Success, 0-Unknown)</li> <li>• Status (Job status: 4-Acknowledged, 3-Completed, 2-InProcess, 1-Waiting, 0-Unknown, 5-CompletedWillRetry)</li> <li>• JobType (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync)</li> <li>• Message</li> <li>• OperationStart (DateTime)</li> <li>• ScheduleType (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_( Monthly), O_(Once))</li> <li>• TargetPath</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>JobHistoryId</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 395: GET Orchestrator Jobs Job History Response Data

Name	Description												
JobHistoryId	An integer indicating the Keyfactor Command reference ID used to track progress during orchestrator jobs.												
AgentMachine	A string indicating the name of the server on which the agent or orchestrator is installed. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.												
JobId	A string indicating the Keyfactor Command reference GUID assigned to the job.												
Schedule	<p>The inventory schedule for the most recently run instance of the orchestrator job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="470 275 669 336">Name</th> <th data-bbox="669 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="470 336 669 625"></td> <td data-bbox="669 336 1398 625"> <table border="1"> <thead> <tr> <th data-bbox="691 357 857 420">Name</th> <th data-bbox="857 357 1375 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="691 420 857 617">Time</td> <td data-bbox="857 420 1375 617">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).				
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).								
JobType	A string indicating the job type (e.g. IISInventory).								
OperationStart	The time, in UTC, at which the orchestrator job started.								
OperationEnd	The time, in UTC, at which the orchestrator job finished.								
Message	A string providing the error message for the operation, if any.								
Result	<p>A string indicating the result of the orchestrator job. Possible values are:</p> <ul style="list-style-type: none"> <li>Unknown</li> <li>Success</li> <li>Warning</li> <li>Failure</li> </ul>								
Status	<p>A string indicating the status of the orchestrator job. Possible values are:</p> <ul style="list-style-type: none"> <li>Unknown</li> <li>Waiting</li> <li>In Process</li> </ul>								

Name	Description
	<ul style="list-style-type: none"> <li>• Completed</li> <li>• Acknowledged</li> <li>• Completed Will Retry</li> </ul>
StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.24.3 GET Orchestrator Jobs Scheduled Jobs

The GET /OrchestratorJobs/ScheduledJobs method is used to retrieve orchestrator (a.k.a. agent) jobs that have active schedules. This includes jobs with ongoing schedules, such as inventory jobs that run periodically, and jobs that have been scheduled but have not yet been completed, such as management or discovery jobs. Both jobs that have not yet started and in-progress jobs are returned by this method. This method returns HTTP 200 OK on a success with details of the scheduled orchestrator jobs.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/read/

Table 396: GET Orchestrator Jobs Scheduled Jobs Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Job History Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• AgentId (The GUID of the orchestrator. Run <a href="#">GET Agents on page 17</a> to find the ID.)</li> <li>• Agent Machine (ClientMachine)</li> <li>• AgentPlatform (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator)</li> <li>• JobType (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync)</li> <li>• AgentType (Use -contains comparison) (see capabilities in <a href="#">GET Agents on page 17</a>)</li> <li>• Requested (DateTime)</li> <li>• ScheduleType (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_( Monthly), O_(Once)</li> <li>• TargetPath</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Requested</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 397: GET Orchestrator Jobs Scheduled Jobs Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID assigned to the job.
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Target	A string indicating the server name and path to the certificate store on the target (e.g. appsvr162.keyexample.com - /opt/app/store.cer). The server name included in the <i>Target</i> is the value from the <i>ClientMachine</i> . The format for the path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). Some types of jobs (e.g. discovery) have no path. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Name	Description
Schedule	

Name	Description
Requested	The time, in UTC, at which the orchestrator job was initiated and added to the job queue.
JobType	A string indicating the job type (e.g. IISInventory).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.24.4 POST Orchestrator Jobs Custom

The POST `/OrchestratorJobs/Custom` method is used to schedule a job with a custom job type on an orchestrator. This method returns HTTP 200 OK on a success with the GUID for the scheduled job.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/agents/management/modify/`

 **Tip:** Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the `GET /OrchestratorJobs/JobHistory` method (see [GET Orchestrator Jobs Job History on page 978](#)) to determine the `JobHistoryId` of the completed job and then use the `GET /OrchestratorJobs/JobStatus/Data` method (see [GET Orchestrator Jobs Job Status Data on page 977](#)) to retrieve the data.

Table 398: POST Orchestrator Jobs Custom Input Parameters

Name	In	Description								
AgentId	Body	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</p> <p>To schedule a Fetch Logs job, use the <code>GET /Agents</code> method (see <a href="#">GET Agents on page 17</a>) with a query of <code>Status -eq 2</code> and <code>Capabilities -contains "LOGS"</code> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrator for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <code>GET /Agents</code> method (see <a href="#">GET Agents on page 17</a>) with a query of <code>Status -eq 2</code> to retrieve a list of your approved orchestrators to determine the ID of the orchestrator for which you want to schedule a custom job with your custom job type.</p>								
JobTypeName	Body	<p><b>Required.</b> A string indicating the reference name for the custom job type for the job.</p> <p>Use the <code>GET /JobTypes/Custom</code> method (see <a href="#">GET Custom Job Types on page 751</a>) to retrieve a list of your defined custom job types to determine the job type name to use.</p>								
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).                             <div style="border: 1px solid #ccc; border-radius: 10px; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <span style="font-size: 1.2em;">★</span> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.                             </div> </td> </tr> <tr> <td>Weekly</td> <td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid #ccc; border-radius: 10px; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <span style="font-size: 1.2em;">★</span> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.                             </div>	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description									
Off	Turn off a previously configured schedule.									
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid #ccc; border-radius: 10px; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <span style="font-size: 1.2em;">★</span> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.                             </div>									
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:									

Name	In	Description						
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).		
Name	Description							
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).							

Name	In	Description				
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </td> </tr> </tbody> </table> <p> <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>The default is <i>Immediate</i>.</p>	Name	Description		 <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i> .
Name	Description					
	 <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i> .					
JobFields	Body	<p>An object that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <pre>"JobFields": {   "Favorite Type of Pet": "Rat",   "Mother's Birthday": "1952-05-21" }</pre> <p> <b>Note:</b> If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value.</p> <p>Use the <a href="#">GET /JobTypes/Custom</a> method (see <a href="#">GET Custom Job Types on page 751</a>) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <p> <b>Tip:</b> The built-in Fetch Logs job does not have any optional job fields.</p>				

Table 399: POST Orchestrator Jobs Custom Response Data

Name	Description
JobId	A string indicating the Keyfactor Command reference GUID for the job.
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
JobTypeName	A string indicating the reference name for the custom job type for the job.
Schedule	An object containing the schedule for the custom job.
JobFields	An array of objects that set the values for any optional job fields configured for the custom job type.
RequestTimestamp	A string containing the date, in UTC, when the custom job was submitted.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.24.5 POST Orchestrator Jobs Reschedule

The POST /OrchestratorJobs/Reschedule method is used to reschedule a failed orchestrator job to retry. Jobs must have a result of Failed and a status of Completed or Acknowledged to be eligible for rescheduling. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for rescheduling, including:

- Certificate Store Management
- Reenrollment
- Mac Auto-enrollment
- JKS, PEM and F5 Certificate Store Discovery
- SSH Synchronization
- Custom Jobs scheduled to run Weekly or Monthly

The following types of jobs cannot be rescheduled with this method:

- Certificate Store Inventory  
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 619](#)).

- Custom Jobs scheduled to run Immediately or Exactly Once  
A new custom job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 988](#)).
- Fetch Logs  
A new fetch logs job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 988](#)).
- SSL Discovery and Monitoring  
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1478](#)).
- CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator  
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 414](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/modify/  
/certificate\_stores/schedule/  
OR

/agents/management/modify/  
/certificate\_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)

The required permissions will vary depending on the job type being rescheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Tip:** Be sure to resolve the problem that caused the job to fail before rescheduling it.

Table 400: POST Orchestrator Jobs Reschedule Input Parameters

Name	In	Description
JobAuditIds	Body	<p><b>Required*</b>. An array of integers indicating the job IDs of the failed jobs that should be scheduled to retry.</p> <p>Use the <a href="#">GET /OrchestratorJobs/JobHistory</a> method (see <a href="#">GET Orchestrator Jobs Job History on page 978</a>) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for rescheduling:</p> <pre>JobType -ne "Inventory" AND Result -eq "4" AND (Status -eq "4" OR Status -eq "3")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>
Query	Body	<p><b>Required*</b>. A string containing a query to identify the jobs to reschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, see to <i>Orchestrator Scheduled Job Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.24.6 POST Orchestrator Jobs Unschedule

The POST /OrchestratorJobs/Unschedule method is used to unschedule a scheduled orchestrator job. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for unscheduling, including:

- Certificate Store Discovery and Management
- Reenrollment
- Mac Auto-enrollment
- Fetch Logs
- Custom Jobs

The following types of jobs cannot be unscheduled with this method:

- **Certificate Store Inventory**  
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 619](#)).
- **SSH Synchronization**  
Change the schedule on these using PUT /SSH/ServerGroups (see [PUT SSH Server Groups on page 1339](#)).
- **SSL Discovery and Monitoring**  
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1478](#)).
- **CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator**  
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 414](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/modify/  
/certificate\_stores/schedule/  
OR

/agents/management/modify/  
/certificate\_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)

The required permissions will vary depending on the job type being unscheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 401: POST Orchestrator Jobs Unschedule Input Parameters

Name	In	Description
JobIds	Body	<p><b>Required*</b>. An array of strings indicating the GUIDs for the job IDs of the jobs that should be unscheduled.</p> <p>Use the <code>GET /OrchestratorJobs/ScheduledJobs</code> method (see <a href="#">GET Orchestrator Jobs Scheduled Jobs on page 984</a>) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for unscheduling:</p> <pre>JobType -notcontains "SslDiscovery" AND JobType -notcontains "Monitoring" AND JobType -notcontains "Sync" AND JobType -notcontains "SSHSync" AND JobType -notcontains "Inventory"</pre> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>
Query	Body	<p><b>Required*</b>. A string containing a query to identify the jobs to unschedule (e.g. <code>field1 -eq value1 AND field2 -gt value2</code>). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, see to <i>Orchestrator Scheduled Job Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>.</p> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.24.7 POST Orchestrator Jobs Acknowledge

The `POST /OrchestratorJobs/Acknowledge` method is used to set an orchestrator job to a status of acknowledged. Jobs must have a result of Failed or Warning and a status of Completed or CompletedWillRetry to be eligible for acknowledgment. Jobs that are in process or that have completed successfully cannot be set to a status of acknowledged. Setting a job to a status of acknowledged removes it from the count on the job history tab in the Keyfactor Command Management Portal (if the job falls within the count period defined by the *Job Failures and Warnings Age Out (days)* application setting—see *Application Settings: Agents Tab* in the *Keyfactor Command Reference Guide*). This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/modify/

Table 402: POST Orchestrator Jobs Acknowledge Input Parameters

Name	In	Description
JobAuditIds	Body	<p><b>Required*</b>. An array of integers indicating the job IDs of the jobs that should be set to a status of acknowledged.</p> <p>Use the <a href="#">GET /OrchestratorJobs/JobHistory</a> method (see <a href="#">GET Orchestrator Jobs Job History on page 978</a>) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for acknowledgment:</p> <pre>(Result -eq "4" OR Result -eq "3") AND (Status -eq "3" OR Status -eq "5")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>
Query	Body	<p><b>Required*</b>. A string containing a query to identify the jobs to acknowledge (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, see to <i>Orchestrator Scheduled Job Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.24.8 POST Orchestrator Jobs Custom Bulk

The POST /OrchestratorJobs/Custom/Bulk method is used to schedule a job with a specified custom job type on multiple orchestrators at once. This method returns HTTP 200 OK on a success with the GUIDs for the scheduled jobs.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/agents/management/modify/

 **Tip:** Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the [GET /OrchestratorJobs/JobHistory](#) method (see [GET Orchestrator Jobs Job History on page 978](#)) to

determine the *JobHistoryId* of the completed job and then use the *GET /OrchestratorJobs/JobStatus/Data* method (see [GET Orchestrator Jobs Job Status Data on page 977](#)) to retrieve the data.

Table 403: POST Orchestrator Jobs Custom Bulk Input Parameters

Name	In	Description												
Orchestrator Ids	Body	<p><b>Required.</b> A string indicating the Keyfactor Command referenced GUIDs of the orchestrators what will execute the jobs.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 17</a>) with a query of <i>Status -eq 2</i> and <i>Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrators for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 17</a>) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrators for which you want to schedule a custom job with your custom job type.</p>												
JobType Name	Body	<p><b>Required.</b> A string indicating the reference name for the custom job type for the job. A single bulk operation can only execute one job type.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 751</a>) to retrieve a list of your defined custom job types to determine the job type name to use.</p>												
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table border="1" data-bbox="581 1024 1404 1732"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any</td> </tr> </tbody> </table> <table border="1" data-bbox="803 1575 1372 1732"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).									

 **Note:** Although the Keyfactor API Reference and Utility–

Name	In	Description
		<p> Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>The default is <i>Immediate</i>.</p>
JobFields	Body	<p>An object that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <pre data-bbox="581 674 1404 888"> "JobFields": {   "Favorite Type of Pet": "Rat",   "Mother's Birthday": "1952-05-21" } </pre> <p> <b>Note:</b> If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value.</p> <p>Use the <a href="#">GET /JobTypes/Custom</a> method (see <a href="#">GET Custom Job Types on page 751</a>) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <p> <b>Tip:</b> The built-in Fetch Logs job does not have any optional job fields.</p>

Table 404: POST Orchestrator Jobs Custom Bulk Response Data

Name	Description						
Orchestrator Job Pairs	<p>An array of objects containing identifying information for each orchestrator on which the job will be run. Orchestrator job pair parameters include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>JobId</td> <td>A string indicating the Keyfactor Command reference GUID for the job.</td> </tr> <tr> <td>Orchestrator Id</td> <td>A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</td> </tr> </tbody> </table>	Value	Description	JobId	A string indicating the Keyfactor Command reference GUID for the job.	Orchestrator Id	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
Value	Description						
JobId	A string indicating the Keyfactor Command reference GUID for the job.						
Orchestrator Id	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.						
JobType Name	A string indicating the reference name for the custom job type for the job.						
Schedule	An object containing the schedule for the custom job.						
JobFields	An array of objects indicating the values for any optional job fields configured for the custom job type.						
Request Timestmap	A string indicating the date, in UTC, when the custom job was submitted.						

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.25 PAM Providers

Privileged Access Management (PAM) functionality in the Keyfactor API allows for configuration of third party PAM providers to secure certificate stores and provide access credentials for certificate authorities, workflows, and other functions. PAM functionality is provided using custom PAM extensions. Keyfactor provides several PAM extensions on the publicly-facing Keyfactor GitHub:

<https://keyfactor.github.io/integrations-catalog/content/pam>

The PAM component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list PAM providers and PAM provider types. PAM provider types must be created before PAM providers for them can be created.

Table 405: PamProviders Endpoints

Endpoint	Method	Description	Link
/	GET	Returns a list of all the configured PAM providers.	<a href="#">GET PAM Providers on page 1030</a>
/	POST	Creates a new PAM provider.	<a href="#">POST PAM Providers on page 1045</a>
/	PUT	Updates a PAM provider.	<a href="#">PUT PAM Providers on page 1062</a>
/id}	GET	Returns information for the specified PAM provider.	<a href="#">GET PAM Providers ID on the next page</a>
/id}	DELETE	Deletes a PAM provider.	<a href="#">DELETE PAM Providers ID below</a>
/Types	GET	Returns a list of all available PAM provider types.	<a href="#">GET PAM Providers Types on page 1019</a>
/Types	POST	Creates a new PAM provider type.	<a href="#">POST PAM Providers Types on page 1023</a>
/Types	GET	Returns the PAM provider type with the specified ID.	<a href="#">GET PAM Providers Types ID on page 1078</a>

### 2.6.25.1 DELETE PAM Providers ID

The DELETE /PamProviders/{id} method is used to delete a PAM provider by ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/pam/modify/

OR

/pam/modify/#/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

Table 406: DELETE PamProviders {id} v1 & v2 Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the PAM provider to be deleted. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of all the PAM providers to determine the PAM provider's ID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## 2.6.25.2 GET PAM Providers ID

The *GET /PamProviders/{id}* method is used to return a PAM provider by ID. This method returns HTTP 200 OK on a success with details about the specified PAM provider.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/pam/read/  
OR  
/pam/read/#/ (where # is a reference to a specific PAM provider ID)  
Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the *GET /PamProviders/{id}* method has been redesigned to remove references to PAM associations with areas and containers.

Table 407: GET PamProviders {id} v2 Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the PAM provider to retrieve. Use the <i>GET /PAM/Providers</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of all the PAM providers to determine the provider's ID.

Table 408: GET PamProviders {id} v2 Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																		
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																		
Provider Type	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider Type Params</td> <td> <p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> <tr> <td>Data Type</td> <td> <p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> </ul> </td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider type.	Name	A string indicating the name of the provider type.	Provider Type Params	<p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> <tr> <td>Data Type</td> <td> <p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> </ul> </td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type.	Name	A string indicating the internal name for the PAM provider type parameter.	Display Name	A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).	Data Type	<p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> </ul>
Value	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the provider type.																		
Name	A string indicating the name of the provider type.																		
Provider Type Params	<p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> <tr> <td>Data Type</td> <td> <p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> </ul> </td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type.	Name	A string indicating the internal name for the PAM provider type parameter.	Display Name	A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).	Data Type	<p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> </ul>								
Value	Description																		
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type.																		
Name	A string indicating the internal name for the PAM provider type parameter.																		
Display Name	A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).

For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.	Instance	A Boolean that sets whether the parameter is used
Value	Description																						
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.																						
Value	A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).																						
Instance Id	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used. This is considered deprecated and may be removed in a future release.																						
Instance Guid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used. This is considered deprecated and may be removed in a future release.																						
Provider Type Param	An object indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td> </tr> <tr> <td>Instance</td> <td>A Boolean that sets whether the parameter is used</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	Display Name	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.	Instance	A Boolean that sets whether the parameter is used												
Value	Description																						
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.																						
Name	A string indicating the internal name for the PAM provider type parameter.																						
Display Name	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.																						
Instance	A Boolean that sets whether the parameter is used																						

Name	Description								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Level</td> <td>to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Value	Description		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Level</td> <td>to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.</td> </tr> </tbody> </table>	Value	Description	Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.
Value	Description								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Level</td> <td>to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.</td> </tr> </tbody> </table>	Value	Description	Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.				
Value	Description								
Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.								
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .								

## Version 1

Version 1 of the GET /PamProviders/{id} method includes the same capabilities as version 2 except it includes references to the deprecated parameters related to the area of Keyfactor Command to which the PAM provider applies.

Table 409: GET PamProviders {id} Iv1 nput Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the PAM provider to retrieve. Use the <i>GET /PAM/Providers</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of all the PAM providers to determine the provider's ID.

Table 410: GET PamProviders {id} v1 Response Data

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. This is considered deprecated and may be removed in a future release.																
Provider Type	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider Type Params</td> <td> <p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider type.	Name	A string indicating the name of the provider type.	Provider Type Params	<p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type.	Name	A string indicating the internal name for the PAM provider type parameter.	Display Name	A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).
Value	Description																
Id	A string indicating the Keyfactor Command reference GUID for the provider type.																
Name	A string indicating the name of the provider type.																
Provider Type Params	<p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type.	Name	A string indicating the internal name for the PAM provider type parameter.	Display Name	A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).								
Value	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type.																
Name	A string indicating the internal name for the PAM provider type parameter.																
Display Name	A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).

Value	Description																						
	<pre>{   "Name": "SecretFieldName",   "DisplayName": "Secret Field Name",   "InstanceLevel": true,   "DataType": "string" }</pre> <p>In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in Delinea where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array.</p>																						
Provider Type	An object containing details for the provider type. Provider type parameters include: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type.</td> </tr> <tr> <td>Provider Type Params</td> <td>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.</td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type.	Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.														
Value	Description																						
Id	A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.																						
Name	A string indicating the internal name for the PAM provider type.																						
Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.																						
Provider Type Param Values	An array of objects containing the values for the provider types specified by ProviderTypeParam. The field does not return data on responses.																						
Provider Type	An array of objects containing the values for the provider types specified by ProviderTypeParam. . Provider type parameter values include:																						

Name	Description																						
Param Values	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).</td> </tr> <tr> <td>Instance Id</td> <td>An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used. This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Instance Guid</td> <td>A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used. This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Provider Type Param</td> <td>An object indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td> </tr> <tr> <td>Instance</td> <td>A Boolean that sets whether the parameter is used</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Value	A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).	Instance Id	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used. This is considered deprecated and may be removed in a future release.	Instance Guid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used. This is considered deprecated and may be removed in a future release.	Provider Type Param	An object indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Name	A string indicating the internal name for the PAM provider type parameter.	Display Name	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.	Instance	A Boolean that sets whether the parameter is used
	Value	Description																					
	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.																					
	Value	A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).																					
	Instance Id	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used. This is considered deprecated and may be removed in a future release.																					
	Instance Guid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used. This is considered deprecated and may be removed in a future release.																					
Provider Type Param	An object indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td> </tr> <tr> <td>Instance</td> <td>A Boolean that sets whether the parameter is used</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	Display Name	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.	Instance	A Boolean that sets whether the parameter is used												
Value	Description																						
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.																						
Name	A string indicating the internal name for the PAM provider type parameter.																						
Display Name	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.																						
Instance	A Boolean that sets whether the parameter is used																						

Name	Description								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Level</td> <td>to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Value	Description		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Level</td> <td>to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.</td> </tr> </tbody> </table>	Value	Description	Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.
Value	Description								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Level</td> <td>to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.</td> </tr> </tbody> </table>	Value	Description	Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.				
Value	Description								
Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.								
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .								
Secure Area Id	An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any. This is considered deprecated and may be removed in a future release.								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.25.3 GET PAM Providers Types

The GET /PamProviders/Types method returns a list of all the PAM provider types that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider type. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/pam/read/  
OR  
/pam/read/#/ (where # is a reference to a specific PAM provider ID)  
Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#). The data returned in the response is the same for both versions.

Table 411: GET PamProviders Types v1 & v2 Response Data

Name	Description																												
Id	A string containing the Keyfactor Command reference GUID for the PAM provider type.																												
Name	A string containing the name of the PAM provider type.																												
Parameters	<p>An array of objects containing parameters set for the PAM provider type. Parameter details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td> <p>An integer indicating the ID of the parameter. Parameters will vary depending on your PAM extension. Built-in parameters include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Private Ark Safe</td> </tr> <tr> <td>2</td> <td>PrivateArk Folder Name</td> </tr> <tr> <td>3</td> <td>PrivateArk Protected Password Name</td> </tr> <tr> <td>4</td> <td>Application ID</td> </tr> <tr> <td>5</td> <td>Secret Server Url</td> </tr> <tr> <td>6</td> <td>Rule Name</td> </tr> <tr> <td>7</td> <td>Thycotic Secret ID</td> </tr> <tr> <td>8</td> <td>Rule Key</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> <tr> <td>DataType</td> <td> <p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> </ul> </td> </tr> </tbody> </table>	Value	Description	Id	<p>An integer indicating the ID of the parameter. Parameters will vary depending on your PAM extension. Built-in parameters include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Private Ark Safe</td> </tr> <tr> <td>2</td> <td>PrivateArk Folder Name</td> </tr> <tr> <td>3</td> <td>PrivateArk Protected Password Name</td> </tr> <tr> <td>4</td> <td>Application ID</td> </tr> <tr> <td>5</td> <td>Secret Server Url</td> </tr> <tr> <td>6</td> <td>Rule Name</td> </tr> <tr> <td>7</td> <td>Thycotic Secret ID</td> </tr> <tr> <td>8</td> <td>Rule Key</td> </tr> </tbody> </table>	Value	Description	1	Private Ark Safe	2	PrivateArk Folder Name	3	PrivateArk Protected Password Name	4	Application ID	5	Secret Server Url	6	Rule Name	7	Thycotic Secret ID	8	Rule Key	Name	A string indicating the internal name for the PAM parameter.	Display Name	A string indicating the display name for the PAM parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).	DataType	<p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> </ul>
Value	Description																												
Id	<p>An integer indicating the ID of the parameter. Parameters will vary depending on your PAM extension. Built-in parameters include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Private Ark Safe</td> </tr> <tr> <td>2</td> <td>PrivateArk Folder Name</td> </tr> <tr> <td>3</td> <td>PrivateArk Protected Password Name</td> </tr> <tr> <td>4</td> <td>Application ID</td> </tr> <tr> <td>5</td> <td>Secret Server Url</td> </tr> <tr> <td>6</td> <td>Rule Name</td> </tr> <tr> <td>7</td> <td>Thycotic Secret ID</td> </tr> <tr> <td>8</td> <td>Rule Key</td> </tr> </tbody> </table>	Value	Description	1	Private Ark Safe	2	PrivateArk Folder Name	3	PrivateArk Protected Password Name	4	Application ID	5	Secret Server Url	6	Rule Name	7	Thycotic Secret ID	8	Rule Key										
Value	Description																												
1	Private Ark Safe																												
2	PrivateArk Folder Name																												
3	PrivateArk Protected Password Name																												
4	Application ID																												
5	Secret Server Url																												
6	Rule Name																												
7	Thycotic Secret ID																												
8	Rule Key																												
Name	A string indicating the internal name for the PAM parameter.																												
Display Name	A string indicating the display name for the PAM parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).																												
DataType	<p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> </ul>																												

Name	Description	
	Value	Description
		<ul style="list-style-type: none"> <li>• 2 = Secret</li> </ul>
Instance Level		<p>A Boolean that sets whether the parameter is used to define the underlying PAM provider (false) or a field that needs to be set to a value when configuring a record (e.g. a certificate store) to use the PAM provider (true).</p> <div data-bbox="630 575 1382 1709" style="background-color: #fff9c4; padding: 10px; border: 1px solid #ccc;"> <p> <b>Example:</b> For Delinea when defining a PAM provider, you configure two Delinea-specific fields:</p> <ul style="list-style-type: none"> <li>• Secret Server URL: The URL to the Secret Server vault instance, including port number if applicable (e.g. <code>https://websrvr38.keyexample.com/SecretServer</code>).</li> <li>• Secret Server Username: The name of the user that will be used to connect to SecretServer.</li> <li>• Secret Server Password: The password of the user that will be used to connect to SecretServer.</li> </ul> <p>Because these fields are configured on the PAM provider definition, they appear as InstanceLevel=False like so:</p> <pre data-bbox="708 991 1373 1709"> {   "Name": "Host",   "DisplayName": "Secret Server URL",   "InstanceLevel": false,   "DataType": "string" }, {   "Name": "Username",   "DisplayName": "Secret Server Username",   "InstanceLevel": false,   "DataType": "secret" }, {   "Name": "Password",   "DisplayName": "Secret Server Password",   "InstanceLevel": false,   "DataType": "secret" } </pre> </div>

Name	Description				
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p> When you configure a certificate store to use Delinea as a credential provider, you enter the name of the secret field in Delinea referencing the protected object and you enter the ID of the projected object containing the username or password used to access the certificate store. Because these fields are configured on the certificate store level, they appear as InstanceLevel=True like so:</p> <pre> {   "Name": "SecretId",   "DisplayName": "Secret Server Secret ID",   "InstanceLevel": true,   "DataType": "string" }, {   "Name": "SecretFieldName",   "DisplayName": "Secret Field Name",   "InstanceLevel": true,   "DataType": "string" } </pre> <p>In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in Delinea where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array.</p> </td> </tr> </tbody> </table>	Value	Description		<p> When you configure a certificate store to use Delinea as a credential provider, you enter the name of the secret field in Delinea referencing the protected object and you enter the ID of the projected object containing the username or password used to access the certificate store.  **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.25.4 POST PAM Providers Types

The POST /PamProviders/Types method creates a new PAM provider type. This method returns HTTP 200 OK on a success with details about the PAM provider type.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/pam/modify/

OR

/pam/modify/#!/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#). The input parameters and response data returned are the same for both versions.

Table 412: POST PamProviders Types v1 & v2 Input Parameters

Name	In	Description										
Name	Body	<b>Required.</b> A string containing the name of the PAM provider type.										
Parameters	Body	<p><b>Required.</b> An array of objects containing parameters set for the PAM provider type. Parameter details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td><b>Required.</b> A string indicating the internal name for the PAM parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication). If a <i>DisplayName</i> is not provided, the <i>Name</i> will be used as the <i>DisplayName</i>.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the data type for the parameter. Value	Description				
	<p> When you configure a certificate store to use Delinea as a credential provider, you enter the name of the secret field in Delinea referencing the protected object and you enter the ID of the projected object containing the username or password used to access the certificate store. Because these fields are configured on the certificate store level, they appear as InstanceLevel=True like so:</p> <pre> {   "Name": "SecretId",   "DisplayName": "Secret Server Secret ID",   "InstanceLevel": true,   "DataType": "string" }, {   "Name": "SecretFieldName",   "DisplayName": "Secret Field Name",   "InstanceLevel": true,   "DataType": "string" } </pre> <p>In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in Delinea where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array.</p>				

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.25.5 GET PAM Providers

The GET /PamProviders method returns a list of all the PAM providers that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/pam/read/

OR

/pam/read/#/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the GET /PamProviders method has been redesigned to remove references to PAM associations with areas and containers.

Table 414: GET PamProviders v2 Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• Area</li> <li>• Name</li> <li>• ProviderType</li> <li>• SecuredAreald</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 415: GET PamProviders v2 Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																		
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																		
Provider Type	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider Type Params</td> <td> <p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. See example, above.</td> </tr> </tbody> </table>	Value	Description	Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.
Value	Description								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Level</td> <td>to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.</td> </tr> </tbody> </table>	Value	Description	Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.				
Value	Description								
Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.								
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .								

## Version 1

Version 1 of the GET /PamProviders method includes the same capabilities as version 2 except it includes references to the deprecated parameters related to the area of Keyfactor Command to which the PAM provider applies.

Table 416: GET PamProviders v1 Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• Area</li> <li>• Name</li> <li>• ProviderType</li> <li>• SecuredAreald</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 417: GET PamProviders v1 Response Data

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. This is considered deprecated and may be removed in a future release.																
Provider Type	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider Type Params</td> <td> <p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider type.	Name	A string indicating the name of the provider type.	Provider Type Params	<p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. See example, above.</td> </tr> </tbody> </table>	Value	Description	Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.
Value	Description								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Level</td> <td>to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.</td> </tr> </tbody> </table>	Value	Description	Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.				
Value	Description								
Level	to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.								
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .								
Secure Area Id	An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any. This is considered deprecated and may be removed in a future release.								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.25.6 POST PAM Providers

The POST `/PamProviders` method creates a new PAM provider. This method returns HTTP 200 OK on a success with details for the new provider.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/pam/modify/`  
 OR  
`/pam/modify/#!/` (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers and certificate stores can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the POST /PamProviders method has been redesigned to remove references to PAM associations with areas and containers.

Table 418: POST PamProviders v2 Input Parameters

Name	In	Description										
Name	Body	<p><b>Required.</b> A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.</p> <div style="border: 1px solid orange; background-color: #ffe4c4; padding: 10px; margin-top: 10px;"> <p> <b>Important:</b> The name you give to your PAM provider in Keyfactor Command must match the name of the PAM provider as referenced in the manifest.json file (see <i>Installing Custom PAM Provider Extensions</i> in the <i>Keyfactor Command Reference Guide</i>).</p> </div>										
Provider Type	Body	<p><b>Required.</b> An object containing details about the provider type for the provider. Only the provider type ID is needed on input. Provider type details include:</p> <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td><b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> </tbody> </table>	Value	Description	Id	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.						
Value	Description											
Id	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.											
Provider Type Param Values	Body	<p><b>Required*</b>. An array of objects containing the values for the provider types specified by ProviderTypeParam. Values are only <b>required</b> in this field if the <i>Remote</i> parameter is set to <i>false</i>. Provider type parameter values include:</p> <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td><b>Required.</b> A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).</td> </tr> <tr> <td>Instance Id</td> <td>An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.  This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Instance Guid</td> <td>A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.  This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Provider</td> <td>An object indicating parameters that the provider type</td> </tr> </tbody> </table>	Value	Description	Value	<b>Required.</b> A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).	Instance Id	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.  This is considered deprecated and may be removed in a future release.	Instance Guid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.  This is considered deprecated and may be removed in a future release.	Provider	An object indicating parameters that the provider type
Value	Description											
Value	<b>Required.</b> A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).											
Instance Id	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.  This is considered deprecated and may be removed in a future release.											
Instance Guid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.  This is considered deprecated and may be removed in a future release.											
Provider	An object indicating parameters that the provider type											

Name	In	Description														
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Type Param</td> <td> <p>uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Name	A string indicating the internal name for the PAM provider type.	Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.										
Value	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.																		
Name	A string indicating the internal name for the PAM provider type.																		
Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.																		
Provider Type Param Values	An array of objects containing the values for the provider types specified by Provider-TypeParam. The field does not return data on responses.																		
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command ( <i>false</i> ) or local to the orchestrator ( <i>true</i> ). The default is <i>false</i> .																		

## Version 1

Version 1 of the POST /PamProviders method includes the same capabilities as version 2 except it includes references to the deprecated parameters related to the area of Keyfactor Command to which the PAM provider applies.

Table 420: POST PamProviders v1 Input Parameters

Name	In	Description										
Name	Body	<p><b>Required.</b> A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.</p> <div style="border: 1px solid orange; background-color: #f9cb9c; padding: 10px; margin-top: 10px;"> <p> <b>Important:</b> The name you give to your PAM provider in Keyfactor Command must match the name of the PAM provider as referenced in the manifest.json file (see <i>Installing Custom PAM Provider Extensions</i> in the <i>Keyfactor Command Reference Guide</i>).</p> </div>										
Provider Type	Body	<p><b>Required.</b> An object containing details about the provider type for the provider. Only the provider type ID is needed on input. Provider type details include:</p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th style="width: 30%;">Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td><b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> </tbody> </table>	Value	Description	Id	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.						
Value	Description											
Id	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.											
Provider Type Param Values	Body	<p><b>Required*</b>. An array of objects containing the values for the provider types specified by ProviderTypeParam. Values are only <b>required</b> in this field if the <i>Remote</i> parameter is set to <i>false</i>. Provider type parameter values include:</p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th style="width: 30%;">Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td><b>Required.</b> A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).</td> </tr> <tr> <td>Instance Id</td> <td>An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.  This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Instance Guid</td> <td>A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.  This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Provider</td> <td>An object indicating parameters that the provider type</td> </tr> </tbody> </table>	Value	Description	Value	<b>Required.</b> A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).	Instance Id	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.  This is considered deprecated and may be removed in a future release.	Instance Guid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.  This is considered deprecated and may be removed in a future release.	Provider	An object indicating parameters that the provider type
Value	Description											
Value	<b>Required.</b> A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).											
Instance Id	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.  This is considered deprecated and may be removed in a future release.											
Instance Guid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.  This is considered deprecated and may be removed in a future release.											
Provider	An object indicating parameters that the provider type

See example, above.</td> </tr> </tbody> </table>	Value	Description	Id	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	Display Name	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.	Instance Level	A Boolean that sets whether the parameter is used to define the underlying PAM provider ( <i>False</i> ) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider ( <i>True</i> ). See example, above.					
Value	Description															
Id	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.															
Name	A string indicating the internal name for the PAM provider type parameter.															
Display Name	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.															
Instance Level	A Boolean that sets whether the parameter is used to define the underlying PAM provider ( <i>False</i> ) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider ( <i>True</i> ). See example, above.															

Name	In	Description
		 <pre data-bbox="597 323 1403 1142">       "id": "bd1762ce-3ea5-41fb-bfb4-1b6de6393fa3"     },     "providerTypeParamValues": [       {         "providerTypeParam": {           "Id": 19         },         "Value": "https://MyDelineaURL"       },       {         "providerTypeParam": {           "Id": 20         },         "Value": "MyDelineaServiceAccountUser"       },       {         "providerTypeParam": {           "Id": 21         },         "Value": "MySuperSecretPasswordtoAccessDelinea"       }     ]   } </pre>
Remote	Body	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .

Table 421: POST PamProviders v2 Response Data

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. This is considered deprecated and may be removed in a future release.																
Provider Type	An object containing details about the provider type for the provider. Provider type details include: <table border="1" data-bbox="363 705 1403 1642"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider Type Params</td> <td>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:               <table border="1" data-bbox="535 1066 1377 1625"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider type.	Name	A string indicating the name of the provider type.	Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include: <table border="1" data-bbox="535 1066 1377 1625"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type.	Name	A string indicating the internal name for the PAM provider type parameter.	Display Name	A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).
Value	Description																
Id	A string indicating the Keyfactor Command reference GUID for the provider type.																
Name	A string indicating the name of the provider type.																
Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include: <table border="1" data-bbox="535 1066 1377 1625"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. Name	A string indicating the internal name for the PAM provider type.	Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.										
Value	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.																		
Name	A string indicating the internal name for the PAM provider type.																		
Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.																		
Provider Type Param Values	An array of objects containing the values for the provider types specified by ProviderTypeParam. The field does not return data on responses.																		
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command ( <i>false</i> ) or local to the orchestrator ( <i>true</i> ). The default is <i>false</i> .																		

Name	Description
Secure Area Id	An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any. This is considered deprecated and may be removed in a future release.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.25.7 PUT PAM Providers

The PUT /PamProviders method updates an existing PAM provider. This method returns HTTP 200 OK on a success with details for the updated provider.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/pam/modify/  
OR  
/pam/modify/#!/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers and certificate stores can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

Version 2 of the PUT /PamProviders method has been redesigned to remove references to PAM associations with areas and containers.

Table 422: PUT PamProviders v2 Input Parameters

Name	In	Description								
Id	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.								
Name	Body	<p><b>Required.</b> A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.</p> <div style="border: 1px solid orange; background-color: #ffe4c4; padding: 10px; border-radius: 10px;"> <p> <b>Important:</b> The name you give to your PAM provider in Keyfactor Command must match the name of the PAM provider as referenced in the manifest.json file (see <i>Installing Custom PAM Provider Extensions in the Keyfactor Command Reference Guide</i>).</p> </div>								
Provider Type	Body	<p><b>Required.</b> An object containing details about the provider type for the provider. Only the provider type ID is needed on input. Provider type details include:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 30%;">Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td><b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> </tbody> </table>	Value	Description	Id	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.

Name	A string indicating the internal name for the PAM provider type.	Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.										
Value	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.																		
Name	A string indicating the internal name for the PAM provider type.																		
Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.																		
Provider Type Param Values	An array of objects containing the values for the provider types specified by Provider-TypeParam. The field does not return data on responses.																		
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command ( <i>false</i> ) or local to the orchestrator ( <i>true</i> ). The default is <i>false</i> .																		

## Version 1

Version 1 of the PUT /PamProviders method includes the same capabilities as version 2 except it includes references to the deprecated parameters related to the area of Keyfactor Command to which the PAM provider applies.

Table 424: PUT PamProviders v1 Input Parameters

Name	In	Description								
Id	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.								
Name	Body	<p><b>Required.</b> A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.</p> <div style="border: 1px solid orange; background-color: #f9cb9c; padding: 10px; border-radius: 10px;"> <p> <b>Important:</b> The name you give to your PAM provider in Keyfactor Command must match the name of the PAM provider as referenced in the manifest.json file (see <i>Installing Custom PAM Provider Extensions in the Keyfactor Command Reference Guide</i>).</p> </div>								
Provider Type	Body	<p><b>Required.</b> An object containing details about the provider type for the provider. Only the provider type ID is needed on input. Provider type details include:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 30%;">Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td><b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> </tbody> </table>	Value	Description	Id	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.				
Value	Description									
Id	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the provider type.									
Provider Type Param Values	Body	<p><b>Required*</b>. An array of objects containing the values for the provider types specified by ProviderTypeParam. Values are only <b>required</b> in this field if the <i>Remote</i> parameter is set to <i>false</i>. Provider type parameter values include:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 30%;">Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td><b>Required.</b> A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).</td> </tr> <tr> <td>Instance Id</td> <td>An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.  This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Instance Guid</td> <td>A string indicating the Keyfactor Command reference GUID for the provider. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.	Instance Level	A Boolean that sets whether the parameter is used to define the underlying PAM provider ( <i>False</i> ) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider ( <i>True</i> ). See example, above.							
Value	Description																	
Id	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.																	
Name	A string indicating the internal name for the PAM provider type parameter.																	
Display Name	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.																	
Instance Level	A Boolean that sets whether the parameter is used to define the underlying PAM provider ( <i>False</i> ) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider ( <i>True</i> ). See example, above.																	
		<p> <b>Example:</b> When creating a new PAM provider for Delinea local to Keyfactor Command, your POST body might look like:</p>																

Name	In	Description
		 <pre data-bbox="630 331 1370 1251"> {   "name": "PAMProviders.Delinea.PAMProvider",   "providerType": {     "id": "bd1762ce-3ea5-41fb-bfb4-1b6de6393fa3"   },   "providerTypeParamValues": [     {       "providerTypeParam": {         "Id": 19       },       "Value": "https://MyDelineaURL"     },     {       "providerTypeParam": {         "Id": 20       },       "Value": "MyDelineaServiceAccountUser"     },     {       "providerTypeParam": {         "Id": 21       },       "Value": "MySuperSecretPasswordtoAccessDelinea"     }   ] } </pre>
Remote	Body	A Boolean indicating whether the PAM provider is local to the Keyfactor Command (false) or local to the orchestrator (true). The default is <i>false</i> .

Table 425: PUT PamProviders v1 Response Data

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. This is considered deprecated and may be removed in a future release.																
Provider Type	An object containing details about the provider type for the provider. Provider type details include: <table border="1" data-bbox="360 701 1403 1640"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider Type Params</td> <td>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:               <table border="1" data-bbox="532 1062 1377 1625"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. For provider types with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider type.	Name	A string indicating the name of the provider type.	Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include: <table border="1" data-bbox="532 1062 1377 1625"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>Display Name</td> <td>A string indicating the display name for the PAM provider type parameter. Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.								
Value	Description																						
	<pre>{   "Name": "SecretFieldName",   "DisplayName": "Secret Field Name",   "InstanceLevel": true,   "DataType": "string" }</pre> <p>In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in Delinea where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array.</p>																						
Provider Type	An object containing details for the provider type. Provider type parameters include: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type.</td> </tr> <tr> <td>Provider Type Params</td> <td>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.</td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type.	Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.														
Value	Description																						
Id	A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.																						
Name	A string indicating the internal name for the PAM provider type.																						
Provider Type Params	An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new records.																						
Provider Type Param Values	An array of objects containing the values for the provider types specified by ProviderTypeParam. The field does not return data on responses.																						
Remote	A Boolean indicating whether the PAM provider is local to the Keyfactor Command ( <i>false</i> ) or local to the orchestrator ( <i>true</i> ). The default is <i>false</i> .																						

Name	Description
Secure Area Id	An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any. This is considered deprecated and may be removed in a future release.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.25.8 GET PAM Providers Types ID

The GET `/PamProviders/Types/{id}` method returns the PAM provider type with the specified ID. This method returns HTTP 200 OK on a success with details about the specified PAM provider type. This method has only a v2 version.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/pam/read/`  
 OR  
`/pam/read/#/` (where # is a reference to a specific PAM provider ID)  
 Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

Table 426: GET PamProviders Types {id} v2 Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the PAM provider to be deleted. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 1030</a> ) to retrieve a list of all the PAM providers to determine the PAM provider's ID.

Table 427: GET PamProviders Types {id} v2 Response Data

Name	Description																												
Id	A string containing the Keyfactor Command reference GUID for the PAM provider type.																												
Name	A string containing the name of the PAM provider type.																												
Parameters	<p>An array of objects containing parameters set for the PAM provider type. Parameter details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td> <p>An integer indicating the ID of the parameter. Parameters will vary depending on your PAM extension. Built-in parameters include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Private Ark Safe</td> </tr> <tr> <td>2</td> <td>PrivateArk Folder Name</td> </tr> <tr> <td>3</td> <td>PrivateArk Protected Password Name</td> </tr> <tr> <td>4</td> <td>Application ID</td> </tr> <tr> <td>5</td> <td>Secret Server Url</td> </tr> <tr> <td>6</td> <td>Rule Name</td> </tr> <tr> <td>7</td> <td>Thycotic Secret ID</td> </tr> <tr> <td>8</td> <td>Rule Key</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM parameter.</td> </tr> <tr> <td>Display Name</td> <td> <p>A string indicating the display name for the PAM parameter. Display Name	<p>A string indicating the display name for the PAM parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).</p>																												
DataType	<p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> </ul>																												

Name	Description						
	<table border="1"> <thead> <tr> <th data-bbox="418 275 607 338">Value</th> <th data-bbox="607 275 1403 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="418 338 607 401"></td> <td data-bbox="607 338 1403 401"> <ul style="list-style-type: none"> <li>2 = Secret</li> </ul> </td> </tr> <tr> <td data-bbox="418 401 607 1734">Instance Level</td> <td data-bbox="607 401 1403 1734"> <p>A Boolean that sets whether the parameter is used to define the underlying PAM provider (false) or a field that needs to be set to a value when configuring a record (e.g. a certificate store) to use the PAM provider (true).</p> <p> <b>Example:</b> For Delinea when defining a PAM provider, you configure two Delinea-specific fields:</p> <ul style="list-style-type: none"> <li>Secret Server URL: The URL to the Secret Server vault instance, including port number if applicable (e.g. <code>https://websrvr38.keyexample.com/SecretServer</code>).</li> <li>Secret Server Username: The name of the user that will be used to connect to SecretServer.</li> <li>Secret Server Password: The password of the user that will be used to connect to SecretServer.</li> </ul> <p>Because these fields are configured on the PAM provider definition, they appear as InstanceLevel=False like so:</p> <pre data-bbox="708 989 1373 1713"> {   "Name": "Host",   "DisplayName": "Secret Server URL",   "InstanceLevel": false,   "DataType": "string" }, {   "Name": "Username",   "DisplayName": "Secret Server Username",   "InstanceLevel": false,   "DataType": "secret" }, {   "Name": "Password",   "DisplayName": "Secret Server Password",   "InstanceLevel": false,   "DataType": "secret" } </pre> </td> </tr> </tbody> </table>	Value	Description		<ul style="list-style-type: none"> <li>2 = Secret</li> </ul>	Instance Level	<p>A Boolean that sets whether the parameter is used to define the underlying PAM provider (false) or a field that needs to be set to a value when configuring a record (e.g. a certificate store) to use the PAM provider (true).</p> <p> <b>Example:</b> For Delinea when defining a PAM provider, you configure two Delinea-specific fields:</p> <ul style="list-style-type: none"> <li>Secret Server URL: The URL to the Secret Server vault instance, including port number if applicable (e.g. <code>https://websrvr38.keyexample.com/SecretServer</code>).</li> <li>Secret Server Username: The name of the user that will be used to connect to SecretServer.</li> <li>Secret Server Password: The password of the user that will be used to connect to SecretServer.</li> </ul> <p>Because these fields are configured on the PAM provider definition, they appear as InstanceLevel=False like so:</p> <pre data-bbox="708 989 1373 1713"> {   "Name": "Host",   "DisplayName": "Secret Server URL",   "InstanceLevel": false,   "DataType": "string" }, {   "Name": "Username",   "DisplayName": "Secret Server Username",   "InstanceLevel": false,   "DataType": "secret" }, {   "Name": "Password",   "DisplayName": "Secret Server Password",   "InstanceLevel": false,   "DataType": "secret" } </pre>
Value	Description						
	<ul style="list-style-type: none"> <li>2 = Secret</li> </ul>						
Instance Level	<p>A Boolean that sets whether the parameter is used to define the underlying PAM provider (false) or a field that needs to be set to a value when configuring a record (e.g. a certificate store) to use the PAM provider (true).</p> <p> <b>Example:</b> For Delinea when defining a PAM provider, you configure two Delinea-specific fields:</p> <ul style="list-style-type: none"> <li>Secret Server URL: The URL to the Secret Server vault instance, including port number if applicable (e.g. <code>https://websrvr38.keyexample.com/SecretServer</code>).</li> <li>Secret Server Username: The name of the user that will be used to connect to SecretServer.</li> <li>Secret Server Password: The password of the user that will be used to connect to SecretServer.</li> </ul> <p>Because these fields are configured on the PAM provider definition, they appear as InstanceLevel=False like so:</p> <pre data-bbox="708 989 1373 1713"> {   "Name": "Host",   "DisplayName": "Secret Server URL",   "InstanceLevel": false,   "DataType": "string" }, {   "Name": "Username",   "DisplayName": "Secret Server Username",   "InstanceLevel": false,   "DataType": "secret" }, {   "Name": "Password",   "DisplayName": "Secret Server Password",   "InstanceLevel": false,   "DataType": "secret" } </pre>						

Name	Description				
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p> When you configure a certificate store to use Delinea as a credential provider, you enter the name of the secret field in Delinea referencing the protected object and you enter the ID of the projected object containing the username or password used to access the certificate store. Because these fields are configured on the certificate store level, they appear as InstanceLevel=True like so:</p> <pre> {   "Name": "SecretId",   "DisplayName": "Secret Server Secret ID",   "InstanceLevel": true,   "DataType": "string" }, {   "Name": "SecretFieldName",   "DisplayName": "Secret Field Name",   "InstanceLevel": true,   "DataType": "string" } </pre> <p>In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in Delinea where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array.</p> </td> </tr> </tbody> </table>	Value	Description		<p> When you configure a certificate store to use Delinea as a credential provider, you enter the name of the secret field in Delinea referencing the protected object and you enter the ID of the projected object containing the username or password used to access the certificate store. Because these fields are configured on the certificate store level, they appear as InstanceLevel=True like so:</p> <pre> {   "Name": "SecretId",   "DisplayName": "Secret Server Secret ID",   "InstanceLevel": true,   "DataType": "string" }, {   "Name": "SecretFieldName",   "DisplayName": "Secret Field Name",   "InstanceLevel": true,   "DataType": "string" } </pre> <p>In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in Delinea where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array.</p>
Value	Description				
	<p> When you configure a certificate store to use Delinea as a credential provider, you enter the name of the secret field in Delinea referencing the protected object and you enter the ID of the projected object containing the username or password used to access the certificate store. Because these fields are configured on the certificate store level, they appear as InstanceLevel=True like so:</p> <pre> {   "Name": "SecretId",   "DisplayName": "Secret Server Secret ID",   "InstanceLevel": true,   "DataType": "string" }, {   "Name": "SecretFieldName",   "DisplayName": "Secret Field Name",   "InstanceLevel": true,   "DataType": "string" } </pre> <p>In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in Delinea where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array.</p>				

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

## 2.6.26 Permissions

The Permissions component of the Keyfactor API includes the GET method to list all of the area permissions that are available to use to configure security settings for access to Keyfactor Command. This is mostly used for reference when configuring security settings.

Table 428: Security Roles Endpoints

Endpoint	Method	Description	Link
/	GET	Returns a list of all of the area permissions that are available to use to configure security settings for access to Keyfactor Command.	<a href="#">GET Permissions below</a>

### 2.6.26.1 GET Permissions

The GET /Permissions method is used to list all area permissions available for use to control user access to all aspects of Keyfactor Command. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/security/read/`

Table 429: GET Permissions Response Data

Name	Description
n/a	<p>An array of strings listing the full permissions list in Keyfactor Command.</p> <p>For example:</p> <pre data-bbox="375 401 1282 1293"> [ "/", "/agents/", "/agents/auto_registration/", "/agents/auto_registration/modify/", "/agents/auto_registration/read/", "/agents/management/", "/agents/management/mac/", "/agents/management/mac/auto-enrollment/", "/agents/management/mac/auto-enrollment/management/", "/agents/management/mac/auto-enrollment/management/modify/", "/agents/management/mac/auto-enrollment/management/read/", ... "/certificate_stores/", ... "/ssl/read/", "/system_settings/", "/system_settings/modify/", "/system_settings/read/", "/workflows/", "/workflows/definitions/", ] </pre>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.27 Permission Sets

The Permission Sets component of the Keyfactor API includes methods necessary to programmatically create, edit, retrieve, and delete permission sets within Keyfactor Command.

Permission sets are used to organize security roles (see [Security Roles on page 1205](#)) and provide compartmentalization on permissions. An unconfigured Keyfactor Command has one permission set—the *Global Permission Set*—that will contain all the security roles created in Keyfactor Command and allow users with administrative permissions to grant any of the possible permissions (see Security Role Permissions in the *Keyfactor Command Reference Guide*) in Keyfactor Command to other users. An implementation with two or more permission sets can be used to limit the actions that administrative users (or any users) can take.

Permission sets can only be managed with the Keyfactor API.

**Q Example:** An organization has a couple of administrators who should be allowed to make whatever changes are necessary to Keyfactor Command and a handful of other administrators who need full control to Keyfactor Command but should not be able to access certain sensitive features of the system. However, this second set of administrators do need to be able to change permissions of users on occasion. To meet this need, the organization decides to use permission sets:

- The *Global Permission Set* contains the following permission:

```
/
```

This is the base permission set that is created on installation. It allows any security roles created as part of the Global Permission Set to potentially contain any possible security permission within Keyfactor Command.

- The organization adds an *Operational Permission Set* which contains the following permissions:

```
/agents/  
/application_settings/  
/certificate_stores/  
/certificates/  
/certificate_authorities/  
/certificate_templates/  
/dashboard/  
/metadata/  
/monitoring/  
/portal/  
/reports/  
/security/  
/scripts/  
/ssl/  
/workflows/
```

This allows any security roles created as part of the Operational Permission Set to potentially contain any of the permissions in the referenced areas of Keyfactor Command. Notice that security is among these areas. It does not allow security roles added to this permission set to be granted permissions in areas such as /auditing/ and /identity\_providers/.

The organization creates these security roles:

- A Global Administrators security role in the Global Permission Set which grants full control to the system. This is created by default during the installation.
- An Operational Administrators security role in the Operational Permission Set which grants all the permissions in the Operational Permission Set.
- A Power Users security role in the Operational Permission Set which grants a large subset of the permissions in the Operational Permission Set, more granularly than grants to the administrators (e.g. /certificates/enrollment/csr/).
- A Viewers security role in the Operational Permission Set which grants a small subset of the permissions in the Operational Permission Set, more granularly than grants to the administrators (e.g. /certificates/collections/read/).

In this configuration, users who hold the Operational Administrators security role:

- Can edit the Power Users and Viewers security roles and change the permissions granted to those roles, but they cannot add any permissions that are not in the Operational Permission Set.
- Can edit the Operational Administrators security role, but can't add any permissions that aren't in the Operational Permission Set.
- Can add new claims for users, groups and other entities.
- Can add new security roles in the Operational Permission Set, referencing only permissions in that set.
- Can associate users, groups and other entities with the Power Users, Viewers and Operational Administrators security roles.
- Can remove role associations for users, groups and other entities for the Power Users, Viewers and Operational Administrators security roles.
- Cannot edit the Global Administrators role because it's not in the permission set to which their own security role belongs.
- Cannot add or edit permission sets.

Table 430: Permission Sets Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns the permission set with the specified GUID.	<a href="#">GET Permission Sets ID on the next page</a>

Endpoint	Method	Description	Link
/ {id}	DELETE	Deletes the permission set with the specified GUID.	<a href="#">DELETE Permission Sets ID on the next page</a>
/	GET	Returns a list of all the permission sets.	<a href="#">GET Permission Sets on the next page</a>
/	POST	Adds a new permission set into Keyfactor Command.	<a href="#">POST Permission Sets on page 1089</a>
/	PUT	Updates a permission set.	<a href="#">PUT Permission Sets on page 1090</a>

### 2.6.27.1 GET Permission Sets ID

The GET /PermissionSets/{id} method is used to return a permission set by GUID. This method returns HTTP 200 OK on a success with details for the specified permission set.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

Table 431: GET Permission Sets{id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the permission set to retrieve.  Use the <i>GET /PermissionSets</i> method (see <a href="#">GET Permission Sets on the next page</a> ) to retrieve a list of all the permission sets to determine the permission set's ID.

Table 432: GET Permission Sets {id} Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.27.2 DELETE Permission Sets ID

The DELETE /PermissionSets/{id} method is used to delete the permission set with the specified GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 433: DELETE Permission Sets{id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the permission set to delete. Use the <i>GET /PermissionSets</i> method (see <a href="#">GET Permission Sets below</a> ) to determine the ID of the permission set you wish to delete.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.27.3 GET Permission Sets

The GET /PermissionSets method is used to return a list of the permission sets defined in Keyfactor Command (see [Permission Sets on page 1083](#)). This method returns HTTP 200 OK on a success with details for the permission sets.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

Table 434: GET Permission Sets Input Parameters

Name	In	Description
QueryString	Query	There are no query parsers for this endpoint..
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 435: GET Permission Sets Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.27.4 POST Permission Sets

The POST /PermissionSets method is used to create a new permission set in Keyfactor Command (see [Permission Sets on page 1083](#)). This method returns HTTP 200 OK on a success with the details of the new permission set.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 436: POST Permission Sets Input Parameters

Name	In	Description
Name	Body	<b>Required.</b> A string indicating the short name for the permission set.
Permissions	Body	<b>Required.</b> An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example: <pre>"Permissions": [   "/agents/",   "/certificate_stores/",   "/certificates/",   "/certificate_authorities/",   "/certificate_templates/",   "/dashboard/",   "/metadata/",   "/monitoring/",   "/portal/",   "/reports/",   "/ssl/",   "/workflows/", ]</pre>

Table 437: POST Permission Sets Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.27.5 PUT Permission Sets

The PUT /PermissionSets method is used to update a permission set in Keyfactor Command (see [Permission Sets on page 1083](#)). This method returns HTTP 200 OK on a success with the details of the updated permission set.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 438: PUT Permission Sets Input Parameters

Name	Description
Id	<b>Required.</b> A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	<p><b>Required.</b> An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre> "Permissions": [   "/agents/",   "/certificate_stores/",   "/certificates/",   "/certificate_authorities/",   "/certificate_templates/",   "/dashboard/",   "/metadata/",   "/monitoring/",   "/portal/"   "/reports/",   "/ssl/",   "/workflows/" ] </pre>

Table 439: PUT Permission Sets Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.28 Reports

The Reports component of the Keyfactor API includes methods necessary to list, update, and schedule built-in reports as well as methods to create, update, list and delete custom reports.

Table 440: Reports Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns the built-in report with the specified ID.	<a href="#">GET Reports ID on the next page</a>
/Custom/{id}	DELETE	Deletes the custom report with the specified ID.	<a href="#">DELETE Reports Custom ID on page 1101</a>
/Custom/{id}	GET	Returns the custom report with the specified ID.	<a href="#">GET Reports Custom ID on page 1102</a>
/Schedules/{id}	DELETE	Deletes the schedule for the built-in report with the specified schedule ID.	<a href="#">DELETE Reports Schedules ID on page 1103</a>
/Schedules/{id}	GET	Returns the schedule for the built-in report with the specified schedule ID.	<a href="#">GET Reports Schedules ID on page 1104</a>
/id}/Parameters	GET	Returns the parameters for the built-in report with the specified report ID.	<a href="#">GET Reports ID Parameters on page 1108</a>
/id}/Parameters	PUT	Updates the parameters for the built-in report with the specified report ID.	<a href="#">PUT Reports ID Parameters on page 1111</a>
/	GET	Returns all built-in reports with filtering and output options.	<a href="#">GET Reports on page 1113</a>
/	PUT	Updates the built-in report with the specified ID. Only some fields can be updated.	<a href="#">PUT Reports on page 1116</a>
/Custom	GET	Returns all custom reports with filtering and output options.	<a href="#">GET Reports Custom on page 1119</a>
/Custom	POST	Creates a custom report.	<a href="#">POST Reports Custom on page 1121</a>
/Custom	PUT	Updates the custom report with the specified ID.	<a href="#">PUT Reports Custom on page 1123</a>
/id}/Schedules	GET	Returns the schedule for the built-in	<a href="#">GET Reports ID</a>

Endpoint	Method	Description	Link
		report with the specified report ID.	<a href="#">Schedules on page 1124</a>
<code>/{id}/Schedules</code>	POST	Creates a schedule for the built-in report with the specified report ID.	<a href="#">POST Reports ID Schedules on page 1129</a>
<code>/{id}/Schedules</code>	PUT	Updates a schedule for the built-in report with the specified report ID.	<a href="#">PUT Reports ID Schedules on page 1140</a>

### 2.6.28.1 GET Reports ID

The GET `/Reports/{id}` method is used to return the built-in report with the specified ID. This method returns HTTP 200 OK on a success with the details of the report.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/reports/read/`

Table 441: GET Reports {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer containing the Keyfactor Command reference ID for the report that should be retrieved. Use the <code>GET /Reports</code> method (see <a href="#">GET Reports on page 1113</a> ) to retrieve a list of your built-in reports to determine the report ID to use.

Table 442: GET Reports {id} Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
Display Name	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;">  <b>Tip:</b> Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF).         </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
Report Path	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
Version Number	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> <li>• CertificateCounts</li> <li>• CertificateLifecycle</li> <li>• CertificateLocations</li> <li>• PKIOperations</li> <li>• SecurityVulnerability</li> <li>• SSHKeys</li> </ul>
Short Name	A string containing the short reference name for the report.
In Navigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
Remove Duplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;">  <b>Tip:</b> When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that         </div>

Name	Description								
	<p> matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see <a href="#">POST Certificate Collections on page 464</a>). This corresponds to the Keyfactor Command Management Portal <i>Ignore renewed certificate results by</i> option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p>								
Uses Collection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).								
Report Parameter	<p>An array of objects containing the parameters for the report. . Report parameters include:</p> <table border="1" data-bbox="407 926 1409 1724"> <thead> <tr> <th data-bbox="418 940 621 989">Name</th> <th data-bbox="626 940 1409 989">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="418 995 621 1085">Id</td> <td data-bbox="626 995 1409 1085">An integer indicating the Keyfactor Command reference ID of the report <b>parameter</b>.</td> </tr> <tr> <td data-bbox="418 1092 621 1182">Parameter Name</td> <td data-bbox="626 1092 1409 1182">A string containing the short reference name for the report parameter (e.g. EvalDate).</td> </tr> <tr> <td data-bbox="418 1188 621 1717">Parameter Type</td> <td data-bbox="626 1188 1409 1717"> <p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul> </td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the report <b>parameter</b> .	Parameter Name	A string containing the short reference name for the report parameter (e.g. EvalDate).	Parameter Type	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul>
Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the report <b>parameter</b> .								
Parameter Name	A string containing the short reference name for the report parameter (e.g. EvalDate).								
Parameter Type	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul>								

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Display Name</td> <td>A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).</td> </tr> <tr> <td>Description</td> <td>A string containing the description for the parameter.</td> </tr> <tr> <td>Default Value</td> <td>A string containing the default value for the parameter.  <div style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> Default values that are integers are also stored as strings in this parameter. </div> </td> </tr> <tr> <td>Display Order</td> <td>An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.</td> </tr> <tr> <td>Parameter Visibility</td> <td>A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i>. The alternative setting is <i>Hidden</i>.</td> </tr> </tbody> </table>	Name	Description	Display Name	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).	Description	A string containing the description for the parameter.	Default Value	A string containing the default value for the parameter. <div style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> Default values that are integers are also stored as strings in this parameter. </div>	Display Order	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.	Parameter Visibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .
Name	Description												
Display Name	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).												
Description	A string containing the description for the parameter.												
Default Value	A string containing the default value for the parameter. <div style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> Default values that are integers are also stored as strings in this parameter. </div>												
Display Order	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.												
Parameter Visibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .												
Schedules	<p>An array of objects containing the configured schedules for running the report, if any. Schedules include the following information:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the report <b>schedule</b>.</td> </tr> <tr> <td>Send Report</td> <td>A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).</td> </tr> <tr> <td>Save Report</td> <td>A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).</td> </tr> <tr> <td>Save Report Path</td> <td>A string containing the UNC path to which the report will be written, if configured.</td> </tr> <tr> <td>Report Format</td> <td>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> </ul> </td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the report <b>schedule</b> .	Send Report	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).	Save Report	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).	Save Report Path	A string containing the UNC path to which the report will be written, if configured.	Report Format	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> </ul>
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the report <b>schedule</b> .												
Send Report	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
Save Report	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
Save Report Path	A string containing the UNC path to which the report will be written, if configured.												
Report Format	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> </ul>												

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <ul style="list-style-type: none"> <li>• CSV</li> </ul> </td> </tr> </tbody> </table>	Name	Description		<ul style="list-style-type: none"> <li>• CSV</li> </ul>								
Name	Description												
	<ul style="list-style-type: none"> <li>• CSV</li> </ul>												
Keyfactor Schedule	<p>An object providing the schedule for the report. The schedule can be one of:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre> </td> </tr> <tr> <td>Weekly</td> <td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description												
Off	Turn off a previously configured schedule.												
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).								
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:												

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Metadata	The custom metadata fields selected to include in the report.	MinCert Count	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	Orchestrator Pool	The orchestrator pool selected to report on.	Period Count	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKey Type	The SSH key type(s) selected to report on.
Name	Description																						
CertAuth	The certificate authority or authorities selected to report on.																						
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																						
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																						
Metadata	The custom metadata fields selected to include in the report.																						
MinCert Count	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																						
Orchestrator Pool	The orchestrator pool selected to report on.																						
Period Count	The number of days, weeks or months selected to report on.																						
PeriodSize	The selected reporting period (day, weeks or months).																						
Requesters	The certificate requesters selected to include in the report.																						
SSHKey Type	The SSH key type(s) selected to report on.																						

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Start Date</td> <td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Template Ids</td> <td>The Keyfactor Command identifiers for the templates to include in the report.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Start Date</td> <td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Template Ids	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Start Date</td> <td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Template Ids</td> <td>The Keyfactor Command identifiers for the templates to include in the report.</td> </tr> </tbody> </table>	Name	Description	Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Template Ids	The Keyfactor Command identifiers for the templates to include in the report.				
Name	Description										
Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).										
Template Ids	The Keyfactor Command identifiers for the templates to include in the report.										
Accepted Schedule Formats	An array of strings containing the report formats supported for the report. Typically supported formats are PDF and Excel. Select reports support CSV format.										

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.28.2 DELETE Reports Custom ID

The DELETE /Reports/Custom/{id} method is used to delete the custom report link with the specified ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/reports/modify/

Table 443: DELETE Reports Custom {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer containing the Keyfactor Command reference ID for the report link to be deleted. Use the <i>GET /Reports/Custom</i> method (see <a href="#">GET Reports Custom on page 1119</a> ) to retrieve a list of your custom report links to determine the report ID to use.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.28.3 GET Reports Custom ID

The GET `/Reports/Custom/{id}` method is used to return the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/reports/read/`

Table 444: GET Reports Custom {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer containing the Keyfactor Command reference ID for the report link that should be retrieved. Use the <i>GET /Reports/Custom</i> method (see <a href="#">GET Reports Custom on page 1119</a> ) to retrieve a list of your custom reports to determine the report ID to use.

Table 445: GET Reports Custom {id} Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <p> <b>Tip:</b> Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.28.4 DELETE Reports Schedules ID

The DELETE /Reports/Schedules/{id} method is used to delete the schedule for the built-in report with the specified schedule ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/reports/modify/

Table 446: DELETE Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 1113</a> ) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see <a href="#">GET Reports ID on page 1093</a> ) to retrieve the details for that report to determine the schedule ID to use.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.28.5 GET Reports Schedules ID

The *GET /Reports/Schedules/{id}* method is used to return the schedule for the built-in report with the specified **schedule** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the *GET /Reports/{id}/Schedules* method to return the schedule based on the **report** ID (see [GET Reports ID Schedules on page 1124](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
*/reports/read/*

Table 447: GET Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 1113</a> ) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see <a href="#">GET Reports ID on page 1093</a> ) to retrieve the details for that report to determine the schedule ID to use.

Table 448: GET Reports Schedules {id} Response Data

Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the report <b>schedule</b> .										
Send Report	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).										
Save Report	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).										
Save Report Path	A string containing the UNC path to which the report will be written, if configured.										
Report Format	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>										
Keyfactor Schedule	<p>An object providing the schedule for the report. The schedule can be one of:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description										
Off	Turn off a previously configured schedule.										
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										

Name	Description						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre> "weekly": {   "days": [     "Monday",     "Wednesday",     "Friday"   ],   "time": "2023-11-27T17:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—Example Value may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre>	Name	Description	Day	The number of the day, in the month, to run the job.

	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre>	Name	Description	Day	The number of the day, in the month, to run the job.				
Name	Description								
Day	The number of the day, in the month, to run the job.								
Email Recipients	An array of strings containing the email addresses of users configured as recipients of the scheduled report, if any.								
Runtime Parameters	<p>An object containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertAuth</td> <td>The certificate authority or authorities selected to report on.</td> </tr> <tr> <td>EndDate</td> <td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td> </tr> <tr> <td>EvalDate</td> <td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> </tbody> </table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).
Name	Description								
CertAuth	The certificate authority or authorities selected to report on.								
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).								
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).								

Name	Description																				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Metadata</td> <td>The custom metadata fields selected to include in the report.</td> </tr> <tr> <td>MinCert Count</td> <td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td> </tr> <tr> <td>Orchestrator Pool</td> <td>The orchestrator pool selected to report on.</td> </tr> <tr> <td>Period Count</td> <td>The number of days, weeks or months selected to report on.</td> </tr> <tr> <td>PeriodSize</td> <td>The selected reporting period (day, weeks or months).</td> </tr> <tr> <td>Requesters</td> <td>The certificate requesters selected to include in the report.</td> </tr> <tr> <td>SSHKey Type</td> <td>The SSH key type(s) selected to report on.</td> </tr> <tr> <td>Start Date</td> <td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Template Ids</td> <td>The Keyfactor Command identifiers for the templates to include in the report.</td> </tr> </tbody> </table>	Name	Description	Metadata	The custom metadata fields selected to include in the report.	MinCert Count	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	Orchestrator Pool	The orchestrator pool selected to report on.	Period Count	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKey Type	The SSH key type(s) selected to report on.	Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Template Ids	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																				
Metadata	The custom metadata fields selected to include in the report.																				
MinCert Count	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																				
Orchestrator Pool	The orchestrator pool selected to report on.																				
Period Count	The number of days, weeks or months selected to report on.																				
PeriodSize	The selected reporting period (day, weeks or months).																				
Requesters	The certificate requesters selected to include in the report.																				
SSHKey Type	The SSH key type(s) selected to report on.																				
Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																				
Template Ids	The Keyfactor Command identifiers for the templates to include in the report.																				

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.28.6 GET Reports ID Parameters

The GET /Reports/{id}/Parameters method is used to return the parameters for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report parameters.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

 /reports/read/

Table 449: GET Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the parameter is associated with. Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 1113</a> ) to retrieve a list of your built-in reports to determine the report ID to use.

Table 450: GET Reports {id} Parameters Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the report <b>parameter</b> .
Parameter Name	A string containing the short reference name for the report parameter (e.g. EvalDate).
Parameter Type	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul>
Display Name	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
Default Value	A string containing the default value for the parameter. <div style="background-color: #e0f2f1; padding: 5px; border-radius: 10px; margin-top: 10px;">  <b>Tip:</b> Default values that are integers are also stored as strings in this parameter. </div>
Display Order	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
Parameter Visibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## 2.6.28.7 PUT Reports ID Parameters

The PUT /Reports/{id}/Parameters method is used to update the parameters for the built-in report with the specified report ID. Only some fields can be updated. This method returns HTTP 200 OK on a success with the details of the report parameters.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/reports/modify/

Table 451: PUT Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the parameter is associated with. Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 1113</a> ) to retrieve a list of your built-in reports to determine the report ID to use.
Id	Body	<b>Required.</b> The Keyfactor Command reference ID of the report <b>parameter</b> . Use the <i>GET /Reports/{id}</i> (see <a href="#">GET Reports ID on page 1093</a> ) to retrieve the details for the desired report to determine the parameter ID to use.
DisplayName	Body	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	Body	A string containing the description for the parameter.
DefaultValue	Body	A string containing the default value for the parameter.   <b>Tip:</b> Default values that are integers are also stored as strings in this parameter.

Table 452: PUT Reports {id} Parameters Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the report <b>parameter</b> .
Parameter Name	A string containing the short reference name for the report parameter (e.g. EvalDate).
Parameter Type	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul>
Display Name	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
Default Value	A string containing the default value for the parameter. <div style="background-color: #e0f2f1; padding: 5px; border-radius: 10px; margin-top: 10px;">  <b>Tip:</b> Default values that are integers are also stored as strings in this parameter. </div>
Display Order	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
Parameter Visibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## 2.6.28.8 GET Reports

The GET /Reports method is used to return all built-in reports with filtering and output options. This method returns HTTP 200 OK on a success with selected details of the reports. To view details of schedules and parameters for a report, use the *GET /Reports/{id}* method (see [GET Reports ID on page 1093](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/reports/read/

Table 453: GET Reports Input Parameters

Name	In	Description
AmmendedQuery	Query	This parameter is not available for use and will be deprecated in version 12.
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• Categories (CertificateCounts, CertificateLifecycle, Certificate Locations, PKIOperations, SecurityVulnerability,SSHKeys)</li> <li>• Favorite (true, false)</li> <li>• InNavigator (true, false)</li> <li>• Scheduled (Number of schedules)</li> </ul> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> <b>Tip:</b> This method offers limited searchable fields. The most useful search is probably by category. For example, to return all the reports tagged with the PKI Operations category: Categories -contains "PKIOperations"</p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 454: GET Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
Scheduled	An integer indicating the number of schedules configured for the report.
Display Name	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> <b>Tip:</b> Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF).</p> </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
Report Path	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
Version Number	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> <li>• CertificateCounts</li> <li>• CertificateLifecycle</li> <li>• CertificateLocations</li> <li>• PKIOperations</li> <li>• SecurityVulnerability</li> <li>• SSHKeys</li> </ul>
Short Name	A string containing the short reference name for the report.
In Navigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
Remove Duplicates	A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).

Name	Description
	<p> <b>Tip:</b> When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see <a href="#">POST Certificate Collections on page 464</a>). This corresponds to the Keyfactor Command Management Portal <i>Ignore renewed certificate results by</i> option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p>
Uses Collec- tion	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.28.9 PUT Reports

The PUT /Reports method is used to update the built-in report with the specified report ID. Only some fields can be updated. To create or update a report schedule, use the *POST /Reports/{id}/Schedules* (see [POST Reports ID Schedules on page 1129](#)) or *PUT /Reports/{id}/Schedules* (see [PUT Reports ID Schedules on page 1140](#)) method. To update parameters for a built-in report, use the *PUT /Reports/{id}/Parameters* method (see [PUT Reports ID Parameters on page 1111](#)). This method returns HTTP 200 OK on a success with the details of the report.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/reports/modify/

Table 455: PUT Reports Input Parameters

Name	In	Description
Id	Body	<p><b>Required.</b> The Keyfactor Command reference ID of the built-in report that should be updated.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 1113</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p>
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	Body	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div style="border: 1px solid #c8e6c9; padding: 10px; margin-top: 10px;"> <p> <b>Tip:</b> When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable.</p> <p>Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see <a href="#">POST Certificate Collections on page 464</a>). This corresponds to the Keyfactor Command Management Portal “Ignore renewed certificate results by” option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p> </div>

Table 456: PUT Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
Display Name	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF).</p> </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
Report Path	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
Version Number	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> <li>• CertificateCounts</li> <li>• CertificateLifecycle</li> <li>• CertificateLocations</li> <li>• PKIOperations</li> <li>• SecurityVulnerability</li> <li>• SSHKeys</li> </ul>
Short Name	A string containing the short reference name for the report.
In Navigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
Remove Duplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> When de-duplication is enabled for a report, the report results will include</p> </div>

Name	Description
	<p> only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see <a href="#">POST Certificate Collections on page 464</a>). This corresponds to the Keyfactor Command Management Portal <i>Ignore renewed certificate results by</i> option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p>
Uses Collection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.28.10 GET Reports Custom

The GET /Reports/Custom method is used to return all custom report links with filtering and output options. This method returns HTTP 200 OK on a success with the details of the report linkages.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/reports/read/

Table 457: GET Reports Custom Input Parameters

Name	In	Description
AmmendedQuery	Query	This parameter is not available for use and will be deprecated in version 12.
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>Favorite (true, false)</li> <li>InNavigator (true, false)</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 458: GET Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).</p> <p> <b>Tip:</b> Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.28.11 POST Reports Custom

The POST `/Reports/Custom` method is used to add a link within Keyfactor Command to an externally hosted custom report. This method returns HTTP 200 OK on a success with the details of the report linkage.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/reports/modify/`

Table 459: POST Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	<p><b>Required.</b> A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <a href="https://my-webserver.keyexample.com/mycustomreport/">https://my-webserver.keyexample.com/mycustomreport/</a>).</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> Custom reports are automatically opened in a new browser tab.                 </div>
DisplayName	Body	<p><b>Required.</b> A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>
Description	Body	<p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>
InNavigator	Body	<p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i>.</p>
Favorite	Body	<p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i>.</p>

Table 460: POST Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <a href="https://my-webserver.keyexample.com/mycustomreport/">https://my-webserver.keyexample.com/mycustomreport/</a>).</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 5px; margin-top: 10px;">  <b>Tip:</b> Custom reports are automatically opened in a new browser tab.                 </div>
Id	<p>An integer containing the Keyfactor Command reference ID for the report link.</p>
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>
Description	<p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>
InNavigator	<p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).</p>
Favorite	<p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).</p>

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.28.12 PUT Reports Custom

The PUT /Reports/Custom method is used to update the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/reports/modify/

Table 461: PUT Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	<p><b>Required.</b> A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> Custom reports are automatically opened in a new browser tab.</p> </div>
Id	Body	<p><b>Required.</b> An integer containing the Keyfactor Command reference ID for the report link.</p> <p>Use the <a href="#">GET /Reports/Custom</a> method (see <a href="#">GET Reports Custom on page 1119</a>) to retrieve a list of your custom report links to determine the report ID to use.</p>
DisplayName	Body	<p><b>Required.</b> A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>
Description	Body	<p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>
InNavigator	Body	<p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i>.</p>
Favorite	Body	<p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i>.</p>

Table 462: PUT Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).</p> <p> <b>Tip:</b> Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.28.13 GET Reports ID Schedules

The GET `/Reports/{id}/Schedules` method is used to return the schedule for the built-in report with the specified **report** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the `GET /Reports/Schedules/{id}` method to return the schedule based on the **schedule** ID (see [GET Reports Schedules ID on page 1104](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/reports/read/`

Table 463: GET Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the schedule is associated with. Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 1113</a> ) to retrieve a list of your built-in reports to determine the report ID to use.

Table 464: GET Reports {id} Schedules Response Data

Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the report <b>schedule</b> .										
Send Report	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).										
Save Report	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).										
Save Report Path	A string containing the UNC path to which the report will be written, if configured.										
Report Format	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>										
Keyfactor Schedule	An object providing the schedule for the report. The schedule can be one of: <table border="1" data-bbox="431 940 1403 1675"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="626 1171 1377 1402"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="626 1478 1377 1675"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="626 1171 1377 1402"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="626 1478 1377 1675"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description										
Off	Turn off a previously configured schedule.										
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="626 1171 1377 1402"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="626 1478 1377 1675"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										

Name	Description						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre> "weekly": {   "days": [     "Monday",     "Wednesday",     "Friday"   ],   "time": "2023-11-27T17:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—Example Value may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre>	Name	Description	Day	The number of the day, in the month, to run the job.
Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre>	Name	Description	Day	The number of the day, in the month, to run the job.				
Name	Description								
Day	The number of the day, in the month, to run the job.								
Email Recipients	An array of strings containing the email addresses of users configured as recipients of the scheduled report, if any.								
Runtime Parameters	<p>An object containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertAuth</td> <td>The certificate authority or authorities selected to report on.</td> </tr> <tr> <td>EndDate</td> <td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td> </tr> <tr> <td>EvalDate</td> <td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> </tbody> </table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).
Name	Description								
CertAuth	The certificate authority or authorities selected to report on.								
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).								
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).								

Name	Description																				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Metadata</td> <td>The custom metadata fields selected to include in the report.</td> </tr> <tr> <td>MinCert Count</td> <td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td> </tr> <tr> <td>Orchestrator Pool</td> <td>The orchestrator pool selected to report on.</td> </tr> <tr> <td>Period Count</td> <td>The number of days, weeks or months selected to report on.</td> </tr> <tr> <td>PeriodSize</td> <td>The selected reporting period (day, weeks or months).</td> </tr> <tr> <td>Requesters</td> <td>The certificate requesters selected to include in the report.</td> </tr> <tr> <td>SSHKey Type</td> <td>The SSH key type(s) selected to report on.</td> </tr> <tr> <td>Start Date</td> <td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Template Ids</td> <td>The Keyfactor Command identifiers for the templates to include in the report.</td> </tr> </tbody> </table>	Name	Description	Metadata	The custom metadata fields selected to include in the report.	MinCert Count	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	Orchestrator Pool	The orchestrator pool selected to report on.	Period Count	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKey Type	The SSH key type(s) selected to report on.	Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Template Ids	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																				
Metadata	The custom metadata fields selected to include in the report.																				
MinCert Count	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																				
Orchestrator Pool	The orchestrator pool selected to report on.																				
Period Count	The number of days, weeks or months selected to report on.																				
PeriodSize	The selected reporting period (day, weeks or months).																				
Requesters	The certificate requesters selected to include in the report.																				
SSHKey Type	The SSH key type(s) selected to report on.																				
Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																				
Template Ids	The Keyfactor Command identifiers for the templates to include in the report.																				

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.28.14 POST Reports ID Schedules

The POST /Reports/{id}/Schedules method is used to create a schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

 /reports/modify/

Table 465: POST Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the built-in <b>report</b> the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 1113</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p>
Send Report	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .
Save Report	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .
Save Report Path	Body	<p><b>Required*</b>. A string containing the UNC path to which the report will be written, if configured.</p> <div style="border: 1px solid #add8e6; padding: 10px; margin: 10px 0;"> <p> <b>Note:</b> The path for saved reports must be provided in UNC format (\\servername\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> <li>• Do not use a trailing “\” in the report path.</li> <li>• Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved.</li> <li>• When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted.</li> </ul> </div> <p>This field is <b>required</b> if <i>SaveReport</i> is set to <i>true</i>.</p>
Report Format	Body	<p><b>Required.</b> A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>
Keyfactor Schedule	Body	<p><b>Required.</b> An object providing the schedule for the report. The schedule can be one of:</p>

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre>	Name	Description	Day	The number of the day, in the month, to run the job.				
Name	Description								
Day	The number of the day, in the month, to run the job.								
Email Recipients	An array of strings containing the email addresses of users configured as recipients of the scheduled report, if any.								
Runtime Parameters	<p>An object containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertAuth</td> <td>The certificate authority or authorities selected to report on.</td> </tr> <tr> <td>EndDate</td> <td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td> </tr> <tr> <td>EvalDate</td> <td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> </tbody> </table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).
Name	Description								
CertAuth	The certificate authority or authorities selected to report on.								
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).								
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).								

Name	Description																				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Metadata</td> <td>The custom metadata fields selected to include in the report.</td> </tr> <tr> <td>MinCert Count</td> <td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td> </tr> <tr> <td>Orchestrator Pool</td> <td>The orchestrator pool selected to report on.</td> </tr> <tr> <td>Period Count</td> <td>The number of days, weeks or months selected to report on.</td> </tr> <tr> <td>PeriodSize</td> <td>The selected reporting period (day, weeks or months).</td> </tr> <tr> <td>Requesters</td> <td>The certificate requesters selected to include in the report.</td> </tr> <tr> <td>SSHKey Type</td> <td>The SSH key type(s) selected to report on.</td> </tr> <tr> <td>Start Date</td> <td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Template Ids</td> <td>The Keyfactor Command identifiers for the templates to include in the report.</td> </tr> </tbody> </table>	Name	Description	Metadata	The custom metadata fields selected to include in the report.	MinCert Count	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	Orchestrator Pool	The orchestrator pool selected to report on.	Period Count	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKey Type	The SSH key type(s) selected to report on.	Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Template Ids	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																				
Metadata	The custom metadata fields selected to include in the report.																				
MinCert Count	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																				
Orchestrator Pool	The orchestrator pool selected to report on.																				
Period Count	The number of days, weeks or months selected to report on.																				
PeriodSize	The selected reporting period (day, weeks or months).																				
Requesters	The certificate requesters selected to include in the report.																				
SSHKey Type	The SSH key type(s) selected to report on.																				
Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																				
Template Ids	The Keyfactor Command identifiers for the templates to include in the report.																				

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.28.15 PUT Reports ID Schedules

The PUT /Reports/{id}/Schedules method is used to update the schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

 /reports/modify/

Table 467: PUT Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the built-in <b>report</b> the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 1113</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p>
Id	Body	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the report <b>schedule</b>.</p> <p>Use the <i>GET /Reports/{id}</i> (see <a href="#">GET Reports ID on page 1093</a>) to retrieve the details for the desired report to determine the schedule ID to use.</p>
Send Report	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .
Save Report	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .
Save Report Path	Body	<p><b>Required*</b>. A string containing the UNC path to which the report will be written, if configured.</p> <div style="border: 1px solid #add8e6; padding: 10px; margin: 10px 0;"> <p> <b>Note:</b> The path for saved reports must be provided in UNC format (\\servername\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> <li>• Do not use a trailing “\” in the report path.</li> <li>• Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved.</li> <li>• When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted.</li> </ul> </div> <p>This field is <b>required</b> if <i>SaveReport</i> is set to <i>true</i>.</p>
Report Format	Body	<p><b>Required.</b> A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>
Keyfactor Schedule	Body	<b>Required.</b> An object providing the schedule for the report.

This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Template Ids</td> <td>The Keyfactor Command identifiers for the templates to include in the report.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "RuntimeParameters": {   "StartDate": "60-Day-Before",   "EndDate": "7-Day-Before",   "Metadata": "AppOwnerFirstName, AppOwnerLastName",   "Requesters": "jsmith" } </pre> <p>This field is <b>required</b> for reports that have runtime parameters.</p>	Name	Description	Requesters	The certificate requesters selected to include in the report.	SSHKey Type	The SSH key type(s) selected to report on.	Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Template Ids	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description											
Requesters	The certificate requesters selected to include in the report.											
SSHKey Type	The SSH key type(s) selected to report on.											
Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).											
Template Ids	The Keyfactor Command identifiers for the templates to include in the report.											

Table 468: PUT Reports {id} Schedules Response Data

Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the report <b>schedule</b> .										
Send Report	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).										
Save Report	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).										
Save Report Path	A string containing the UNC path to which the report will be written, if configured.										
Report Format	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>										
Keyfactor Schedule	An object providing the schedule for the report. The schedule can be one of: <table border="1" data-bbox="431 940 1403 1675"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="626 1171 1377 1402"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="626 1478 1377 1659"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="626 1171 1377 1402"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="626 1478 1377 1659"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description										
Off	Turn off a previously configured schedule.										
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" data-bbox="626 1171 1377 1402"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="626 1478 1377 1659"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										

Name	Description						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre> "weekly": {   "days": [     "Monday",     "Wednesday",     "Friday"   ],   "time": "2023-11-27T17:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre> "Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" } </pre> <p> <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—Example Value may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Day	The number of the day, in the month, to run the job.				
Name	Description								
Day	The number of the day, in the month, to run the job.								
Email Recipients	An array of strings containing the email addresses of users configured as recipients of the scheduled report, if any.								
Runtime Parameters	<p>An object containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertAuth</td> <td>The certificate authority or authorities selected to report on.</td> </tr> <tr> <td>EndDate</td> <td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td> </tr> <tr> <td>EvalDate</td> <td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> </tbody> </table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).
Name	Description								
CertAuth	The certificate authority or authorities selected to report on.								
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).								
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).								

Name	Description																				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Metadata</td> <td>The custom metadata fields selected to include in the report.</td> </tr> <tr> <td>MinCert Count</td> <td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td> </tr> <tr> <td>Orchestrator Pool</td> <td>The orchestrator pool selected to report on.</td> </tr> <tr> <td>Period Count</td> <td>The number of days, weeks or months selected to report on.</td> </tr> <tr> <td>PeriodSize</td> <td>The selected reporting period (day, weeks or months).</td> </tr> <tr> <td>Requesters</td> <td>The certificate requesters selected to include in the report.</td> </tr> <tr> <td>SSHKey Type</td> <td>The SSH key type(s) selected to report on.</td> </tr> <tr> <td>Start Date</td> <td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Template Ids</td> <td>The Keyfactor Command identifiers for the templates to include in the report.</td> </tr> </tbody> </table>	Name	Description	Metadata	The custom metadata fields selected to include in the report.	MinCert Count	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	Orchestrator Pool	The orchestrator pool selected to report on.	Period Count	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKey Type	The SSH key type(s) selected to report on.	Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Template Ids	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																				
Metadata	The custom metadata fields selected to include in the report.																				
MinCert Count	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																				
Orchestrator Pool	The orchestrator pool selected to report on.																				
Period Count	The number of days, weeks or months selected to report on.																				
PeriodSize	The selected reporting period (day, weeks or months).																				
Requesters	The certificate requesters selected to include in the report.																				
SSHKey Type	The SSH key type(s) selected to report on.																				
Start Date	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																				
Template Ids	The Keyfactor Command identifiers for the templates to include in the report.																				

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## 2.6.29 Scheduling

The Scheduling component of the Keyfactor API includes a method necessary to programmatically create and edit scheduled tasks in Keyfactor Command for task management that is not otherwise covered by an individual endpoint (e.g. PUT /Alerts/Expiration/Schedule).

Table 469: Scheduling Endpoints

Endpoint	Method	Description	Link
/	POST	Create or update task management schedules.	

### 2.6.29.1 POST Scheduling

The POST /Scheduling method is used to add or update the schedule for a task in the Keyfactor Command database. This method returns HTTP 200 OK on a success with details of the scheduled task.

This method is intended primarily to be used for updating CA health monitoring schedules. Although it is possible to update issued, expiration, key rotation, and pending alert schedules using this method, each of these has an endpoint dedicated to this purpose (see [PUT Alerts Issued Schedule on page 135](#), [PUT Alerts Expiration Schedule on page 95](#), [PUT Alerts Key Rotation Schedule on page 171](#), and [PUT Alerts Pending Schedule on page 208](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/modify/

Table 470: POST Scheduling Input Parameters

Name	In	Description												
Id	Body	<p><b>Required*</b>. An integer indicating the Keyfactor Command reference ID of the schedule to create or update.</p> <p>This value is <b>required</b> if you're updating an existing schedule.</p> <p>Use a GET method to determine this ID. For example, use the GET /CertificateAuthority/HealthMonitoring/Schedule method (see <a href="#">GET Certificate Authority Health Monitoring Schedule on page 451</a>) to retrieve the schedule for CA health monitoring to determine the health monitoring schedule ID.</p>												
ScheduleType	Body	<p><b>Required</b>. An integer indicating the type of schedule to be updated. Supported schedule types are:</p> <table border="1"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration Alert</td> </tr> <tr> <td>2</td> <td>Pending Alert</td> </tr> <tr> <td>10</td> <td>CA Health Monitoring Alert</td> </tr> <tr> <td>20</td> <td>Issued Alert</td> </tr> <tr> <td>22</td> <td>SSH Key Rotation Alert</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration Alert	2	Pending Alert	10	CA Health Monitoring Alert	20	Issued Alert	22	SSH Key Rotation Alert
Code	Category Name													
1	Expiration Alert													
2	Pending Alert													
10	CA Health Monitoring Alert													
20	Issued Alert													
22	SSH Key Rotation Alert													
Enabled	Body	A Boolean that indicates whether the schedule is enabled (true) or not (false). The default is <i>false</i> .												
Interval	Body	<p><b>Required*</b>. An integer indicating a job scheduled to run every x minutes with x equal to the specified value.</p> <p>One of either <i>Interval</i> or <i>TimeOfDay</i> is <b>required</b>.</p>												
TimeOfDay	Body	<p><b>Required*</b>. A string indicating a job scheduled to run daily at the specified time of day. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p> <p>One of either <i>Interval</i> or <i>TimeOfDay</i> is <b>required</b>.</p>												

Table 471: POST Scheduling Response Data

Name	Description												
id	An integer indicating the Keyfactor Command reference ID of the schedule.												
Schedule	A string indicating the schedule set for the item. For an interval schedule, this will look like I_mm where mm is the number of minutes (e.g. I_30 for every 30 minutes). For daily schedules, this will look like D_hh:mm where hh:mm is the time to run the job (e.g. D_14:30 for daily at 2:30 pm).												
ScheduleType	An integer indicating the type of schedule. Supported schedule types are: <table border="1" data-bbox="457 600 1404 978"> <thead> <tr> <th>Code</th> <th>Category Name</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Expiration Alert</td> </tr> <tr> <td>2</td> <td>Pending Alert</td> </tr> <tr> <td>10</td> <td>CA Health Monitoring Alert</td> </tr> <tr> <td>20</td> <td>Issued Alert</td> </tr> <tr> <td>22</td> <td>SSH Key Rotation Alert</td> </tr> </tbody> </table>	Code	Category Name	1	Expiration Alert	2	Pending Alert	10	CA Health Monitoring Alert	20	Issued Alert	22	SSH Key Rotation Alert
Code	Category Name												
1	Expiration Alert												
2	Pending Alert												
10	CA Health Monitoring Alert												
20	Issued Alert												
22	SSH Key Rotation Alert												
Enabled	A Boolean that indicates whether the schedule is enabled (true) or not (false).												
Name	A string indicating the type of job.												
EntityId	This is considered deprecated and may be removed in a future release.												
LastRun	This is considered deprecated and may be removed in a future release.												

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.30 Security

The Security component of the Keyfactor API includes methods necessary to list, add, and delete security identities and their permissions which are used to control access to aspects of Keyfactor Command.

Table 472: Security Endpoints

Endpoint	Method	Description	Link
/Identities	POST	Adds a new security identity into Keyfactor Command.	<a href="#">POST Security Identities on page 1165</a>
/Identities	GET	Returns all security identities with with sorting and filter options.	<a href="#">GET Security Identities on page 1161</a>
/Identities/Lookup	GET	Validates that the identity with the specified name exists.	<a href="#">GET Security Identities Lookup on page 1161</a>
/Identities/{id}	DELETE	Deletes the security identity with the specified ID.	<a href="#">DELETE Security Identities ID below</a>
/Identities/{id}	GET	Returns permission details for the security identity with the specified ID.	<a href="#">GET Security Identities ID on the next page</a>
/Containers/{id}/Roles	GET	Returns permission details for the certificate store container with the specified ID.	<a href="#">GET Security Containers ID Roles on page 1167</a>
/Containers/{id}/Roles	POST	Sets the permissions of the certificate store container with the specified ID.	<a href="#">POST Security Containers ID Roles on page 1168</a>
/Audit/Collections/{id}	GET	Returns permission details for the certificate collection with the specified ID.	<a href="#">GET Security Audit Collections ID on page 1169</a>
/My	GET	Returns permission details for the current user, including certificate collections and certificate store containers.	<a href="#">GET Security My on page 1172</a>

### 2.6.30.1 DELETE Security Identities ID

The DELETE `/Security/Identities/{id}` method is used to delete the security identity with the specified ID from Keyfactor Command. Use the `GET /Security/Identities` method (see [GET Security Identities on page 1161](#)) to determine the ID of the security identity you wish to delete. The current user's identity may not be deleted. This endpoint returns 204 with no content upon success.

**Note:** This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 1154](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

Table 473: DELETE Security Identities {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer containing the Keyfactor Command reference ID of the security identity that should be deleted from Keyfactor Command. Use the <i>GET /Security/Identity</i> method (see <a href="#">GET Security Identities on page 1161</a> ) to retrieve a list of all the security identities to determine the identity's ID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.30.2 GET Security Identities ID

The *GET /Security/Identities/{id}* method is used to return the security identities configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details of the security identity's permissions.

**Note:** This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 1154](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

Table 474: GET Security Identities {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security identity to retrieve. Use the <i>GET /Security/Identities</i> method (see <a href="#">GET Security Identities on page 1161</a> ) to retrieve a list of all the security identities to determine the identity's ID.

Table 475: GET Security Identities {id} Response Data

Name	Description						
Identity	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; background-color: #f9f9f9; margin: 10px 0;"> <p style="text-align: center;">KEYEXAMPLE\PKI Administrators</p> </div>						
SecuredAreaPer- missions	<p>An array of objects containing information about the global permissions granted to the security identity. Global permission information includes:</p> <table border="1" data-bbox="506 600 1404 926" style="margin: 10px 0;"> <thead> <tr> <th data-bbox="506 600 776 657">Name</th> <th data-bbox="776 600 1404 657">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="506 657 776 827">Permission</td> <td data-bbox="776 657 1404 827">A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.</td> </tr> <tr> <td data-bbox="506 827 776 926">GrantedByRoles</td> <td data-bbox="776 827 1404 926">An object containing a list of roles that grant that permission.</td> </tr> </tbody> </table> <p>For example:</p> <pre style="background-color: #f9f9f9; padding: 10px; border: 1px solid #ccc;"> "SecuredAreaPermissions": [   {     "Permission": "AdminPortal:Read",     "GrantedByRoles": [       "Read Only",       "Staff"     ]   },   {     "Permission": "Reports:Read",     "GrantedByRoles": [       "Read Only"     ]   }, ] </pre> <p>For more information about global permissions, see Security Roles and Claims in the <i>Keyfactor Command Reference Guide</i>.</p>	Name	Description	Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.	GrantedByRoles	An object containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.						
GrantedByRoles	An object containing a list of roles that grant that permission.						
Collec- tionPermissions	<p>An array of objects containing information about the certificate collection permissions granted to the security identity. Collection permission information</p>						

Name	Description						
	<p>includes:</p> <table border="1" data-bbox="505 327 1406 657"> <thead> <tr> <th data-bbox="505 327 776 394">Name</th> <th data-bbox="776 327 1406 394">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="505 394 776 558">Permission</td> <td data-bbox="776 394 1406 558">A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.</td> </tr> <tr> <td data-bbox="505 558 776 657">GrantedByRoles</td> <td data-bbox="776 558 1406 657">An array containing a list of roles that grant that permission.</td> </tr> </tbody> </table> <p>For example:</p> <pre data-bbox="505 726 1406 1367"> "CollectionPermissions": [   {     "Permission": "Issued in the Last Week:Certificates_Read",     "GrantedByRoles": [       "Staff",       "Power Users"     ]   },   {     "Permission": "Web Server Certs:Certificates_EditMetadata",     "GrantedByRoles": [       "Power Users"     ]   }, ] </pre> <p>For more information about collection permissions, see Certificate Permissions in the <i>Keyfactor Command Reference Guide</i>.</p>	Name	Description	Permission	A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.	GrantedByRoles	An array containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.						
GrantedByRoles	An array containing a list of roles that grant that permission.						
ContainerPermissions	<p>An array of objects containing information about the certificate store container permissions granted to the security identity. Container permission information includes:</p> <table border="1" data-bbox="505 1591 1406 1728"> <thead> <tr> <th data-bbox="505 1591 776 1659">Name</th> <th data-bbox="776 1591 1406 1659">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="505 1659 776 1728">Permission</td> <td data-bbox="776 1659 1406 1728">A string indicating the permission granted. 	case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).						
GrantedByRoles	An array containing a list of roles that grant that permission.						
	<p>For example:</p> <pre> "ContainerPermissions": [   {     "Permission": "IIS Personal:CertificateStoreManagement_ Read",     "GrantedByRoles": [       "Power Users",       "Staff"     ]   },   {     "Permission": "F5 SSL Profiles REST:CertificateStoreManagement_Schedule",     "GrantedByRoles": [       "Power Users"     ]   }, ] </pre> <p>For more information about container permissions, see Container Permissions in the <i>Keyfactor Command Reference Guide</i>.</p>						

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.30.3 GET Security Identities Lookup

The GET /Security/Identities/Lookup method is used to confirm that the security identity specified is valid for the environment—the Active Directory forest in which Keyfactor Command is installed and any forests in a two-way trust (or one-way trust in a direction that allows the lookup to occur). It can be used to query an identity in the source identity store (Active Directory) to confirm its validity before using *POST /Security/Identities* (see [POST Security Identities on page 1165](#)) to create a new identity in Keyfactor Command with that user or group. This method returns HTTP 200 OK on a success with a response of true or false.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

Table 476: GET Security Identities Lookup Input Parameters

Name	In	Description
Name	Query	<b>Required.</b> The identity name in the source identity store. For Active Directory users and groups, this can be given either as DOMAIN\name or name@-domain.com. For users in the local domain (the domain in which the Keyfactor Command server is installed), the lookup may be done without a domain name.

Table 477: GET Security Identities Lookup Response Data

Name	Description
Valid	A Boolean that indicates whether the provided name is valid (true) or not (false).

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.30.4 GET Security Identities

The GET /Security/Identities method is used to return the list of security identities configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities.

**Note:** This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 1154](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

Table 478: GET Security Identities Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> . <i>IdentityType</i> may be used as a sort order.
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.
Validate	Query	A Boolean that specifies whether the optional parameter of <i>validate</i> is <b>false</b> , which allows the AuditXML validation to be skipped when loading records, or <b>true</b> (or not specified) in which case validation will occur. The default is <b>true</b> .

Table 479: GET Security Identities Response Data

Name	Description																					
Id	An integer containing the Keyfactor Command reference ID for the security identity.																					
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>																					
IdentityType	A string indicating the type of identity—User or Group.																					
Roles	An array of objects containing information about the security roles assigned to the security identity. Role information includes: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>In</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>Body</td> <td><b>Required.</b> An integer containing the Keyfactor Command identifier for the security role.  Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</td> </tr> <tr> <td>Name</td> <td>Body</td> <td><b>Required.</b> A string containing the short reference name for the security role.</td> </tr> <tr> <td>Description</td> <td>Body</td> <td><b>Required.</b> A string containing the description for the security role.</td> </tr> <tr> <td>Enabled</td> <td>Body</td> <td>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>.  This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Immutable</td> <td>Body</td> <td>A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.</td> </tr> <tr> <td>Valid</td> <td>Body</td> <td>A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not</td> </tr> </tbody> </table>	Name	In	Description	Id	Body	<b>Required.</b> An integer containing the Keyfactor Command identifier for the security role.  Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a> ) to retrieve a list of all the security roles to determine the role's ID.	Name	Body	<b>Required.</b> A string containing the short reference name for the security role.	Description	Body	<b>Required.</b> A string containing the description for the security role. 		end-user configurable.										
Private	Body	<p>A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>										
Permission SetId	Body	<p>A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see <a href="#">Permission Sets on page 1083</a>).</p>										
Identities	Body	<p>An array of objects containing information about the security identities assigned to the security role. Identity details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>Account Name</td> <td> <p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <div style="border: 1px solid #ccc; border-radius: 5px; padding: 5px; background-color: #f9f9f9; display: inline-block;">KEYEXAMPLE\PKI Administrators</div> </td> </tr> <tr> <td>Identity Type</td> <td>A string indicating the type of identity—User or Group.</td> </tr> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Account Name	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <div style="border: 1px solid #ccc; border-radius: 5px; padding: 5px; background-color: #f9f9f9; display: inline-block;">KEYEXAMPLE\PKI Administrators</div>	Identity Type	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description											
Id	An integer containing the Keyfactor Command identifier for the security identity.											
Account Name	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <div style="border: 1px solid #ccc; border-radius: 5px; padding: 5px; background-color: #f9f9f9; display: inline-block;">KEYEXAMPLE\PKI Administrators</div>											
Identity Type	A string indicating the type of identity—User or Group.											
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.											
Permissions	Body	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs.</p>										

Name	Description		
	<b>Name</b>	<b>In</b>	<b>Description</b>
			<p>See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre>
Valid	A Boolean indicating whether the security identity's audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.		

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.30.5 POST Security Identities

The POST `/Security/Identities` method is used to create a new security identity in Keyfactor Command. Use the `GET /Security/Identities/Lookup` method (see [GET Security Identities Lookup on page 1161](#)) before creating the new identity to confirm that the identity you plan to create is valid. This method returns HTTP 200 OK on a success with the details of the new security identity.

 **Note:** This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 1154](#)).

 **Tip:** This method cannot be used to assign roles to an identity. Use the `PUT /Security/Roles` method (see [PUT Security Roles on page 1229](#)) to assign roles to an identity.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 480: POST Security Identities Input Parameters

Name	In	Description
AccountName	Body	<b>Required.</b> A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>

Table 481: POST Security Identities Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security identity.
AccountName	A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>
IdentityType	A string indicating the type of identity—User or Group.
Roles	An array of objects containing information about the security roles assigned to the security identity. For new security identities, this will be blank.
Valid	A Boolean that indicates whether the security identity’s audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.30.6 GET Security Containers ID Roles

The GET /Security/Containers/{id}/Roles method is used to return the list of security roles and permissions defined for the specified certificate store container. This method returns HTTP 200 OK on a success with details of the security roles and permissions for the container.

See also [GET Security Roles ID Permissions Containers on page 1193](#) to list permissions on certificate store containers for a specified security role.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

Table 482: GET Security Containers {id} Roles Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the certificate store container for which to retrieve permission information. Use the <i>GET /CertificateStoreContainers</i> method (see <a href="#">GET Certificate Store Containers on page 633</a> ) to determine the ID of the certificate store container you wish to evaluate.

Table 483: GET Security Containers {id} Roles Response Data

Name	Description
SecurityRoleId	An integer indicating the Keyfactor Command reference ID of the security role granted permissions to the certificate store container.
Name	A string containing the short reference name for the security role granted permissions to the certificate store container.
Permissions	A comma-delimited array of strings indicating the permissions granted to the role for the certificate store container. See Security Role Operations: Certificate Store Management in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.30.7 POST Security Containers ID Roles

The POST /Security/Containers/{id}/Roles method is used to assign permissions for a security role to a certificate store container. This method returns HTTP 200 OK on a success with the details of the security role and permissions.

See also [POST Security Roles ID Permissions Containers on page 1194](#) to assign permissions for one or more certificate store containers to a security role.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 484: POST Security Containers {id} Roles Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the certificate store container to update. Use the <a href="#">GET /CertificateStoreContainers</a> method (see <a href="#">GET Certificate Store Containers on page 633</a> ) to determine the ID of the certificate store container.
SecurityRoleId	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role granted permissions to the certificate store container. Use the <a href="#">GET /Security/Roles</a> method (see <a href="#">GET Security Roles on page 1213</a> ) to determine the ID of the security role.
Permissions	Body	<b>Required.</b> A comma-delimited array of strings indicating the permissions granted to the role for the certificate store container. See Security Role Operations: Certificate Store Management in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example: <pre>"Permissions": [   "Read",   "Modify" ]</pre>

Table 485: POST Security Containers {id} Roles Response Data

Name	Description
SecurityRoleId	An integer indicating the Keyfactor Command reference ID of the security role granted permissions to the certificate store container.
Name	A string containing the short reference name for the security role granted permissions to the certificate store container.
Permissions	A comma-delimited array of strings indicating the permissions granted to the role for the certificate store container. See Security Role Operations: Certificate Store Management in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.30.8 GET Security Audit Collections ID

The GET /Security/Audit/Collections/{id} method is used to return the list of security roles and permissions defined for the specified certificate collection. This method returns HTTP 200 OK on a success with details of the security roles and permissions for the collection.

See also [GET Security Roles ID Permissions Collections on page 1198](#) to list permissions on certificate collections for a specified security role.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

Table 486: GET Security Audit Collections {id} Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the certificate collection for which to retrieve permission information. Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 461</a> ) to determine the ID of the certificate collection you wish to evaluate.

Table 487: GET Security Audit Collections {id} Response Data

Name	Description																		
QueryId	An integer indicating the Keyfactor Command reference ID of the certificate collection.																		
AccessControlList	<p>An array of objects containing the permissions granted to the user in a comma-separated list of arrays. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>RoleId</td> <td>An integer indicating the Keyfactor Command reference ID for the security role.</td> </tr> <tr> <td>AreaPermissions</td> <td> <p>An array of comma-delimited integers indicating the collection permissions assigned to the role. Name	Description						
	<pre> 5, 41 ] }, {   "RoleId": "3",   "AreaPermissions": [     4,     8,     41   ] } ], </pre>						
AssignableRoles	<p>An array of objects containing the security roles defined in Keyfactor Command. Role information includes:</p> <table border="1" data-bbox="509 932 1404 1192"> <thead> <tr> <th data-bbox="509 932 672 995">Name</th> <th data-bbox="675 932 1404 995">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="509 999 672 1094">RoleId</td> <td data-bbox="675 999 1404 1094">An integer indicating the Keyfactor Command reference ID for the security role.</td> </tr> <tr> <td data-bbox="509 1098 672 1192">Name</td> <td data-bbox="675 1098 1404 1192">A string containing the short reference name for the security role.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "AssignableRoles": [   {     "RoleId": "1",     "Name": "Administrator"   },   {     "RoleId": "2",     "Name": "Reporting API Access"   } ] </pre>	Name	Description	RoleId	An integer indicating the Keyfactor Command reference ID for the security role.	Name	A string containing the short reference name for the security role.
Name	Description						
RoleId	An integer indicating the Keyfactor Command reference ID for the security role.						
Name	A string containing the short reference name for the security role.						

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.30.9 GET Security My

The GET /Security/My method is used to return the list of security roles and permissions configured in Keyfactor Command for the current user. This method returns HTTP 200 OK on a success with the details of the security roles and permissions. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
None

Table 488: GET Security My Roles Response Data

Name	Description
Roles	An array of strings indicating the roles that the user holds.
GlobalPermissions	<p>An array of objects containing the permissions granted to the user. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre> "GlobalPermissions": [   {     "Area": "AdminPortal",     "Permission": "Read"   },   {     "Area": "Dashboard",     "Permission": "Read"   } ], </pre>

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results

returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.31 Security Claims

The Security Roles component of the Keyfactor API includes methods necessary to list, add, update, and delete security claims which are used to control user access to all aspects of Keyfactor Command.

Table 489: Security Claims Endpoints

Endpoint	Method	Description	Link
/id	GET	Returns details for the security claim with the specified ID, including permissions granted to the role and claims assigned the role.	<a href="#">GET Security Claims ID on page 1181</a>
/	GET	Returns all security claims with filtering and output options.	<a href="#">GET Security Claims below</a>
/	POST	Adds a new security claim.	<a href="#">POST Security Claims on page 1176</a>
/	PUT	Updates the security claim with the specified ID.	<a href="#">PUT Security Claims on page 1179</a>
/id	DELETE	Deletes the security claim with the specified ID.	<a href="#">DELETE Security Claims ID on page 1183</a>
/Roles	GET	Returns the security claim assigned to the security claim identified by the selected parameters.	<a href="#">GET Security Claims Roles on page 1183</a>

### 2.6.31.1 GET Security Claims

The GET /Security/Claims method is used to return the list of security claims configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security claims.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/security/read/`

Table 490: GET Security Claims Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Security Claim Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• ADClaimValue</li><li>• ClaimType</li><li>• ClaimValue</li><li>• Description</li></ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Provider</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 491: GET Security Claims Response Data

Name	In	Description																								
Id		An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	Body	A string indicating a description for the security claim.																								
Claim Type	Body	<p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuth Oid</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuth Role</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuth Subject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuth ClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuth Oid	An open authorization claim of a type not covered by client, role or subject	4	OAuth Role	An open authorization group claim	5	OAuth Subject	An open authorization user claim	6	OAuth ClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																								
0	User	Active Directory user account																								
1	Group	Active Directory group.																								
2	Computer	Active Directory machine account																								
3	OAuth Oid	An open authorization claim of a type not covered by client, role or subject																								
4	OAuth Role	An open authorization group claim																								
5	OAuth Subject	An open authorization user claim																								
6	OAuth ClientId	An open authorization client application claim																								
Claim Value	Body	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	Body	<p>An object containing information about the provider assigned to the security claim.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.																				
Name	Description																									
Id	A string indicating the Keyfactor Command reference GUID for the provider.																									

Name	In	Description

Display Name	A string containing the short reference name for the provider (e.g. Active Directory).
Name	Description							
Authentication Scheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).							
Display Name	A string containing the short reference name for the provider (e.g. Active Directory).							

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.31.2 POST Security Claims

The POST /Security/Claims method is used to create a new security claim in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the new security claim.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 492: POST Security Claims Input Parameters

Name	In	Description																								
Description	Body	<b>Required.</b> A string indicating a description for the security claim.																								
Claim Type	Body	<p><b>Required.</b> A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuth OID</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuth Role</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuth Subject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuth ClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuth OID	An open authorization claim of a type not covered by client, role or subject	4	OAuth Role	An open authorization group claim	5	OAuth Subject	An open authorization user claim	6	OAuth ClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																								
0	User	Active Directory user account																								
1	Group	Active Directory group.																								
2	Computer	Active Directory machine account																								
3	OAuth OID	An open authorization claim of a type not covered by client, role or subject																								
4	OAuth Role	An open authorization group claim																								
5	OAuth Subject	An open authorization user claim																								
6	OAuth ClientId	An open authorization client application claim																								
Claim Value	Body	<b>Required.</b> A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider Authentication Scheme	Body	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																								

Table 493: POST Security Claims Response Data

Name	Description																								
Id	An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	A string indicating a description for the security claim.																								
Claim Type	<p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuth Oid</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuth Role</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuth Subject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuth ClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuth Oid	An open authorization claim of a type not covered by client, role or subject	4	OAuth Role	An open authorization group claim	5	OAuth Subject	An open authorization user claim	6	OAuth ClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																							
0	User	Active Directory user account																							
1	Group	Active Directory group.																							
2	Computer	Active Directory machine account																							
3	OAuth Oid	An open authorization claim of a type not covered by client, role or subject																							
4	OAuth Role	An open authorization group claim																							
5	OAuth Subject	An open authorization user claim																							
6	OAuth ClientId	An open authorization client application claim																							
Claim Value	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	<p>An object containing information about the provider assigned to the security claim.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>Authentication Scheme</td> <td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td> </tr> <tr> <td>Display Name</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	Authentication Scheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	Display Name	A string containing the short reference name for the provider (e.g. Active Directory).																
Name	Description																								
Id	A string indicating the Keyfactor Command reference GUID for the provider.																								
Authentication Scheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																								
Display Name	A string containing the short reference name for the provider (e.g. Active Directory).																								

Name	Description
Provider Authentication Scheme	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.31.3 PUT Security Claims

The PUT /Security/Claims method is used to update a security claim in Keyfactor Command. Only the claim description is editable for an existing claim. This method returns HTTP 200 OK on a success with the details of the security claim.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 494: PUT Security Claims Input Parameters

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the security claim.
Description	A string indicating a description for the security claim.

Table 495: PUT Security Claims Response Data

Name	Description																								
Id	An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	A string indicating a description for the security claim.																								
Claim Type	A string indicating the type of claim. Supported values are: <table border="1" data-bbox="428 499 1404 1136"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuth Oid</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuth Role</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuth Subject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuth ClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuth Oid	An open authorization claim of a type not covered by client, role or subject	4	OAuth Role	An open authorization group claim	5	OAuth Subject	An open authorization user claim	6	OAuth ClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																							
0	User	Active Directory user account																							
1	Group	Active Directory group.																							
2	Computer	Active Directory machine account																							
3	OAuth Oid	An open authorization claim of a type not covered by client, role or subject																							
4	OAuth Role	An open authorization group claim																							
5	OAuth Subject	An open authorization user claim																							
6	OAuth ClientId	An open authorization client application claim																							
Claim Value	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	An object containing information about the provider assigned to the security claim. <table border="1" data-bbox="428 1388 1404 1780"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>Authentication Scheme</td> <td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td> </tr> <tr> <td>Display Name</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	Authentication Scheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	Display Name	A string containing the short reference name for the provider (e.g. Active Directory).																
Name	Description																								
Id	A string indicating the Keyfactor Command reference GUID for the provider.																								
Authentication Scheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																								
Display Name	A string containing the short reference name for the provider (e.g. Active Directory).																								

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.31.4 GET Security Claims ID

The GET `/Security/Claims/{id}` method is used to return a security claim by ID. This method returns HTTP 200 OK on a success with details for the specified security claim.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/security/read/`

Table 496: GET Security Claims{id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the security claim to retrieve. Use the <i>GET /Security/Claims</i> method (see <a href="#">GET Security Claims on page 1173</a> ) to retrieve a list of all the security claims to determine the claim's ID.

Table 497: GET Security Claims{id} Response Data

Name	Description																								
Id	An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	A string indicating a description for the security claim.																								
Claim Type	A string indicating the type of claim. Supported values are: <table border="1" data-bbox="428 499 1404 1136"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuth OID</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuth Role</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuth Subject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuth ClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuth OID	An open authorization claim of a type not covered by client, role or subject	4	OAuth Role	An open authorization group claim	5	OAuth Subject	An open authorization user claim	6	OAuth ClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																							
0	User	Active Directory user account																							
1	Group	Active Directory group.																							
2	Computer	Active Directory machine account																							
3	OAuth OID	An open authorization claim of a type not covered by client, role or subject																							
4	OAuth Role	An open authorization group claim																							
5	OAuth Subject	An open authorization user claim																							
6	OAuth ClientId	An open authorization client application claim																							
Claim Value	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	An object containing information about the provider assigned to the security claim. <table border="1" data-bbox="428 1388 1404 1780"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>Authentication Scheme</td> <td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td> </tr> <tr> <td>Display Name</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	Authentication Scheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	Display Name	A string containing the short reference name for the provider (e.g. Active Directory).																
Name	Description																								
Id	A string indicating the Keyfactor Command reference GUID for the provider.																								
Authentication Scheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																								
Display Name	A string containing the short reference name for the provider (e.g. Active Directory).																								

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.31.5 DELETE Security Claims ID

The DELETE /Security/Claims/{id} method is used to delete the security claim with the specified ID. This endpoint returns 204 with no content upon success.

**Note:** You cannot delete a claim that is used to grant permissions—via roles—to the user executing the delete command.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 498: DELETE Security Claims{id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the security claim that should be deleted from Keyfactor Command. Use the <i>GET /Security/Claims</i> method (see <a href="#">GET Security Claims on page 1173</a> ) to determine the ID of the security claim you wish to delete.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.31.6 GET Security Claims Roles

The GET /Security/Claims/Roles method is used to return the security roles assigned to the security claim identified by the selected parameters. Run [GET Security Claims ID on page 1181](#) to determine

the parameter values. This method returns HTTP 200 OK on a success with the details of the roles assigned to the claim.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

Table 499: GET Security Claims Roles Input Parameters

Name	In	Description																								
Claim Type	Body	<p><b>Required.</b> An integer indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuth OID</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuth Role</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuth Subject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuth ClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuth OID	An open authorization claim of a type not covered by client, role or subject	4	OAuth Role	An open authorization group claim	5	OAuth Subject	An open authorization user claim	6	OAuth ClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																								
0	User	Active Directory user account																								
1	Group	Active Directory group.																								
2	Computer	Active Directory machine account																								
3	OAuth OID	An open authorization claim of a type not covered by client, role or subject																								
4	OAuth Role	An open authorization group claim																								
5	OAuth Subject	An open authorization user claim																								
6	OAuth ClientId	An open authorization client application claim																								
Claim Value	Body	<p><b>Required.</b> A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).</p>																								
Provider Authentication Scheme	Body	<p><b>Required.</b> A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown). The value in the <i>Provider Authentication Scheme:</i> parameter from <a href="#">GET Security Claims on page 1173</a> or <a href="#">GET Security Claims ID on page 1181</a>.</p>																								

Table 500: GET Security Claims Roles Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the security role.
Name	A string containing the short reference name of the security role.
Description	A string containing the description of the security role.
Permission SetId	A string containing the Keyfactor Command reference GUID for the permission set assigned to the security role.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.32 Security Roles Permissions

The Security Roles Permissions component of the Keyfactor API includes methods necessary to list, add, and update security roles permissions at the role, global, provider, container and collection-level.

Table 501: Security Roles Permissions Endpoints

Endpoint	Method	Description	Link
/{{id}}/Per- misssions	GET	Returns all permissions associated with the security role that matches the id	<a href="#">GET Security Roles ID Permissions on the next page</a>
/{{id}}/Per- misssions /Global	GET	Returns all global permissions associated with the security role that matches the ID.	<a href="#">GET Security Roles ID Permissions Global on page 1188</a>
/{{id}}/Per- misssions /Global	POST	Adds global permissions to the security role that matches the id. Note that the Areas <i>Certificates</i> and <i>Certificate Store Management</i> are reserved for collection and container permissions, respectively.	<a href="#">POST Security Roles ID Permissions Global on page 1189</a>
/{{id}}/Per- misssions /Global	PUT	Sets global permissions of the security role that matches the ID. Note that the Areas <i>Certificates</i> and <i>Certificate Store Management</i> are reserved for collection and container permissions, respectively.	<a href="#">PUT Security Roles ID Permissions Global on page 1191</a>
/{{id}}/Per- misssions /Con- tainers	GET	Returns all container permissions associated with the security role that matches the ID.	<a href="#">GET Security Roles ID Permissions Containers on page 1193</a>
/{{id}}/Per- misssions /Con- tainers	POST	Adds container permissions to the security role that matches the ID.	<a href="#">POST Security Roles ID Permissions Containers on page 1194</a>
/{{id}}/Per- misssions /Con- tainers	PUT	Sets container permissions to the security role that matches the ID.	<a href="#">PUT Security Roles ID Permissions Containers on page 1196</a>
/{{id}}/Per- misssions /Col- lections	GET	Returns all collection permissions associated with the security role that matches the ID.	<a href="#">GET Security Roles ID Permissions</a>

Endpoint	Method	Description	Link
			<a href="#">Collections on page 1198</a>
<code>/{id}/Permissions/Collections</code>	POST	Adds collection permissions to the security role that matches the ID.	<a href="#">POST Security Roles ID Permissions Collections on page 1199</a>
<code>/{id}/Permissions/Collections</code>	PUT	Sets collection permissions to the security role that matches the ID.	<a href="#">PUT Security Roles ID Permissions Collections on page 1201</a>
<code>/{id}/Permissions/PamProviders</code>	GET	Returns all PAM provider permissions associated with the security role that matches the ID.	<a href="#">GET Security Roles ID Permissions PAM Providers on page 1203</a>
<code>/{id}/Permissions/PamProviders</code>	PUT	Sets PAM provider permissions to the security role that matches the ID.	<a href="#">PUT Security Roles ID Permissions PAM Providers on page 1204</a>

### 2.6.32.1 GET Security Roles ID Permissions

The GET `/Security/Roles/{id}/Permissions` method is used to return all permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/security/read/`

Table 502: GET Security Roles {id} Permissions Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve permissions.  Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a> ) to retrieve a list of all the security roles to determine the role's ID.

Table 503: GET Security Roles {id} Permissions Response Data

Name	Description								
	An object containing information about the permissions granted to the security role. Details include: <table border="1" data-bbox="375 730 1403 1052"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Type</td> <td>A string containing the area at which the permission is applied to (global, container, or collection).</td> </tr> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. Certificates).</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. Read).</td> </tr> </tbody> </table>	Name	Description	Type	A string containing the area at which the permission is applied to (global, container, or collection).	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description								
Type	A string containing the area at which the permission is applied to (global, container, or collection).								
Area	A string containing the name of the permission (e.g. Certificates).								
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.32.2 GET Security Roles ID Permissions Global

The *GET /Security/Roles/{id}/Permissions/Global* method is used to return all global permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
*/security/read/*

Table 504: GET Security Roles {id} Global Permissions Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve global permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</p>

Table 505: GET Security Roles {id} Global Permissions Response Data

Name	Description						
	<p>An object containing information about the global permissions granted to the security role. Details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. Certificates).</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. Read).</td> </tr> </tbody> </table>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.32.3 POST Security Roles ID Permissions Global

The POST */Security/Roles/{id}/Permissions/Global* method is used to add global permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

 **Important:** Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

 **Note:** The API Endpoint utility header displays a list of valid global Area and Permission combinations.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 506: POST Security Roles {id} Global Permissions Input Parameters

Name	In	Description						
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to set global permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</p>						
globalPermissions	Body	<p>An object containing information about the global permissions granted for this security role.</p> <div style="border: 1px solid #0070C0; background-color: #D9E1F2; padding: 5px; margin: 10px 0;"> <p> <b>Note:</b> See the API endpoint header for a list of all the valid Area and Permission combinations.</p> </div> <p>Details include:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td><b>Required.</b> A string indicating the name of the permissions to grant (e.g. AdminPortal).</td> </tr> <tr> <td>Permission</td> <td><b>Required.</b> A string indicating the permission level to grant (e.g. Read)</td> </tr> </tbody> </table>	Name	Description	Area	<b>Required.</b> A string indicating the name of the permissions to grant (e.g. AdminPortal).	Permission	<b>Required.</b> A string indicating the permission level to grant (e.g. Read)
Name	Description							
Area	<b>Required.</b> A string indicating the name of the permissions to grant (e.g. AdminPortal).							
Permission	<b>Required.</b> A string indicating the permission level to grant (e.g. Read)							

Table 507: POST Security Roles {id} Global Permissions Response Data

Name	Description						
	<p>An object containing information about the global permissions granted to the security role.</p> <p>Details include:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. Certificates).</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. Read).</td> </tr> </tbody> </table>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.32.4 PUT Security Roles ID Permissions Global

The PUT `/Security/Roles/{id}/Permissions/Global` method is used to update the global permissions granted to the specified security role by ID. Note that the areas *Certificates* and *CertificateStoreManagement* are reserved for collection and container permissions. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

**Important:** Any previously defined permissions of the given type (e.g. global) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/security/modify/`

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 508: PUT Security Roles {id} Global Permissions Input Parameters

Name	In	Description						
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to set global permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</p>						
globalPermissions	Body	<p>An object containing information about the global permissions granted for this security role.</p> <div style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 5px; margin: 10px 0;"> <p> <b>Note:</b> See the API endpoint header for a list of all the valid Area and Permission combinations.</p> </div> <p>Details include:</p> <table border="1" style="margin: 10px 0;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td><b>Required.</b> A string indicating the name of the permissions to grant (e.g. AdminPortal).</td> </tr> <tr> <td>Permission</td> <td><b>Required.</b> A string indicating the permission level to grant (e.g. Read)</td> </tr> </tbody> </table>	Name	Description	Area	<b>Required.</b> A string indicating the name of the permissions to grant (e.g. AdminPortal).	Permission	<b>Required.</b> A string indicating the permission level to grant (e.g. Read)
Name	Description							
Area	<b>Required.</b> A string indicating the name of the permissions to grant (e.g. AdminPortal).							
Permission	<b>Required.</b> A string indicating the permission level to grant (e.g. Read)							

Table 509: PUT Security Roles {id} Global Permissions Response Data

Name	Description						
	<p>An object containing information about the global permissions granted to the security role.</p> <p>Details include:</p> <table border="1" style="margin: 10px 0;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. Certificates).</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. Read).</td> </tr> </tbody> </table>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Refer-

ence and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.32.5 GET Security Roles ID Permissions Containers

The GET /Security/Roles/{id}/Permissions/Containers method is used to return all certificate store container permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

Table 510: GET Security Roles {id} Permissions Containers Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve certificate store container permissions. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a> ) to retrieve a list of all the security roles to determine the role's ID.

Table 511: GET Security Roles {id} Permissions Containers Response Data

Name	Description								
	An object containing information about the certificate store container permissions granted to the security role. Details include: <table border="1" data-bbox="373 1270 1396 1533"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ContainerId</td> <td>An integer containing the container ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate store container.</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	ContainerId	An integer containing the container ID.	Name	A string containing the name of the certificate store container.	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Refer-

ence and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.32.6 POST Security Roles ID Permissions Containers

The POST `/Security/Roles/{id}/Permissions/Containers` method is used to add new container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Important:** Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/security/modify/`

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 512: POST Security Roles {id} Permissions Containers Input Parameters

Name	In	Description						
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to set certificate store container permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</p>						
containerPermissions	Body	<p>An object containing information about the permissions granted to certificate store containers for this security role. Container details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ContainerId</td> <td> <p><b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate store container.</p> </td> </tr> <tr> <td>Permission</td> <td> <p><b>Required.</b> A string indicating the permission granted on the container for this role—<i>Read</i>, <i>Schedule</i>, or <i>Modify</i>.</p> <div style="border: 1px solid green; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> Users with <i>Modify</i> permissions on a container inherit <i>Read</i> and <i>Schedule</i>; users with <i>Schedule</i> permissions on a container inherit <i>Read</i>.</p> </div> </td> </tr> </tbody> </table>	Name	Description	ContainerId	<p><b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate store container.</p>	Permission	<p><b>Required.</b> A string indicating the permission granted on the container for this role—<i>Read</i>, <i>Schedule</i>, or <i>Modify</i>.</p> <div style="border: 1px solid green; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> Users with <i>Modify</i> permissions on a container inherit <i>Read</i> and <i>Schedule</i>; users with <i>Schedule</i> permissions on a container inherit <i>Read</i>.</p> </div>
Name	Description							
ContainerId	<p><b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate store container.</p>							
Permission	<p><b>Required.</b> A string indicating the permission granted on the container for this role—<i>Read</i>, <i>Schedule</i>, or <i>Modify</i>.</p> <div style="border: 1px solid green; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> Users with <i>Modify</i> permissions on a container inherit <i>Read</i> and <i>Schedule</i>; users with <i>Schedule</i> permissions on a container inherit <i>Read</i>.</p> </div>							

Table 513: POST Security Roles {id} Permissions Containers Response Data

Name	Description								
	<p>An object containing information about the certificate store container permissions granted to the security role. Details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ContainerId</td> <td>An integer containing the container ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate store container.</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	ContainerId	An integer containing the container ID.	Name	A string containing the name of the certificate store container.	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.32.7 PUT Security Roles ID Permissions Containers

The PUT /Security/Roles/{id}/Permissions/Containers method is used to update container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Important:** Any previously defined permissions of the given type (e.g. container) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 514: PUT Security Roles {id} Permissions Containers Input Parameters

Name	In	Description						
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to set certificate store container permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</p>						
containerPermissions	Body	<p>An object containing information about the permissions granted to certificate store containers for this security role. Container details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ContainerId</td> <td><b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate store container.</td> </tr> <tr> <td>Permission</td> <td><b>Required.</b> A string indicating the permission granted on the container for this role—<i>Read</i>, <i>Schedule</i>, or <i>Modify</i>.</td> </tr> </tbody> </table> <div style="border: 1px solid green; background-color: #e0f2f1; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> Users with <i>Modify</i> permissions on a container inherit <i>Read</i> and <i>Schedule</i>; users with <i>Schedule</i> permissions on a container inherit <i>Read</i>.</p> </div>	Name	Description	ContainerId	<b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate store container.	Permission	<b>Required.</b> A string indicating the permission granted on the container for this role— <i>Read</i> , <i>Schedule</i> , or <i>Modify</i> .
Name	Description							
ContainerId	<b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate store container.							
Permission	<b>Required.</b> A string indicating the permission granted on the container for this role— <i>Read</i> , <i>Schedule</i> , or <i>Modify</i> .							

Table 515: PUT Security Roles {id} Permissions Containers Response Data

Name	Description								
	<p>An object containing information about the certificate store container permissions granted to the security role. Details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ContainerId</td> <td>An integer containing the container ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate store container.</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	ContainerId	An integer containing the container ID.	Name	A string containing the name of the certificate store container.	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.32.8 GET Security Roles ID Permissions Collections

The GET /Security/Roles/{id}/Permissions/Collections method is used to return all certificate collection permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

Table 516: GET Security Roles {id} Permissions Collections Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve certificate collection permissions. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a> ) to retrieve a list of all the security roles to determine the role's ID.

Table 517: GET Security Roles {id} Permissions Collections Response Data

Name	Description								
	An object containing information about the certificate collection permissions granted to the security role. Details include: <table border="1" data-bbox="378 1381 1403 1633"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CollectionId</td> <td>An integer containing the collection ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate collection .</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	CollectionId	An integer containing the collection ID.	Name	A string containing the name of the certificate collection .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	An integer containing the collection ID.								
Name	A string containing the name of the certificate collection .								
Permission	A string indicating the permission granted on the entity for this role.								

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results

returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.32.9 POST Security Roles ID Permissions Collections

The POST/Security/Roles/{id}/Permissions/Collections method is used to add new collection permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

**Important:** Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 518: POST Security Roles {id} Permissions Collections Input Parameters

Name	In	Description						
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to set certificate collection permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</p>						
collectionPermissions	Body	<p>An object containing information about the permissions granted to certificate collection for this security role. Collection details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CollectionId</td> <td><b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate collection.</td> </tr> <tr> <td>Permission</td> <td><b>Required.</b> A string indicating the permission granted on the collection for this role—<i>Read, EditMetadata, Recover, Revoke, or Delete.</i></td> </tr> </tbody> </table>	Name	Description	CollectionId	<b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate collection.	Permission	<b>Required.</b> A string indicating the permission granted on the collection for this role— <i>Read, EditMetadata, Recover, Revoke, or Delete.</i>
Name	Description							
CollectionId	<b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate collection.							
Permission	<b>Required.</b> A string indicating the permission granted on the collection for this role— <i>Read, EditMetadata, Recover, Revoke, or Delete.</i>							

Table 519: POST Security Roles {id} Permissions Collections Response Data

Name	Description								
	<p>An object containing information about the certificate collection permissions granted to the security role. Details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CollectionId</td> <td>An integer containing the collection ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate collection .</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	CollectionId	An integer containing the collection ID.	Name	A string containing the name of the certificate collection .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	An integer containing the collection ID.								
Name	A string containing the name of the certificate collection .								
Permission	A string indicating the permission granted on the entity for this role.								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.32.10 PUT Security Roles ID Permissions Collections

The PUT /Security/Roles/{id}/Permissions/Collections method is used to update collection permissions to the security role that matches the ID. It replaces the deprecated endpoint: POST /CertificateCollections/{id}/Permissions. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

**Important:** Any previously defined permissions of the given type (e.g. collection) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 520: PUT Security Roles {id} Permissions Collections Input Parameters

Name	In	Description						
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to set certificate collection permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</p>						
collectionPermissions	Body	<p>An object containing information about the permissions granted to certificate collection for this security role. Collection details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CollectionId</td> <td><b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate collection.</td> </tr> <tr> <td>Permission</td> <td><b>Required.</b> A string indicating the permission granted on the collection for this role—<i>Read, EditMetadata, Recover, Revoke, or Delete.</i></td> </tr> </tbody> </table>	Name	Description	CollectionId	<b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate collection. Name	Description							
CollectionId	<b>Required.</b> An integer containing the Keyfactor Command identifier for the certificate collection.							
Permission	<b>Required.</b> A string indicating the permission granted on the collection for this role— <i>Read, EditMetadata, Recover, Revoke, or Delete.</i>							

Table 521: PUT Security Roles {id} Permissions Collections Response Data

Name	Description								
	<p>An object containing information about the certificate collection permissions granted to the security role. Details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CollectionId</td> <td>An integer containing the collection ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate collection .</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	CollectionId	An integer containing the collection ID.	Name	A string containing the name of the certificate collection .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	An integer containing the collection ID.								
Name	A string containing the name of the certificate collection .								
Permission	A string indicating the permission granted on the entity for this role.								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.32.11 GET Security Roles ID Permissions PAM Providers

The GET /Security/Roles/{id}/Permissions/PamProviders method is used to return all PAM provider permissions associated with the security role with the specified ID. This method returns HTTP 200 OK on a success with PAM provider permission details for the specified security role.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

Table 522: GET Security Roles {id} Permissions PAM Providers Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the security role for which to retrieve PAM provider permissions. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a> ) to retrieve a list of all the security roles to determine the role's ID.

Table 523: GET Security Roles {id} Permissions PAM Providers Response Data

Name	Description								
	An object containing information about the certificate permissions granted to the security role. Details include: <table border="1" data-bbox="376 1247 1403 1499"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate .</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the ID.	Name	A string containing the name of the certificate .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
Id	An integer containing the ID.								
Name	A string containing the name of the certificate .								
Permission	A string indicating the permission granted on the entity for this role.								

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.32.12 PUT Security Roles ID Permissions PAM Providers

The PUT /Security/Roles/{id}/Permissions/PamProviders method is used to update PAM provider permissions on the security role that matches the specified ID. This method returns HTTP 200 OK on a success with PAM provider permission details for the specified security role.

 **Important:** Any previously defined permissions of the given type (e.g. ) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

Table 524: PUT Security Roles {id} Permissions PAM Providers Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security role for which to set permissions. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a> ) to retrieve a list of all the security roles to determine the role's ID.

Table 525: PUT Security Roles {id} Permissions PAM Providers Response Data

Name	Description								
	An object containing information about the certificate permissions granted to the security role. Details include: <table border="1" data-bbox="373 1386 1396 1638"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the ID.</td> </tr> <tr> <td>Name</td> <td>A string containing the name of the certificate .</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission granted on the entity for this role.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the ID.	Name	A string containing the name of the certificate .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
Id	An integer containing the ID.								
Name	A string containing the name of the certificate .								
Permission	A string indicating the permission granted on the entity for this role.								

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results

returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.33 Security Roles

The Security Roles component of the Keyfactor API includes methods necessary to list, add, update, and delete security roles which are used to control access to all aspects of Keyfactor Command.

Table 526: Security Roles Endpoints

Endpoint	Method	Description	Link
/ {id}	GET	Returns details for the security role with the specified ID, including permissions granted to the role and claims assigned the role.	<a href="#">GET Security Roles ID on the next page</a>
/ {id}	DELETE	Deletes the security role with the specified ID.	<a href="#">DELETE Security Roles ID below</a>
/	GET	Returns all security roles with filtering and output options.	<a href="#">GET Security Roles on page 1213</a>
/	POST	Adds a new security role.	<a href="#">POST Security Roles on page 1218</a>
/	PUT	Updates the security role with the specified ID.	<a href="#">PUT Security Roles on page 1229</a>
/ {id}/Identities	GET	Returns the security identities assigned to the security role with the specified ID.	<a href="#">GET Security Roles ID Identities on page 1246</a>
/ {id}/Identities	PUT	Updates the security identities assigned to the security role with the specified ID.	<a href="#">PUT Security Roles ID Identities on page 1244</a>
/ {id}/Copy	POST	Adds a new security role by copying the existing security role with the specified ID.	<a href="#">POST Security Roles ID Copy on page 1241</a>

### 2.6.33.1 DELETE Security Roles ID

The DELETE /Security/Roles/{id} method is used to delete the security role with the specified ID. Use the GET /Security/Roles method (see [GET Security Roles on page 1213](#)) to determine the ID of the security role you wish to delete. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

Table 527: DELETE Security Roles {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the security role that should be deleted from Keyfactor Command.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.33.2 GET Security Roles ID

The GET /Security/Roles/{id} method is used to return a security role by ID. This method returns HTTP 200 OK on a success with details for the specified security roles.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

This method has two available versions. Keyfactor strongly recommends using the newer method when possible; the v1 method has been deprecated since it supports Active Directory identities only. The v2 method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. This version of the method supports both Active Directory and other identity providers. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the GET /Security/Roles/{id} method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. All new development should use this version.

Table 528: GET Security Roles {id} v2 Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the security role to retrieve. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a> ) to retrieve a list of all the security roles to determine the role's ID.

Table 529: GET Security Roles {id} v2 Response Data

Name	Description									
Id	An integer containing the Keyfactor Command identifier for the security role.									
Name	A string containing the short reference name for the security role.									
Description	A string containing the description for the security role.									
Immutable	A Boolean indicating if the role is immutable or not. Only the built-in <i>Administrators</i> role is considered immutable. The value of this parameter cannot be changed.									
Permission SetId	A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see <a href="#">Permission Sets on page 1083</a> ).									
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version Two Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example:</p> <pre> "Permissions": [   "/portal/read/",   "/dashboard/read/",   "/certificates/collections/metadata/modify/6/",   "/certificates/collections/private_key/read/6/" ], </pre>									
Claims	<p>An array of objects containing the claims associated with the role.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>In</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Description</td> <td>Body</td> <td>A string indicating a description for the security claim.</td> </tr> <tr> <td>Claim Type</td> <td>Body</td> <td>A string indicating the type of claim. Supported values are:</td> </tr> </tbody> </table>	Name	In	Description	Description	Body	A string indicating a description for the security claim.	Claim Type	Body	A string indicating the type of claim. Supported values are:
Name	In	Description								
Description	Body	A string indicating a description for the security claim.								
Claim Type	Body	A string indicating the type of claim. Supported values are:								

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>In</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Provider Authentication Scheme</td> <td>Body</td> <td>A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td> </tr> </tbody> </table>	Name	In	Description	Provider Authentication Scheme	Body	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).		
Name	In	Description							
Provider Authentication Scheme	Body	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).							

## Version 1

Version 1 of the GET /Security/Roles/{id} method includes the same capabilities as version 2, but offers support for managing legacy formatted Active Directory identities.

**Important:** This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other identity providers. See version 2 of this method.

Table 530: GET Security Roles {id} v1 Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the security role to retrieve. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a> ) to retrieve a list of all the security roles to determine the role's ID.

Table 531: GET Security Roles {id} v1 Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> .  This is considered deprecated and may be removed in a future release.								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .  This is considered deprecated and may be removed in a future release.								
Permission SetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see <a href="#">Permission Sets on page 1083</a> ).								
Identities	An array of objects containing information about the security identities assigned to the security role. Identity details include: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>Account Name</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:  KEYEXAMPLE\PKI Administrators</td> </tr> <tr> <td>Identity Type</td> <td>A string indicating the type of identity—User or Group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Account Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:  KEYEXAMPLE\PKI Administrators	Identity Type	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
Account Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:  KEYEXAMPLE\PKI Administrators								
Identity Type	A string indicating the type of identity—User or Group.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre>				

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.33.3 GET Security Roles

The GET /Security/Roles method is used to return the list of security roles configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security roles.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

This method has two available versions. Keyfactor strongly recommends using the newer method when possible; the v1 method has been deprecated since it supports Active Directory identities only. The v2 method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. This version of the method supports both Active Directory and other identity providers. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the GET /Security/Roles method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. All new development should use this version.

Table 532: GET Security Roles v2 Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Security Role Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>Name</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 533: GET Security Roles v2 Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security role.
Name	A string containing the short reference name for the security role.
Immutable	A Boolean indicating if the role is immutable or not. Only the built-in <i>Administrators</i> role is considered immutable. The value of this parameter cannot be changed.
Permission SetId	<p>A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see <a href="#">Permission Sets on page 1083</a>).</p> <p> <b>Tip:</b> For details of the permissions associated with the role, use the <i>GET /SecurityRoles/{id}</i> method (see <a href="#">GET Security Roles ID on page 1207</a>) for the desired role. For details of the permissions associated with the permission set to which the role belongs, use <i>GET /PermissionSets/{id}</i> method (see <a href="#">GET Permission Sets ID on page 1086</a>) using this permission set GUID. A role may be only granted a subset of the permissions available in a permission set.</p>
Claims Count	<p>An integer indicating the number of claims mapped to the role.</p> <p> <b>Tip:</b> For details of the claims associated with the role, use the <i>GET /SecurityRoles/{id}</i> method (see <a href="#">GET Security Roles ID on page 1207</a>) for the desired role.</p>

## Version 1

Version 1 of the GET /Security/Roles method includes the same capabilities as version 2, but offers support for managing legacy formatted Active Directory identities only.

**Important:** This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other identity providers. See version 2 of this method.

Table 534: GET Security Roles v1 Input Parameters

Name	In	Description
Validate	Query	A Boolean that specifies whether the optional parameter of <i>validate</i> is <b>false</b> , which allows the AuditXML validation to be skipped when loading records, or <b>true</b> (or not specified) in which case validation will occur. The default is <b>true</b> .
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Security Role Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>Name</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 535: GET Security Roles v1 Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.								
Permission SetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see <a href="#">Permission Sets on page 1083</a> ).								
Identities	An array of objects containing information about the security identities assigned to the security role. Identity details include: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>Account Name</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\\PKI Administrators</div></td> </tr> <tr> <td>Identity Type</td> <td>A string indicating the type of identity—User or Group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Account Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\\PKI Administrators</div>	Identity Type	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
Account Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\\PKI Administrators</div>								
Identity Type	A string indicating the type of identity—User or Group.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre>				

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.33.4 POST Security Roles

The POST /Security/Roles method is used to create a new security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security role.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

This method has two available versions. Keyfactor strongly recommends using the newer method when possible; the v1 method has been deprecated since it supports Active Directory identities only. The v2 method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. This version of the method

supports both Active Directory and other identity providers. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the POST /Security/Roles method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. All new development should use this version.

Table 536: POST Security Roles v2 Input Parameters

Name	Description																		
Name	<b>Required.</b> A string containing the short reference name for the security role.																		
Description	<b>Required.</b> A string containing the description for the security role.																		
Permission SetId	A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see <a href="#">Permission Sets on page 1083</a> ).																		
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version Two Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example:</p> <pre> "Permissions": [   "/portal/read/",   "/dashboard/read/",   "/certificates/collections/metadata/modify/6/",   "/certificates/collections/private_key/read/6/" ], </pre>																		
Claims	<p>An array of objects containing the claims associated with the role.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>In</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Description</td> <td>Body</td> <td>A string indicating a description for the security claim.</td> </tr> <tr> <td>Claim Type</td> <td>Body</td> <td> <p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	In	Description	Description	Body	A string indicating a description for the security claim.	Claim Type	Body	<p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.
Name	In	Description																	
Description	Body	A string indicating a description for the security claim.																	
Claim Type	Body	<p>A string indicating the type of claim. Supported values are:</p> <table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>User</td> <td>Active Directory user account</td> </tr> <tr> <td>1</td> <td>Group</td> <td>Active Directory group.</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.								
Claim Type Integer	Claim Type String	Description																	
0	User	Active Directory user account																	
1	Group	Active Directory group.																	

Name	Description																				
			<table border="1"> <thead> <tr> <th>Claim Type Integer</th> <th>Claim Type String</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>Computer</td> <td>Active Directory machine account</td> </tr> <tr> <td>3</td> <td>OAuth Oid</td> <td>An open authorization claim of a type not covered by client, role or subject</td> </tr> <tr> <td>4</td> <td>OAuth Role</td> <td>An open authorization group claim</td> </tr> <tr> <td>5</td> <td>OAuth Subject</td> <td>An open authorization user claim</td> </tr> <tr> <td>6</td> <td>OAuth ClientId</td> <td>An open authorization client application claim</td> </tr> </tbody> </table>	Claim Type Integer	Claim Type String	Description	2	Computer	Active Directory machine account	3	OAuth Oid	An open authorization claim of a type not covered by client, role or subject	4	OAuth Role	An open authorization group claim	5	OAuth Subject	An open authorization user claim	6	OAuth ClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																			
2	Computer	Active Directory machine account																			
3	OAuth Oid	An open authorization claim of a type not covered by client, role or subject																			
4	OAuth Role	An open authorization group claim																			
5	OAuth Subject	An open authorization user claim																			
6	OAuth ClientId	An open authorization client application claim																			
Claim Value	Body	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																			
Provider Authentication Scheme	Body	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																			

Table 537: POST Security Roles v2 Response Data

Name	In	Description												
Id	Body	An integer containing the Keyfactor Command identifier for the security role.												
Name	Body	A string containing the short reference name for the security role.												
Description	Body	A string containing the description for the security role.												
Immutable	Body	A Boolean indicating if the role is immutable (true) or not (false). Only the built-in <i>Administrators</i> role is considered immutable. The value of this parameter cannot be changed.												
PermissionSetId	Body	A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see <a href="#">Permission Sets on page 1083</a> ).												
Permissions	Body	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version Two Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": [   "/portal/read/",   "/dashboard/read/",   "/certificates/collections/metadata/modify/6/",   "/certificates/collections/private_key/read/6/" ],</pre>

Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the provider.																		
Authentication Scheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																		
Display Name	A string containing the short reference name for the provider (e.g. Active Directory).																		

## Version 1

Version 1 of the POST /Security/Roles method includes the same capabilities as version 2, but offers support for managing legacy formatted Active Directory identities only.

**Important:** This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication

 model that accompanies this. These newer methods support both Active Directory and other identity providers. See version 2 of this method.

Table 538: POST Security Roles v1 Input Parameters

Name	In	Description				
Name	Body	<b>Required.</b> A string containing the short reference name for the security role.				
Description	Body	<b>Required.</b> A string containing the description for the security role.				
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.				
Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.				
Permission SetId	Body	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see <a href="#">Permission Sets on page 1083</a> ).				
Permissions	Body	An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example: <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre>				
Identities	Body	An array of objects containing one or more identifiers for each security identity to associate with the role. Supported identifiers include: <table border="1" data-bbox="568 1386 1396 1722"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AccountName</td> <td><b>Required*</b> A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <pre>KEYEXAMPLE\PKI Administrators</pre></td> </tr> </tbody> </table>	Name	Description	AccountName	<b>Required*</b> A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <pre>KEYEXAMPLE\PKI Administrators</pre>
Name	Description					
AccountName	<b>Required*</b> A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <pre>KEYEXAMPLE\PKI Administrators</pre>					

Name	In	Description				
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td> <p><b>Required</b>*. A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</p> <p>* One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.</p> </td> </tr> </tbody> </table> <p>For example:</p> <pre> "Identities": [   {     "AccountName": "KEYEXAMPLE\jsmith"   },   {     "AccountName": "KEYEXAMPLEmjones"   } ] </pre>	Name	Description	SID	<p><b>Required</b>*. A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</p> <p>* One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.</p>
Name	Description					
SID	<p><b>Required</b>*. A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</p> <p>* One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.</p>					

Table 539: POST Security Roles v1 Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.								
Permission SetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see <a href="#">Permission Sets on page 1083</a> ).								
Identities	An array of objects containing information about the security identities assigned to the security role. Identity details include: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>Account Name</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 5px; padding: 2px 10px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div></td> </tr> <tr> <td>Identity Type</td> <td>A string indicating the type of identity—User or Group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Account Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 5px; padding: 2px 10px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>	Identity Type	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
Account Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 5px; padding: 2px 10px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>								
Identity Type	A string indicating the type of identity—User or Group.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre>				

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.33.5 PUT Security Roles

The PUT /Security/Roles method is used to update a security role in Keyfactor Command including the permissions set for the role and the security identities mapped to the role. This method returns HTTP 200 OK on a success with the details of the security role.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected

data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

This method has two available versions. Keyfactor strongly recommends using the newer method when possible; the v1 method has been deprecated since it supports Active Directory identities only. The v2 method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. This version of the method supports both Active Directory and other identity providers. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the PUT /Security/Roles method has been redesigned to provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. All new development should use this version.

Table 540: PUT Security Roles v2 Input Parameters

Name	In	Description									
Id	Body	<p><b>Required.</b> An integer containing the Keyfactor Command identifier for the security role.</p> <p>Use the <a href="#">GET /Security/Roles</a> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</p>									
Name	Body	<p><b>Required.</b> A string containing the short reference name for the security role.</p>

Authentication Scheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	Display Name	A string containing the short reference name for the provider (e.g. Active Directory).									
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the provider.																		
Authentication Scheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																		
Display Name	A string containing the short reference name for the provider (e.g. Active Directory).																		

## Version 1

Version 1 of the PUT /Security/Roles method includes the same capabilities as version 2, but offers support for managing legacy formatted Active Directory identities only.

**Important:** This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication

 model that accompanies this. These newer methods support both Active Directory and other identity providers. See version 2 of this method.

Table 542: PUT Security Roles v1 Input Parameters

Name	In	Description				
Id	Body	<p><b>Required.</b> An integer containing the Keyfactor Command identifier for the security role.</p> <p>Use the <a href="#">GET /Security/Roles</a> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</p>				
Name	Body	<p><b>Required.</b> A string containing the short reference name for the security role.</p>				
Description	Body	<p><b>Required.</b> A string containing the description for the security role.</p>				
Enabled	Body	<p>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>				
Private	Body	<p>A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>				
Permission SetId	Body	<p>A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see <a href="#">Permission Sets on page 1083</a>).</p>				
Permissions	Body	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre> "Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ], </pre>				
Identities	Body	<p>An array of objects containing one or more identifiers for each security identity to associate with the role. Supported identifiers include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AccountName</td> <td><b>Required*</b>. A string containing the account name</td> </tr> </tbody> </table>	Name	Description	AccountName	<b>Required*</b> . A string containing the account name
Name	Description					
AccountName	<b>Required*</b> . A string containing the account name					

Name	In	Description						
		<table border="1"> <thead> <tr> <th data-bbox="571 275 812 336">Name</th> <th data-bbox="812 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="571 336 812 646"></td> <td data-bbox="812 336 1398 646">           for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example:           <div data-bbox="834 457 1377 562" style="border: 1px solid #ccc; padding: 5px; margin: 5px 0;">             KEYEXAMPLE\PKI Administrators           </div>           * One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.         </td> </tr> <tr> <td data-bbox="571 646 812 835">SID</td> <td data-bbox="812 646 1398 835"> <b>Required*</b>. A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.            * One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.         </td> </tr> </tbody> </table> <p data-bbox="565 877 711 905">For example:</p> <div data-bbox="571 919 1398 1276" style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <pre data-bbox="607 957 1146 1234"> "Identities": [   {     "AccountName": "KEYEXAMPLE\jsmith"   },   {     "AccountName": "KEYEXAMPLE\mjones"   } ] </pre> </div>	Name	Description		for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <div data-bbox="834 457 1377 562" style="border: 1px solid #ccc; padding: 5px; margin: 5px 0;">             KEYEXAMPLE\PKI Administrators           </div> * One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.	SID	<b>Required*</b> . A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity. * One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.
Name	Description							
	for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <div data-bbox="834 457 1377 562" style="border: 1px solid #ccc; padding: 5px; margin: 5px 0;">             KEYEXAMPLE\PKI Administrators           </div> * One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.							
SID	<b>Required*</b> . A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity. * One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.							

Table 543: PUT Security Roles v1 Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role’s audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.								
Permission SetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see <a href="#">Permission Sets on page 1083</a> ).								
Identities	An array of objects containing information about the security identities assigned to the security role. Identity details include: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>Account Name</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div></td> </tr> <tr> <td>Identity Type</td> <td>A string indicating the type of identity—User or Group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Account Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div>	Identity Type	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
Account Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 5px 0;">KEYEXAMPLE\PKI Administrators</div>								
Identity Type	A string indicating the type of identity—User or Group.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre>				

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.33.6 POST Security Roles ID Copy

The POST `/Security/Roles{id}/Copy` method is used to copy an existing security role in Keyfactor Command to create a new security role. This method returns HTTP 200 OK on a success with the details of the new security role.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/security/modify/`

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

 **Important:** This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication

model that accompanies this. These newer methods support both Active Directory and other identity providers. There is not an equivalent function to this among the newer methods. Instead, use the v2 versions of [GET /Security/Roles/{id}](#) and [POST /Security/Roles](#) (see [GET Security Roles ID on page 1207](#) and [POST Security Roles on page 1218](#)).

Table 544: POST Security Roles {id} Copy Input Parameters

Name	In	Description						
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID of the security role from which to copy role information.</p> <p>Use the <a href="#">GET /Security/Roles</a> method (see <a href="#">GET Security Roles on page 1213</a>) to retrieve a list of all the security roles to determine the role's ID.</p>						
role	Body	<p>An array containing information about the new security role to create. Role details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td><b>Required.</b> A string containing the short reference name for the security role.</td> </tr> <tr> <td>Description</td> <td><b>Required.</b> A string containing the description for the security role.</td> </tr> </tbody> </table>	Name	Description	Name	<b>Required.</b> A string containing the short reference name for the security role.	Description	<b>Required.</b> A string containing the description for the security role.
Name	Description							
Name	<b>Required.</b> A string containing the short reference name for the security role.							
Description	<b>Required.</b> A string containing the description for the security role.							

Table 545: POST Security Roles {id} Copy Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> .  This is considered deprecated and may be removed in a future release.								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role’s audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .  This is considered deprecated and may be removed in a future release.								
Permission SetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see <a href="#">Permission Sets on page 1083</a> ).								
Identities	An array of objects containing information about the security identities assigned to the security role. Identity details include: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin-top: 10px;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>Account Name</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div></td> </tr> <tr> <td>Identity Type</td> <td>A string indicating the type of identity—User or Group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Account Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>	Identity Type	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
Account Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin-top: 5px;">KEYEXAMPLE\PKI Administrators</div>								
Identity Type	A string indicating the type of identity—User or Group.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre>				

 **Tip:** See the interactive code examples installed with your Keyfactor Command instance in the [Keyfactor API Reference and Utility](#).

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.33.7 PUT Security Roles ID Identities

The PUT /Security/Roles{id}/Identities method is used to update security identities assigned to a security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities actively assigned to the security role.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1083](#)).

**Important:** This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other identity providers. See the v2 version of PUT /Security/Roles to update claims on a security role (see [PUT Security Roles on page 1229](#)).

Table 546: PUT Security Roles {id} Identities Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the security role for which to update identities. Use the <a href="#">GET /Security/Roles</a> method (see <a href="#">GET Security Roles on page 1213</a> ) to retrieve a list of all the security roles to determine the role's ID.
identities	Body	An array in which you provide a <b>complete</b> list of the identities that are associated with an Security Role Id. Use the <a href="#">GET /Security/Identities</a> method (see <a href="#">GET Security Identities on page 1161</a> ) to retrieve a list of all the security identities to determine the identity ID(s).

Table 547: PUT Security Roles {id} Identities Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security identity.
Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>

**Tip:** See the interactive code examples installed with your Keyfactor Command instance in the [Keyfactor API Reference and Utility](#). [Keyfactor API Reference and Utility](#).

**Tip:** See the [Keyfactor API Reference and Utility](#) [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.33.8 GET Security Roles ID Identities

The GET /Security/Roles/{id}/Identities method is used to return the security identities assigned to a security role by security role ID. This method returns HTTP 200 OK on a success with details of the security identities assigned to the specified security role.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/security/read/

**Important:** This has been deprecated since it supports Active Directory identities only. It is retained for backwards compatibility, but all new development should use methods that provide support for alternate identity providers and the newer claims-based authentication model that accompanies this. These newer methods support both Active Directory and other identity providers. See the v2 version of GET /Security/Roles/{id} to review claims on a security role (see [GET Security Roles ID on page 1207](#)).

Table 548: GET Security Roles {id} Identities Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the security role for which to retrieve security identities. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1213</a> ) to retrieve a list of all the security roles to determine the role's ID.

Table 549: GET Security Roles {id} Identities Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security identity.
Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.34 SSH

The SSH component of the Keyfactor API includes methods necessary to create, update, and delete SSH keys, logons, servers, server groups, and service accounts within Keyfactor Command.

Table 550: SSH Endpoints

Endpoint	Method	Description	Link
/Keys/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	<a href="#">DELETE SSH Keys Unmanaged ID on page 1252</a>
/Keys/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	<a href="#">GET SSH Keys Unmanaged ID on page 1253</a>
/Keys/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	<a href="#">GET SSH Keys My Key on page 1254</a>
/Keys/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	<a href="#">POST SSH Keys My Key on page 1257</a>
/Keys/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	<a href="#">PUT SSH Keys My Key on page 1261</a>
/Keys/Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	<a href="#">DELETE SSH Keys Unmanaged on page 1264</a>
/Keys/Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	<a href="#">GET SSH Keys Unmanaged on page 1265</a>
/Logons/{id}	DELETE	Deletes a Linux logon from Keyfactor Command.	<a href="#">DELETE SSH Logons ID on page 1268</a>
/Logons/{id}	GET	Returns information about a Linux logons.	<a href="#">GET SSH Logons ID on page 1269</a>
/Logons/	GET	Returns information about one or	<a href="#">GET SSH</a>

Endpoint	Method	Description	Link
		more Linux logons.	<a href="#">Logons on page 1271</a>
/Logons/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory and publish policy</i> mode, publishes it out to a Linux server.	<a href="#">POST SSH Logons on page 1273</a>
/Logons/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	<a href="#">POST SSH Logons Access on page 1276</a>
/Servers/{id}	DELETE	Deletes the SSH server with the specified ID.	<a href="#">DELETE SSH Servers ID on page 1278</a>
/Servers/{id}	GET	Returns the SSH server with the specified ID.	<a href="#">GET SSH Servers ID on page 1279</a>
/Servers/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.	<a href="#">GET SSH Servers Access ID on page 1284</a>
/Servers/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	<a href="#">GET SSH Servers on page 1286</a>
/Servers/	POST	Creates a new SSH server.	<a href="#">POST SSH Servers on page 1292</a>
/Servers/	PUT	Updates an existing SSH server.	<a href="#">PUT SSH Servers on page 1298</a>
/Servers/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	<a href="#">DELETE SSH Servers Access on page 1304</a>
/Servers/Access	POST	Creates Linux logon to user and service account mappings for an SSH	<a href="#">POST SSH Servers</a>

		server.	<a href="#">Access on page 1307</a>
/ServerGroups/{id}	DELETE	Deletes the SSH server group with the specified ID.	<a href="#">DELETE SSH Server Groups ID on page 1311</a>
/ServerGroups/{id}	GET	Returns the SSH server group with the specified ID.	<a href="#">GET SSH Server Groups ID on page 1311</a>
/ServerGroups/{name}	GET	Returns the SSH server group with the specified name.	<a href="#">GET SSH Server Groups Name on page 1317</a>
/ServerGroups/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	<a href="#">GET SSH Server Groups Access ID on page 1322</a>
/ServerGroups/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	<a href="#">GET SSH Server Groups on page 1324</a>
/ServerGroups/	POST	Creates a new SSH server group.	<a href="#">POST SSH Server Groups on page 1330</a>
/ServerGroups/	PUT	Updates an existing SSH server group.	<a href="#">PUT SSH Server Groups on page 1339</a>
/ServerGroups/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	<a href="#">DELETE SSH Server Groups Access on page 1348</a>
/ServerGroups/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	<a href="#">POST SSH Server Groups Access on page 1351</a>

Endpoint	Method	Description	Link
/ServiceAccounts/{id}	DELETE	Deletes the SSH service account with the specified ID.	<a href="#">DELETE SSH Service Accounts ID on page 1354</a>
/ServiceAccounts/{id}	GET	Returns the SSH service account with the specified ID.	<a href="#">GET SSH Service Accounts ID on page 1357</a>
/ServiceAccounts/Key/{id}	GET	Returns the public key and optional private key of an SSH service account with the specified ID.	<a href="#">GET SSH Service Accounts Key ID on page 1364</a>
/ServiceAccounts/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	<a href="#">DELETE SSH Service Accounts on page 1368</a>
/ServiceAccounts/	GET	Returns a list of SSH service accounts based on the specified filters.	<a href="#">GET SSH Service Accounts on page 1370</a>
/ServiceAccounts/	POST	Creates a new SSH service account.	<a href="#">POST SSH Service Accounts on page 1378</a>
/ServiceAccounts/	PUT	Updates an existing SSH service account.	<a href="#">PUT SSH Service Accounts on page 1388</a>
/ServiceAccounts/Rotate/{id}	POST	Generates a new key pair for an existing service account.	<a href="#">POST SSH Service Accounts Rotate ID on page 1396</a>
/Users/{id}	DELETE	Deletes the SSH user with the specified ID.	<a href="#">DELETE SSH Users ID on page 1400</a>

Endpoint	Method	Description	Link
/Users/{id}	GET	Returns the SSH user with the specified ID.	<a href="#">GET SSH Users ID on page 1401</a>
/Users/	GET	Returns a list of SSH users based on the specified filters.	<a href="#">GET SSH Users on page 1406</a>
/Users/	POST	Creates a new SSH user.	<a href="#">POST SSH Users on page 1417</a>
/Users/	PUT	Updates an existing SSH user.	<a href="#">PUT SSH Users on page 1419</a>
/Users/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	<a href="#">POST SSH Users Access on page 1421</a>

### 2.6.34.1 SSH Keys

The SSH Keys component of the Keyfactor API includes methods necessary to allow a user with the *SSH User* Keyfactor Command role permission (see *SSH Permissions* in the *Keyfactor Command Reference Guide*) to generate an SSH key pair for himself or herself, retrieve that key, update it, or delete it. Methods are also included to list and delete unmanaged keys—keys discovered on servers configured in inventory only mode.

Table 551: SSH Keys Endpoints

Endpoint	Method	Description	Link
/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	<a href="#">DELETE SSH Keys Unmanaged ID on the next page</a>
/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	<a href="#">GET SSH Keys Unmanaged ID on page 1253</a>
/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	<a href="#">GET SSH Keys My Key on page 1254</a>
/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	<a href="#">POST SSH Keys My Key on page 1257</a>

Endpoint	Method	Description	Link
/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	<a href="#">PUT SSH Keys My Key on page 1261</a>
Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	<a href="#">DELETE SSH Keys Unmanaged on page 1264</a>
Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	<a href="#">GET SSH Keys Unmanaged on page 1265</a>

## DELETE SSH Keys Unmanaged ID

The DELETE /SSH/Keys/Unmanaged/{id} method is used to delete an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Note:** Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See *Unmanaged SSH Keys* in the *Keyfactor Command Reference Guide* for more information.

Table 552: DELETE SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the unmanaged SSH key to be deleted. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see <a href="#">GET SSH Keys Unmanaged on page 1265</a> ) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Keys Unmanaged ID

The GET /SSH/Keys/Unmanaged/{id} method is used to retrieve an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This method returns HTTP 200 OK on a success with details for the requested SSH key.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /ssh/server\_admin/  
 OR  
 /ssh/enterprise\_admin/  
 SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 553: GET SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the unmanaged SSH key to be retrieved. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see <a href="#">GET SSH Keys Unmanaged on page 1265</a> ) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

Table 554: GET SSH Keys Unmanaged {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	A string indicating the date, in UTC, on which the SSH key was discovered.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Keys My Key

The GET /SSH/Keys/MyKey method is used to retrieve the current user's SSH key generated in Keyfactor Command (see [POST SSH Keys My Key on page 1257](#)). This method returns HTTP 200 OK on a success with the key's details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/user/

OR

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

Table 555: GET SSH Keys My Key Input Parameters

Name	In	Description
includePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (true) or not (false). If set to <i>true</i> , the <i>x-keyfactor-key-passphrase</i> header must be supplied. The default is <i>false</i> .
x-keyfactor-key-passphrase	Header	<b>Required*</b> . A string that sets a password used to secure the private key of the SSH key pair for download. This field is <b>required</b> if <i>IncludePrivateKey</i> is set to <i>true</i> .   <b>Tip:</b> This password does not need to match the password entered to secure the private key when the SSH key pair was initially generated. The private key is encrypted at download time and a different password may be used for each download.

Table 556: GET SSH Keys My Key Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	A string indicating the date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days.  The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results

returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST SSH Keys My Key

The POST /SSH/Keys/MyKey method is used to generate a new SSH key pair for the current user in Keyfactor Command. The user needs to download the private key as an encrypted file and store it locally and an administrator needs to use Keyfactor Command to associate the user's Keyfactor user account with his or her Linux logon account(s) on the target server(s) that the user wishes to access via SSH (see [POST SSH Logons Access on page 1276](#), [POST SSH Server Groups Access on page 1351](#), and [POST SSH Servers Access on page 1307](#)). This method returns HTTP 200 OK on a success with the key's details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/user/

OR

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

Table 557: POST SSH Keys My Key Input Parameters

Name	In	Description								
KeyType	Body	<p><b>Required.</b> A string indicating the cryptographic algorithm to use to generate the SSH key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Numeric Value</th> <th>Text Value</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>ECDSA</td> </tr> <tr> <td>2</td> <td>Ed25519</td> </tr> <tr> <td>3</td> <td>RSA</td> </tr> </tbody> </table> <p>The <i>KeyType</i> may be specified using either the numeric value or text value.</p>	Numeric Value	Text Value	1	ECDSA	2	Ed25519	3	RSA
Numeric Value	Text Value									
1	ECDSA									
2	Ed25519									
3	RSA									
PrivateKeyFormat	Body	<p><b>Required.</b> A string indicating the format to use for the downloadable private key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Numeric Value</th> <th>Text Value</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>OpenSSH</td> </tr> <tr> <td>2</td> <td>PKCS8</td> </tr> </tbody> </table> <p>The <i>PrivateKeyFormat</i> may be specified using either the numeric value or text value.</p>	Numeric Value	Text Value	1	OpenSSH	2	PKCS8		
Numeric Value	Text Value									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<p><b>Required</b>*. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and <b>required</b> if the <i>KeyType</i> is set to RSA.</p>								
Email	Body	<p><b>Required.</b> A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.</p>								
Password	Body	<p><b>Required.</b> A string that sets a password used to secure the private key of the SSH key pair for download.</p> <div style="border: 1px solid green; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> <b>Tip:</b> This password is used to secure the private key in the downloaded copy of the SSH key pair. You may later download the SSH key pair with private key (see <a href="#">GET SSH Keys My Key on page 1254</a>) and encrypt it with a different pass-</p> </div>								

Name	In	Description
		 word, if desired.
Comment	Body	<p>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</p> <p> <b>Note:</b> Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery.</p>

Table 558: POST SSH Keys My Key Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	A string indicating the date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days.  The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results

returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## PUT SSH Keys My Key

The PUT /SSH/Keys/MyKey method is used to update the existing SSH key pair for the current user in Keyfactor Command. Most features of a key pair are fixed and cannot be changed. Only the email address and comment associated with the key may be changed with this option. This method returns HTTP 200 OK on a success with the key's details.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/user/

OR

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 559: PUT SSH Keys My Key Input Parameters

Name	In	Description
ID	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH key.
Email	Body	<b>Required.</b> A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comment	Body	<p>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</p> <div style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> <b>Note:</b> Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery.</p> </div>

Table 560: PUT SSH Keys My Key Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	A string indicating the date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days.  The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development.

It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## DELETE SSH Keys Unmanaged

The DELETE /SSH/Keys/Unmanaged method is used to delete one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Note:** Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See *Unmanaged SSH Keys* in the *Keyfactor Command Reference Guide* for more information.

Table 561: DELETE SSH Keys Unmanaged Input Parameters

Name	In	Description
ids	Body	<p><b>Required.</b> An array of integers indicating the Keyfactor Command reference IDs for the unmanaged SSH keys to be deleted provided in the request body in the following format (without parameter name):</p> <pre>[4, 27, 89]</pre> <p>Use the <a href="#">GET /SSH/Keys/Unmanaged</a> method (see <a href="#">GET SSH Keys Unmanaged on the next page</a>) to retrieve a list of all the unmanaged keys to determine the unmanaged key IDs.</p>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Keys Unmanaged

The GET /SSH/Keys/Unmanaged method is used to retrieve one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH keys.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 562: GET SSH Keys Unmanaged Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Unmanaged Keys Search</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>DiscoveredDate</li> <li>KeyComments</li> <li>KeyLength</li> <li>KeyType</li> <li>ServerId</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal.
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 563: GET SSH Keys Unmanaged Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	A string indicating the date, in UTC, on which the SSH key was discovered.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.34.2 SSH Logons

The SSH Logons component of the Keyfactor API includes methods necessary to view and manage the Linux user accounts associated with authorized\_keys files containing valid SSH public keys. The logons include both those discovered on SSH servers during the initial discovery phase using the orchestrator and those created in Keyfactor Command and published to the SSH servers using the orchestrator.

Table 564: SSH Logon Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a Linux logon from Keyfactor Command.	<a href="#">DELETE SSH Logons ID below</a>
/id}	GET	Returns information about a Linux logons.	<a href="#">GET SSH Logons ID on the next page</a>
/	GET	Returns information about one or more Linux logons.	<a href="#">GET SSH Logons on page 1271</a>
/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory and publish policy</i> mode, publishes it out to a Linux server.	<a href="#">POST SSH Logons on page 1273</a>
/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	<a href="#">POST SSH Logons Access on page 1276</a>

## DELETE SSH Logons ID

The DELETE /SSH/Logons/{id} method is used to delete a Linux logon in Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Note:** Deleting a logon in Keyfactor Command does not delete it on the Linux server. It must be manually removed from the Linux server at the same time. If this is not done, when the next inventory of the Linux server is performed, the logon will be recreated in Keyfactor Command. This method is intended primarily to be used to clean up logons in Keyfactor Command from SSH servers that have been retired.

Table 565: DELETE SSH Logons {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH logon to be deleted. Use the <i>GET /SSH/Logons</i> method (see <a href="#">GET SSH Logons on page 1271</a> ) to retrieve a list of all the SSH logons to determine the logon's ID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Logons ID

The *GET /SSH/Logons/{id}* method is used to retrieve a Linux logon by ID. This method returns HTTP 200 OK on a success with details for the requested SSH logon.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssh/server\_admin/  
OR  
/ssh/enterprise\_admin/  
SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin (/ssh/server\_admin/)* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 566: GET SSH Logons {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH logon to retrieve. Use the <i>GET /SSH/Logons</i> method (see <a href="#">GET SSH Logons on page 1271</a> ) to retrieve a list of all the SSH logons to determine the logon's ID.

Table 567: GET SSH Keys Unmanaged {id} Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>An object containing details about the server on which the SSH logon resides. Server information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td> </tr> <tr> <td>Hostname</td> <td>A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>UnderManagement</td> <td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td> </tr> <tr> <td>GroupName</td> <td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of objects providing information about the users mapped to the logon. Access information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Logons

The GET /SSH/Logons method is used to retrieve one or more Linux logons. Results can be limited to selected logons using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH logons.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 568: GET SSH Logons Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Logons Search</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• Id (Login ID)</li> <li>• LastLogon</li> <li>• Hostname (Logon Server Name)</li> <li>• LogonUserUsername</li> <li>• ServerId</li> <li>• UnmanagedKeyId</li> <li>• Username</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 569: GET SSH Logons Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.
Username	A string indicating the user's logon name on the Linux server.
ServerId	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.
ServerName	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
GroupName	A string indicating the server group to which the server referenced by <i>ServerName</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ServerUnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST SSH Logons

The POST /SSH/Logons method is used to create a new Linux logon in Keyfactor Command and, for servers in *inventory and publish policy* mode, publish it out to a Linux server. The logon can optionally be associated with one or more SSH keys by mapping the logon to one or more *users* or *service accounts* during creation. This method returns HTTP 200 OK on a success with details for the new SSH logon.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssh/server\_admin/  
OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin (/ssh/server\_admin/)* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 570: POST SSH Logons Input Parameters

Name	In	Description
Username	Body	<b>Required.</b> A string indicating the user's logon name on the Linux server.
ServerId	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon should be created. Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on page 1286</a> ) to retrieve a list of all the SSH servers to determine the server's ID.
UserIds	Body	An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format: <pre>[4,7,19]</pre> See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts. Use the <i>GET /SSH/Users</i> method (see <a href="#">GET SSH Users on page 1406</a> ) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID.

Table 571: POST SSH Logons Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>An object containing details about the server on which the SSH logon resides. Server information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td> </tr> <tr> <td>Hostname</td> <td>A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>UnderManagement</td> <td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td> </tr> <tr> <td>GroupName</td> <td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of objects providing information about the users mapped to the logon. Access information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST SSH Logons Access

The POST `/SSH/Logons/Access` method is used to associate one or more SSH keys with a Linux logon by mapping the logon to one or more *users* or *service accounts*. This method returns HTTP 200 OK on a success with a list of the users associated with the logon.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssh/server_admin/`  
 OR  
`/ssh/enterprise_admin/`  
 SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 572: POST SSH Logons Access Input Parameters

Name	In	Description
LogonId	Body	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH logon.</p> <p>Use the <code>GET /SSH/Logons</code> method (see <a href="#">GET SSH Logons on page 1271</a>) to retrieve a list of all the SSH logons to determine the logon's ID.</p>
UserIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">[4,7,19]</div> <p>Use the <code>GET /SSH/Users</code> method (see <a href="#">GET SSH Users on page 1406</a>) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID.</p> <p>See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts.</p>

Table 573: POST SSH Logons Access Response Data

Name	Description						
LogonId	An integer indicating the Keyfactor Command reference ID for the SSH logon.						
LogonName	A string indicating the user's logon name on the Linux server.						
Users	<p>An array of objects providing information about the users mapped to the logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.						

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.34.3 SSH Servers

The SSH Servers component of the Keyfactor API includes methods necessary to create, update, and delete SSH servers within Keyfactor Command.

Table 574: SSH Servers Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH server with the specified ID.	<a href="#">DELETE SSH Servers ID on the next page</a>
/id}	GET	Returns the SSH server with the specified ID.	<a href="#">GET SSH Servers ID on page 1279</a>

Endpoint	Method	Description	Link
/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.	<a href="#">GET SSH Servers Access ID on page 1284</a>
/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	<a href="#">GET SSH Servers on page 1286</a>
/	POST	Creates a new SSH server.	<a href="#">POST SSH Servers on page 1292</a>
/	PUT	Updates an existing SSH server.	<a href="#">PUT SSH Servers on page 1298</a>
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	<a href="#">DELETE SSH Servers Access on page 1304</a>
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	<a href="#">POST SSH Servers Access on page 1307</a>

## DELETE SSH Servers ID

The DELETE /SSH/Servers/{id} method is used to delete an SSH server in Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 575: DELETE SSH Servers {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH server to be deleted. Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on page 1286</a> ) to retrieve a list of all the SSH servers to determine the server's ID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Servers ID

The *GET /SSH/Servers/{id}* method is used to retrieve an SSH server with the specified ID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssh/server\_admin/  
OR  
/ssh/enterprise\_admin/  
SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 576: GET SSH Servers {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH server to be retrieved. Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on page 1286</a> ) to retrieve a list of all the SSH servers to determine the server's ID.

Table 577: GET SSH Servers {id} Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="511 273 682 336">Name</th> <th data-bbox="682 273 1404 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="511 336 682 619"></td> <td data-bbox="682 336 1404 619"> <table border="1"> <thead> <tr> <th data-bbox="706 357 868 420">Name</th> <th data-bbox="868 357 1388 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="706 420 868 619">Time</td> <td data-bbox="868 420 1388 619">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p data-bbox="706 651 1039 682">For example, daily at 11:30 pm:</p> <pre data-bbox="706 693 1388 871"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre> </td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th data-bbox="706 357 868 420">Name</th> <th data-bbox="868 357 1388 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="706 420 868 619">Time</td> <td data-bbox="868 420 1388 619">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p data-bbox="706 651 1039 682">For example, daily at 11:30 pm:</p> <pre data-bbox="706 693 1388 871"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="706 357 868 420">Name</th> <th data-bbox="868 357 1388 420">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="706 420 868 619">Time</td> <td data-bbox="868 420 1388 619">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p data-bbox="706 651 1039 682">For example, daily at 11:30 pm:</p> <pre data-bbox="706 693 1388 871"> "Daily": {   "Time": "2023-11-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).				
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).								
Weekly	<p data-bbox="706 913 1339 997">A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th data-bbox="706 1029 868 1092">Name</th> <th data-bbox="868 1029 1388 1092">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="706 1092 868 1291">Time</td> <td data-bbox="868 1092 1388 1291">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="706 1291 868 1491">Days</td> <td data-bbox="868 1291 1388 1491">An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p data-bbox="706 1522 1356 1585">For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre data-bbox="706 1596 1388 1669"> "Weekly": { </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").		
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).								
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").								

Name	Description												
	<table border="1" data-bbox="511 275 1398 338"> <thead> <tr> <th data-bbox="511 275 683 338">Name</th> <th data-bbox="683 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="511 338 683 695"></td> <td data-bbox="683 338 1398 695"> <pre data-bbox="706 359 1375 674"> "Days": [   "Monday",   "Wednesday",   "Friday" ], "Time": "2023-11-27T17:30:00Z" } </pre> </td> </tr> <tr> <td data-bbox="511 695 683 1772">Monthly</td> <td data-bbox="683 695 1398 1772"> <p data-bbox="706 716 1375 800">A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1" data-bbox="706 831 1375 1188"> <thead> <tr> <th data-bbox="706 831 868 894">Name</th> <th data-bbox="868 831 1375 894">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="706 894 868 1094">Time</td> <td data-bbox="868 894 1375 1094">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.						
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Day	The number of the day, in the month, to run the job.												

Name	Description						
	<pre> "SyncSchedule": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-11-20T14:00:00Z"   } } </pre>						
UnderManagement	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div data-bbox="511 825 1404 955" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.</p> </div>						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1" data-bbox="511 1178 1404 1507"> <thead> <tr> <th data-bbox="511 1178 711 1245">Name</th> <th data-bbox="711 1178 1404 1245">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="511 1245 711 1377">Id</td> <td data-bbox="711 1245 1404 1377">An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td data-bbox="511 1377 711 1507">Username</td> <td data-bbox="711 1377 1404 1507">A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	<p>A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p>						

Name	Description
	For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i> .
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Servers Access ID

The GET `/SSH/Servers/Access/{id}` method is used to retrieve Linux logons for an SSH server, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server ID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssh/server_admin/`  
 OR  
`/ssh/enterprise_admin/`  
 SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 578: GET SSH Servers Access {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH server for which to retrieve logon and user mappings. Use the <code>GET /SSH/Servers</code> method (see <a href="#">GET SSH Servers on page 1286</a> ) to retrieve a list of all the SSH servers to determine the server's ID.

Table 579: GET SSH Servers Access {id} Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonId</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Servers

The GET /SSH/Servers method is used to retrieve one or more SSH servers defined in Keyfactor Command. Results can be limited to selected servers using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH servers.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 580: GET SSH Servers Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the SSH Server Search</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• Agent (Agent ID)</li> <li>• Hostname</li> <li>• Orchestrator (ClientMachine)</li> <li>• ServerGroup (Server Group Id)</li> <li>• ServerGroupName</li> <li>• ServerGroupOwner (Username)</li> <li>• EnforcePublishPolicy (UnderManagement) (true, false)</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Hostname</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 581: GET SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description										
	<pre data-bbox="706 357 1372 672"> "Days": [   "Monday",   "Wednesday",   "Friday" ], "Time": "2023-11-27T17:30:00Z" } </pre>										
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										

Name	Description						
	<pre> "SyncSchedule": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-11-20T14:00:00Z"   } } </pre>						
UnderManagement	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div data-bbox="511 821 1404 955" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.</p> </div>						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1" data-bbox="511 1178 1404 1507"> <thead> <tr> <th data-bbox="511 1178 708 1241">Name</th> <th data-bbox="708 1178 1404 1241">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="511 1241 708 1375">Id</td> <td data-bbox="708 1241 1404 1375">An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td data-bbox="511 1375 708 1507">Username</td> <td data-bbox="708 1375 1404 1507">A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	<p>A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p>						

Name	Description
	For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i> .
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## POST SSH Servers

The POST /SSH/Servers method is used to create a new SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server.

Before adding a new SSH server, be sure that you have added at least one server group (see [POST SSH Server Groups on page 1330](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 17](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /ssh/server\_admin/  
 OR  
 /ssh/enterprise\_admin/  
 SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin (/ssh/server\_admin/)* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 582: POST SSH Servers Input Parameters

Name	In	Description
AgentId	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.
Hostname	Body	<b>Required.</b> A string indicating the hostname of the SSH server.
ServerGroupId	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.
