UnderManagement	Body	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div style="border: 1px solid green; border-radius: 10px; padding: 5px; background-color: #e0f2f1;"> <p> <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.</p> </div>
Port	Body	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

Table 583: POST SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
	<pre data-bbox="704 359 1382 674"> "Days": [   "Monday",   "Wednesday",   "Friday" ], "Time": "2023-11-27T17:30:00Z" } </pre>										
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										

Name	Description						
	<pre> "SyncSchedule": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-11-20T14:00:00Z"   } } </pre>						
UnderManagement	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div data-bbox="511 825 1404 955" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.</p> </div>						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1" data-bbox="511 1178 1404 1507"> <thead> <tr> <th data-bbox="511 1178 711 1245">Name</th> <th data-bbox="711 1178 1404 1245">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="511 1245 711 1377">Id</td> <td data-bbox="711 1245 1404 1377">An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td data-bbox="511 1377 711 1507">Username</td> <td data-bbox="711 1377 1404 1507">A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	<p>A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p>						

Name	Description
	For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i> .
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## PUT SSH Servers

The PUT /SSH/Servers method is used to update an existing SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH server.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /ssh/server\_admin/  
 OR  
 /ssh/enterprise\_admin/  
 SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 584: PUT SSH Servers Input Parameters

Name	In	Description
ID	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.
UnderManagement	Body	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).  <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 5px; background-color: #e8f5e9;">  <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.                 </div>
Port	Body	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

Table 585: PUT SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Day	The number of the day, in the month, to run the job.										

Name	Description						
	<pre> "SyncSchedule": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-11-20T14:00:00Z"   } } </pre>						
UnderManagement	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div data-bbox="511 821 1403 953" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.</p> </div>						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1" data-bbox="511 1178 1403 1507"> <thead> <tr> <th data-bbox="511 1178 708 1241">Name</th> <th data-bbox="708 1178 1403 1241">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="511 1241 708 1373">Id</td> <td data-bbox="708 1241 1403 1373">An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td data-bbox="511 1373 708 1507">Username</td> <td data-bbox="708 1373 1403 1507">A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	<p>A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p>						

Name	Description
	For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i> .
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## DELETE SSH Servers Access

The DELETE /SSH/Servers/Access method is used to remove a mapping of Keyfactor Command users or service accounts to one or more Linux logons on one or more SSH servers. This method returns HTTP 200 OK on a success with details of the logons and remaining associated users, if applicable, for the specified SSH server(s).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssh/server\_admin/  
OR  
/ssh/enterprise\_admin/  
SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

 **Tip:** Before deleting a logon to user mapping, be sure that you have switched the server from which you will removing your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be removed from the server. If the server is in *inventory only* mode and you remove a mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the server.

Table 586: DELETE SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	<p><b>Required.</b> An array of objects containing information for the Linux logon(s) to update. The following information should be included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "LogonUsers": [   {     "LogonName": "johns",     "Users": [       "KEYEXAMPLE\jsmith"     ]   } ] </pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.							

Table 587: DELETE SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonId</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST SSH Servers Access

The POST `/SSH/Servers/Access` method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH servers. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server(s).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

`/ssh/server_admin/`

OR

`/ssh/enterprise_admin/`

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Tip:** Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 588: POST SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	<p><b>Required.</b> An array of objects containing information for the Linux logon(s) to update. The following information should be included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "LogonUsers": [   {     "LogonName": "johns",     "Users": [       "KEYEXAMPLE\jsmith"     ]   } ] </pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.							

Table 589: POST SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonId</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.34.4 SSH Server Groups

The SSH Server Groups component of the Keyfactor API includes methods necessary to create, update and delete SSH server groups within Keyfactor Command.

Table 590: SSH Server Groups Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH server group with the specified ID.	<a href="#">DELETE SSH Server Groups ID on the next page</a>
/id}	GET	Returns the SSH server group with the specified ID.	<a href="#">GET SSH Server Groups ID on the next page</a>
/name}	GET	Returns the SSH server group with the specified name.	<a href="#">GET SSH Server Groups Name on page 1317</a>
/Access/id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	<a href="#">GET SSH Server Groups Access ID on page 1322</a>
/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	<a href="#">GET SSH Server Groups on page 1324</a>
/	POST	Creates a new SSH server group.	<a href="#">POST SSH Server Groups on page 1330</a>
/	PUT	Updates an existing SSH server group.	<a href="#">PUT SSH Server Groups on page 1339</a>
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	<a href="#">DELETE SSH Server Groups Access on page 1348</a>
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	<a href="#">POST SSH Server Groups Access on page 1351</a>

## DELETE SSH Server Groups ID

The DELETE /SSH/ServerGroups/{id} method is used to delete an SSH server group in Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssh/enterprise\_admin/

Table 591: DELETE SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH server group to be deleted. Use the <a href="#">GET /SSH/ServerGroups</a> method (see <a href="#">GET SSH Server Groups on page 1324</a> ) to retrieve a list of all the SSH server groups to determine the server group's GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Server Groups ID

The GET /SSH/ServerGroups/{id} method is used to retrieve an SSH server group with the specified GUID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssh/server\_admin/  
OR  
/ssh/enterprise\_admin/  
SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 592: GET SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH server group to be retrieved. Use the <i>GET /SSH/ServerGroups</i> method (see <a href="#">GET SSH Server Groups on page 1324</a> ) to retrieve a list of all the SSH server groups to determine the server group's GUID.

Table 593: GET SSH Server Groups {id} Response Data

Name	Description										
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.										
GroupName	A string indicating the name of the SSH server group.										
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. UnderManagement	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).				
ServerCount	An integer indicating the number of SSH servers that belong to the server group.				

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Server Groups Name

The GET /SSH/ServerGroups/{name} method is used to retrieve an SSH server group with the specified name from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 594: GET SSH Server Groups {name} Input Parameters

Name	In	Description
name	Path	<b>Required.</b> A string indicating the full name of the SSH server group to be retrieved.

Table 595: GET SSH Server Groups {name} Response Data

Name	In	Description										
ID	Body	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	Body	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.				
Name	Description											
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.											
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.											
GroupName	Body	A string indicating the name of the SSH server group.										
SyncSchedule	Body	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Server Groups Access ID

The GET /SSH/ServerGroups/Access/{id} method is used to retrieve Linux logons for an SSH server group, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server group GUID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin (/ssh/server\_admin/)* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 596: GET SSH Server Groups Access {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH server group for which to retrieve logon and user mappings. Use the <i>GET /SSH/ServerGroups</i> method (see <a href="#">GET SSH Server Groups on page 1324</a> ) to retrieve a list of all the SSH server groups to determine the server group's ID.

Table 597: GET SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td> <p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.												

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development.

It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Server Groups

The GET /SSH/ServerGroups method is used to retrieve one or more SSH server groups defined in Keyfactor Command. Results can be limited to selected server groups using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH server groups.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 598: GET SSH Server Groups Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Server Group Search</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• GroupId</li> <li>• GroupName</li> <li>• Owner (Owner ID)</li> <li>• OwnerName (Username)</li> <li>• EnforcePublishPolicy (Under Management) (true, false)</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>GroupName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 599: GET SSH Server Groups Response Data

Name	Description										
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.										
GroupName	A string indicating the name of the SSH server group.										
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Off	Turn off a previously configured schedule.										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> </tbody> </table>	Name	Description		<pre>"Interval": {   "Minutes": 60 }</pre>		
Name	Description						
	<pre>"Interval": {   "Minutes": 60 }</pre>						
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Days	An array of values representing the days						

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="511 277 682 340">Name</th> <th data-bbox="682 277 1396 340">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="511 340 682 592"></td> <td data-bbox="682 340 1396 592"> <table border="1"> <thead> <tr> <th data-bbox="706 361 868 424">Name</th> <th data-bbox="868 361 1372 424">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="706 424 868 592"></td> <td data-bbox="868 424 1372 592"> of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").				
Name	Description								
	of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").								
Monthly	A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters: <table border="1"> <thead> <tr> <th data-bbox="706 1213 868 1276">Name</th> <th data-bbox="868 1213 1372 1276">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="706 1276 868 1474">Time</td> <td data-bbox="868 1276 1372 1474">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="706 1474 868 1570">Day</td> <td data-bbox="868 1474 1372 1570">The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.		
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).								
Day	The number of the day, in the month, to run the job.								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> <b>Note:</b> Although the Keyfactor API Reference and Utility—Swagger—Example Value may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>For example:</p> <pre>"SyncSchedule": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-11-20T14:00:00Z"   } }</pre>	Name	Description		<pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre>
Name	Description				
	<pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre>				
UnderManagement	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).				
ServerCount	An integer indicating the number of SSH servers that belong to the server group.				

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST SSH Server Groups

The POST /SSH/ServerGroups method is used to create an SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server group.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssh/enterprise\_admin/

Table 600: POST SSH Server Groups Input Parameters

Name	In	Description												
OwnerName	Body	<p><b>Required.</b> A string indicating the Active Directory user who owns the server group (in DOMAIN\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</p> </div>												
GroupName	Body	<p><b>Required.</b> A string indicating the name of the SSH server group.</p>												
SyncSchedule	Body	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" style="width: 100%; border-collapse: collapse; margin: 10px 0;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="background-color: #f5f5f5; padding: 10px; border: 1px solid #ccc;"> "Interval": {   "Minutes": 60 } </pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule. UnderManagement	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).				
ServerCount	An integer indicating the number of SSH servers that belong to the server group.				

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## PUT SSH Server Groups

The PUT /SSH/ServerGroups method is used to update an existing SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the updated SSH server group.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 602: PUT SSH Server Groups Input Parameters

Name	In	Description										
ID	Body	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
OwnerName	Body	<p><b>Required.</b> A string indicating the Active Directory user who owns the server group (in DOMAIN\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> <b>Tip:</b> Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</p> </div>										
GroupName	Body	<b>Required.</b> A string indicating the name of the SSH server group.										
SyncSchedule	Body	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. 	pm: <pre data-bbox="824 394 1380 615"> {   "Monthly": {     "Day": 1     "Time": "2023-11-27T17:30:00Z"   } } </pre>					
UnderManagement	Body	A Boolean indicating whether the SSH server group is in <i>inventory only mode</i> (False) or <i>inventory and publish policy mode</i> (True). The default is False.				

Table 603: PUT SSH Server Groups Response Data

Name	In	Description										
ID	Body	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	Body	An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </div>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.				
Name	Description											
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.											
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.											
GroupName	Body	A string indicating the name of the SSH server group.										
SyncSchedule	Body	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> </div> <p>For example, every hour:</p> </td> </tr> </tbody> </table> </div>	Name	Description	Off	Turn off a previously configured schedule.	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> </div> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description											
Off	Turn off a previously configured schedule.											
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;"> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> </div> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.							
Name	Description											
Minutes	An integer indicating the number of minutes between each interval.											

Name	In	Description				
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> </tbody> </table>	Name	Description		<pre>"Interval": {   "Minutes": 60 }</pre>
Name	Description					
	<pre>"Interval": {   "Minutes": 60 }</pre>					
Daily		<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description					
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).					
Weekly		<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description					
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).					

Name	In	Description						
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. UnderManagement	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).				
ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.				

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## DELETE SSH Server Groups Access

The DELETE /SSH/ServerGroups/Access method is used to remove a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Tip:** Before deleting a logon to user mapping, be sure that you have switched the server group from which you will removing your mapping to *inventory and publish policy* mode so that the key for the user will be removed from the servers in the server group. If the server group is in *inventory only* mode and you remove a mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the servers.

Table 604: DELETE SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH server group.						
LogonUsers	Body	<p>An array of objects containing information for the Linux logon(s) to update. The following information should be included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "LogonUsers": [   {     "LogonName": "johns",     "Users": [       "KEYEXAMPLE\jsmith"     ]   } ] </pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.							

Table 605: DELETE SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td> <p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.												

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development.

It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST SSH Server Groups Access

The POST /SSH/ServerGroups/Access method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Tip:** Before creating a logon to user mapping, be sure that you have switched the server group to which you will add your mapping to *inventory and publish policy* mode so that the key for the user will be published to the servers in the group. If the server group is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the servers.

Table 606: POST SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH server group.						
LogonUsers	Body	<p><b>Required.</b> An array of objects containing information for the Linux logon (s) to update. The following information should be included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "LogonUsers": [   {     "LogonName": "johns",     "Users": [       "KEYEXAMPLE\jsmith"     ]   } ] </pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.							

Table 607: POST SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td> <p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td> </tr> <tr> <td>Users</td> <td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td> </tr> </tbody> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.												

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development.

It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.34.5 SSH Service Accounts

The SSH Service Accounts component of the Keyfactor API includes methods necessary to retrieve, create, update, rotate and delete service accounts and associated keys in Keyfactor Command.

Table 608: SSH Service Accounts Endpoints

Endpoint	Method	Description	Link
/id	DELETE	Deletes the SSH service account with the specified ID.	<a href="#">DELETE SSH Service Accounts ID below</a>
/id	GET	Returns the SSH service account with the specified ID.	<a href="#">GET SSH Service Accounts ID on page 1357</a>
/Key/id	GET	Returns the public key and optional private key of an SSH service account with the specified ID.	<a href="#">GET SSH Service Accounts Key ID on page 1364</a>
/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	<a href="#">DELETE SSH Service Accounts on page 1368</a>
/	GET	Returns a list of SSH service accounts based on the specified filters.	<a href="#">GET SSH Service Accounts on page 1370</a>
/	POST	Creates a new SSH service account.	<a href="#">POST SSH Service Accounts on page 1378</a>
/	PUT	Updates an existing SSH service account.	<a href="#">PUT SSH Service Accounts on page 1388</a>
/Rotate/id	POST	Generates a new key pair for an existing service account.	<a href="#">POST SSH Service Accounts Rotate ID on page 1396</a>

#### DELETE SSH Service Accounts ID

The DELETE /SSH/ServiceAccounts/id method is used to delete an SSH service account in Keyfactor Command, including its SSH key pair. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

`/ssh/server_admin/`

OR

`/ssh/enterprise_admin/`

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 609: DELETE SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH service account to be deleted.</p> <p>Use the <code>GET /SSH/ServiceAccounts</code> method (see <a href="#">GET SSH Service Accounts on page 1370</a>) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>Tip:</b> Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre data-bbox="503 724 1396 1732"> 1  { 2    "Id": 2, 3    "ClientHostname": "appsrvr80.keyexample.com", 4    "ServerGroup": { 5      "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", 6      "GroupName": "Server Group Two", 7      "UnderManagement": false 8    }, 9    "User": { 10     "Id": 7, 11     "Key": { 12       "Id": 36, 13       "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rx- 14 t2qXwGp7qcvzdBjVTDHNg=", 15       "PublicKey": "ssh-rsa AAAAB3Nz- 16 aC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", 17       "KeyType": "RSA", 18       "KeyLength": 2048, 19       "CreationDate": "2023-11-17T17:53:55.68", 20       "Email": "pkiadmins@keyexample.com", 21       "Comments": [ 22         "Access App Two" 23       ], 24       "LogonCount": 3 25     }, 26     "Username": "svc_access2@appsrvr80.keyexample.com" 27   } 28 } </pre> </div>

Name	In	Description
		 It contains three IDs: <ul style="list-style-type: none"> <li>• ID 2 (line 2): The service account's ID. Use this one for delete requests.</li> <li>• ID 7 (line 10): The service account user's ID.</li> <li>• ID 36 (line 12): The ID of the service account user's key.</li> </ul>

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Service Accounts ID

The GET /SSH/ServiceAccounts/{id} method is used to retrieve an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account and its public key. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1364](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /ssh/server\_admin/  
 OR  
 /ssh/enterprise\_admin/  
 SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 610: GET SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH service account to be retrieved. Use the <i>GET /SSH/ServiceAccounts</i> method (see <a href="#">GET SSH Service Accounts on page 1370</a> ) to retrieve a list of all the SSH service accounts to determine the service account's ID.

Table 611: GET SSH Service Accounts {id} Response Data

Name	Description																		
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
Client Host-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetost).																		
Server Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Group Name</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>Sync Schedule</td> <td> <p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Group Name	A string indicating the name of the SSH server group.	Sync Schedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.																		
Group Name	A string indicating the name of the SSH server group.																		
Sync Schedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.																		

Name	Description														
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.	Logon Count	An integer indicating the number of Linux logons associated with the SSH key pair.				
Name	Description																		
Key Length	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																		
Creation Date	A string indicating the date, in UTC, on which the SSH key pair was created.																		
Stale Date	A string indicating the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																		
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.																		
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.																		
Logon Count	An integer indicating the number of Linux logons associated with the SSH key pair.																		
Username	A string indicating the full username of the service account. The username is made up of																		

Name	Description
	the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Service Accounts Key ID

The GET `/SSH/ServiceAccounts/Key/{id}` method is used to retrieve the key information for an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account key, including optional private key.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssh/server_admin/`  
OR  
`/ssh/enterprise_admin/`  
SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 612: GET SSH Service Accounts Key {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH service account key for which to retrieve key information. Use the <code>GET /SSH/ServiceAccounts</code> method (see <a href="#">GET SSH Service Accounts on page 1370</a>) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> <b>Tip:</b> Be sure to use the ID of the service account's key and not the ID of the service account itself or the service account user. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre style="background-color: #e0f0e0; padding: 10px;"> 1  { 2    "Id": 2, 3    "ClientHostname": "appsrvr80.keyexample.com", 4    "ServerGroup": { 5      "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", 6      "GroupName": "Server Group Two", 7      "UnderManagement": false 8    }, 9    "User": { 10     "Id": 7, 11     "Key": { 12       "Id": 36, 13       "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rx- 14 t2qXwGp7qcvzdBjVTDHNg=", 15       "PublicKey": "ssh-rsa AAAAB3Nz- 16 aC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", 17       "KeyType": "RSA", 18       "KeyLength": 2048, 19       "CreationDate": "2023-11-17T17:53:55.68", 20       "Email": "pkiadmins@keyexample.com", 21       "Comments": [ 22         "Access App Two" 23       ], 24       "LogonCount": 3 25     }, 26     "Username": "svc_access2@appsr- 27 vr80.keyexample.com" 28   } 29 } </pre> <p>It contains three IDs:</p> </div>

Name	In	Description
		 <ul style="list-style-type: none"> <li>• ID 2 (line 2): The service account's ID.</li> <li>• ID 7 (line 10): The service account user's ID.</li> <li>• ID 36 (line12): The ID of the service account user's key. Use this one to request the key.</li> </ul>
IncludePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (True) or not (False). The default is <i>False</i> . If set to True, the X-Keyfactor-Key-Passphrase header must be supplied.
X-Keyfactor-Key-Passphrase	Header	<b>Required*</b> . A string that sets a password used to secure the private key of the SSH key pair for download. This field is <b>required</b> if <i>IncludePrivateKey</i> is set to <i>True</i> .

Table 613: GET SSH Service Accounts Key {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	A string indicating the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development.

It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## DELETE SSH Service Accounts

The DELETE /SSH/ServiceAccounts method is used to delete one or more SSH service accounts in Keyfactor Command, including their SSH key pairs. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 614: DELETE SSH Service Accounts Input Parameters

Name	In	Description
ids	Body	<p><b>Required.</b> An array of integers indicating the Keyfactor Command reference IDs for the SSH service accounts to be deleted provided in the request body in the following format:</p> <pre data-bbox="565 428 1406 474">[4,12,17]</pre> <p>Use the <a href="#">GET /SSH/ServiceAccounts</a> method (see <a href="#">GET SSH Service Accounts on the next page</a>) to retrieve a list of all the SSH service accounts to determine the service accounts IDs.</p> <div data-bbox="516 625 1406 1740" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a GET /SSH/ServiceAccounts:</p> <pre data-bbox="656 785 1370 1724"> {   "Id": 2,   "ClientHostname": "appsrvr80.keyexample.com",   "ServerGroup": {     "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546",     "GroupName": "Server Group Two",     "UnderManagement": false   },   "User": {     "Id": 7,     "Key": {       "Id": 36,       "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=",       "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]",       "KeyType": "RSA",       "KeyLength": 2048,       "CreationDate": "2020-11-17T17:53:55.68",       "Email": "pkiadmins@keyexample.com",       "Comments": [         "Access App Two"       ],       "LogonCount": 3     },     "Username": "svc_access2@appsrvr80.keyexample.com"   } } </pre> </div>

Name	In	Description
		 } <p>It contains three IDs:</p> <ul style="list-style-type: none"> <li>• ID 2: The service account's ID. Use this one for delete requests.</li> <li>• ID 7: The service account user's ID.</li> <li>• ID 36: The ID of the service account user's key.</li> </ul>

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Service Accounts

The GET /SSH/ServiceAccounts method is used to retrieve one or more SSH service accounts defined in Keyfactor Command. Results can be limited to selected service accounts using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH service accounts and their public keys. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1364](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /ssh/server\_admin/  
 OR  
 /ssh/enterprise\_admin/  
 SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 615: GET SSH Service Accounts Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Service Account Key Search</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• Comments (Key comments)</li> <li>• CreationDate</li> <li>• Id</li> <li>• KeyLength</li> <li>• KeyType</li> <li>• ServerGroup (Server Group ID)</li> <li>• ServerGroupName</li> <li>• Username</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 616: GET SSH Service Accounts Response Data

Name	Description																		
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
Client Host-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).																		
Server Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Group Name</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>Sync Schedule</td> <td> <p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Group Name	A string indicating the name of the SSH server group.	Sync Schedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.																		
Group Name	A string indicating the name of the SSH server group.																		
Sync Schedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.																		

Name	Description														
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Logon Count	An integer indicating the number of Linux logons associated with the SSH key pair.				
Name	Description																		
Key Length	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																		
Creation Date	A string indicating the date, in UTC, on which the SSH key pair was created.																		
Stale Date	A string indicating the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																		
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.																		
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.																		
Logon Count	An integer indicating the number of Linux logons associated with the SSH key pair.																		
Username	A string indicating the full username of the service account. The username is made up of																		

Name	Description
	the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### POST SSH Service Accounts

The POST /SSH/ServiceAccounts method is used to create a new SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH service account.

Before adding a new SSH service account, be sure that you have added at least one server group (see [POST SSH Server Groups on page 1330](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 17](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
 /ssh/server\_admin/  
 OR  
 /ssh/enterprise\_admin/  
 SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>myapp@appsrvr75).</td> </tr> <tr> <td>LogonIds</td> <td>An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.</td> </tr> </tbody> </table>	Name	Description		myapp@appsrvr75).	LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.
Name	Description							
	myapp@appsrvr75).							
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.							
ClientHostname	Body	<b>Required.</b> A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. user-name@client_hostname). The naming convention is to use the hostname of the server on which the application that will use the private key resides (e.g. appsrvr12), but you can put anything you like in this field (e.g. cheesetoast).						
ServerGroupId	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						

Table 618: POST SSH Service Accounts Response Data

Name	Description																		
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
Client Host-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetost).																		
Server Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Group Name</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>Sync Schedule</td> <td> <p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Group Name	A string indicating the name of the SSH server group.	Sync Schedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.																		
Group Name	A string indicating the name of the SSH server group.																		
Sync Schedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.

Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.	Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.	Logon Count	An integer indicating the number of Linux logons associated with the SSH key pair.				
Name	Description																		
Key Length	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																		
Creation Date	A string indicating the date, in UTC, on which the SSH key pair was created.																		
Stale Date	A string indicating the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																		
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.																		
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.																		
Logon Count	An integer indicating the number of Linux logons associated with the SSH key pair.																		
Username	A string indicating the full username of the service account. The username is made up of																		

Name	Description
	the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## PUT SSH Service Accounts

The PUT /SSH/ServiceAccounts method is used to update an existing SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH service account.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssh/server\_admin/  
OR  
/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 619: PUT SSH Service Accounts Input Parameters

Name	In	Description								
Key Update Request	Body	<p><b>Required.</b> An object that sets the information to include in the SSH service account key update request. Key update request information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td><b>Required.</b> An integer indicating the Keyfactor Command reference ID for the service account's key.</td> </tr> <tr> <td>Email</td> <td><b>Required.</b> A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.</td> </tr> <tr> <td>Comment</td> <td>A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</td> </tr> </tbody> </table>	Name	Description	Id	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the service account's key.	Email	<b>Required.</b> A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.	Comment	A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.
Name	Description									
Id	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the service account's key.									
Email	<b>Required.</b> A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.									
Comment	A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.									
Id	Body	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID for the service account.</p> <p>Use the <a href="#">GET /SSH/ServiceAccounts</a> method (see <a href="#">GET SSH Service Accounts on page 1370</a>) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p>								

Table 620: PUT SSH Service Accounts Response Data

Name	Description																		
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
Client Host-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetost).																		
Server Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Group Name</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>Sync Schedule</td> <td> <p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Group Name	A string indicating the name of the SSH server group.	Sync Schedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.																		
Group Name	A string indicating the name of the SSH server group.																		
Sync Schedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.

Logon Count	An integer indicating the number of Linux logons associated with the SSH key pair.																		
Username	A string indicating the full username of the service account. The username is made up of																		

Name	Description
	the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## POST SSH Service Accounts Rotate ID

The POST `/SSH/ServiceAccounts/Rotate/{id}` method is used to generate a new key pair in Keyfactor Command for an existing SSH service account. This method returns HTTP 200 OK on a success with details for the new key pair of the SSH service account, including the private key.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssh/server_admin/`  
OR  
`/ssh/enterprise_admin/`  
SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 621: GET SSH Service Accounts Rotate {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID for the SSH service account key for which to retrieve key information.</p> <p>Use the <code>GET /SSH/ServiceAccounts</code> method (see <a href="#">GET SSH Service Accounts on page 1370</a>) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> <b>Tip:</b> Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre data-bbox="565 653 1398 1724"> 1  { 2    "Id": 2, 3    "ClientHostname": "appsrvr80.keyexample.com", 4    "ServerGroup": { 5      "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", 6      "GroupName": "Server Group Two", 7      "UnderManagement": false 8    }, 9    "User": { 10     "Id": 7, 11     "Key": { 12       "Id": 36, 13       "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rx- 14 t2qXwGp7qcvzdBjVTDHNg=", 15       "PublicKey": "ssh-rsa AAAAB3Nz- 16 aC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", 17       "KeyType": "RSA", 18       "KeyLength": 2048, 19       "CreationDate": "2023-11-17T17:53:55.68", 20       "Email": "pkiadmins@keyexample.com", 21       "Comments": [ 22         "Access App Two" 23       ], 24       "LogonCount": 3 25     }, 26     "Username": "svc_access2@appsrvr80.keyexample.com" 27   } 28 } </pre> <p>It contains three IDs:</p> </div>

Name	In	Description								
		 <ul style="list-style-type: none"> <li>• ID 2 (line 2): The service account's ID. Use this one to rotate the key.</li> <li>• ID 7 (line 10): The service account user's ID.</li> <li>• ID 36 (line 12): The ID of the service account user's key.</li> </ul>								
KeyType	Body	<p><b>Required.</b> A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>ECDSA</td> </tr> <tr> <td>2</td> <td>Ed25519</td> </tr> <tr> <td>3</td> <td>RSA</td> </tr> </tbody> </table>	Value	Description	1	ECDSA	2	Ed25519	3	RSA
Value	Description									
1	ECDSA									
2	Ed25519									
3	RSA									
PrivateKeyFormat	Body	<p><b>Required.</b> A string indicating the format to use for the downloadable private key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>OpenSSH</td> </tr> <tr> <td>2</td> <td>PKCS8</td> </tr> </tbody> </table>	Value	Description	1	OpenSSH	2	PKCS8		
Value	Description									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<p><b>Required</b><sup>*</sup>. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and <b>required</b> if the <i>KeyType</i> is set to RSA.</p>								
Email	Body	<p><b>Required.</b> A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.</p>								
Password	Body	<p><b>Required.</b> A string that sets a password used to secure the private key of the SSH key pair for download.</p>								
Comment	Body	<p>An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</p>								

Table 622: GET SSH Service Accounts Rotate {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account key. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.34.6 SSH Users

The SSH Users component of the Keyfactor API includes methods necessary to retrieve, create, update, rotate, and delete users and associated keys in Keyfactor Command.

Table 623: SSH Users Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH user with the specified ID.	<a href="#">DELETE SSH Users ID below</a>
/id}	GET	Returns the SSH user with the specified ID.	<a href="#">GET SSH Users ID on the next page</a>
/	GET	Returns a list of SSH users based on the specified filters.	<a href="#">GET SSH Users on page 1406</a>
/	POST	Creates a new SSH user.	<a href="#">POST SSH Users on page 1417</a>
/	PUT	Updates an existing SSH user.	<a href="#">PUT SSH Users on page 1419</a>
/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	<a href="#">POST SSH Users Access on page 1421</a>

## DELETE SSH Users ID

The DELETE /SSH/Users/{id} method is used to delete an SSH user in Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssh/server\_admin/

Table 624: DELETE SSH Users {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH user (user or service account) to be deleted. Use the <i>GET /SSH/Users</i> method (see <a href="#">GET SSH Users on page 1406</a> ) to retrieve a list of all the SSH users to determine the user's ID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Refer-

ence and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Users ID

The GET /SSH/Users/{id} method is used to retrieve an SSH user defined in Keyfactor Command. The method can return either a *user* or a *service account*. See *SSH* in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. This method returns HTTP 200 OK on a success with details for the requested SSH user and its public key. To return an SSH private key, use the GET /SSH/Keys/MyKey method (see [GET SSH Keys My Key on page 1254](#)) for a user account or the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1364](#)) for a service account.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssh/server\_admin/  
OR  
/ssh/enterprise\_admin/  
SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the GET /SSH/Users/{id} method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 625: GET SSH Users {id} v2 Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH user (user or service account) to be retrieved. Use the <i>GET /SSH/Users</i> method (see <a href="#">GET SSH Users on page 1406</a> ) to retrieve a list of all the SSH users to determine the user's ID.

Table 626: GET SSH Users {id} v2 Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																		
Key	An object containing information about the key for the user. Key details include: <table border="1" data-bbox="414 436 1404 1690"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td> </tr> <tr> <td>Fingerprint</td> <td>A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.</td> </tr> <tr> <td>PublicKey</td> <td>A string indicating the public key of the key pair for the SSH user.</td> </tr> <tr> <td>KeyType</td> <td>A string indicating the cryptographic algorithm used to generate the SSH key. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description						
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.						
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.						
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).						
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.						

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## GET SSH Users

The GET /SSH/Users method is used to retrieve one or more SSH users defined in Keyfactor Command. The method returns both *users* and *service accounts*. See *SSH* in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. Results can be limited to selected users using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH users and their public keys. To return the SSH private key, use the GET /SSH/Keys/MyKey method (see [GET SSH Keys My Key on page 1254](#)) for user accounts and the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1364](#)) for service accounts.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

## Version 2

Version 2 of the GET /SSH/Users method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 629: GET SSH Users v2 Input Parameters

Name	In	Description
showOwnedAccess	Query	<p>A Boolean that specifies whether to return only users that have logons on servers that the requesting user owns (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p>This option applies only to requesting users with <i>SSH User</i> or <i>SSH Server Admin</i> permissions; users with <i>SSH Enterprise Admin</i> permissions will see all users regardless of the configuration of this setting.</p> <p>Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on page 1286</a>) or the <i>GET /SSH/ServerGroups</i> method (see <a href="#">GET SSH Server Groups on page 1324</a>) to determine ownership of a server or server group.</p> <div data-bbox="669 724 1404 1501" style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p> <b>Example: Example Scenario One</b></p> <ul style="list-style-type: none"> <li>• Server A is owned by Gina and server B is owned by John.</li> <li>• Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>.</li> <li>• Dave has a logon on server B but not on server A.</li> </ul> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave’s user record. She sees Dave’s user record, but sees no specific logon information for Dave (other than the LogonCount), because all Dave’s logons are on servers that Gina does not own.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave’s user record. Dave’s user record does not appear.</p> <p>The presence or absence of Dave’s user record is controlled by <i>showOwnedAccess</i>. The presence or absence of logon information associated with Dave’s user record is controlled by Gina’s level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p> </div> <div data-bbox="669 1522 1404 1747" style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p> <b>Example: Example Scenario Two</b></p> <ul style="list-style-type: none"> <li>• Server A is owned by Gina and server B is owned by John.</li> <li>• Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>.</li> <li>• Dave has a logon on server B and a logon on server A.</li> </ul> </div>

Name	In	Description
		<p> Gina does a GET /SSH/Users with <i>showOwnedAccess=false</i> and looks at the results for Dave’s user record. She sees Dave’s user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Gina does a GET /SSH/Users with <i>showOwnedAccess=true</i> and looks at the results for Dave’s user record. She sees Dave’s user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Notice there is no difference here in the results whether you choose <i>true</i> or <i>false</i> because at least one logon for Dave is present on a server owned by Gina. The <i>showOwnedAccess</i> option only comes into play when a user has no logons on a server owned by the requesting user.</p> <p>The presence or absence of logon information associated with Dave’s user record is controlled by Gina’s level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p>
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 =eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: <i>Using the SSH Server Search</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• Email</li> <li>• Fingerprint</li> <li>• IsServiceAccount</li> <li>• KeyLength</li> <li>• KeyType</li> <li>• LogonCount</li> <li>• LogonServerGroupId</li> <li>• LogonServerId</li> <li>• ServiceAccountId</li> <li>• StaleDate</li> </ul>

Name	In	Description
		<ul style="list-style-type: none"> <li>Username</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 630: GET SSH Users v2 Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																		
Key	An object containing information about the key for the user. Key details include: <table border="1" data-bbox="414 441 1404 1690"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td> </tr> <tr> <td>Fingerprint</td> <td>A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.</td> </tr> <tr> <td>PublicKey</td> <td>A string indicating the public key of the key pair for the SSH user.</td> </tr> <tr> <td>KeyType</td> <td>A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:               <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul> </td> </tr> <tr> <td>KeyLength</td> <td>An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.</td> </tr> <tr> <td>CreationDate</td> <td>A string containing the date, in UTC, on which the SSH key pair was created.</td> </tr> <tr> <td>StaleDate</td> <td>A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Email</td> <td>A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.	Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.	PublicKey	A string indicating the public key of the key pair for the SSH user.	KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>	KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.	CreationDate	A string containing the date, in UTC, on which the SSH key pair was created.	StaleDate	A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																		
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																		
PublicKey	A string indicating the public key of the key pair for the SSH user.																		
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>																		
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																		
CreationDate	A string containing the date, in UTC, on which the SSH key pair was created.																		
StaleDate	A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																		
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																		

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Comments</td> <td>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.</td> </tr> <tr> <td>LogonCount</td> <td>An integer indicating the number of Linux logons associated with the SSH key pair.</td> </tr> </tbody> </table>	Name	Description	Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.		
Name	Description								
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.								
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.								
Username	A string indicating the full username of the user or service account. For a user account, the username appears in <code>DOMAIN\username</code> format (e.g. <code>KEYEXAMPLE\jsmith</code> ). For a service account, the username is made up of the user name and <code>ClientHostname</code> entered when the service account is created (e.g. <code>myapp@appsrvr75</code> ).								
Access	<p>An object containing information about the Linux logons mapped to the user. Linux logon mapping details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>KeyCount</td> <td>An integer indicating the number of SSH keys associated with the Linux logon.</td> </tr> <tr> <td>Access</td> <td>An object containing information about the users mapped to the Linux logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.	KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.	Access	An object containing information about the users mapped to the Linux logon.
Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.								
KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.								
Access	An object containing information about the users mapped to the Linux logon.								
IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).								

## Version 1

Version 1 of the `GET /SSH/Users` method includes the same capabilities as version 2, but offers more limited information on returned logons for the user.

Table 631: GET SSH Users v1 Input Parameters

Name	In	Description
showOwnedAccess	Query	<p>A Boolean that specifies whether to return only users that have logons on servers that the requesting user owns (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p>This option applies only to requesting users with <i>SSH User</i> or <i>SSH Server Admin</i> permissions; users with <i>SSH Enterprise Admin</i> permissions will see all users regardless of the configuration of this setting.</p> <p>Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on page 1286</a>) or the <i>GET /SSH/ServerGroups</i> method (see <a href="#">GET SSH Server Groups on page 1324</a>) to determine ownership of a server or server group.</p> <div data-bbox="669 724 1404 1501" style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p> <b>Example: Example Scenario One</b></p> <ul style="list-style-type: none"> <li>• Server A is owned by Gina and server B is owned by John.</li> <li>• Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>.</li> <li>• Dave has a logon on server B but not on server A.</li> </ul> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave’s user record. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.</td> </tr> <tr> <td>LogonCount</td> <td>An integer indicating the number of Linux logons associated with the SSH key pair.</td> </tr> </tbody> </table>	Name	Description	Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description						
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.						
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.						
Username	A string indicating the full username of the user or service account. For a user account, the username appears in <code>DOMAIN\username</code> format (e.g. <code>KEYEXAMPLE\jsmith</code> ). For a service account, the username is made up of the user name and <code>ClientHostname</code> entered when the service account is created (e.g. <code>myapp@appsrvr75</code> ).						
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.						

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

## POST SSH Users

The `POST /SSH/Users` method is used to create a new SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons during creation to allow the public key for the user to be published out to a Linux server—for servers in *inventory and publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssh/server_admin/`  
OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin (/ssh/server\_admin/)* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 633: POST SSH Users Input Parameters

Name	In	Description
Username	Body	<p><b>Required.</b> A string indicating the full username of the <i>user</i> or <i>service account</i>.</p> <p>For a <i>user</i> account, the username is given in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a <i>service account</i>, the username is made up of a user name (e.g. svc_myapp) and client hostname reference for the service account. The client hostname is used for reference only and does not need to match an actual client hostname. The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast). The full service account name is given in the form username@clienthostname (e.g. svc_myapp@appsvr75).</p>
LogonIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <pre>[12, 27, 39]</pre> <p>Use the <i>GET /SSH/Logons</i> method (see <a href="#">GET SSH Logons on page 1271</a>) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p>

Table 634: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results

returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## PUT SSH Users

The PUT /SSH/Users method is used to update an existing SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons to allow the public key for the user to be published out to a Linux server—for servers in *inventory and publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server\_admin/

OR

/ssh/enterprise\_admin/

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (/ssh/server\_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 635: PUT SSH Users Input Parameters

Name	In	Description
ID	Body	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the SSH user.</p> <p>Use the <a href="#">GET /SSH/Users</a> method (see <a href="#">GET SSH Users on page 1406</a>) to retrieve a list of all the SSH users to determine the user's ID.</p>
LogonIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <pre>[ 12, 27, 39 ]</pre> <p>Use the <a href="#">GET /SSH/Logons</a> method (see <a href="#">GET SSH Logons on page 1271</a>) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p> <div style="border: 1px solid orange; padding: 5px; background-color: #fff9e6;"> <p> <b>Important:</b> Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see <a href="#">GET SSH Users on page 1406</a>) before updating and provide both existing and new logon IDs.</p> </div>

Table 636: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## POST SSH Users Access

The POST `/SSH/Users/Access` method is used to create a mapping of one or more Linux logons to a Keyfactor Command user or service account. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

`/ssh/server_admin/`

OR

`/ssh/enterprise_admin/`

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Tip:** Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 637: POST SSH Users Access Input Parameters

Name	In	Description
ID	Body	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the SSH user.</p> <p>Use the <a href="#">GET /SSH/Users</a> method (see <a href="#">GET SSH Users on page 1406</a>) to retrieve a list of all the SSH users to determine the user's ID.</p>
LogonIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <pre>[12, 27, 39]</pre> <p>Use the <a href="#">GET /SSH/Logons</a> method (see <a href="#">GET SSH Logons on page 1271</a>) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p> <div style="border: 1px solid orange; padding: 5px;"><p> <b>Important:</b> Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see <a href="#">GET SSH Users on page 1406</a>) before updating and provide both existing and new logon IDs.</p></div>

Table 638: POST SSH Users Access Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																		
Key	An object containing information about the key for the user. Key details include: <table border="1" data-bbox="412 436 1403 1688"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td> </tr> <tr> <td>Fingerprint</td> <td>A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.</td> </tr> <tr> <td>PublicKey</td> <td>A string indicating the public key of the key pair for the SSH user.</td> </tr> <tr> <td>KeyType</td> <td>A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:               <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul> </td> </tr> <tr> <td>KeyLength</td> <td>An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.</td> </tr> <tr> <td>CreationDate</td> <td>A string containing the date, in UTC, on which the SSH key pair was created.</td> </tr> <tr> <td>StaleDate</td> <td>A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Email</td> <td>A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.	Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.	PublicKey	A string indicating the public key of the key pair for the SSH user.	KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>	KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.	CreationDate	A string containing the date, in UTC, on which the SSH key pair was created.	StaleDate	A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																		
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																		
PublicKey	A string indicating the public key of the key pair for the SSH user.																		
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>																		
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																		
CreationDate	A string containing the date, in UTC, on which the SSH key pair was created.																		
StaleDate	A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																		
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																		

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Comments</td> <td>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.</td> </tr> <tr> <td>LogonCount</td> <td>An integer indicating the number of Linux logons associated with the SSH key pair.</td> </tr> </tbody> </table>	Name	Description	Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.				
Name	Description										
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the user or service account. For a user account, the username appears in <code>DOMAIN\username</code> format (e.g. <code>KEYEXAMPLE\jsmith</code> ). For a service account, the username is made up of the user name and <code>ClientHostname</code> entered when the service account is created (e.g. <code>myapp@appsrvr75</code> ).										
Access	<p>An object containing information about the Linux logons mapped to the user. Linux logon mapping details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>Username</td> <td>A string indicating the user's logon name on the Linux server.</td> </tr> <tr> <td>KeyCount</td> <td>An integer indicating the number of SSH keys associated with the Linux logon.</td> </tr> <tr> <td>Access</td> <td>An object containing information about the users mapped to the Linux logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.	Username	A string indicating the user's logon name on the Linux server.	KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.	Access	An object containing information about the users mapped to the Linux logon.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.										
Username	A string indicating the user's logon name on the Linux server.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.										
Access	An object containing information about the users mapped to the Linux logon.										
IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).										

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Refer-

ence and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.35 SMTP

The SMTP component of the Keyfactor API includes methods necessary to programmatically edit and retrieve the SMTP configuration profile and send a test email message. Editing the SMTP configuration profile in Keyfactor Command will only apply within the software. Only one SMTP profile may be configured.

Table 639: SMTP Endpoints

Endpoint	Method	Description	Link
/	GET	Returns information about the SMTP configuration profile.	<a href="#">GET SMTP below</a>
/	PUT	Updates settings for the SMTP configuration profile.	<a href="#">PUT SMTP on page 1426</a>
/Test	POST	Sends a test email message to confirm SMTP configuration.	<a href="#">POST SMTP Test on page 1429</a>

### 2.6.35.1 GET SMTP

The GET /SMTP method is used to retrieve the SMTP configuration profile from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SMTP profile. Only one profile may be configured. There are no input parameters for this method.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/system_settings/read/`

Table 640: GET SMTP Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). This is considered deprecated and may be removed in a future release.						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results

returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.35.2 PUT SMTP

The PUT /SMTP method is used to update the SMTP configuration profile information. This method returns HTTP 200 OK on a success with details about the SMTP configuration profile.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/system_setting/modify/`

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 641: PUT SMTP Input Parameters

Name	In	Description						
Host	Body	<b>Required.</b> A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	An integer indicating the type of authentication used to connect to the mail server. Possible values are: <table border="1" data-bbox="721 695 1403 890"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	<b>Required*</b> A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is <b>required</b> if <i>RelayAuthenticationType</i> is set to 2. No data is output in this field on a GET.						
RelayUsername	Body	<b>Required*</b> A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format. This field is <b>required</b> if <i>RelayAuthenticationType</i> is set to 2. For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.						
SenderAccount	Body	<b>Required.</b> A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	Body	<b>Required.</b> A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthentic-</i>						

Name	In	Description
		<i>ationType</i> .
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.

Table 642: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	An integer indicating the type of authentication used to connect to the mail server. Possible values are: <table border="1" data-bbox="581 919 1404 1115"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format. For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.35.3 POST SMTP Test

The POST /SMTP/Test method is used to test the SMTP settings by sending a test email message. This method returns HTTP 200 OK on a success with details about the SMTP profile.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/system\_setting/modify/

Table 643: POST SMTP Test Input Parameters

Name	In	Description						
Host	Body	<b>Required.</b> A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	<b>Required.</b> An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	An integer indicating the type of authentication used to connect to the mail server. Possible values are: <table border="1" data-bbox="721 661 1404 856"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	<b>Required*</b> . A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is <b>required</b> if <i>RelayAuthenticationType</i> is set to 2. No data is output in this field on a GET.						
RelayUsername	Body	<b>Required*</b> . A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format. This field is <b>required</b> if <i>RelayAuthenticationType</i> is set to 2. For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.						
SenderAccount	Body	<b>Required.</b> A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results

returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.36 SSL

The SSL component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list SSL networks, network ranges, and endpoints found in an SSL scan.

Table 645: SSL Endpoints

Endpoint	Method	Description	Link
/Parts/{id}	GET	Returns detailed information about a scan job for SSL discovery or monitoring.	<a href="#">GET SSL Parts ID on page 1435</a>
/Endpoints/{id}	GET	Returns the details about a single endpoint discovered during SSL scanning.	<a href="#">GET SSL Endpoints ID on page 1437</a>
/NetworkRanges/{id}	DELETE	Removes all network ranges from the specified SSL network.	<a href="#">DELETE SSL NetworkRanges ID on page 1439</a>
/NetworkRanges/{id}	GET	Returns network range information about the specified SSL network.	<a href="#">GET SSL NetworkRanges ID on page 1439</a>
/Networks/{identifier}	GET	Returns information about the specified SSL network.	<a href="#">GET SSL Networks Identifier on page 1440</a>
/	GET	Returns the results of an SSL scan based on query information.	<a href="#">GET SSL on page 1451</a>
/Networks	GET	Returns information about all SSL networks in Keyfactor Command.	<a href="#">GET SSL Networks on page 1453</a>
/Networks	POST	Creates a new SSL network.	<a href="#">POST SSL Networks on page 1464</a>
/Networks	PUT	Updates an existing SSL	<a href="#">PUT SSL Networks</a>

Endpoint	Method	Description	Link
		network.	<a href="#">on page 1478</a>
/Endpoints/{id}/History	GET	Returns a list of all the SSL scanning endpoint histories for an endpoint with the given ID.	<a href="#">GET SSL Endpoints ID History on page 1492</a>
/Networks/{id}/Parts	GET	Returns the scan job information for SSL discovery or monitoring.	<a href="#">GET SSL Networks ID Parts on page 1497</a>
/NetworkRanges	POST	Adds network ranges to the specified SSL network.	<a href="#">POST SSL NetworkRanges on page 1499</a>
/NetworkRanges	PUT	Updates network range information on the specified SSL network.	<a href="#">PUT SSL NetworkRanges on page 1500</a>
/Endpoints/ReviewStatus	PUT	Used to change the <i>reviewed</i> status for a given SSL endpoint.	<a href="#">PUT SSL Endpoints Review Status on page 1501</a>
/Endpoints/MonitorStatus	PUT	Used to change the <i>monitoring</i> status for a given SSL endpoint.	<a href="#">PUT SSL Endpoints Monitor Status on page 1502</a>
/Endpoints/ReviewAll	PUT	Used to change the <i>reviewed</i> status for all given SSL endpoints to true.	<a href="#">PUT SSL Endpoints Review All on page 1502</a>
/Endpoints/MonitorAll	PUT	Used to change the <i>monitoring</i> status for all given SSL endpoints to true.	<a href="#">PUT SSL Endpoints Monitor All on page 1503</a>
/Networks/{id}/Scan	POST	Starts an SSL discovery or monitoring scan job manually.	<a href="#">POST SSL Networks ID Scan on page 1504</a>
/NetworkRanges/Validate	POST	Validates all SSL networks given.	<a href="#">POST SSL NetworkRanges Validate on page 1505</a>
/Networks/{id}	DELETE	Removes an SSL network from Keyfactor Command.	<a href="#">DELETE SSL Networks ID on page 1506</a>

### 2.6.36.1 GET SSL Parts ID

The GET /SSL/Parts/{id} method retrieves information for a specific job scan segment (see [GET SSL Networks ID Parts on page 1497](#)). This method returns HTTP 200 OK on a success with details about the specified scan job segment.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssl/read/`

Table 646: GET SSL Parts {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL scan job segment to be retrieved. Use the <code>GET /SSL/Networks/{id}/Parts</code> method (see <a href="#">GET SSL Networks ID Parts on page 1497</a> ) to retrieve a list of all the scan job segments in an SSL network to determine the SSL scan job segment's GUID.

Table 647: GET SSL Parts {id} Response Data

Parameter Name	Description								
ScanJobPartId	A string indicating the Keyfactor Command reference GUID for the scan job segment.								
LogicalScanJobId	A string indicating the Keyfactor Command reference GUID for the scan job as a whole.								
AgentJobId	A string indicating the Keyfactor Command reference GUID for the orchestrator that ran the job segment, if applicable. If the segment has not yet started scanning, this will show all zeros.								
EstimatedEndpointCount	An integer indicating the number of endpoints that will be scanned for the segment estimated in preparation for scanning. The number of endpoints per segment is configurable (see the <i>SSL Maximum Scan Job Size</i> setting on the agents tab in <i>Application Settings: Agents Tab</i> in the <i>Keyfactor Command Reference Guide</i> ).								
Status	An integer indicating the status of the scan job segment. Possible values are: <table border="1" data-bbox="669 961 1404 1222"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Not Started</td> </tr> <tr> <td>2</td> <td>In Progress</td> </tr> <tr> <td>3</td> <td>Complete</td> </tr> </tbody> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StatTotalEndpointCount	An integer indicating the number of endpoints that were scanned for the segment. This value will be null if the scan is not yet complete.								
StatTimedOutConnectingCount	An integer indicating the number of endpoints that timed out while attempting connections. This value will be null if the scan is not yet complete.								
StatConnectionRefusedCount	An integer indicating the number of endpoints that received a connection refused while attempting connections. This value will be null if the scan is not yet complete.								
StatTimedOutDownloadingCount	An integer indicating the number of endpoints that timed out while downloading while attempting connections. This value will be null if the scan is not yet complete.								

Parameter Name	Description
StatExceptionDownloadingCount	An integer indicating the number of endpoints that encountered an exception while attempting connections. This value will be null if the scan is not yet complete.
StatNotSslCount	An integer indicating the number of endpoints that made a connection and were considered not SSL (connection on a non-SSL port such as 22 or 636). This value will be null if the scan is not yet complete.
StatBadSslHandshakeCount	An integer indicating the number of endpoints that had a bad handshake while attempting connections. This value will be null if the scan is not yet complete.
StatCertificateFoundCount	An integer indicating the number of endpoints where a certificate was found. This value will be null if the scan is not yet complete.
StatNoCertificateCount	An integer indicating the number of endpoints where the handshake got to the part of the TLS where a certificate should be returned, but did not find a certificate. This is an uncommon occurrence, so will usually be zero.
ScanJobPartsDefinitions	This is no longer in use and will always return "null".
StartTime	A string indicating the date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.
EndTime	A string indicating the date and time at which the scan job segment finished in UTC. For jobs that have not yet started, this value will be null.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.2 GET SSL Endpoints ID

The GET /SSL/Endpoints/{id} method is used to retrieve information about an endpoint found in an SSL discover or monitor scan using the EndpointId. This method returns HTTP 200 OK on a success with details of the SSL endpoints.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssl/read/`

Table 648: GET SSL Endpoints {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSL endpoint to be retrieved. Use the <i>GET /SSL</i> method (see <a href="#">GET SSL on page 1451</a> ) to retrieve a list of all the SSL endpoints to determine the SSL endpoint's GUID.

Table 649: GET SSL Endpoints {id} Response Data

Name	Description
EndpointId	A string indicating the Keyfactor Command reference GUID for the endpoint.
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network that scanned the endpoint.
LastHistoryId	A string indicating the Keyfactor Command reference GUID for the last history entry on the endpoint.
IpAddressBytes	A string indicating the IP address for the endpoint as bytes.
Port	An integer indicating the port on which this endpoint was found.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
EnableMonitor	A Boolean indicating whether monitoring is enabled on this endpoint (true) or not (false).
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.3 DELETE SSL NetworkRanges ID

The DELETE /SSL/NetworkRanges/{id} method is used to delete all the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/modify/

 **Tip:** To delete some but not all of the network ranges for a network, use the *PUT /SSL/Networks* method to update the network and submit the request with only those network ranges you wish to retain (see [PUT SSL Networks on page 1478](#)).

Table 650: DELETE SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL network for which to delete network ranges. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1453</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.4 GET SSL NetworkRanges ID

The GET /SSL/NetworkRanges/{id} method is used to retrieve the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/read/

Table 651: GET SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL network for which to retrieve network ranges. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1453</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 652: GET SSL Network Ranges {id} Response Data

Name	Description										
ItemType	An integer indicating the type of network range. Possible values are: <table border="1" data-bbox="402 688 1404 1003"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>IP Address</td> </tr> <tr> <td>2</td> <td>Host Name</td> </tr> <tr> <td>3</td> <td>Network Notation</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	IP Address	2	Host Name	3	Network Notation
Value	Description										
0	Unknown										
1	IP Address										
2	Host Name										
3	Network Notation										
Value	A string indicating the value for the network range, including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).										

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.5 GET SSL Networks Identifier

The *GET /SSL/Networks/{identifier}* method is used to retrieve a defined SSL network according to the provided name from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SSL network.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
*/ssl/read/*

Table 653: GET SSL Networks {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL network to be retrieved. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1453</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 654: GET SSL Networks {id} Response Data

Name	Description										
Network Id	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
Agent Pool Name	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
Discover Schedule	<p>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description																		
	<table border="1"> <thead> <tr> <th data-bbox="438 275 636 336">Name</th> <th data-bbox="636 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="438 336 636 548"></td> <td data-bbox="636 336 1398 548"> <pre data-bbox="695 394 911 495">"Interval": {   "Minutes": 60 }</pre> </td> </tr> <tr> <td data-bbox="438 548 636 1157">Daily</td> <td data-bbox="636 548 1398 1157"> <p data-bbox="656 569 1344 632">A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th data-bbox="662 659 821 720">Name</th> <th data-bbox="821 659 1391 720">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="662 720 821 890">Time</td> <td data-bbox="821 720 1391 890">The date and time to next run the job. Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						

Name	Description										
Exactly Once	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" }</pre> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Monitor Schedule	<p>An object providing the monitoring schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes</td> </tr> </tbody> </table>	Name	Description	Minutes	An integer indicating the number of minutes
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes</td> </tr> </tbody> </table>	Name	Description	Minutes	An integer indicating the number of minutes						
Name	Description										
Minutes	An integer indicating the number of minutes

These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").             </td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").												
Name	Description																		
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).																		
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																		

Name	Description						
	<table border="1"> <thead> <tr> <th data-bbox="440 275 634 338">Name</th> <th data-bbox="634 275 1401 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="440 338 634 766"></td> <td data-bbox="634 338 1401 766"> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre data-bbox="659 396 1380 753"> {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2023-11-27T17:30:00Z"   } } </pre> </td> </tr> </tbody> </table>	Name	Description		<p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre data-bbox="659 396 1380 753"> {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2023-11-27T17:30:00Z"   } } </pre>		
Name	Description						
	<p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre data-bbox="659 396 1380 753"> {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2023-11-27T17:30:00Z"   } } </pre>						
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th data-bbox="659 877 821 940">Name</th> <th data-bbox="821 877 1377 940">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="659 940 821 1108">Time</td> <td data-bbox="821 940 1377 1108">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="659 1108 821 1203">Day</td> <td data-bbox="821 1108 1377 1203">The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre data-bbox="659 1276 1380 1497"> {   "Monthly": {     "Day": 1     "Time": "2023-11-27T17:30:00Z"   } } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						

Name	Description				
Exactly Once	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" }</pre> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).				
Discover Percent Complete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.				
Monitor Percent Complete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.				
Discover Status	An integer indicating the status of the discovery job. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Unknown
Value	Description				
0	Unknown				

Name	Description																
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours		
Value	Description																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
Monitor Status	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
Discover Last Scanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
Monitor Last Scanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
Ssl Alert Recipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;"> <p> <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.</p> </div>																

Name	Description
Auto Monitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
Get Robots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
Discover Timeout Ms	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
Monitor Timeout Ms	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
Expiration Alert Days	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
Discover Job Parts	An integer that indicates the number of job parts that have been created for a discovery job.
Monitor Job Parts	An integer that indicates the number of job parts that have been created for a monitoring job.
Quiet Hours	An array of objects providing the list of scheduled quiet hour periods.
Blackout Start	An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.  This is considered deprecated and may be removed in a future release.
Blackout End	An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.  This is considered deprecated and may be removed in a future release.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.6 GET SSL

The GET /SSL method is used to return a list of all discovered SSL endpoints, limited by the provided parameters. This method returns HTTP 200 OK on a success with details about the requested endpoints.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssl/read/`

Table 655: GET SSL Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to: <i>Using the Discovery Results Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AgentPoolName</i></li> <li>• <i>CertificateCN</i></li> <li>• <i>CertificateFound</i> (True, False)</li> <li>• <i>Status</i> ( 6-Certificate Found, 1-Timed Out Connecting, 2-Exception Connecting, 3-Timed Out Downloading, 4-Exception Downloading, 5-Not SSL, 7-Exception in Sql, 8-Invalid or Unreachable Host, 9-Connection Refused, 10-Bad SSL Handshake, 11-Client Authentication Failed, 12-No Certificate, 13-SSL Refused, 14-Not Probed, 0-Unknown)</li> <li>• <i>IpAddress</i></li> <li>• <i>IsMonitored</i> (True, False)</li> <li>• <i>IssuerDN</i></li> <li>• <i>NetworkName</i></li> <li>• <i>Port</i></li> <li>• <i>ReverseDNS</i></li> <li>• <i>Reviewed</i> (True, False)</li> <li>• <i>SelfSigned</i> (True, False)</li> <li>• <i>SNIName</i></li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ReverseDNS</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 656: GET SSL Response Data

Name	Description
EndpointId	A string indicating the Keyfactor Command reference GUID for the endpoint.
ReverseDNS	A string indicating the DNS name resolved for the endpoint based on the discovered IP address. If a host name could not be resolved, this will be the IP address.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
IpAddress	A string indicating the IP address of the endpoint.
Port	An integer indicating the port at which the endpoint was found.
CertificateFound	A Boolean indicating whether a certificate was found at the endpoint (true) or not (false).
AgentPoolName	A string indicating the name of the orchestrator pool that performed a scan (discovery or monitoring) on the endpoint.
NetworkName	A string indicating the name of the SSL network that performed a scan (discovery or monitoring) on the endpoint.
MonitorStatus	A Boolean indicating whether the endpoint should be monitored (true) or not (false).
CertificateCN	A string indicating the common name of the certificate that was found at the endpoint.
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.7 GET SSL Networks

The GET /SSL/Networks method is used to retrieve one or more SSL networks from Keyfactor Command. Results can be limited to selected SSL networks using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified SSL networks.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssl/read/`

Table 657: GET SSL Networks Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Network Scan Details Search</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• Name</li><li>• Pool</li></ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending. This field is optional.

Table 658: GET SSL Networks Response Data

Name	Description										
Network Id	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
Agent Pool Name	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
Discover Schedule	<p>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Interval": {   "Minutes": 60 }</pre> </td> </tr> </tbody> </table>	Name	Description		<pre>"Interval": {   "Minutes": 60 }</pre>		
Name	Description						
	<pre>"Interval": {   "Minutes": 60 }</pre>						
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						

Name	Description						
	<table border="1"> <thead> <tr> <th data-bbox="438 275 634 336">Name</th> <th data-bbox="634 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="438 336 634 764"></td> <td data-bbox="634 336 1398 764"> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre data-bbox="657 394 1375 751"> {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2023-11-27T17:30:00Z"   } } </pre> </td> </tr> </tbody> </table>	Name	Description		<p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre data-bbox="657 394 1375 751"> {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2023-11-27T17:30:00Z"   } } </pre>		
Name	Description						
	<p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre data-bbox="657 394 1375 751"> {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2023-11-27T17:30:00Z"   } } </pre>						
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th data-bbox="657 877 821 938">Name</th> <th data-bbox="821 877 1375 938">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="657 938 821 1108">Time</td> <td data-bbox="821 938 1375 1108">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="657 1108 821 1203">Day</td> <td data-bbox="821 1108 1375 1203">The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre data-bbox="657 1276 1375 1493"> {   "Monthly": {     "Day": 1     "Time": "2023-11-27T17:30:00Z"   } } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						

Name	Description										
Exactly Once	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" }</pre> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Monitor Schedule	<p>An object providing the monitoring schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes</td> </tr> </tbody> </table>	Name	Description	Minutes	An integer indicating the number of minutes
Name	Description

These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").             </td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").												
Name	Description																		
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).																		
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																		

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ],   "Time": "2023-11-27T17:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description		<p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ],   "Time": "2023-11-27T17:30:00Z" }</pre>		
Name	Description						
	<p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ],   "Time": "2023-11-27T17:30:00Z" }</pre>						
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2023-11-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						

Name	Description				
Exactly Once	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2023-11-27T11:45:00Z" }</pre> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).				
Discover Percent Complete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.				
Monitor Percent Complete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.				
Discover Status	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Unknown
Value	Description				
0	Unknown				

Name	Description																
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours		
Value	Description

2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
Monitor Status	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
Discover Last Scanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
Monitor Last Scanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
Ssl Alert Recipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;"> <p> <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.</p> </div>																

Name	Description
Get Robots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
Discover Timeout Ms	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
Monitor Timeout Ms	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
Expiration Alert Days	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
Discover Job Parts	An integer that indicates the number of job parts that have been created for a discovery job.
Monitor Job Parts	An integer that indicates the number of job parts that have been created for a monitoring job.
Quiet Hours	An array of objects providing the list of scheduled quiet hour periods.
Blackout Start	An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.  This is considered deprecated and may be removed in a future release.
Blackout End	An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.  This is considered deprecated and may be removed in a future release.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.8 POST SSL Networks

The POST `/SSL/Networks` method is used to create an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSL network.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssl/modify/`

Table 659: POST SSL Networks Input Parameters

Name	In	Description										
Network Id	Body	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	<b>Required.</b> A string indicating the name for the SSL network.										
Agent Pool Name	Body	<b>Required.</b> A string indicating the name of the orchestrator pool assigned to the SSL network. See for more information.										
AgentPoolId	Body	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	<b>Required.</b> A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
Discover Schedule	Body	<p>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #4CAF50; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Discover Percent Complete	Body	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
Monitor Percent Complete	Body	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
Discover Status	Body	An integer indicating the status of the discovery job. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	

Name	In	Description																
Monitor Status	Body	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
Discover Last Scanned	Body	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																
Monitor Last Scanned	Body	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																
Ssl Alert Recipients	Body	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.</p> </div>																
Get Robots	Body	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).																
Discover Timeout Ms	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.																
Monitor Timeout Ms	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate																

Name	In	Description
		expiration details.
Expiration Alert Days	Body	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
Discover Job Parts	Body	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
Monitor Job Parts	Body	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
Quiet Hours	Body	<p>An array of objects providing the list of scheduled quiet hour periods. For example:</p> <pre> "QuietHours": [   {     "StartDay": "Monday",     "StartTime": "2022-11-21T14:00:08Z",     "EndDay": "Tuesday",     "EndTime": "2022-11-22T14:00:08Z"   },   {     "StartDay": "Saturday",     "StartTime": "2022-11-26T04:00:08Z",     "EndDay": "Sunday",     "EndTime": "2022-11-27T16:00:08Z"   } ] </pre>
Blackout Start	Body	<p>An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>
Blackout End	Body	<p>An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>

Table 660: POST SSL Networks Response Data

Name	Description				
Network Id	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.				
Name	A string indicating the name for the SSL network.				
Agent Pool Name	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.				
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.				
Description	A string indicating the description of the SSL network.				
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.				
Discover Schedule	An object providing the discovery schedule for the SSL network group.				
Monitor Schedule	An object providing the monitoring schedule for the SSL network group.				
Discover Percent Complete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.				
Monitor Percent Complete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.				
Discover Status	An integer indicating the status of the discovery job. Possible values are: <table border="1" data-bbox="435 1528 1404 1669"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Unknown

6	In Quiet Hours																
Discover Last Scanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
Monitor Last Scanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
Ssl Alert Recipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;"> <p> <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.</p> </div>																

Name	Description
Auto Monitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
Get Robots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
Discover Timeout Ms	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
Monitor Timeout Ms	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
Expiration Alert Days	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
Discover Job Parts	An integer that indicates the number of job parts that have been created for a discovery job.
Monitor Job Parts	An integer that indicates the number of job parts that have been created for a monitoring job.
Quiet Hours	An array of objects providing the list of scheduled quiet hour periods.
Blackout Start	An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.  This is considered deprecated and may be removed in a future release.
Blackout End	An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.  This is considered deprecated and may be removed in a future release.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.9 PUT SSL Networks

The PUT /SSL/Networks method is used to update an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSL network.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/modify/

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 661: PUT SSL Networks Input Parameters

Name	In	Description										
Network Id	Body	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	<b>Required.</b> A string indicating the name for the SSL network.										
Agent Pool Name	Body	<b>Required.</b> A string indicating the name of the orchestrator pool assigned to the SSL network. See for more information.										
AgentPoolId	Body	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	<b>Required.</b> A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
Discover Schedule	Body	<p>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #4CAF50; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #4CAF50; border-radius: 10px; padding: 5px; margin-top: 10px;"> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. 	<p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p>																	
Discover Percent Complete	Body	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
Monitor Percent Complete	Body	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
Discover Status	Body	An integer indicating the status of the discovery job. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running

4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	

Name	In	Description																
Monitor Status	Body	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
Discover Last Scanned	Body	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																
Monitor Last Scanned	Body	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																
Ssl Alert Recipients	Body	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.</p> </div>																
Get Robots	Body	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).																
Discover Timeout Ms	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.																
Monitor Timeout Ms	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate																

Name	In	Description
		expiration details.
Expiration Alert Days	Body	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
Discover Job Parts	Body	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
Monitor Job Parts	Body	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
Quiet Hours	Body	<p>An array of objects providing the list of scheduled quiet hour periods. For example:</p> <pre> "QuietHours": [   {     "StartDay": "Monday",     "StartTime": "2022-11-21T14:00:08Z",     "EndDay": "Tuesday",     "EndTime": "2022-11-22T14:00:08Z"   },   {     "StartDay": "Saturday",     "StartTime": "2022-11-26T04:00:08Z",     "EndDay": "Sunday",     "EndTime": "2022-11-27T16:00:08Z"   } ] </pre>
Blackout Start	Body	<p>An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>
Blackout End	Body	<p>An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.</p> <p>This is considered deprecated and may be removed in a future release.</p>

Table 662: PUT SSL Networks Response Data

Name	Description				
Network Id	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.				
Name	A string indicating the name for the SSL network.				
Agent Pool Name	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.				
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.				
Description	A string indicating the description of the SSL network.				
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.				
Discover Schedule	An object providing the discovery schedule for the SSL network group.				
Monitor Schedule	An object providing the monitoring schedule for the SSL network group.				
Discover Percent Complete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.				
Monitor Percent Complete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.				
Discover Status	An integer indicating the status of the discovery job. Possible values are: <table border="1" data-bbox="435 1528 1404 1669"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Unknown

Monitor Last Scanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
Ssl Alert Recipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #add8e6; padding: 10px; margin-top: 10px;"> <p> <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.</p> </div>																

Name	Description
Auto Monitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
Get Robots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
Discover Timeout Ms	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
Monitor Timeout Ms	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
Expiration Alert Days	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
Discover Job Parts	An integer that indicates the number of job parts that have been created for a discovery job.
Monitor Job Parts	An integer that indicates the number of job parts that have been created for a monitoring job.
Quiet Hours	An array of objects providing the list of scheduled quiet hour periods.
Blackout Start	An object providing the start day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.  This is considered deprecated and may be removed in a future release.
Blackout End	An object providing the ending day and time for the first scheduled quiet hours period. See <i>QuietHours</i> for the full list of scheduled quiet hours. If both a Blackout period and a QuietHours period are configured for the same network, the QuietHours period will be used.  This is considered deprecated and may be removed in a future release.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.36.10 GET SSL Endpoints ID History

The GET /SSL/Endpoints/{id}/History method is used to return a list of history found for a given SSL endpoint. URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the specified endpoint.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssl/read/`

Table 663: GET SSL Endpoints {id} History Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL endpoint for which to return history information. Use the <i>GET /SSL</i> method (see <a href="#">GET SSL on page 1451</a> ) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 664: GET SSL Endpoints {id} History Response Data

Name	Description																																
History Id	A string indicating the Keyfactor Command reference GUID for the history entry.																																
Endpoint Id	A string indicating the Keyfactor Command reference GUID for the endpoint with which the history is associated.																																
AuditId	An integer indicating the Keyfactor Command ID used to track progress during scan jobs.																																
Timestamp	A string indicating the date and time the history entry was created.																																
Status	<p>An integer containing the status of the scan for which the history item was created. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>TimeOut Connecting</td> </tr> <tr> <td>2</td> <td>Exception Connecting</td> </tr> <tr> <td>3</td> <td>Timeout Downloading</td> </tr> <tr> <td>4</td> <td>Exception Downloading</td> </tr> <tr> <td>5</td> <td>NotSsl</td> </tr> <tr> <td>6</td> <td>Certificate Found</td> </tr> <tr> <td>7</td> <td>Exception In Sql</td> </tr> <tr> <td>8</td> <td>Invalid Or Unreachable Host</td> </tr> <tr> <td>9</td> <td>Connection Refused</td> </tr> <tr> <td>10</td> <td>Bad Ssl Handshake</td> </tr> <tr> <td>11</td> <td>Client Authentication Failed</td> </tr> <tr> <td>12</td> <td>No Certificate</td> </tr> <tr> <td>13</td> <td>Ssl Refused</td> </tr> <tr> <td>14</td> <td>Not Probed</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	TimeOut Connecting	2	Exception Connecting	3	Timeout Downloading	4	Exception Downloading	5	NotSsl	6	Certificate Found	7	Exception In Sql	8	Invalid Or Unreachable Host	9	Connection Refused	10	Bad Ssl Handshake	11	Client Authentication Failed	12	No Certificate	13	Ssl Refused	14	Not Probed
Value	Description																																
0	Unknown																																
1	TimeOut Connecting																																
2	Exception Connecting																																
3	Timeout Downloading																																
4	Exception Downloading																																
5	NotSsl																																
6	Certificate Found																																
7	Exception In Sql																																
8	Invalid Or Unreachable Host																																
9	Connection Refused																																
10	Bad Ssl Handshake																																
11	Client Authentication Failed																																
12	No Certificate																																
13	Ssl Refused																																
14	Not Probed																																
Job Type	An integer containing the type of scan job from which the history entry was created. The																																

Name	Description												
	<p>possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Discovery</td> </tr> <tr> <td>2</td> <td>Monitoring</td> </tr> <tr> <td>3</td> <td>Compliance</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Discovery	2	Monitoring	3	Compliance		
Value	Description												
0	Unknown												
1	Discovery												
2	Monitoring												
3	Compliance												
Probe Type	<p>An integer containing the type of connection made to the endpoint for the scan from which the history entry was created. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>SSLv2</td> </tr> <tr> <td>3</td> <td>TLS</td> </tr> </tbody> </table>	Value	Description	2	SSLv2	3	TLS						
Value	Description												
2	SSLv2												
3	TLS												
Reverse DNS	<p>A string indicating the DNS name of the endpoint resolved based on the discovered IP address at the time the history entry was created. If a host name could not be resolved, this will be the IP address.</p>												
History Certificates	<p>An array of objects indicating the certificates found at the endpoint during the scan from which the history entry was created. Information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the certificate.</td> </tr> <tr> <td>Issued DN</td> <td>A string indicating the distinguished name of the certificate.</td> </tr> <tr> <td>Serial Number</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>Not Before</td> <td>A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.</td> </tr> <tr> <td>Not After</td> <td>A string indicating the date, in UTC, on which the certificate expires.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	Issued DN	A string indicating the distinguished name of the certificate.	Serial Number	A string indicating the serial number of the certificate.	Not Before	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.	Not After	A string indicating the date, in UTC, on which the certificate expires.
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the certificate.												
Issued DN	A string indicating the distinguished name of the certificate.												
Serial Number	A string indicating the serial number of the certificate.												
Not Before	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.												
Not After	A string indicating the date, in UTC, on which the certificate expires.												

Name	Description										
	<table border="1"><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Signing Algorithm</td><td>A string indicating the algorithm used to sign the certificate.</td></tr><tr><td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr><tr><td>IssuerDN</td><td>A string indicating the distinguished name of the issuer.</td></tr><tr><td>IssuedCN</td><td>A string indicating the common name of the certificate.</td></tr></tbody></table>	Name	Description	Signing Algorithm	A string indicating the algorithm used to sign the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.	IssuerDN	A string indicating the distinguished name of the issuer.	IssuedCN	A string indicating the common name of the certificate.
Name	Description										
Signing Algorithm	A string indicating the algorithm used to sign the certificate.										
Thumbprint	A string indicating the thumbprint of the certificate.										
IssuerDN	A string indicating the distinguished name of the issuer.										
IssuedCN	A string indicating the common name of the certificate.										

Name	Description																																				
Subject Alt Name Elements	<p>An array of objects containing the subject alternative name elements of the certificate. SAN data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the SAN Element.</td> </tr> <tr> <td>Type</td> <td> <p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Value Hash</td> <td>A string indicating a hash of the SAN value.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the SAN Element.	Value	A string indicating the value of the SAN Element.	Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown	Value Hash	A string indicating a hash of the SAN value.
Name	Description																																				
Id	An integer containing the Keyfactor Command reference ID of the SAN Element.																																				
Value	A string indicating the value of the SAN Element.																																				
Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown										
Value	Description																																				
0	Other Name																																				
1	RFC 822 Name																																				
2	DNS Name																																				
3	X400 Address																																				
4	Directory Name																																				
5	Ediparty Name																																				
6	Uniform Resource Identifier																																				
7	IP Address																																				
8	Registered Id																																				
100	MS_NTPrincipalName

Value Hash	A string indicating a hash of the SAN value.																																				

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.11 GET SSL Networks ID Parts

The GET /SSL/Networks/{id}/Parts method returns a list of scan job segments for an SSL network defined in Keyfactor Command. This method returns HTTP 200 OK on a success with the scan job segments for the specified SSL network. The results will only include more than one segment if the SSL management job was broken up into segments due to the number of endpoints it contained. The number of endpoints per segment is configurable (see the *SSL Maximum Discovery Scan Job Size* and *SSL Maximum Monitoring Scan Job Size* settings in *Application Settings: Agents Tab* in the *Keyfactor Command Reference Guide*). The results from this method are of the currently in progress job or the latest completed job.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/read/

Table 665: GET SSL Networks {id} Parts Input Parameters

Name	In	Description
ID	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL network for which to retrieve scan job segments. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1453</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Network Scan Details Search</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• Agent</li> <li>• EndTime</li> <li>• EndpointCount</li> <li>• Status</li> <li>• StartTime</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Status</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 666: GET SSL Networks {id} Parts Response Data

Name	Description								
ScanJobPartId	A string indicating the Keyfactor Command reference GUID for the scan job segment.								
Agent	A string indicating the client machine name of the orchestrator that ran the scan job segment.								
Status	An integer indicating the status of the scan job segment. Possible values are: <table border="1" data-bbox="467 562 1403 821"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Not Started</td> </tr> <tr> <td>2</td> <td>In Progress</td> </tr> <tr> <td>3</td> <td>Complete</td> </tr> </tbody> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StartTime	A string indicating the date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.								
EndTime	A string indicating the date and time at which the scan job segment finished in UTC. For jobs that are in progress, this value will be null.								
EndpointCount	An integer indicating the number of endpoints scanned for the segment.								

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.12 POST SSL NetworkRanges

The POST /SSL/NetworkRanges method is used to add network ranges to a specified SSL network. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/modify/

Table 667: POST SSL Network Ranges Input Parameters

Name	In	Description
NetworkId	Body	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSL network.</p> <p>Use the GET /SSL/Networks method (see <a href="#">GET SSL Networks on page 1453</a>) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.</p>
Ranges	Body	<p><b>Required.</b> An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).</p> <p>For example:</p> <pre>"Ranges": [ "192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443" ]</pre>

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.13 PUT SSL NetworkRanges

The PUT /SSL/NetworkRanges method is used to update network ranges for a specified SSL network. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 668: PUT SSL Network Ranges {id} Input Parameters

Name	In	Description
NetworkId	Body	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSL network.</p> <p>Use the GET /SSL/Networks method (see <a href="#">GET SSL Networks on page 1453</a>) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.</p>
Ranges	Body	<p><b>Required.</b> An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).</p> <p>For example:</p> <pre>"Ranges": [ "192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443" ]</pre>

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.14 PUT SSL Endpoints Review Status

The PUT /SSL/Endpoints/ReviewStatus method is used to update the reviewed status of the specified endpoint. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/modify/

Table 669: PUT SSL Endpoints Review Status Input Parameters

Name	In	Description
Id	Body	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID for the endpoint to be updated.</p> <p>Use the GET /SSL method (see <a href="#">GET SSL on page 1451</a>) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.</p>
Status	Body	<p><b>Required.</b> A Boolean indicating whether the endpoint should be marked as reviewed (true) or not (false).</p>

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.15 PUT SSL Endpoints Monitor Status

The PUT /SSL/Endpoints/MonitorStatus method is used to update the monitoring status of the specified endpoint. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/modify/

Table 670: PUT SSL Endpoints Monitor Status Input Parameters

Name	In	Description
Id	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the endpoint to be updated.  Use the <i>GET /SSL</i> method (see <a href="#">GET SSL on page 1451</a> ) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
Status	Body	<b>Required.</b> A Boolean indicating whether monitoring should be enabled on this endpoint (true) or not (false).

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.16 PUT SSL Endpoints Review All

The PUT /SSL/Endpoints/ReviewAll method is used to update all endpoints in the given query to set the reviewed status to true. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

 /ssl/modify/

Table 671: PUT SSL Endpoints Review All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as reviewed (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as reviewed. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to: <i>Using the Discovery Results Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> .

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.17 PUT SSL Endpoints Monitor All

The PUT /SSL/Endpoint/MonitorAll method is used to update all endpoints in the given query to set the monitoring status to true. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/modify/

Table 672: PUT SSL Endpoints Monitor All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as monitored (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as monitored. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to: <i>Using the Discovery Results Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> .

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.18 POST SSL Networks ID Scan

The POST /SSL/Networks/{id}/Scan method is used to initiate a scan job for an SSL network defined in Keyfactor Command. A scan may be manually initiated for a configured network at any time that a scan is not already running for the network or the network is not in quiet hours. When you initiate a scan, you can choose whether to run a discovery scan, a monitoring scan, or both. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/modify/

Table 673: POST SSL Networks {id} Scan Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSL network for which to initiate a manual scan. Use the <a href="#">GET /SSL/Networks</a> method (see <a href="#">GET SSL Networks on page 1453</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
Discovery	Body	A Boolean indicating whether to initiate a manual discovery scan (true) or not (false).
Monitoring	Body	A Boolean indicating whether to initiate a manual monitoring scan (true) or not (false).

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.19 POST SSL Networks ID Reset

The POST `/SSL/Networks/{id}/Reset` method is used to reset an SSL scan. Reset deletes all scan jobs, scan job parts, logical scan jobs, and current schedules associated with the selected network. The agent job status relating to the SSL scans is set to failed and completed, and the agent is forced to register for a new session. Afterward, *Scan Now* is enabled to allow you to initiate a manual scan. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssl/modify/`

Table 674: POST SSL Networks {id} Reset Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSL network for which to reset. Use the <a href="#">GET /SSL/Networks</a> method (see <a href="#">GET SSL Networks on page 1453</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.20 POST SSL NetworkRanges Validate

The POST `/SSL/NetworkRanges/Validate` method ensures that network ranges supplied in the request are of valid structure. This endpoint returns 204 with no content upon success. Use this method to test a proposed network range before using POST `/SSL/NetworkRanges` or PUT `/SSL/NetworkRanges` to configure it for an SSL network.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/ssl/read/`

Table 675: POST SSL Network Ranges Validate Input Parameters

Name	In	Description
network Ranges To Verify	Body	<p><b>Required.</b> An array of strings indicating the network ranges to validate. For example:</p> <pre>[   "10.5.4.0/24:443",   "192.168.12.0/16:443,22",   "keyexample.com:443" ]</pre>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.36.21 DELETE SSL Networks ID

The DELETE /SSL/Networks/{id} method is used to delete an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims](#) in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/ssl/modify/

Table 676: DELETE SSL Networks {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSL network to be deleted.</p> <p>Use the <a href="#">GET /SSL/Networks</a> method (see <a href="#">GET SSL Networks on page 1453</a>) to retrieve a list of all the SSL networks to determine the SSL network's GUID.</p>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.37 Status

The Status component of the Keyfactor API includes methods necessary to retrieve the current list of Keyfactor API endpoints.

Table 677: Status Endpoints

Endpoint	Method	Description	Link
/Endpoints	GET	Returns a list of the Keyfactor API endpoints.	<a href="#">GET Status Endpoints below</a>

### 2.6.37.1 GET Status Endpoints

The GET /Status/Endpoints method returns a list of all the endpoints currently available for use in the Keyfactor API. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)). This method returns HTTP 200 OK on a success with a list of all the API endpoints available in the Keyfactor API.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
None

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.38 Templates

The Templates component of the Keyfactor API includes methods necessary to programmatically edit, import and retrieve templates. Editing a template in Keyfactor Command will only apply within the software.

Table 678: Templates Endpoints

Endpoint	Method	Description	Link
/id	GET	Returns information about the specified template.	<a href="#">GET Templates ID below</a>
/Settings	GET	Returns the global template policy settings.	<a href="#">GET Templates Settings on page 1524</a>
/Settings	PUT	Sets global values for template policy.	<a href="#">PUT Templates Settings on page 1531</a>
/SubjectParts	GET	Returns a list of supported subject parts for template regular expressions and default subjects.	<a href="#">GET Templates Subject Parts on page 1548</a>
/	GET	Returns a list of templates.	<a href="#">GET Templates on page 1548</a>
/	PUT	Updates selected settings for the specified template.	<a href="#">PUT Templates on page 1561</a>
/Import	POST	Import templates from a specified configuration tenant into Keyfactor Command	<a href="#">POST Templates Import on page 1593</a>

### 2.6.38.1 GET Templates ID

The GET /Templates/{id} method is used to retrieve a specified template from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the requested template.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_templates/read/

Table 679: GET Templates {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer specifying the ID of the template in Keyfactor Command. Use the <i>GET /Templates</i> method (see <a href="#">GET Templates on page 1548</a> ) to retrieve a list of all the templates to determine the template ID.

Table 680: GET Templates {id} Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
Common Name	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i>&lt;end entity profile name&gt;_&lt;certificate profile name&gt;</i> . This field is populated based on information retrieved from the CA and is not configurable.
Template Name	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i>&lt;end entity profile name&gt; (&lt;certificate profile name&gt;)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as returned by the CA. This value is calculated based on the algorithms provided in the template from the CA (see <i>KeyAlgorithms</i> ). The algorithm key types and sizes are evaluated in order (RSA, ECC, Ed448, and Ed25519) and from these, the minimum type and size is determined. For example, if the template supports RSA, Ed448, and Ed25519, the minimum key type will be evaluated to RSA. Then for that algorithm, the minimum key size returned by the CA will be selected (e.g. 2048 if 2048 and 4096 are returned for RSA). See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
KeyType	A string indicating the key type of the template as returned by the CA. See details under <i>KeySize</i> . See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
Forest Root	A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.  <div style="border: 1px solid #007bff; border-radius: 10px; padding: 5px; background-color: #e6f2ff;">  <b>Note:</b> The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility.         </div>
Configuration Tenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
Friendly Name	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR

Name	Description										
	generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
Key Retention	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>After Expiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>From Issuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	After Expiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.	From Issuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
After Expiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
From Issuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
Key Retention Days	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
Key Archival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
Enrollment Fields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> <li>• Preventing users from requesting invalid certificates, based on your specific certificate requirements per template.</li> <li>• Providing additional information to the CA with the CSR.</li> </ul> <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> <b>Note:</b> These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div>										

Name	Description																
	<p>The enrollment fields object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the custom enrollment field.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td> </tr> <tr> <td>Options</td> <td>For multiple choice values, an array of strings containing the value choices.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
Metadata Fields	<p>An array of objects containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> <li>• Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>.</li> <li>• The <i>default value</i> for the metadata field.</li> <li>• A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message.</li> <li>• For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns.</li> </ul> <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.												
Name	Description																
Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.																

Name	Description																		
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Default Value</td> <td>A string containing the default value defined for the metadata field for the specific template.</td> </tr> <tr> <td>Metadata Id</td> <td>An integer indicating the global metadata field associated with the template-specific settings.</td> </tr> <tr> <td>Validation</td> <td> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> </td> </tr> <tr> <td>Enrollment</td> <td> <p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Default Value	A string containing the default value defined for the metadata field for the specific template.	Metadata Id	An integer indicating the global metadata field associated with the template-specific settings.	Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>	Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Name	Description																		
Default Value	A string containing the default value defined for the metadata field for the specific template.																		
Metadata Id	An integer indicating the global metadata field associated with the template-specific settings.																		
Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>																		
Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.										
Value	Description																		
0	Optional Users have the option to either enter a value or not enter a value in the field.																		
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.																		
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.																		

Name	Description																		
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Message</td> <td>A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).</td> </tr> </tbody> </table>	Name	Description	Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression ( <i>Validation</i> field).														
Name	Description																		
Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression ( <i>Validation</i> field).																		
Allowed Enrollment Types	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>CSR Enrollment &amp; PFX Enrollment</td> </tr> <tr> <td>4</td> <td>CSR Generation</td> </tr> <tr> <td>5</td> <td>CSR Generation &amp; PFX Enrollment</td> </tr> <tr> <td>6</td> <td>CSR Generation &amp; CSR Enrollment</td> </tr> <tr> <td>7</td> <td>CSR Enrollment, PFX Enrollment &amp; CSR Generation</td> </tr> </tbody> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation
Value	Description																		
0	None																		
1	PFX Enrollment																		
2	CSR Enrollment																		
3	CSR Enrollment & PFX Enrollment																		
4	CSR Generation																		
5	CSR Generation & PFX Enrollment																		
6	CSR Generation & CSR Enrollment																		
7	CSR Enrollment, PFX Enrollment & CSR Generation																		
Template Regexes	<p>An array of objects containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see <a href="#">GET Templates Settings on page 1524</a>.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Template Id</td> <td>In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> </tbody> </table>	Name	Description	Template Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.														
Name	Description																		
Template Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.																		

Name	Description						
Subject Part	A string indicating the portion of the subject the regular expression applies to (e.g. CN).						
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1" data-bbox="537 726 1382 1640"> <thead> <tr> <th data-bbox="537 726 711 821">Subject Part</th> <th data-bbox="711 726 1382 821">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="537 821 711 1419">           CN (Common Name)         </td> <td data-bbox="711 821 1382 1419"> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre data-bbox="732 1045 1354 1157">^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre data-bbox="732 1234 1354 1346">.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> <tr> <td data-bbox="537 1419 711 1640">           O (Organization)         </td> <td data-bbox="711 1419 1382 1640"> <p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre data-bbox="732 1549 1354 1629">^(?:Key Example Inc Key Example Key</pre> </td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre data-bbox="732 1045 1354 1157">^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre data-bbox="732 1234 1354 1346">.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>	O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre data-bbox="732 1549 1354 1629">^(?:Key Example Inc Key Example Key</pre>
Subject Part	Example						
CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre data-bbox="732 1045 1354 1157">^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre data-bbox="732 1234 1354 1346">.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>						
O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre data-bbox="732 1549 1354 1629">^(?:Key Example Inc Key Example Key</pre>

Template Defaults	<p>An array of objects containing individual template-level template default settings. Template defaults defined on a template apply to enrollments made with that template only. Template-level defaults, if defined, take precedence over system-wide template defaults. For more information about system-wide template defaults, see <a href="#">GET Templates Settings on page 1524</a>. The template default object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SubjectPart</td> <td> <p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> </td> </tr> <tr> <td>Value</td> <td>A string containing the value to assign as the default for that subject part (e.g. Chicago).</td> </tr> </tbody> </table>	Value	Description	SubjectPart	<p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p>	Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).				
Value	Description										
SubjectPart	<p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p>										
Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).										
Template Policy	<p>An object containing the individual template-level template policy settings. Template policies defined on a template apply to enrollments made with that template only. Template-level policies, if defined, take precedence over system-wide template policies. For more information about system-wide template policies, see <a href="#">GET Templates Settings on page 1524</a>. The template policy object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Template Id</td> <td>The Keyfactor Command reference ID of the certificate template the policy is associated with.</td> </tr> <tr> <td>Allow Key Reuse</td> <td>A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.</td> </tr> <tr> <td>Allow Wildcards</td> <td>A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.</td> </tr> <tr> <td>RFC Enforce-</td> <td>A Boolean that indicates whether RFC 2818 compliance enforce-</td> </tr> </tbody> </table>	Value	Description	Template Id	The Keyfactor Command reference ID of the certificate template the policy is associated with.	Allow Key Reuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.	Allow Wildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.	RFC Enforce-	A Boolean that indicates whether RFC 2818 compliance enforce-
Value	Description										
Template Id	The Keyfactor Command reference ID of the certificate template the policy is associated with.										
Allow Key Reuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.										
Allow Wildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.										
RFC Enforce-	A Boolean that indicates whether RFC 2818 compliance enforce-										

Name	Description								
ment	<table border="1"> <thead> <tr> <th data-bbox="381 275 609 338">Value</th> <th data-bbox="609 275 1398 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="381 338 609 665"></td> <td data-bbox="609 338 1398 665">           ment is enabled (true) or not (false). When this option is set to <i>true</i>, certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.         </td> </tr> </tbody> </table>	Value	Description		ment is enabled (true) or not (false). Name	Description												
	key.												
Ed448	An object containing two arrays: <ul style="list-style-type: none"> <li>bit_lengths: An array of integers indicating the key sizes supported for enrollment through Keyfactor Command.</li> <li>curves: There are no curves for this type of key.</li> </ul>												
Ed25519	An object containing two arrays: <ul style="list-style-type: none"> <li>bit_lengths: An array of integers indicating the key sizes supported for enrollment through Keyfactor Command.</li> <li>curves: There are no curves for this type of key.</li> </ul>												
Use Allowed Requesters	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>												
Allowed Requesters	<p>An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.</p>												
Display Name	<p>A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.</p>												

Name	Description															
RFC Enforcement	<p>A Boolean indicating whether RFC 2818 compliance enforcement is enabled (<i>true</i>) or not (<i>false</i>). When this option is set to <i>true</i>, certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.</p>															
Requires Approval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="381 625 1404 1186" style="background-color: #f9a825; padding: 10px; border: 1px solid #ccc;"> <p> <b>Important:</b> Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 8: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>															
Key Usage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1" data-bbox="381 1339 1404 1724"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> <tr> <td>4</td> <td>Key Certificate</td> <td>The key can be used to sign certificates.</td> </tr> </tbody> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate	The key can be used to sign certificates.
Value	Function	Description														
0	None	No key usage parameters.														
1	Encipherment Only	The key can be used for encryption only.														
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).														
4	Key Certificate	The key can be used to sign certificates.														

Name	Description																								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>Signing</td> <td></td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description		Signing		8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																							
	Signing																								
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																							
16	Data Encipherment	The key can be used for data encryption.																							
32	Key Encipherment	The key can be used for key encryption.																							
64	Nonrepudiation	The key can be used for authentication.																							
128	Digital Signature	The key can be used as a digital signature.																							
32768	Decipherment Only	The key can be used for decryption only.																							
Extended Key Usages	<p>An array of objects containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the extended key usage in Active Directory.</td> </tr> <tr> <td>Oid</td> <td>A string containing the object ID of the extended key usage.</td> </tr> <tr> <td>Display Name</td> <td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.	Oid	A string containing the object ID of the extended key usage.	Display Name	A string specifying the display name of the extended key usage (e.g. Server Authentication).																
Name	Description																								
Id	An integer indicating the ID of the extended key usage in Active Directory.																								
Oid	A string containing the object ID of the extended key usage.																								
Display Name	A string specifying the display name of the extended key usage (e.g. Server Authentication).																								
Curve	<p>A string indicating the friendly name of the elliptic curve algorithm configured for the template returned from the CA, for ECC templates. Possible values include:</p> <ul style="list-style-type: none"> <li>P-256 1.2.840.10045.3.1.7 = P-256/ prime256v1/ secp256r1</li> <li>P-384 1.3.132.0.34 = P-384/secp384r1</li> <li>P-521</li> </ul>																								

Name	Description
	<p>1.3.132.0.35 = P-521/secp521r1</p> <p>If the template supports more than one curve, this field contains the minimum curve value.</p>
Allow One Click Renewals	<p>A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false).</p> <p>If you wish to use <i>One-Click Renewal</i> for certificates, the <b>Allow One-Click Renewals</b> option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>). For more information about one-click renewals, see <i>Certificate Operations: Renew</i> in the <i>Keyfactor Command Reference Guide</i>.</p>
KeyTypes	<p>A string containing a comma-delimited list of the key sizes and types supported for the template returned from the CA as they are displayed in the Management Portal templates grid. Possible values include RSA 2048, ECC P-384, Ed25519, and Ed448.</p>

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.38.2 GET Templates Settings

The GET /Templates/Settings method is used to retrieve the global template policy settings Keyfactor Command. This method returns HTTP 200 OK on a success with details about the global template policy settings. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

 **Tip:** Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 1561](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_templates/read/

Table 681: GET Templates Settings Response Data

Name	Description												
Template Regexes	<p>An array of objects containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA).</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject Part</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td>RegEx</td> <td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> <tr> <td>O (Organ-</td> <td>This regular expression requires that the organization</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Subject Part	A string indicating the portion of the subject the regular expression applies to (e.g. CN). Ed448	An object containing two arrays: <ul style="list-style-type: none"> <li>• bit_lengths: An array of integers indicating the key sizes supported for enrollment through Keyfactor Command.</li> <li>• curves: There are no curves for this type of key.</li> </ul>										
Ed25519	An object containing two arrays: <ul style="list-style-type: none"> <li>• bit_lengths: An array of integers indicating the key sizes supported for enrollment through Keyfactor Command.</li> <li>• curves: There are no curves for this type of key.</li> </ul>										

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.38.3 PUT Templates Settings

The PUT /Templates/Settings method is used to create or update the global template policy settings in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the template policy settings.

**Tip:** Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 1561](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

**Note:** Global template settings replaced and expanded upon select enrollment-related applications settings in release 10.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificate_templates/modify/`

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 682: PUT Templates Settings Input Parameters

Name	Description												
Template Regexes	<p>An array of objects containing the system-wide template regular expression settings. Name	Description														
AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option allows to certificate renewals.														
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).														
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.														
KeyInfo	<p>An object containing the supported key types for the template along with the bit lengths and/or curves for the key types as appropriate. Key info includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ECDSA</td> <td> <p>An object containing two arrays:</p> <ul style="list-style-type: none"> <li>bit_lengths: An array of integers indicating the key sizes supported for enrollment through Keyfactor Command.</li> <li>curves: An array of strings indicating the elliptic curve algorithms that are supported for enrollment through Keyfactor Command.</li> </ul> <p>ECC curves may be specified using the well-known OIDs for ECC algorithms or by friendly name. Name	Description														
AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option allows to certificate renewals.														
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).														
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.														
KeyInfo	<p>An object containing the supported key types for the template along with the bit lengths and/or curves for the key types as appropriate. Key info includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ECDSA</td> <td> <p>An object containing two arrays:</p> <ul style="list-style-type: none"> <li>bit_lengths: An array of integers indicating the key sizes supported for enrollment through Keyfactor Command.</li> <li>curves: An array of strings indicating the elliptic curve algorithms that are supported for enrollment through Keyfactor Command.</li> </ul> <p>ECC curves may be specified using the well-known OIDs for ECC algorithms or by friendly name. Name	Description
	<pre> "RFCEnforcement": true, "KeyInfo": {   "ECDSA": {     "bit_lengths": [       256,       384,       521     ],     "curves": [       "1.2.840.10045.3.1.7",       "1.3.132.0.34",       "1.3.132.0.35"     ]   },   "RSA": {     "bit_lengths": [       2048,       4096     ],     "curves": []   },   "Ed448": {     "bit_lengths": [       448     ],     "curves": []   },   "Ed25519": {     "bit_lengths": [       255     ],     "curves": []   } } </pre>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development.

It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.38.4 GET Templates Subject Parts

The GET /Templates/SubjectParts method is used to retrieve a list of the certificate subject parts that are supported for regular expressions (TemplateRegexes) and defaults (TemplateDefaults). This method returns HTTP 200 OK on a success with the list of supported certificate subject part fields. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_templates/read/

Table 684: GET Templates Subject Parts Response Data

Name	Description
SubjectPart	A string indicating the supported subject part code (e.g. L for City/Locality).
SubjectPartName	A string containing a friendly name for the subject part (e.g. City/Locality).

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.38.5 GET Templates

The GET /Templates method is used to retrieve one or more templates from Keyfactor Command. Results can be limited to selected templates using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified templates.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_templates/read/

Table 685: GET Templates Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Template Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• AllowedEnrollmentType (1-PFX Enrollment, 2-CSR Enrollment, 3-CSR Generation, 0-None)</li> <li>• ConfigurationTenant</li> <li>• DisplayName</li> <li>• ForestRoot (deprecated)</li> <li>• FriendlyName</li> <li>• HasPrivateKeyRetention (True, False)</li> <li>• IsDefaultTemplate (True, False)</li> <li>• ShortName</li> </ul> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> To filter out all the built-in Active Directory templates and display only your custom templates, use the following query:</p> <pre style="text-align: center;">IsDefaultTemplate -eq "false"</pre> <p>To filter out all templates that are not configured for either PFX Enrollment or CSR Enrollment, use the following query:</p> <pre style="text-align: center;">AllowedEnrollmentType -eq "3"</pre> <p>A value of 1 will filter out all templates except those configured for PFX Enrollment. A value of 2 will filter out all templates except those configured for CSR Enrollment.</p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .

Name	In	Description
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 686: GET Templates Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
Common Name	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i>&lt;end entity profile name&gt;_&lt;certificate profile name&gt;</i> . This field is populated based on information retrieved from the CA and is not configurable.
Template Name	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i>&lt;end entity profile name&gt; (&lt;certificate profile name&gt;)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as returned by the CA. This value is calculated based on the algorithms provided in the template from the CA (see <i>KeyAlgorithms</i> ). The algorithm key types and sizes are evaluated in order (RSA, ECC, Ed448, and Ed25519) and from these, the minimum type and size is determined. For example, if the template supports RSA, Ed448, and Ed25519, the minimum key type will be evaluated to RSA. Then for that algorithm, the minimum key size returned by the CA will be selected (e.g. 2048 if 2048 and 4096 are returned for RSA). See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
KeyType	A string indicating the key type of the template as returned by the CA. See details under <i>KeySize</i> . See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
Forest Root	A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.  <div style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; background-color: #e6f2ff;">  <b>Note:</b> The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
Configuration Tenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
Friendly Name	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR

Name	Description										
	generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
Key Retention	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table border="1" data-bbox="383 495 1401 940"> <thead> <tr> <th data-bbox="383 495 578 554">Value</th> <th data-bbox="578 495 1401 554">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="383 554 578 613">None</td> <td data-bbox="578 554 1401 613">The private key will not be retained.</td> </tr> <tr> <td data-bbox="383 613 578 672">Indefinite</td> <td data-bbox="578 613 1401 672">The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td data-bbox="383 672 578 806">After Expiration</td> <td data-bbox="578 672 1401 806">The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td data-bbox="383 806 578 940">From Issuance</td> <td data-bbox="578 806 1401 940">The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	After Expiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.	From Issuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
After Expiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
From Issuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
Key Retention Days	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
Key Archival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
Enrollment Fields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> <li>• Preventing users from requesting invalid certificates, based on your specific certificate requirements per template.</li> <li>• Providing additional information to the CA with the CSR.</li> </ul> <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div data-bbox="383 1619 1401 1745" style="border: 1px solid #007bff; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> <b>Note:</b> These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div>										

Name	Description																
	<p>The enrollment fields object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the custom enrollment field.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td> </tr> <tr> <td>Options</td> <td>For multiple choice values, an array of strings containing the value choices.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
Allowed Enrollment Types	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>CSR Enrollment &amp; PFX Enrollment</td> </tr> <tr> <td>4</td> <td>CSR Generation</td> </tr> </tbody> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation				
Value	Description																
0	None

Value	Description												
5	CSR Generation & PFX Enrollment												
6	CSR Generation & CSR Enrollment												
7	CSR Enrollment, PFX Enrollment & CSR Generation												
Template Regexes	<p>An array of objects containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see <a href="#">GET Templates Settings on page 1524</a>.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Template Id</td> <td>In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> <tr> <td>Subject Part</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td>RegEx</td> <td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Template Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.	Subject Part	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i> :
Name	Description												
Template Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.												
Subject Part	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i> :								
Subject Part	Example												
CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i> :

Name	Description												
	<table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>^[a-zA-Z0-9' _\. \- ]*@keyexample\.com\$</pre> </td> </tr> <tr> <td>UPN (Subject Alternative Name: User Principal Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly “@keyexample.com”:</p> <pre>^[a-zA-Z0-9' _\. \- ]*@keyexample\.com\$</pre> </td> </tr> </tbody> </table>	Subject Part	Example		<pre>^[a-zA-Z0-9' _\. \- ]*@keyexample\.com\$</pre>	UPN (Subject Alternative Name: User Principal Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly “@keyexample.com”:</p> <pre>^[a-zA-Z0-9' _\. \- ]*@keyexample\.com\$</pre>						
Subject Part	Example												
	<pre>^[a-zA-Z0-9' _\. \- ]*@keyexample\.com\$</pre>												
UPN (Subject Alternative Name: User Principal Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly “@keyexample.com”:</p> <pre>^[a-zA-Z0-9' _\. \- ]*@keyexample\.com\$</pre>												
Error	<p>A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression.</p> <p> <b>Note:</b> The error message already includes a leading string with the subject part (e.g. “Common Name:” or “Invalid CN provided:” depending on the interface used). Your custom message follows this.</p>												
Use Allowed Requesters	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>												

Name	Description												
Allowed Requesters	An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.												
Display Name	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.												
Requires Approval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div style="background-color: #f4a460; padding: 10px; border: 1px solid #ccc;"> <p><b>⚠ Important:</b> Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p style="text-align: center;"><i>Figure 9: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>												
Key Usage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> </tbody> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).
Value	Function	Description											
0	None	No key usage parameters.											
1	Encipherment Only	The key can be used for encryption only.											
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).											

Name	Description																								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>Key Certificate Signing</td> <td>The key can be used to sign certificates.</td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																							
4	Key Certificate Signing	The key can be used to sign certificates.																							
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																							
16	Data Encipherment	The key can be used for data encryption.																							
32	Key Encipherment	The key can be used for key encryption.																							
64	Nonrepudiation	The key can be used for authentication.																							
128	Digital Signature	The key can be used as a digital signature.																							
32768	Decipherment Only	The key can be used for decryption only.																							
Extended Key Usages	<p>An array of objects containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the extended key usage in Active Directory.</td> </tr> <tr> <td>Oid</td> <td>A string containing the object ID of the extended key usage.</td> </tr> <tr> <td>Display Name</td> <td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.	Oid	A string containing the object ID of the extended key usage.	Display Name	A string specifying the display name of the extended key usage (e.g. Server Authentication).																
Name	Description																								
Id	An integer indicating the ID of the extended key usage in Active Directory.																								
Oid	A string containing the object ID of the extended key usage.																								
Display Name	A string specifying the display name of the extended key usage (e.g. Server Authentication).																								
Allow One Click Renewals	<p>A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false).</p> <p>If you wish to use <i>One-Click Renewal</i> for certificates, the <b>Allow One-Click Renewals</b> option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>). For more information about one-click renewals, see <i>Certificate Operations: Renew</i> in the <i>Keyfactor Command Reference Guide</i>.</p>																								

Name	Description
KeyTypes	A string containing a comma-delimited list of the key sizes and types supported for the template returned from the CA as they are displayed in the Management Portal templates grid. Possible values include RSA 2048, ECC P-384, Ed25519, and Ed448.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.38.6 PUT Templates

The PUT /Templates method is used to update selected information about a certificate template. This method returns HTTP 200 OK on a success with details about the specified template.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_templates/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 687: PUT Templates Input Parameters

Name	In	Description										
Id	Body	<b>Required.</b> An integer indicating the ID of the template in Keyfactor Command.										
Friendly Name	Body	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
Key Retention	Body	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters: <div data-bbox="440 699 1404 1188" data-label="Table"> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>After Expiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>From Issuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table> </div>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	After Expiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.	From Issuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.
Value	Description											
None	The private key will not be retained.											
Indefinite	The private key will be retained until it is explicitly deleted.											
After Expiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.											
From Issuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.											
Key Retention Days	Body	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
Key Archival	Body	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
Enrollment Fields	Body	An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as: <ul style="list-style-type: none"> <li>Preventing users from requesting invalid certificates, based on your specific certificate requirements per template.</li> <li>Providing additional information to the CA with the CSR.</li> </ul>										

Name	In	Description																
		<p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <p> <b>Note:</b> These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> <p>The enrollment fields object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the custom enrollment field.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td> </tr> <tr> <td>Options</td> <td>For multiple choice values, an array of strings containing the value choices.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table> <p>For example:</p> <pre> "EnrollmentFields": [   {     "Id": 3,     "Name": "MyCustomField",     "Options": ["Green", "Red", "Yellow", "Blue"],     "DataType": 2   } ] </pre>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																	
Id	An integer indicating the ID of the custom enrollment field.																	
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																	
Options	For multiple choice values, an array of strings containing the value choices.																	
DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.											
Value	Description																	
1	String: A free-form data entry field.																	
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																	

Name	In	Description										
Metadata Fields	Body	<p>An array of objects containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> <li>• Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>.</li> <li>• The <i>default value</i> for the metadata field.</li> <li>• A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message.</li> <li>• For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns.</li> </ul> <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.</td> </tr> <tr> <td>Default Value</td> <td>A string containing the default value defined for the metadata field for the specific template.</td> </tr> <tr> <td>Metadata Id</td> <td>An integer indicating the global metadata field associated with the template-specific settings.</td> </tr> <tr> <td>Validation</td> <td> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> </td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.	Default Value	A string containing the default value defined for the metadata field for the specific template.	Metadata Id	An integer indicating the global metadata field associated with the template-specific settings.	Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>
Name	Description											
Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.											
Default Value	A string containing the default value defined for the metadata field for the specific template.											
Metadata Id	An integer indicating the global metadata field associated with the template-specific settings.											
Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>											

Name	In	Description														
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Enrollment</td> <td> <p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. Template Regexes	Body	<p data-bbox="440 1625 1403 1751">An array of objects containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information</p>																		

Name	In	Description												
		<p>about system-wide regular expressions, see <a href="#">GET Templates Settings on page 1524</a>.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Templ-ate Id</td> <td>In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> <tr> <td>Subje-ct Part</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td>RegEx</td> <td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_.\ -]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Templ-ate Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.	Subje-ct Part	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_.\ -]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_.\ -]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>
Name	Description													
Templ-ate Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.													
Subje-ct Part	A string indicating the portion of the subject the regular expression applies to (e.g. CN).													
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_.\ -]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_.\ -]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>									
Subject Part	Example													
CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_.\ -]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>

Use Allowed Requesters	Body	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Allowed Requesters	Body	<p>An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.</p> <p>For example:</p> <pre> "AllowedRequesters": [ </pre>

		<table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>Key Certificate Signing</td> <td>The key can be used to sign certificates.</td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																								
4	Key Certificate Signing	The key can be used to sign certificates.																								
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																								
16	Data Encipherment	The key can be used for data encryption.																								
32	Key Encipherment	The key can be used for key encryption.																								
64	Nonrepudiation	The key can be used for authentication.																								
128	Digital Signature	The key can be used as a digital signature.																								
32768	Decipherment Only	The key can be used for decryption only.																								
Allow One Click Renewals	Body	<p>A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false).</p> <p>If you wish to use <i>One-Click Renewal</i> for certificates, the <b>Allow One-Click Renewals</b> option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>). For more information about one-click renewals, see <i>Certificate Operations: Renew</i> in the <i>Keyfactor Command Reference Guide</i>.</p>																								

Table 688: PUT Templates Response Body

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
Common Name	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i>&lt;end entity profile name&gt;_&lt;certificate profile name&gt;</i> . This field is populated based on information retrieved from the CA and is not configurable.
Template Name	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i>&lt;end entity profile name&gt; (&lt;certificate profile name&gt;)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as returned by the CA. This value is calculated based on the algorithms provided in the template from the CA (see <i>KeyAlgorithms</i> ). The algorithm key types and sizes are evaluated in order (RSA, ECC, Ed448, and Ed25519) and from these, the minimum type and size is determined. For example, if the template supports RSA, Ed448, and Ed25519, the minimum key type will be evaluated to RSA. Then for that algorithm, the minimum key size returned by the CA will be selected (e.g. 2048 if 2048 and 4096 are returned for RSA). See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
KeyType	A string indicating the key type of the template as returned by the CA. See details under <i>KeySize</i> . See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
Forest Root	A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.  <div style="border: 1px solid #007bff; border-radius: 10px; padding: 5px; background-color: #e6f2ff;">  <b>Note:</b> The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility.         </div>
Configuration Tenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
Friendly Name	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR

Name	Description										
	generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
Key Retention	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>After Expiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>From Issuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	After Expiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.	From Issuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
After Expiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
From Issuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
Key Retention Days	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
Key Archival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
Enrollment Fields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> <li>• Preventing users from requesting invalid certificates, based on your specific certificate requirements per template.</li> <li>• Providing additional information to the CA with the CSR.</li> </ul> <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> <b>Note:</b> These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div>										

Name	Description																
	<p>The enrollment fields object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the custom enrollment field.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td> </tr> <tr> <td>Options</td> <td>For multiple choice values, an array of strings containing the value choices.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
Metadata Fields	<p>An array of objects containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> <li>• Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>.</li> <li>• The <i>default value</i> for the metadata field.</li> <li>• A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message.</li> <li>• For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns.</li> </ul> <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.												
Name	Description																
Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.																

Name	Description																		
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Default Value</td> <td>A string containing the default value defined for the metadata field for the specific template.</td> </tr> <tr> <td>Metadata Id</td> <td>An integer indicating the global metadata field associated with the template-specific settings.</td> </tr> <tr> <td>Validation</td> <td> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> </td> </tr> <tr> <td>Enrollment</td> <td> <p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Default Value	A string containing the default value defined for the metadata field for the specific template.	Metadata Id	An integer indicating the global metadata field associated with the template-specific settings.	Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>	Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Name	Description																		
Default Value	A string containing the default value defined for the metadata field for the specific template.																		
Metadata Id	An integer indicating the global metadata field associated with the template-specific settings.																		
Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>																		
Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.										
Value	Description																		
0	Optional Users have the option to either enter a value or not enter a value in the field.																		
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.																		
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.																		

Name	Description																		
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Message</td> <td>A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).</td> </tr> </tbody> </table>	Name	Description	Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression ( <i>Validation</i> field).														
Name	Description																		
Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression ( <i>Validation</i> field).																		
Allowed Enrollment Types	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>CSR Enrollment &amp; PFX Enrollment</td> </tr> <tr> <td>4</td> <td>CSR Generation</td> </tr> <tr> <td>5</td> <td>CSR Generation &amp; PFX Enrollment</td> </tr> <tr> <td>6</td> <td>CSR Generation &amp; CSR Enrollment</td> </tr> <tr> <td>7</td> <td>CSR Enrollment, PFX Enrollment &amp; CSR Generation</td> </tr> </tbody> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation
Value	Description																		
0	None																		
1	PFX Enrollment																		
2	CSR Enrollment																		
3	CSR Enrollment & PFX Enrollment																		
4	CSR Generation																		
5	CSR Generation & PFX Enrollment																		
6	CSR Generation & CSR Enrollment																		
7	CSR Enrollment, PFX Enrollment & CSR Generation																		
Template Regexes	<p>An array of objects containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see <a href="#">GET Templates Settings on page 1524</a>.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Template Id</td> <td>In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> </tbody> </table>	Name	Description	Template Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.														
Name	Description																		
Template Id	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.																		

Name	Description						
Subject Part	A string indicating the portion of the subject the regular expression applies to (e.g. CN).						
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> <tr> <td>O (Organization)</td> <td> <p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre>^(?:Key Example Inc Key Example Key</pre> </td> </tr> </tbody> </table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>	O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre>^(?:Key Example Inc Key Example Key</pre>
Subject Part	Example						
CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>						
O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre>^(?:Key Example Inc Key Example Key</pre>						

Name	Description

The template default object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SubjectPart</td> <td> <p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <code>GET /Templates/SubjectParts</code> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p> </td> </tr> <tr> <td>Value</td> <td>A string containing the value to assign as the default for that subject part (e.g. Chicago).</td> </tr> </tbody> </table>	Value	Description	SubjectPart	<p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <code>GET /Templates/SubjectParts</code> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p>	Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).				
Value	Description										
SubjectPart	<p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <code>GET /Templates/SubjectParts</code> method (see <a href="#">GET Templates Subject Parts on page 1548</a>) to retrieve a list of all the supported subject parts.</p>										
Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).										
Template Policy	<p>An object containing the individual template-level template policy settings. Template policies defined on a template apply to enrollments made with that template only. Template-level policies, if defined, take precedence over system-wide template policies. For more information about system-wide template policies, see <a href="#">GET Templates Settings on page 1524</a>. The template policy object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Template Id</td> <td>The Keyfactor Command reference ID of the certificate template the policy is associated with.</td> </tr> <tr> <td>Allow Key Reuse</td> <td>A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <code>true</code> at a system-wide level.</td> </tr> <tr> <td>Allow Wildcards</td> <td>A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <code>true</code> at a system-wide level.</td> </tr> <tr> <td>RFC Enforce-</td> <td>A Boolean that indicates whether RFC 2818 compliance enforce-</td> </tr> </tbody> </table>	Value	Description	Template Id	The Keyfactor Command reference ID of the certificate template the policy is associated with.	Allow Key Reuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <code>true</code> at a system-wide level.	Allow Wildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <code>true</code> at a system-wide level.	RFC Enforce-	A Boolean that indicates whether RFC 2818 compliance enforce-
Value	Description										
Template Id	The Keyfactor Command reference ID of the certificate template the policy is associated with.										
Allow Key Reuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <code>true</code> at a system-wide level.										
Allow Wildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <code>true</code> at a system-wide level.										
RFC Enforce-	A Boolean that indicates whether RFC 2818 compliance enforce-

Name	Description												
	key.												
Ed448	An object containing two arrays: <ul style="list-style-type: none"> <li>bit_lengths: An array of integers indicating the key sizes supported for enrollment through Keyfactor Command.</li> <li>curves: There are no curves for this type of key.</li> </ul>												
Ed25519	An object containing two arrays: <ul style="list-style-type: none"> <li>bit_lengths: An array of integers indicating the key sizes supported for enrollment through Keyfactor Command.</li> <li>curves: There are no curves for this type of key.</li> </ul>												
Use Allowed Requesters	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>												
Allowed Requesters	<p>An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.</p>												
Display Name	<p>A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.</p>												

Name	Description															
RFC Enforcement	<p>A Boolean indicating whether RFC 2818 compliance enforcement is enabled (<i>true</i>) or not (<i>false</i>). When this option is set to <i>true</i>, certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.</p>															
Requires Approval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="380 625 1403 1184" style="background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p> <b>Important:</b> Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 11: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>															
Key Usage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1" data-bbox="380 1339 1403 1724"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> <tr> <td>4</td> <td>Key Certificate</td> <td>The key can be used to sign certificates.</td> </tr> </tbody> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate	The key can be used to sign certificates.
Value	Function	Description														
0	None	No key usage parameters.														
1	Encipherment Only	The key can be used for encryption only.														
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).														
4	Key Certificate	The key can be used to sign certificates.														

Name	Description																								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>Signing</td> <td></td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description		Signing		8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																							
	Signing																								
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																							
16	Data Encipherment	The key can be used for data encryption.																							
32	Key Encipherment	The key can be used for key encryption.																							
64	Nonrepudiation	The key can be used for authentication.																							
128	Digital Signature	The key can be used as a digital signature.																							
32768	Decipherment Only	The key can be used for decryption only.																							
Extended Key Usages	<p>An array of objects containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the extended key usage in Active Directory.</td> </tr> <tr> <td>Oid</td> <td>A string containing the object ID of the extended key usage.</td> </tr> <tr> <td>Display Name</td> <td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.	Oid	A string containing the object ID of the extended key usage.	Display Name	A string specifying the display name of the extended key usage (e.g. Server Authentication).																
Name	Description																								
Id	An integer indicating the ID of the extended key usage in Active Directory.																								
Oid	A string containing the object ID of the extended key usage.																								
Display Name	A string specifying the display name of the extended key usage (e.g. Server Authentication).																								
Curve	<p>A string indicating the friendly name of the elliptic curve algorithm configured for the template returned from the CA, for ECC templates. Possible values include:</p> <ul style="list-style-type: none"> <li>P-256 1.2.840.10045.3.1.7 = P-256/ prime256v1/ secp256r1</li> <li>P-384 1.3.132.0.34 = P-384/secp384r1</li> <li>P-521</li> </ul>																								

Name	Description
	1.3.132.0.35 = P-521/secp521r1 If the template supports more than one curve, this field contains the minimum curve value.
Allow One Click Renewals	A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false). If you wish to use <i>One-Click Renewal</i> for certificates, the <b>Allow One-Click Renewals</b> option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i> ). For more information about one-click renewals, see <i>Certificate Operations: Renew</i> in the <i>Keyfactor Command Reference Guide</i> .
KeyTypes	A string containing a comma-delimited list of the key sizes and types supported for the template returned from the CA as they are displayed in the Management Portal templates grid. Possible values include RSA 2048, ECC P-384, Ed25519, and Ed448.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.38.7 POST Templates Import

The POST /Templates/Import method is used to import templates from a specified configuration tenant into Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/certificate\_templates/modify/

Table 689: POST Templates Import Input Parameters

Name	Description
ConfigurationTenant	A string indicating the name of the configuration tenant from which to import.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API

Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.39 Workflow Certificates

The endpoints in Keyfactor Command that are found under /Workflow/Certificates refer to the process through which certificate requests that are require manager approval at the CA level before issuance are approved or denied. These endpoints provide the ability to obtain a list of pending certificate enrollment requests, and approve or deny current requests. Endpoints are also included to view denied and external validation requests.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with these endpoints. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1610](#) and [Workflow Instances on page 1765](#)).

Table 690: Workflow Certificates Endpoints

Endpoint	Method	Description	Link
/Certificates/{id}	GET	Retrieve certificate request information for a single request.	<a href="#">GET Workflow Certificates ID on the next page</a>
/Certificates/Denied	GET	Retrieve a list of denied certificate request(s).	<a href="#">GET Workflow Certificates Denied on page 1598</a>
/Certificates/Pending	GET	Retrieve a list of outstanding pending certificate request(s).	<a href="#">GET Workflow Certificates Pending on page 1601</a>
/Certificates/ExternalValidation	GET	Retrieve a list of certificate request(s) requiring external validation.	<a href="#">GET Workflow Certificates External Validation on page 1604</a>
/Certificates/Approve	POST	Approve a list of pending certificate request(s).	<a href="#">POST Workflow Certificates Approve on page 1609</a>
/Certificates/Deny	POST	Deny a list of pending certificate request(s).	<a href="#">POST Workflow Certificates Deny on page 1607</a>

### 2.6.39.1 GET Workflow Certificates ID

The Workflow GET /Certificates/{id} method is used to return details for a certificate enrollment request stored within Keyfactor Command that requires manager approval at the CA level. This method returns HTTP 200 OK on a success with the specified certificate request. This method will return certificate requests with any state (e.g. Pending, Denied, External Validation).

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1610](#) and [Workflow Instances on page 1765](#)).

**Note:** Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 691: GET Workflow Certificates {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the ID of the certificate request to retrieve. Use the <i>GET /Workflow/Certificates/Pending</i> method (see <a href="#">GET Workflow Certificates Pending on page 1601</a> ) to retrieve a list of all the certificate requests to determine the certificate request ID.

Table 692: GET Workflow Certificates {id} Input Parameters

Name	Description
Id	<p>An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.</p> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 10px; background-color: #e6f2ff; margin-top: 10px;">  <b>Note:</b> The reference ID for the certificate request in Keyfactor Command does not necessarily match the reference ID for the issued certificate in Keyfactor Command.                 </div>
CARequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	<p>A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example:</p> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 5px; background-color: #e6f2ff; margin-top: 5px; text-align: center;">             corpca01.keyexample.com\CorpIssuingCA1         </div>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	<p>An integer indicating the request state of the certificate. The possible values are:</p> <ul style="list-style-type: none"> <li>• Unknown (0)</li> <li>• Active (1)</li> <li>• Revoked (2)</li> <li>• Denied (3)</li> <li>• Failed (4)</li> <li>• Pending (5)</li> <li>• Certificate Authority (6)</li> <li>• Parent Certificate Authority (7)</li> <li>• External Validation (8)</li> </ul>
StateString	A string indicating the request state of the certificate (e.g. Pending).

Name	Description								
Metadata	An object containing the metadata fields populated for the certificate request.								
DenialComment	A string containing the user-provided comment entered when the certificate request was denied.								
KeyLength	An integer indicating the key length of the certificate request.								
SANs	An array of strings listing the subject alternative name (SAN) elements of the certificate request.								
CertStores	<p>An array of objects containing the certificate store locations to which the certificate resulting from the request will be distributed once approved. Certificate store location data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EntryName</td> <td>A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.</td> </tr> <tr> <td>ClientMachine</td> <td>A string indicating the machine on which the certificate store is located.</td> </tr> <tr> <td>StorePath</td> <td>A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.</td> </tr> </tbody> </table>	Name	Description	EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.	ClientMachine	A string indicating the machine on which the certificate store is located.	StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.
Name	Description								
EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.								
ClientMachine	A string indicating the machine on which the certificate store is located.								
StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured used for the certificate request, for ECC certificate requests. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul>								
SubjectAltNames	<p>An array of objects indicating the subject alternative name (SAN) elements for the certificate request. SAN data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td>A string indicating the value set for the SAN element.</td> </tr> <tr> <td>Type</td> <td>A string indicating the type of SAN element (e.g. DNS Name).</td> </tr> </tbody> </table>	Name	Description	Value	A string indicating the value set for the SAN element.	Type	A string indicating the type of SAN element (e.g. DNS Name).		
Name	Description								
Value	A string indicating the value set for the SAN element.								
Type	A string indicating the type of SAN element (e.g. DNS Name).								

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.39.2 GET Workflow Certificates Denied

The GET /Workflow/Certificates/Denied method is used to return a list of denied certificate enrollment requests stored within Keyfactor Command for requests that required manager approval at the CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified denied certificate requests.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1610](#) and [Workflow Instances on page 1765](#)).

**Note:** Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 693: GET Workflow Certificates Denied Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• CAHostname</li> <li>• CALogical</li> <li>• CommonName</li> <li>• Requester</li> <li>• RequestType (3-Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 3.</li> <li>• SubmissionDate</li> <li>• Template</li> </ul> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> For example, for recent denied requests from requester key_service:</p> <pre style="margin-left: 40px;">SubmissionDate -ge "2023-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 694: GET Workflow Certificates Denied Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CAResultId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin-top: 5px; background-color: #f9f9f9;">corpca01.keyexample.com\CorpIssuingCA1</div>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate. <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin-top: 5px; background-color: #e1f5fe;">  <b>Note:</b> This method returns only requests with state 3 (denied).         </div>
StateString	A string indicating the request state of the certificate (e.g. Pending). <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin-top: 5px; background-color: #e1f5fe;">  <b>Note:</b> This method returns only requests with a Denied state.         </div>
Metadata	An object containing the metadata fields populated for the certificate request.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.39.3 GET Workflow Certificates Pending

The GET /Workflow/Certificates/Pending method is used to return a list of pending certificate enrollment requests stored within Keyfactor Command for requests that require manager approval at the CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified pending certificate requests.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1610](#) and [Workflow Instances on page 1765](#)).

**Note:** Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 695: GET Workflow Certificates Pending Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• CAHostname</li> <li>• CALogical</li> <li>• CommonName</li> <li>• Requester</li> <li>• RequestType (3-Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 5.</li> <li>• SubmissionDate</li> <li>• Template</li> </ul> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> For example, for recent pending requests from requester key_service:</p> <pre style="margin-left: 40px;">SubmissionDate -ge "2023-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 696: GET Workflow Certificates Pending Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\CorpIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.  <b>Note:</b> This method returns only requests with state 5 (pending).
StateString	A string indicating the request state of the certificate (e.g. Pending).  <b>Note:</b> This method returns only requests with a Pending state.
Metadata	An object containing the metadata fields populated for the certificate request.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.39.4 GET Workflow Certificates External Validation

The GET /Workflow/Certificates/ExternalValidation method is used to return a list of certificate enrollment requests requiring external validation (at the public CA level) stored within Keyfactor Command. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified certificate requests requiring external validation.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1610](#) and [Workflow Instances on page 1765](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/monitoring/alerts/read/

Table 697: GET Workflow Certificates External Validation Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• CAHostname</li> <li>• CALogical</li> <li>• CommonName</li> <li>• Requester</li> <li>• RequestType (3-Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 8.</li> <li>• SubmissionDate</li> <li>• Template</li> </ul> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> <b>Tip:</b> For example, for recent external validation requests from requester key_service:</p> <pre style="text-align: center;">SubmissionDate -ge "2023-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 698: GET Workflow Certificates External Validation Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CAResultId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin-top: 5px; background-color: #f9f9f9;">                     corpca01.keyexample.com\CorpIssuingCA1                 </div>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate. <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin-top: 10px; background-color: #e1f5fe;">  <b>Note:</b> This method returns only requests with state 8 (external validation).                 </div>
StateString	A string indicating the request state of the certificate (e.g. Pending). <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin-top: 10px; background-color: #e1f5fe;">  <b>Note:</b> This method returns only requests with an External Validation state.                 </div>
Metadata	An object containing the metadata fields populated for the certificate request.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

## 2.6.39.5 POST Workflow Certificates Deny

The POST `/Workflow/Certificates/Deny` method will attempt to deny the provided pending certificate enrollment request(s) that require manager approval at the CA level. This method returns HTTP 200 OK on a success with details about successful, failed and denied denial requests.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1610](#) and [Workflow Instances on page 1765](#)).

**Note:** Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificates/requests/manage/`

Table 699: POST Workflow Certificates Deny Input Parameters

Name	In	Description
CertificateRequestIds	Body	<b>Required.</b> An array of integers indicating the Keyfactor Command certificate request IDs for certificate requests that should be denied in the form: <pre>[23,45,12]</pre> Use the <code>GET /Workflow/Certificates/Pending</code> method (see <a href="#">GET Workflow Certificates Pending on page 1601</a> ) to retrieve a list of all the pending certificate requests to determine the certificate request's IDs.
Comment	Body	A string providing a comment regarding the denial. This comment can be delivered to the requester or other interested party using a denied request alert.

Table 700: POST Workflow Certificates Deny Response Data

Name	Description												
Successes	<p>An array of strings indicating the successful denial response details. Response details contain the following information:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CAHost</td> <td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CALogicalName</td> <td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CARequestId</td> <td>The row index of the certificate request in the certificate authority.</td> </tr> <tr> <td>KeyfactorRequestId</td> <td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td> </tr> <tr> <td>Comment</td> <td>A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denials will have alternate comments (see below).</td> </tr> </tbody> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARequestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denials will have alternate comments (see below).
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARequestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denials will have alternate comments (see below).												
Failures	An array of strings indicating the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of strings indicating the denial requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the deny.												

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.39.6 POST Workflow Certificates Approve

The POST `/Workflow/Certificates/Approve` method will attempt to approve the provided pending certificate enrollment request(s) that require manager approval at the CA level. This method returns HTTP 200 OK on a success with details about successful, failed and denied approval requests.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on the next page](#) and [Workflow Instances on page 1765](#)).

**Note:** Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/certificates/requests/manage/`

Table 701: POST Workflow Certificates Approve Input Parameters

Name	In	Description
requestIds	Body	<p><b>Required.</b> An array of integers indicating the Keyfactor Command certificate request IDs for certificate requests that should be approved in the form (without parameter name):</p> <pre>[23,45,12]</pre> <p>Use the <code>GET /Workflow/Certificates/Pending</code> method (see <a href="#">GET Workflow Certificates Pending on page 1601</a>) to retrieve a list of all the certificate requests to determine the certificate request's IDs.</p>

Table 702: POST Workflow Certificates Approve Response Data

Name	Description												
Successes	<p>An array of strings indicating the successful approval response details. Response details contain the following information:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CAHost</td> <td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CALogicalName</td> <td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CARequestId</td> <td>The row index of the certificate request in the certificate authority.</td> </tr> <tr> <td>KeyfactorRequestId</td> <td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td> </tr> <tr> <td>Comment</td> <td>A reason or description about why the request denials succeeded, failed or were denied.</td> </tr> </tbody> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARequestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A reason or description about why the request denials succeeded, failed or were denied.
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARequestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A reason or description about why the request denials succeeded, failed or were denied.												
Failures	An array of strings indicating the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of strings indicating the approval requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the approval.												

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.40 Workflow Definitions

The Workflow Definitions component of the Keyfactor API includes methods necessary to programmatically create, edit, retrieve, and test workflow definitions. There are two types of workflow

definition:

- Global

The global workflow definitions are built into the product and cannot be deleted, though they can be modified to add workflow steps, if desired. Global workflow definitions do not have a specific associated *key*—in the case of the currently available workflows, this is a *certificate template*—and apply to all requests of the workflow’s type (e.g. enrollment) that are not otherwise handled by a custom workflow specifying a key.

- Custom

Custom workflow definitions are any additional workflow definitions you define beyond the built-in ones. Custom workflows are associated with a specific *key* (certificate template or certificate collection) and each workflow only applies to requests made using that key.

All enrollment, certificate renewal, and revocation requests go through workflow even if you haven’t created any workflow steps or added any custom workflow definitions. In the absence of customization, the global workflow definitions are used. Monitoring certificate collections on a periodic basis for certificates that change membership status based on the query criteria of a specified certificate collection can be configured to flow through workflow as well, but there are no global workflows for these.

For more information about workflows, see *Workflow Definitions* in the *Keyfactor Command Reference Guide*.

Table 703: Workflow Definitions Endpoints

Endpoint	Method	Description	Link
/Steps/{extensionName}	GET	Returns information about the structure of the workflow definition step with the specified name.	<a href="#">GET Workflow Definitions Steps Extension Name on the next page</a>
/ {definitionId}	DELETE	Deletes the workflow definition with the specified GUID.	<a href="#">DELETE Workflow Definitions Definition ID on page 1617</a>
/ {definitionId}	GET	Returns details of the workflow definition, including steps, for the workflow with the specified GUID.	<a href="#">GET Workflow Definitions Definition ID on page 1617</a>
/ {definitionId}	PUT	Updates the name and description of the workflow definition with the specified GUID.	<a href="#">PUT Workflow Definitions Definition ID on page 1644</a>
/	GET	Returns a list of workflow definitions, without steps.	<a href="#">GET Workflow Definitions on page 1671</a>
/	POST	Creates a new workflow definition, without steps.	<a href="#">POST Workflow Definitions on page 1674</a>

Endpoint	Method	Description	Link
/Steps	GET	Returns information about the structure of the workflow definitions.	<a href="#">GET Workflow Definitions Steps on page 1702</a>
/Types	GET	Returns a list of the defined workflow definition types.	<a href="#">GET Workflow Definitions Types on page 1708</a>
//{definitionId}/Steps	PUT	Updates the workflow definition with the specified GUID to add new steps or modify existing steps.	<a href="#">PUT Workflow Definitions Definition ID Steps on page 1711</a>
//{definitionId}/Publish	POST	Publishes the workflow definition with the specified GUID to activate it for use.	<a href="#">POST Workflow Definitions Definition ID Publish on page 1739</a>

### 2.6.40.1 GET Workflow Definitions Steps Extension Name

The GET `/Workflow/Definitions/Steps/{extensionName}` method is used to retrieve the workflow definition step structure for the step with the specified `extensionName`. Its primary use case is to populate the UI dialog in which step information is configured. When you are developing a custom workflow step, it can be used to confirm that the workflow step will display correctly in the UI. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition step.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/workflows/definitions/read/`

Table 704: GET Workflow Definitions Steps {extensionName} Input Parameters

Name	In	Description
extensionName	Path	<b>Required.</b> A string indicating the <code>extensionName</code> of the workflow definition step to retrieve. Use the <code>GET /Workflow/Definitions/Steps</code> method (see <a href="#">GET Workflow Definitions Steps on page 1702</a> ) to retrieve a list of all the workflow definition steps to determine the <code>extensionName</code> .

Table 705: GET Workflow Definitions Steps {extensionName} Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> <li>• <b>Email</b> <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> </li> <li>• <b>PowerShell</b> <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> <li>• ConvertFrom-Csv</li> <li>• ConvertFrom-Json</li> <li>• ConvertFrom-Markdown</li> <li>• ConvertFrom-SddlString</li> <li>• ConvertFrom-StringData</li> <li>• ConvertTo-Csv</li> <li>• ConvertTo-Html</li> <li>• ConvertTo-Json</li> <li>• ConvertTo-Xml</li> <li>• ForEach-Object</li> <li>• Get-Command</li> <li>• Where-Object</li> </ul> </li> <li>• <b>CustomPowerShell</b> <p>Run a PowerShell script that has been imported into the Keyfactor Command database. All scripts in the database that have been configured with the workflow category will be available for use. See <i>Extension/Scripts</i> in the <i>Keyfactor API</i></p> </li> </ul>

Name	Description
	<p><i>Reference Guide</i> for adding scripts to the database.</p> <ul style="list-style-type: none"> <li> <b>RequireApproval</b>            Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this.         </li> </ul> <div data-bbox="730 745 1404 940" style="background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p> <b>Important:</b> Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration <i>Authorization Methods Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</p> </div> <div data-bbox="730 966 1404 1161" style="background-color: #add8e6; padding: 10px; border-radius: 10px;"> <p> <b>Note:</b> The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request.</p> </div> <div data-bbox="730 1186 1404 1455" style="background-color: #c8e6c9; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see <i>Issued Request Alert Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p> </div> <ul style="list-style-type: none"> <li> <b>RESTRequest</b>            Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file.         </li> <li> <b>OAuthRESTRequest</b>            Run a REST (API) request using an identity provider other than Active Directory and Token authentication. The REST         </li> </ul>

Name	Description
	<p>request contents are embedded within the step. It does not call out to an external file.</p> <ul style="list-style-type: none"> <li> <b>EnrollmentAgent (Enrollment Only)</b> <p>On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.</p> <p>For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the <i>Enrollment Agent</i> template or the <i>Enrollment Agent (Computer)</i> template) and must have a Certificate Request Agent EKU. Note that the built-in <i>Enrollment Agent</i> and <i>Enrollment Agent (Computer)</i> templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.</p> <div data-bbox="727 1255 1404 1455" style="border: 1px solid orange; background-color: #ffe4c4; padding: 10px; margin: 10px 0;"> <p> <b>Important:</b> This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.</p> </div> </li> <li> <b>SubjectFormatter (Enrollment Only)</b> <p>On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the <i>Build from this Active Directory information</i> option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template,</p> </li> </ul>

Name	Description
	<p>which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the subject as <i>Build from this Active Directory information</i> must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.</p> <div data-bbox="727 562 1404 863" style="border: 1px solid orange; background-color: #f9a825; padding: 10px; margin: 10px 0;"> <p> <b>Important:</b> The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the <i>Keyfactor Windows Enrollment Gateway Installation and Configuration Guide</i>.</p> </div> <ul style="list-style-type: none"> <li data-bbox="699 890 1404 1024"> <p>• <b>EnrollStep</b> Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step.</p> </li> <li data-bbox="699 1037 1404 1136"> <p>• <b>NOOPStep</b> An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow.</p> </li> <li data-bbox="699 1148 1404 1283"> <p>• <b>RevokeStep</b> Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.</p> </li> </ul>
Outputs	An array of strings containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow.
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development.

It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.40.2 DELETE Workflow Definitions Definition ID

The DELETE /Workflow/Definitions/{definitionid} method is used to delete the workflow definition with the specified GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/workflows/definitions/modify/

**Note:** The built-in global workflow definitions (*Global Revocation Workflow* and *Global Enrollment Workflow*) cannot be deleted. A workflow definition cannot be deleted if there is an active or suspended workflow instance for the workflow definition.

Table 706: DELETE Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow definition to delete.  Use the <i>GET /Workflow/Definitions</i> method (see <a href="#">GET Workflow Definitions on page 1671</a> ) to retrieve a list of all the workflow definitions to determine the GUID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.40.3 GET Workflow Definitions Definition ID

The GET /Workflow/Definitions/{definitionid} method is used to retrieve the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the specified workflow definition.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/workflows/definitions/read/`

Table 707: GET Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definition Id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow definition to retrieve. Use the <code>GET /Workflow/Definitions</code> method (see <a href="#">GET Workflow Definitions on page 1671</a> ) to retrieve a list of all the workflow definitions to determine the GUID.
definition Version	Query	An integer indicating which version of the workflow definition to return. The default is to return the most recent version (which may not necessarily be the published version).
exportable	Query	A Boolean indicating whether any security RoleIds (see <a href="#">Security Roles on page 1205</a> ) in the workflow definition should be removed from the response (true) or not (false). A value of <code>true</code> allows for the workflow definition to be exported without role-specific data. The default is <code>false</code> .

Table 708: GET Workflow Definitions {definitionsid} Response Data

Description
A string indicating the Keyfactor Command reference GUID of the workflow definition.
A string indicating the display name defined for the workflow definition.
A string indicating the description for the workflow definition.
A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.

## Description

A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be *false*.

A string indicating the type of workflow definition. The currently supported types are:

- **CertificateEnteredCollection**

The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.

For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.

- **CertificateLeftCollection**

The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.

For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.

- **Enrollment (Including Renewals)**

## Description

The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

- **Revocation**

The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.

An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:

## Description

A string indicating the Keyfactor Command reference GUID of the workflow definition step.

A string indicating the display name for the step.

A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.

## Description

### Description

A string indicating the type of step. The currently supported types are:

- **Email**

Send an email message. This is a separate email message from those typically sent as part of a *Require Approval* step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.

- **PowerShell**

Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:

- ConvertFrom-Csv
- ConvertFrom-Json
- ConvertFrom-Markdown
- ConvertFrom-SddlString
- ConvertFrom-StringData
- ConvertTo-Csv
- ConvertTo-Html
- ConvertTo-Json
- ConvertTo-Xml
- ForEach-Object
- Get-Command
- Where-Object

## Description

### Description

- **CustomPowerShell**

Run a PowerShell script that has been imported into the Keyfactor Command database. All scripts in the database that have been configured with the workflow category will be available for use. See *Extension/Scripts* in the *Keyfactor API Reference Guide* for adding scripts to the database.

- **RequireApproval**

Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an *Email* type step for this.

**Important:** Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration *Authorization Methods Tab* in the *Keyfactor Command Reference Guide*.

**Note:** The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request.

**Tip:** The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see *Issued Request Alert Operations* in the *Keyfactor Command Reference Guide*).

- **RESTRquest**

Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file.

## Description

### Description

- **OAuthRESTRequest**

Run a REST (API) request using an identity provider other than Active Directory and Token authentication. The REST request contents are embedded within the step. It does not call out to an external file.

- **EnrollmentAgent (Enrollment Only)**

On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.

For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the *Enrollment Agent* template or the *Enrollment Agent (Computer)* template) and must have a Certificate Request Agent EKU. Note that the built-in *Enrollment Agent* and *Enrollment Agent (Computer)* templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.

**Important:** This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.

- **SubjectFormatter (Enrollment Only)**

On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the *Build from this Active Directory information* option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template, which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the

## Description

### Description

subject as *Build from this Active Directory information* must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.

**Important:** The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the *Keyfactor Windows Enrollment Gateway Installation and Configuration Guide*.

- **EnrollStep**

Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step.

- **NOOPStep**

An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow.

- **RevokeStep**

Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.

**Tip:** For steps that send email messages, the SMTP settings and sender information come from the standard Keyfactor Command SMTP configuration (see [SMTP on page 1424](#)) and are not configured individually in the workflow steps.

A Boolean indicating whether the step is enabled to run (true) or not (false).

## Description

### Description

An object containing the configuration parameters for the workflow definition step. These will vary depending on the type of workflow and the type of step (see *ExtensionName*).

**Note:** There are no ConfigurationParameters for steps of type *SubjectFormatter*, *EnrollStep*, *NOOPStep*, or *RevokeStep*.

Possible **CustomPowerShell** parameters include:

Value	Description
Script Parameters	An object defining any parameters to be used in the PowerShell script.
Script Name	<p>A string containing the Keyfactor Command reference name of PowerShell script as stored in the Keyfactor Command database (see <a href="#">Extensions Scripts on page 849</a>).</p> <p>A sample PowerShell script (CustomPowershellExample.ps1) is provided in the \ExtensionLibrary\net6.0\Workflow directory on the Keyfactor Command server under the install directory. By default, this is:</p> <pre>C:\Program Files\Keyfactor\Keyfactor Platform \ExtensionLibrary\net6.0\Workflow</pre>

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.

Possible **Email** parameters include:

## Description

### Description

#### Description

A string indicating the subject line for the email message that will be delivered when the workflow definition step is executed.

A string indicating the email message that will be delivered when the workflow definition step is executed. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. For example, for an enrollment pending request notification:

```
"Hello, \n\nA certificate using the $(template) template was requested by
$(requester:displayname) from $(CA) on $(subdate). The certificate details
include: \n\n<table> \n<tr><th>Certificate
Details</th><th>Metadata</th></tr> \n<tr><td>CN: $(request:cn)</td><td>App
Owner First Name: $(metadata:AppOwnerFirstName)</td></tr> \n<tr><td>DN:
$(request:dn)</td><td>App Owner Last Name: $(metadata:Ap-
pOwnerLastName)</td></tr> \n<tr><td>SANS: $(sans)</td><td>App Owner Email
Address: $(metadata:AppOwnerEmailAddress)</td></tr> \n<tr><t-
d>&nbsp;</td><td>Business Critical: $(metadata:BusinessCritical)</td></tr>
\n\nPlease review this request and issue the certificate as appropriate by
going here: \n\n$(reviewlink) \n\nThanks! \n\nYour Certificate Management
Tool\n"
```

## Description

### Description

### Description

See *Table: Tokens for Workflow Definitions* in the *Keyfactor Command Reference Guide* for a complete list of available tokens.

**Note:** The `$(requester:displayname)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

An array of strings containing the recipients for the workflow definition email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:

- `$(requester:mail)`

The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.

**Note:** The `$(requester:mail)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

- Your custom email-based metadata field, which would be specified similarly to `$(metadata:AppOwnerEmailAddress)`.

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select `$(requester)` in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable `$(requester)`.

## Description

### Description

Possible **EnrollmentAgent** parameters include:

Value	Description
Enrollment Agent Cert	A string containing the base-64-encoded representation of the enrollment agent certificate with private key (in PKCS#12 format) that will be used to sign the CSR. This can be either a user certificate or a computer certificate and must have a Certificate Request Agent EKU.
Enrollment Agent Cert Password	<p>An object indicating the password information used to secure the private key of the enrollment agent certificate.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>

Possible **PowerShell** parameters include:

Value	Description
Script Parameters	An object defining any parameters to be used in the PowerShell script. The key is the name of a custom parameter defined by you and the value is the initial value that should be set for that parameter before the PowerShell is executed, if any. Tokens are supported in the <i>value</i> .
Script Content	A string containing the PowerShell commands to execute. This should be the actual contents of the PowerShell script (the PowerShell commands and supporting components), not a path and filename to an external file.

## Description

### Description

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.

Possible **RequireApproval** parameters include:

Value	Description
Minimum Approvals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.
Denial Email Subject	A string indicating the subject line for the email message that will be delivered if the request is denied.
Denial Email Message	A string indicating the email message that will be delivered if the request is denied. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. <i>See Table: Tokens for Workflow Definitions in the Keyfactor Command Reference Guide for a complete list of available tokens.</i>
Denial Email Recipients	An array of strings containing the recipients for the denial email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"><li>• \$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li></ul>

**Note:** The \$(requester:mail) substitutable special text token is

## Description

Value	Description
	<p> only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>.</li></ul>
Approval Email Subject	A string indicating the subject line for the email message that will be delivered if the request is approved.
Approval Email Message	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. <i>See Table: Tokens for Workflow Definitions in the Keyfactor Command Reference Guide for a complete list of available tokens.</i>
Approval Email Recipients	An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"><li><code>\$(requester:mail)</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li></ul> <p> <b>Note:</b> The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>.</li></ul>

## Description

### Description

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select `$(requester)` in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable `$(requester)`.

Possible **RestRequest** parameters include:

Value	Description
Headers	An object containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:

```
"Headers": {
  "x-keyfactor-requested-with": [
    "APIClient"
  ],
  "x-keyfactor-api-version": [
    "2"
  ]
}
```

**Tip:** For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be

## Description

### Description

Value	Description
	 specified, since those are addressed elsewhere in the configuration.
Data Bucket Property	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
Verb	<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"><li>• DELETE</li><li>• GET</li><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>
Use	<p>A Boolean indicating whether Basic authentication should be used for the request (True) or not (False).</p>

## Description

### Description

Value	Description
BasicAuth	If <i>UseBasicAuth</i> is <i>False</i> , Windows authentication in the context of the Keyfactor Command application pool user will be used (see <i>Create Active Directory Service Accounts for Keyfactor Command</i> in the <i>Keyfactor Command Server Installation Guide</i> ).
BasicUsername	<p>An object indicating the username information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>
BasicPassword	<p>An object indicating the password information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>. The syntax is the same as for <i>BasicUsername</i>.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://key-factor.keyexample.-</pre>

## Description

### Description

Value	Description
	<pre>com/KeyfactorAPI/Certificates?pq.queryString=CN%20-contain- s%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://key- factor.keyexample.com/KeyfactorAPI/Certificates/\${certid}</pre> <div style="background-color: #e1f5fe; padding: 10px;"><p> <b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p><pre>192.168.12.0/24,192.168.14.22/24</pre><p>When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.</p></div>
Content Type	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"><li>• application/json</li></ul>
Req-	A string containing the body of the REST request, if needed. For a Keyfactor API

## Description

### Description

Value	Description
request Content	<p>request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):</p> <pre>{   "Id": "\${certid}",   "Metadata":{     "RevocationComment": "\${cmnt}"   } }</pre> <p> <b>Note:</b> This example assumes you have a metadata field called RevocationComment.</p>

 **Tip:** Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—`$(cmnt)`—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the `$(id)`.

Possible **OAuthRestRequest** parameters include:

## Description

## Description

Value	Description
Headers	<p>An object containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre>
Data Bucket Property	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i></p>

## Description

### Description

Value	Description
	<p> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
Verb	<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"><li>• DELETE</li><li>• GET</li><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>
client_id	<p>A string indicating the ID of the identity provider client that should be used to authenticate the session (see <a href="#">Authenticating to the Keyfactor API on page 3</a>).</p>
client_secret	<p>An object indicating the secret of the identity provider client that should be used to authenticate the session (see <a href="#">Authenticating to the Keyfactor API on page 3</a>).</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider.</li></ul>

## Description

### Description

Value	Description
	<p>See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
Token Endpoint	<p>A string container the URL of the token endpoint for your identity provider. For example:</p> <pre>https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/token</pre> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p>
Scope	<p>One or more scopes that are submitted with the token request, if desired. Multiple scopes should be separated by spaces.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
Audience	<p>An audience value that is submitted with the token request, if desired.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://key-</pre>

## Description

### Description

Value	Description
	<pre>factor.keyexample.- com/KeyfactorAPI/Certificates?pq.queryString=CN%20-contain- s%20%22apprvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://key- factor.keyexample.com/KeyfactorAPI/Certificates/\${certid}</pre> <div style="background-color: #e1f5fe; padding: 10px;"><p> <b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p><pre>192.168.12.0/24,192.168.14.22/24</pre><p>When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.</p></div>
Content Type	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"><li>• application/json</li></ul>

## Description

### Description

Value	Description
Request Content	<p>A string containing the body of the REST request, if needed. For a Keyfactor API request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):</p> <pre>{   "Id": "\${certid}",   "Metadata":{     "RevocationComment": "\${cmnt}"   } }</pre>

 **Note:** This example assumes you have a metadata field called RevocationComment.

 **Tip:** Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—`$(cmnt)`—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the `$(id)`.

An array of objects containing data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step (see *ExtensionName*). Possible **RequireApproval** values are:

## Description

### Description

Value	Description
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.
Signal Name	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .

**Important:** If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances.

An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:

Value	Description
Id	A string indicating the Keyfactor Command reference GUID of the condition.
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).

An object indicating the next step in the workflow. Possible values are:

## Description

### Description

Value	Description
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.

An integer indicating the version number of the workflow definition. If this version number does not match the *PublishedVersion*, changes have been made to the workflow definition that have not yet been published.

An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

## Description

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

### 2.6.40.4 PUT Workflow Definitions Definition ID

The PUT `/Workflow/Definitions/{definitionid}` method is used to update the name and description for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/workflows/definitions/modify/`

 **Tip:** A given workflow can only apply to one key. If you need to run the same workflow steps for more than one key (e.g. the same enrollment steps for more than one template), you can either add these steps to the global workflow or, if you want to run the steps for more than one type of enrollment, for example, but not all, you can configure one custom workflow and then export and re-import that workflow to duplicate it (see [PUT Workflow Definitions Definition ID above](#)) and edit the copy to change the key.

 **Note:** If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected

data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 709: PUT Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definition Id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow definition.
Display Name	Body	<b>Required.</b> A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.

Table 710: PUT Workflow Definitions {definitionid} Response Data

Description
A string indicating the Keyfactor Command reference GUID of the workflow definition.
A string indicating the display name defined for the workflow definition.
A string indicating the description for the workflow definition.
A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.

## Description

A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be *false*.

A string indicating the type of workflow definition. The currently supported types are:

- **CertificateEnteredCollection**

The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.

For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.

- **CertificateLeftCollection**

The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.

For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.

- **Enrollment (Including Renewals)**

## Description

The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

- **Revocation**

The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.

An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:

## Description

A string indicating the Keyfactor Command reference GUID of the workflow definition step.

A string indicating the display name for the step.

A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.

## Description

### Description

A string indicating the type of step. The currently supported types are:

- **Email**

Send an email message. This is a separate email message from those typically sent as part of a *Require Approval* step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.

- **PowerShell**

Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:

- ConvertFrom-Csv
- ConvertFrom-Json
- ConvertFrom-Markdown
- ConvertFrom-SddlString
- ConvertFrom-StringData
- ConvertTo-Csv
- ConvertTo-Html
- ConvertTo-Json
- ConvertTo-Xml
- ForEach-Object
- Get-Command
- Where-Object

## Description

### Description

- **CustomPowerShell**

Run a PowerShell script that has been imported into the Keyfactor Command database. All scripts in the database that have been configured with the workflow category will be available for use. See *Extension/Scripts* in the *Keyfactor API Reference Guide* for adding scripts to the database.

- **RequireApproval**

Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an *Email* type step for this.

**Important:** Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration *Authorization Methods Tab* in the *Keyfactor Command Reference Guide*.

**Note:** The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request.

**Tip:** The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see *Issued Request Alert Operations* in the *Keyfactor Command Reference Guide*).

- **RESTRquest**

Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file.

## Description

### Description

- **OAuthRESTRequest**

Run a REST (API) request using an identity provider other than Active Directory and Token authentication. The REST request contents are embedded within the step. It does not call out to an external file.

- **EnrollmentAgent (Enrollment Only)**

On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.

For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the *Enrollment Agent* template or the *Enrollment Agent (Computer)* template) and must have a Certificate Request Agent EKU. Note that the built-in *Enrollment Agent* and *Enrollment Agent (Computer)* templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.

**Important:** This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.

- **SubjectFormatter (Enrollment Only)**

On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the *Build from this Active Directory information* option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template, which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the

## Description

### Description

subject as *Build from this Active Directory information* must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.

**Important:** The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the *Keyfactor Windows Enrollment Gateway Installation and Configuration Guide*.

- **EnrollStep**

Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step.

- **NOOPStep**

An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow.

- **RevokeStep**

Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.

**Tip:** For steps that send email messages, the SMTP settings and sender information come from the standard Keyfactor Command SMTP configuration (see [SMTP on page 1424](#)) and are not configured individually in the workflow steps.

A Boolean indicating whether the step is enabled to run (true) or not (false).

## Description

### Description

An object containing the configuration parameters for the workflow definition step. These will vary depending on the type of workflow and the type of step (see *ExtensionName*).

**Note:** There are no ConfigurationParameters for steps of type *SubjectFormatter*, *EnrollStep*, *NOOPStep*, or *RevokeStep*.

Possible **CustomPowerShell** parameters include:

Value	Description
Script Parameters	An object defining any parameters to be used in the PowerShell script.
Script Name	<p>A string containing the Keyfactor Command reference name of PowerShell script as stored in the Keyfactor Command database (see <a href="#">Extensions Scripts on page 849</a>).</p> <p>A sample PowerShell script (CustomPowershellExample.ps1) is provided in the \ExtensionLibrary\net6.0\Workflow directory on the Keyfactor Command server under the install directory. By default, this is:</p> <pre>C:\Program Files\Keyfactor\Keyfactor Platform \ExtensionLibrary\net6.0\Workflow</pre>

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.

Possible **Email** parameters include:

## Description

### Description

#### Description

A string indicating the subject line for the email message that will be delivered when the workflow definition step is executed.

A string indicating the email message that will be delivered when the workflow definition step is executed. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. For example, for an enrollment pending request notification:

```
"Hello, \n\nA certificate using the $(template) template was requested by
$(requester:displayname) from $(CA) on $(subdate). The certificate details
include: \n\n<table> \n<tr><th>Certificate
Details</th><th>Metadata</th></tr> \n<tr><td>CN: $(request:cn)</td><td>App
Owner First Name: $(metadata:AppOwnerFirstName)</td></tr> \n<tr><td>DN:
$(request:dn)</td><td>App Owner Last Name: $(metadata:Ap-
pOwnerLastName)</td></tr> \n<tr><td>SANs: $(sans)</td><td>App Owner Email
Address: $(metadata:AppOwnerEmailAddress)</td></tr> \n<tr><t-
d>&nbsp;</td><td>Business Critical: $(metadata:BusinessCritical)</td></tr>
\n\nPlease review this request and issue the certificate as appropriate by
going here: \n\n$(reviewlink) \n\nThanks! \n\nYour Certificate Management
Tool\n"
```

## Description

### Description

### Description

See *Table: Tokens for Workflow Definitions* in the *Keyfactor Command Reference Guide* for a complete list of available tokens.

**Note:** The `$(requester:displayname)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

An array of strings containing the recipients for the workflow definition email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:

- `$(requester:mail)`

The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.

**Note:** The `$(requester:mail)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

- Your custom email-based metadata field, which would be specified similarly to `$(metadata:AppOwnerEmailAddress)`.

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select `$(requester)` in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable `$(requester)`.

## Description

### Description

Possible **EnrollmentAgent** parameters include:

Value	Description
Enrollment Agent Cert	A string containing the base-64-encoded representation of the enrollment agent certificate with private key (in PKCS#12 format) that will be used to sign the CSR. This can be either a user certificate or a computer certificate and must have a Certificate Request Agent EKU.
Enrollment Agent Cert Password	<p>An object indicating the password information used to secure the private key of the enrollment agent certificate.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>

Possible **PowerShell** parameters include:

Value	Description
Script Parameters	An object defining any parameters to be used in the PowerShell script. The key is the name of a custom parameter defined by you and the value is the initial value that should be set for that parameter before the PowerShell is executed, if any. Tokens are supported in the <i>value</i> .
Script Content	A string containing the PowerShell commands to execute. This should be the actual contents of the PowerShell script (the PowerShell commands and supporting components), not a path and filename to an external file.

## Description

### Description

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.

Possible **RequireApproval** parameters include:

Value	Description
Minimum Approvals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.
Denial Email Subject	A string indicating the subject line for the email message that will be delivered if the request is denied.
Denial Email Message	A string indicating the email message that will be delivered if the request is denied. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. <i>See Table: Tokens for Workflow Definitions in the Keyfactor Command Reference Guide for a complete list of available tokens.</i>
Denial Email Recipients	An array of strings containing the recipients for the denial email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"><li>• \$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li></ul>

**Note:** The \$(requester:mail) substitutable special text token is

## Description

Value	Description
	<p> only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>.</li></ul>
Approval Email Subject	A string indicating the subject line for the email message that will be delivered if the request is approved.
Approval Email Message	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. <i>See Table: Tokens for Workflow Definitions in the Keyfactor Command Reference Guide for a complete list of available tokens.</i>
Approval Email Recipients	An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"><li><code>\$(requester:mail)</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li></ul> <p> <b>Note:</b> The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>.</li></ul>

## Description

### Description

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select `$(requester)` in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable `$(requester)`.

Possible **RestRequest** parameters include:

Value	Description
Headers	<p>An object containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre>

**Tip:** For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be

## Description

### Description

Value	Description
	 specified, since those are addressed elsewhere in the configuration.
Data Bucket Property	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
Verb	<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"><li>• DELETE</li><li>• GET</li><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>
Use	<p>A Boolean indicating whether Basic authentication should be used for the request (True) or not (False).</p>

## Description

### Description

Value	Description
BasicAuth	If <i>UseBasicAuth</i> is <i>False</i> , Windows authentication in the context of the Keyfactor Command application pool user will be used (see <i>Create Active Directory Service Accounts for Keyfactor Command</i> in the <i>Keyfactor Command Server Installation Guide</i> ).
BasicUsername	<p>An object indicating the username information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>
BasicPassword	<p>An object indicating the password information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>. The syntax is the same as for <i>BasicUsername</i>.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://key-factor.keyexample.-</pre>

## Description

### Description

Value	Description
	<pre>com/KeyfactorAPI/Certificates?pq.queryString=CN%20-contain- s%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://key- factor.keyexample.com/KeyfactorAPI/Certificates/\${certid}</pre> <div style="border: 1px solid #add8e6; padding: 10px;"><p> <b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p><pre>192.168.12.0/24,192.168.14.22/24</pre><p>When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.</p></div>
Content Type	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"><li>• application/json</li></ul>
Req-	A string containing the body of the REST request, if needed. For a Keyfactor API

## Description

### Description

Value	Description
request Content	<p>request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):</p> <pre>{   "Id": "\${certid}",   "Metadata":{     "RevocationComment": "\${cmnt}"   } }</pre> <p> <b>Note:</b> This example assumes you have a metadata field called RevocationComment.</p>

 **Tip:** Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—`$(cmnt)`—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the `$(id)`.

Possible **OAuthRestRequest** parameters include:

## Description

### Description

Value	Description
Headers	<p>An object containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre> <p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be specified, since those are addressed elsewhere in the configuration.</p>
Data Bucket Property	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i></p>

## Description

### Description

Value	Description
	<p> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
Verb	<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"><li>• DELETE</li><li>• GET</li><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>
client_id	<p>A string indicating the ID of the identity provider client that should be used to authenticate the session (see <a href="#">Authenticating to the Keyfactor API on page 3</a>).</p>
client_secret	<p>An object indicating the secret of the identity provider client that should be used to authenticate the session (see <a href="#">Authenticating to the Keyfactor API on page 3</a>).</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider.</li></ul>

## Description

### Description

Value	Description
	<p>See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
Token Endpoint	<p>A string container the URL of the token endpoint for your identity provider. For example:</p> <pre>https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/token</pre> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p>
Scope	<p>One or more scopes that are submitted with the token request, if desired. Multiple scopes should be separated by spaces.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
Audience	<p>An audience value that is submitted with the token request, if desired.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://key-</pre>

## Description

### Description

Val-  
ue

Description

```
factor.keyexample.-  
com/KeyfactorAPI/Certificates?pq.queryString=CN%20-contain-  
s%20%22apprvr14%22%20AND%20CertStorePath%20-ne%20NULL
```

Or, with tokens:

```
https://key-  
factor.keyexample.com/KeyfactorAPI/Certificates/${certid}
```

**Note:** To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR\_BLOCKED\_OUTBOUND\_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:

```
192.168.12.0/24,192.168.14.22/24
```

When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.

Con-  
tent  
Typ-  
e

A string indicating the content type for the request. Supported values are:

- application/json

## Description

### Description

Value	Description
-------	-------------

Request Content	A string containing the body of the REST request, if needed. For a Keyfactor API request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):
-----------------	---

```
{
  "Id": "${certid}",
  "Metadata":{
    "RevocationComment": "${cmnt}"
  }
}
```

**Note:** This example assumes you have a metadata field called RevocationComment.

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—`$(cmnt)`—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the `$(id)`.

An array of objects containing data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step (see *ExtensionName*). Possible **RequireApproval** values are:

## Description

### Description

Value	Description
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.
Signal Name	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .

**Important:** If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances.

An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:

Value	Description
Id	A string indicating the Keyfactor Command reference GUID of the condition.
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).

An object indicating the next step in the workflow. Possible values are:

## Description

### Description

Value	Description
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.

An integer indicating the version number of the workflow definition. If this version number does not match the *PublishedVersion*, changes have been made to the workflow definition that have not yet been published.

An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

## Description

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.40.5 GET Workflow Definitions

The GET /Workflow/Definitions method is used to retrieve the list of workflow definitions. This method returns HTTP 200 OK on a success with high level information about the workflow definitions. Use the GET /Workflow/Definitions/{definitionid} method (see [GET Workflow Definitions Definition ID on page 1617](#)) to return details including the workflow steps.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/workflows/definitions/read/

Table 711: GET Workflow Definitions Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Workflow Definitions Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• DisplayName</li> <li>• Id</li> <li>• IsPublished (true or false)</li> <li>• WorkflowType (CertificateEnteredCollection, CertificateLeftCollection, Enrollment, or Revocation)</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 712: GET Workflow Definitions Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
Display Name	A string indicating the display name defined for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
Key Display Name	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
Workflow Type	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> <li> <b>CertificateEnteredCollection</b>                      The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.                      For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.                 </li> <li> <b>CertificateLeftCollection</b>                      The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.                      For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.                 </li> <li> <b>Enrollment (Including Renewals)</b>                      The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.                 </li> <li> <b>Revocation</b>                      The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.                 </li> </ul>
Draft Version	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.

Name	Description
Published Version	An integer indicating the currently published version number of the workflow definition.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.40.6 POST Workflow Definitions

The POST /Workflow/Definitions method is used to create a new workflow definition without any steps. To add steps to the workflow, use the PUT /Workflow/Definitions/{definitionId}/Steps method (see [PUT Workflow Definitions Definition ID Steps on page 1711](#)). This method returns HTTP 200 OK on a success with details about the workflow definition.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/workflows/definitions/modify/

 **Tip:** A given workflow can only apply to one key. If you need to run the same workflow steps for more than one key (e.g. the same enrollment steps for more than one template), you can either add these steps to the global workflow or, if you want to run the steps for more than one type of enrollment, for example, but not all, you can configure one custom workflow and then export and re-import that workflow to duplicate it (see [POST Workflow Definitions above](#)) and edit the copy to change the key.

Table 713: POST Workflow Definitions Input Parameters

Name	In	Description
Display Name	Body	<b>Required.</b> A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.
Key	Body	<p><b>Required.</b> A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i>. If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i>, this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i>, this field will contain the Keyfactor Command reference ID for the certificate collection.</p> <p>Use the GET /Templates method (see <a href="#">GET Templates on page 1548</a>) to retrieve a list of your certificate templates to determine the template ID.</p> <p>Use the GET /CertificateCollections method (see <a href="#">GET Certificate Collections on page 461</a>) to retrieve a list of your certificate collections to determine the collection ID.</p> <p>This field cannot be modified on an edit.</p>
Key Display Name	Body	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
Workflow Type	Body	<p><b>Required.</b> A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> <li> <b>CertificateEnteredCollection</b>                      The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.                      For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.                 </li> <li> <b>CertificateLeftCollection</b>                      The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.                      For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.                 </li> <li> <b>Enrollment (Including Renewals)</b>                      The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require                 </li> </ul>

Name	In	Description
		<p>manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.</p> <ul style="list-style-type: none"> <li> <b>Revocation</b>            The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.         </li> </ul> <p>This field cannot be modified on an edit.</p>

Table 714: POST Workflow Definitions Response Data

Description
A string indicating the Keyfactor Command reference GUID of the workflow definition.
A string indicating the display name defined for the workflow definition.
A string indicating the description for the workflow definition.
A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.

## Description

A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be *false*.

A string indicating the type of workflow definition. The currently supported types are:

- **CertificateEnteredCollection**

The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.

For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.

- **CertificateLeftCollection**

The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.

For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.

- **Enrollment (Including Renewals)**

## Description

The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

- **Revocation**

The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.

An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:

## Description

A string indicating the Keyfactor Command reference GUID of the workflow definition step.

A string indicating the display name for the step.

A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.

## Description

### Description

A string indicating the type of step. The currently supported types are:

- **Email**

Send an email message. This is a separate email message from those typically sent as part of a *Require Approval* step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.

- **PowerShell**

Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:

- ConvertFrom-Csv
- ConvertFrom-Json
- ConvertFrom-Markdown
- ConvertFrom-SddlString
- ConvertFrom-StringData
- ConvertTo-Csv
- ConvertTo-Html
- ConvertTo-Json
- ConvertTo-Xml
- ForEach-Object
- Get-Command
- Where-Object

## Description

### Description

- **CustomPowerShell**

Run a PowerShell script that has been imported into the Keyfactor Command database. All scripts in the database that have been configured with the workflow category will be available for use. See *Extension/Scripts* in the *Keyfactor API Reference Guide* for adding scripts to the database.

- **RequireApproval**

Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an *Email* type step for this.

**Important:** Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration *Authorization Methods Tab* in the *Keyfactor Command Reference Guide*.

**Note:** The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request.

**Tip:** The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see *Issued Request Alert Operations* in the *Keyfactor Command Reference Guide*).

- **RESTRquest**

Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file.

## Description

### Description

- **OAuthRESTRequest**

Run a REST (API) request using an identity provider other than Active Directory and Token authentication. The REST request contents are embedded within the step. It does not call out to an external file.

- **EnrollmentAgent (Enrollment Only)**

On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.

For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the *Enrollment Agent* template or the *Enrollment Agent (Computer)* template) and must have a Certificate Request Agent EKU. Note that the built-in *Enrollment Agent* and *Enrollment Agent (Computer)* templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.

**Important:** This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.

- **SubjectFormatter (Enrollment Only)**

On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the *Build from this Active Directory information* option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template, which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the

## Description

### Description

subject as *Build from this Active Directory information* must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.

**Important:** The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the *Keyfactor Windows Enrollment Gateway Installation and Configuration Guide*.

- **EnrollStep**

Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step.

- **NOOPStep**

An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow.

- **RevokeStep**

Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.

**Tip:** For steps that send email messages, the SMTP settings and sender information come from the standard Keyfactor Command SMTP configuration (see [SMTP on page 1424](#)) and are not configured individually in the workflow steps.

A Boolean indicating whether the step is enabled to run (true) or not (false).

## Description

### Description

An object containing the configuration parameters for the workflow definition step. These will vary depending on the type of workflow and the type of step (see *ExtensionName*).

**Note:** There are no ConfigurationParameters for steps of type *SubjectFormatter*, *EnrollStep*, *NOOPStep*, or *RevokeStep*.

Possible **CustomPowerShell** parameters include:

Value	Description
Script Parameters	An object defining any parameters to be used in the PowerShell script.
Script Name	<p>A string containing the Keyfactor Command reference name of PowerShell script as stored in the Keyfactor Command database (see <a href="#">Extensions Scripts on page 849</a>).</p> <p>A sample PowerShell script (CustomPowershellExample.ps1) is provided in the \ExtensionLibrary\net6.0\Workflow directory on the Keyfactor Command server under the install directory. By default, this is:</p> <pre>C:\Program Files\Keyfactor\Keyfactor Platform \ExtensionLibrary\net6.0\Workflow</pre>

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.

Possible **Email** parameters include:

## Description

### Description

#### Description

A string indicating the subject line for the email message that will be delivered when the workflow definition step is executed.

A string indicating the email message that will be delivered when the workflow definition step is executed. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. For example, for an enrollment pending request notification:

```
"Hello, \n\nA certificate using the $(template) template was requested by
$(requester:displayname) from $(CA) on $(subdate). The certificate details
include: \n\n<table> \n<tr><th>Certificate
Details</th><th>Metadata</th></tr> \n<tr><td>CN: $(request:cn)</td><td>App
Owner First Name: $(metadata:AppOwnerFirstName)</td></tr> \n<tr><td>DN:
$(request:dn)</td><td>App Owner Last Name: $(metadata:Ap-
pOwnerLastName)</td></tr> \n<tr><td>SANS: $(sans)</td><td>App Owner Email
Address: $(metadata:AppOwnerEmailAddress)</td></tr> \n<tr><t-
d>&nbsp;</td><td>Business Critical: $(metadata:BusinessCritical)</td></tr>
\n\nPlease review this request and issue the certificate as appropriate by
going here: \n\n$(reviewlink) \n\nThanks! \n\nYour Certificate Management
Tool\n"
```

## Description

### Description

### Description

See *Table: Tokens for Workflow Definitions* in the *Keyfactor Command Reference Guide* for a complete list of available tokens.

**Note:** The `$(requester:displayname)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

An array of strings containing the recipients for the workflow definition email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:

- `$(requester:mail)`

The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.

**Note:** The `$(requester:mail)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

- Your custom email-based metadata field, which would be specified similarly to `$(metadata:AppOwnerEmailAddress)`.

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select `$(requester)` in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable `$(requester)`.

## Description

### Description

Possible **EnrollmentAgent** parameters include:

Value	Description
Enrollment Agent Cert	A string containing the base-64-encoded representation of the enrollment agent certificate with private key (in PKCS#12 format) that will be used to sign the CSR. This can be either a user certificate or a computer certificate and must have a Certificate Request Agent EKU.
Enrollment Agent Cert Password	<p>An object indicating the password information used to secure the private key of the enrollment agent certificate.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>

Possible **PowerShell** parameters include:

Value	Description
Script Parameters	An object defining any parameters to be used in the PowerShell script. The key is the name of a custom parameter defined by you and the value is the initial value that should be set for that parameter before the PowerShell is executed, if any. Tokens are supported in the <i>value</i> .
Script Content	A string containing the PowerShell commands to execute. This should be the actual contents of the PowerShell script (the PowerShell commands and supporting components), not a path and filename to an external file.

## Description

### Description

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.

Possible **RequireApproval** parameters include:

Value	Description
Minimum Approvals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.
Denial Email Subject	A string indicating the subject line for the email message that will be delivered if the request is denied.
Denial Email Message	A string indicating the email message that will be delivered if the request is denied. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. <i>See Table: Tokens for Workflow Definitions in the Keyfactor Command Reference Guide for a complete list of available tokens.</i>
Denial Email Recipients	An array of strings containing the recipients for the denial email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"><li>• \$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li></ul>

**Note:** The \$(requester:mail) substitutable special text token is

## Description

### Description

Value	Description
	<p> only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>.</li></ul>
Approval Email Subject	A string indicating the subject line for the email message that will be delivered if the request is approved.
Approval Email Message	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. <i>See Table: Tokens for Workflow Definitions in the Keyfactor Command Reference Guide for a complete list of available tokens.</i>
Approval Email Recipients	An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"><li><code>\$(requester:mail)</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li></ul> <p> <b>Note:</b> The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>.</li></ul>

## Description

### Description

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select `$(requester)` in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable `$(requester)`.

Possible **RestRequest** parameters include:

Value	Description
Headers	<p>An object containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre>
	<p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be</p>

## Description

### Description

Value	Description
	 specified, since those are addressed elsewhere in the configuration.
Data Bucket Property	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
Verb	<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"><li>• DELETE</li><li>• GET</li><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>
Use	<p>A Boolean indicating whether Basic authentication should be used for the request (True) or not (False).</p>

## Description

### Description

Value	Description
BasicAuth	If <i>UseBasicAuth</i> is <i>False</i> , Windows authentication in the context of the Keyfactor Command application pool user will be used (see <i>Create Active Directory Service Accounts for Keyfactor Command</i> in the <i>Keyfactor Command Server Installation Guide</i> ).
BasicUsername	<p>An object indicating the username information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>
BasicPassword	<p>An object indicating the password information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>. The syntax is the same as for <i>BasicUsername</i>.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://key-factor.keyexample.-</pre>

## Description

### Description

Value	Description
	<pre>com/KeyfactorAPI/Certificates?pq.queryString=CN%20-contain- s%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://key- factor.keyexample.com/KeyfactorAPI/Certificates/\${certid}</pre> <div style="border: 1px solid #add8e6; padding: 10px;"><p> <b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p><pre>192.168.12.0/24,192.168.14.22/24</pre><p>When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.</p></div>
Content Type	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"><li>• application/json</li></ul>
Req-	A string containing the body of the REST request, if needed. For a Keyfactor API

## Description

### Description

Value	Description
-------	-------------

request Content	request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):
-----------------	--

```
{
  "Id": "${certid}",
  "Metadata":{
    "RevocationComment": "${cmnt}"
  }
}
```

**Note:** This example assumes you have a metadata field called RevocationComment.

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—`$(cmnt)`—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the `$(id)`.

Possible **OAuthRestRequest** parameters include:

## Description

### Description

Value	Description
Headers	<p>An object containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre> <p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be specified, since those are addressed elsewhere in the configuration.</p>
Data Bucket Property	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i></p>

## Description

### Description

Value	Description
	<p> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
Verb	<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"><li>• DELETE</li><li>• GET</li><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>
client_id	<p>A string indicating the ID of the identity provider client that should be used to authenticate the session (see <a href="#">Authenticating to the Keyfactor API on page 3</a>).</p>
client_secret	<p>An object indicating the secret of the identity provider client that should be used to authenticate the session (see <a href="#">Authenticating to the Keyfactor API on page 3</a>).</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider.</li></ul>

## Description

### Description

Value	Description
	<p>See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
Token Endpoint	<p>A string container the URL of the token endpoint for your identity provider. For example:</p> <pre>https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/token</pre> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p>
Scope	<p>One or more scopes that are submitted with the token request, if desired. Multiple scopes should be separated by spaces.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
Audience	<p>An audience value that is submitted with the token request, if desired.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://key-</pre>

## Description

### Description

Value	Description
	<pre>factor.keyexample.- com/KeyfactorAPI/Certificates?pq.queryString=CN%20-contain- s%20%22apprvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://key- factor.keyexample.com/KeyfactorAPI/Certificates/\${certid}</pre> <div><p> <b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p><pre>192.168.12.0/24,192.168.14.22/24</pre><p>When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.</p></div>
Content Type	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"><li>• application/json</li></ul>

## Description

### Description

Value	Description
-------	-------------

Request Content	A string containing the body of the REST request, if needed. For a Keyfactor API request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):
-----------------	---

```
{
  "Id": "${certid}",
  "Metadata":{
    "RevocationComment": "${cmnt}"
  }
}
```

**Note:** This example assumes you have a metadata field called RevocationComment.

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—`$(cmnt)`—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the `$(id)`.

An array of objects containing data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step (see *ExtensionName*). Possible **RequireApproval** values are:

## Description

### Description

Value	Description
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.
Signal Name	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .

**Important:** If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances.

An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:

Value	Description
Id	A string indicating the Keyfactor Command reference GUID of the condition.
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).

An object indicating the next step in the workflow. Possible values are:

## Description

### Description

Value	Description
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.

An integer indicating the version number of the workflow definition. If this version number does not match the *PublishedVersion*, changes have been made to the workflow definition that have not yet been published.

An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

## Description

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.40.7 GET Workflow Definitions Steps

The GET /Workflow/Definitions/Steps method is used to retrieve the workflow definition step structure for the workflow definition steps. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition steps.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/workflows/definitions/read/

Table 715: GET Workflow Definitions Steps Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Workflow Definitions Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• DisplayName</li> <li>• ExtensionName</li> <li>• SupportedWorkflowTypes</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 716: GET Workflow Definitions Steps Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> <li>• <b>Email</b> <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> </li> <li>• <b>PowerShell</b> <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> <li>• ConvertFrom-Csv</li> <li>• ConvertFrom-Json</li> <li>• ConvertFrom-Markdown</li> <li>• ConvertFrom-SddlString</li> <li>• ConvertFrom-StringData</li> <li>• ConvertTo-Csv</li> <li>• ConvertTo-Html</li> <li>• ConvertTo-Json</li> <li>• ConvertTo-Xml</li> <li>• ForEach-Object</li> <li>• Get-Command</li> <li>• Where-Object</li> </ul> </li> <li>• <b>CustomPowerShell</b> <p>Run a PowerShell script that has been imported into the Keyfactor Command database. All scripts in the database that have been configured with the workflow category will be available for use. See <i>Extension/Scripts</i> in the <i>Keyfactor API</i></p> </li> </ul>

Name	Description
	<p><i>Reference Guide</i> for adding scripts to the database.</p> <ul style="list-style-type: none"> <li> <b>RequireApproval</b>            Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this.         </li> </ul> <div data-bbox="732 743 1406 940" style="background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p> <b>Important:</b> Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration <i>Authorization Methods Tab</i> in the <i>Keyfactor Command Reference Guide</i>.</p> </div> <div data-bbox="732 968 1406 1165" style="background-color: #add8e6; padding: 10px; border-radius: 10px;"> <p> <b>Note:</b> The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request.</p> </div> <div data-bbox="732 1192 1406 1455" style="background-color: #c1e1c1; padding: 10px; border-radius: 10px;"> <p> <b>Tip:</b> The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see <i>Issued Request Alert Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p> </div> <ul style="list-style-type: none"> <li> <b>RESTRequest</b>            Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file.         </li> <li> <b>OAuthRESTRequest</b>            Run a REST (API) request using an identity provider other than Active Directory and Token authentication. The REST         </li> </ul>

Name	Description
	<p>request contents are embedded within the step. It does not call out to an external file.</p> <ul style="list-style-type: none"> <li> <b>EnrollmentAgent (Enrollment Only)</b> <p>On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.</p> <p>For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the <i>Enrollment Agent</i> template or the <i>Enrollment Agent (Computer)</i> template) and must have a Certificate Request Agent EKU. Note that the built-in <i>Enrollment Agent</i> and <i>Enrollment Agent (Computer)</i> templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.</p> <div data-bbox="727 1255 1406 1457" style="border: 1px solid orange; background-color: #ffe4c4; padding: 10px; margin: 10px 0;"> <p> <b>Important:</b> This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.</p> </div> </li> <li> <b>SubjectFormatter (Enrollment Only)</b> <p>On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the <i>Build from this Active Directory information</i> option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template,</p> </li> </ul>

Name	Description
	<p>which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the subject as <i>Build from this Active Directory information</i> must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.</p> <div data-bbox="727 562 1404 863" style="border: 1px solid orange; background-color: #f9a825; padding: 10px; margin: 10px 0;"> <p> <b>Important:</b> The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the <i>Keyfactor Windows Enrollment Gateway Installation and Configuration Guide</i>.</p> </div> <ul style="list-style-type: none"> <li data-bbox="699 890 1404 1024"> <p>• <b>EnrollStep</b> Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step.</p> </li> <li data-bbox="699 1037 1404 1136"> <p>• <b>NOOPStep</b> An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow.</p> </li> <li data-bbox="699 1148 1404 1283"> <p>• <b>RevokeStep</b> Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.</p> </li> </ul>
SupportedWorkflowTypes	<p>An array of strings containing a list of the workflow types supported by the workflow definition step. Possible built-in values are:</p> <ul style="list-style-type: none"> <li data-bbox="699 1430 1404 1738"> <p>• <b>CertificateEnteredCollection</b> The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.</p> </li> <li data-bbox="699 1751 1019 1776"> <p>• <b>CertificateLeftCollection</b></p> </li> </ul>

Name	Description
	<p>The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.</p> <p>For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.</p> <ul style="list-style-type: none"> <li> <b>Enrollment (Including Renewals)</b> <p>The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.</p> </li> <li> <b>Revocation</b> <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p> </li> </ul>
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.40.8 GET Workflow Definitions Types

The GET /Workflow/Definitions/Types method is used to retrieve the workflow definition types that have been defined for use. This method returns HTTP 200 OK on a success with information about the defined workflow definition types.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/workflows/definitions/read/`

Table 717: GET Workflow Definitions Types Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Workflow Definitions Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>Name</li></ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>WorkflowType</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 718: GET Workflow Definitions Types Response Data

Name	Description												
WorkflowType	A string indicating the display name of the workflow type.												
KeyType	A string indicating the key type for the workflow. The built-in enrollment and revocation workflows use <i>Templates</i> as the key type. The built-in certificate entered collection and certificate left collection workflows use <i>Certificate Collections</i> as the key type.												
ContextParameters	An object containing the tokens that the workflow type provider has the ability to replace. These will vary depending on the workflow type.												
BuiltInSteps	<p>An object containing the information about the built-in step(s) for the workflow type (e.g. the enrollment step of the enrollment type). Possible steps include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DisplayName</td> <td>A string indicating the display name for the step.</td> </tr> <tr> <td>ExtensionName</td> <td>A string indicating the extension name for the step. The built-in extensions are:                             <ul style="list-style-type: none"> <li>• EnrollStep</li> <li>• RevokeStep</li> </ul> </td> </tr> <tr> <td>Outputs</td> <td>An array of strings containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete.</td> </tr> <tr> <td>ConfigurationParametersDefinition</td> <td>An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.</td> </tr> <tr> <td>SignalsDefinition</td> <td>An object containing the signals defined for the workflow definition step. These will vary depending on the step.</td> </tr> </tbody> </table>	Name	Description	DisplayName	A string indicating the display name for the step.	ExtensionName	A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> <li>• EnrollStep</li> <li>• RevokeStep</li> </ul>	Outputs	An array of strings containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete. SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.												

Name	Description
	 <b>Note:</b> There are no built-in steps for workflows of types <i>certificate entered collection</i> and <i>certificate left collection</i> .

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.40.9 PUT Workflow Definitions Definition ID Steps

The PUT `/Workflow/Definitions/{definitionid}/Steps` method is used to add or update the workflow steps for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/workflows/definitions/modify/`

 **Note:** If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 719: PUT Workflow Definitions {definitionid} Steps Input Parameters

Description
<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow definition to update.</p> <p>Use the <i>GET /Workflow/Definitions</i> method (see <a href="#">GET Workflow Definitions on page 1671</a>) to retrieve a list of all the workflow definitions to determine the GUID.</p>

## Description

### Description

A string indicating the display name for the step.

A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.

A string indicating the type of step. The currently supported types are:

- **Email**

Send an email message. This is a separate email message from those typically sent as part of a *Require Approval* step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.

- **PowerShell**

Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow

- ConvertFrom-Csv
- ConvertFrom-Json
- ConvertFrom-Markdown
- ConvertFrom-SddlString

Table 720: PUT Workflow Definitions {definitionid} Steps Response Data

Description
A string indicating the Keyfactor Command reference GUID of the workflow definition.
A string indicating the display name defined for the workflow definition.
A string indicating the description for the workflow definition.
A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.

## Description

A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be *false*.

A string indicating the type of workflow definition. The currently supported types are:

- **CertificateEnteredCollection**

The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.

For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.

- **CertificateLeftCollection**

The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.

For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.

- **Enrollment (Including Renewals)**

## Description

The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

- **Revocation**

The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.

An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:

## Description

A string indicating the Keyfactor Command reference GUID of the workflow definition step.

A string indicating the display name for the step.

A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.

## Description

### Description

A string indicating the type of step. The currently supported types are:

- **Email**

Send an email message. This is a separate email message from those typically sent as part of a *Require Approval* step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.

- **PowerShell**

Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:

- ConvertFrom-Csv
- ConvertFrom-Json
- ConvertFrom-Markdown
- ConvertFrom-SddlString
- ConvertFrom-StringData
- ConvertTo-Csv
- ConvertTo-Html
- ConvertTo-Json
- ConvertTo-Xml
- ForEach-Object
- Get-Command
- Where-Object

## Description

### Description

- **CustomPowerShell**

Run a PowerShell script that has been imported into the Keyfactor Command database. All scripts in the database that have been configured with the workflow category will be available for use. See *Extension/Scripts* in the *Keyfactor API Reference Guide* for adding scripts to the database.

- **RequireApproval**

Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an *Email* type step for this.

**Important:** Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration *Authorization Methods Tab* in the *Keyfactor Command Reference Guide*.

**Note:** The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request.

**Tip:** The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see *Issued Request Alert Operations* in the *Keyfactor Command Reference Guide*).

- **RESTRRequest**

Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file.

## Description

### Description

- **OAuthRESTRequest**

Run a REST (API) request using an identity provider other than Active Directory and Token authentication. The REST request contents are embedded within the step. It does not call out to an external file.

- **EnrollmentAgent (Enrollment Only)**

On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.

For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the *Enrollment Agent* template or the *Enrollment Agent (Computer)* template) and must have a Certificate Request Agent EKU. Note that the built-in *Enrollment Agent* and *Enrollment Agent (Computer)* templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.

**Important:** This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.

- **SubjectFormatter (Enrollment Only)**

On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the *Build from this Active Directory information* option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template, which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the

## Description

### Description

subject as *Build from this Active Directory information* must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.

**Important:** The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the *Keyfactor Windows Enrollment Gateway Installation and Configuration Guide*.

- **EnrollStep**

Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step.

- **NOOPStep**

An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow.

- **RevokeStep**

Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.

**Tip:** For steps that send email messages, the SMTP settings and sender information come from the standard Keyfactor Command SMTP configuration (see [SMTP on page 1424](#)) and are not configured individually in the workflow steps.

A Boolean indicating whether the step is enabled to run (true) or not (false).

## Description

### Description

An object containing the configuration parameters for the workflow definition step. These will vary depending on the type of workflow and the type of step (see *ExtensionName*).

**Note:** There are no ConfigurationParameters for steps of type *SubjectFormatter*, *EnrollStep*, *NOOPStep*, or *RevokeStep*.

Possible **CustomPowerShell** parameters include:

Value	Description
Script Parameters	An object defining any parameters to be used in the PowerShell script.
Script Name	<p>A string containing the Keyfactor Command reference name of PowerShell script as stored in the Keyfactor Command database (see <a href="#">Extensions Scripts on page 849</a>).</p> <p>A sample PowerShell script (CustomPowershellExample.ps1) is provided in the \ExtensionLibrary\net6.0\Workflow directory on the Keyfactor Command server under the install directory. By default, this is:</p> <pre>C:\Program Files\Keyfactor\Keyfactor Platform \ExtensionLibrary\net6.0\Workflow</pre>

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.

Possible **Email** parameters include:

## Description

### Description

#### Description

A string indicating the subject line for the email message that will be delivered when the workflow definition step is executed.

A string indicating the email message that will be delivered when the workflow definition step is executed. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. For example, for an enrollment pending request notification:

```
"Hello, \n\nA certificate using the $(template) template was requested by
$(requester:displayname) from $(CA) on $(subdate). The certificate details
include: \n\n<table> \n<tr><th>Certificate
Details</th><th>Metadata</th></tr> \n<tr><td>CN: $(request:cn)</td><td>App

```

## Description

### Description

### Description

See *Table: Tokens for Workflow Definitions* in the *Keyfactor Command Reference Guide* for a complete list of available tokens.

**Note:** The `$(requester:displayname)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

An array of strings containing the recipients for the workflow definition email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:

- `$(requester:mail)`

The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.

**Note:** The `$(requester:mail)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

- Your custom email-based metadata field, which would be specified similarly to `$(metadata:AppOwnerEmailAddress)`.

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select `$(requester)` in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable `$(requester)`.

## Description

### Description

Possible **EnrollmentAgent** parameters include:

Value	Description
Enrollment Agent Cert	A string containing the base-64-encoded representation of the enrollment agent certificate with private key (in PKCS#12 format) that will be used to sign the CSR. This can be either a user certificate or a computer certificate and must have a Certificate Request Agent EKU.
Enrollment Agent Cert Password	<p>An object indicating the password information used to secure the private key of the enrollment agent certificate.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>

Possible **PowerShell** parameters include:

Value	Description
Script Parameters	An object defining any parameters to be used in the PowerShell script. The key is the name of a custom parameter defined by you and the value is the initial value that should be set for that parameter before the PowerShell is executed, if any. Tokens are supported in the <i>value</i> .
Script Content	A string containing the PowerShell commands to execute. This should be the actual contents of the PowerShell script (the PowerShell commands and supporting components), not a path and filename to an external file.

## Description

### Description

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.

Possible **RequireApproval** parameters include:

Value	Description
Minimum Approvals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.
Denial Email Subject	A string indicating the subject line for the email message that will be delivered if the request is denied.
Denial Email Message	A string indicating the email message that will be delivered if the request is denied. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. <i>See Table: Tokens for Workflow Definitions in the Keyfactor Command Reference Guide for a complete list of available tokens.</i>
Denial Email Recipients	An array of strings containing the recipients for the denial email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"><li>• \$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li></ul>

 **Note:** The \$(requester:mail) substitutable special text token is

## Description

### Description

Value	Description
	<p> only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>.</li></ul>
Approval Email Subject	A string indicating the subject line for the email message that will be delivered if the request is approved.
Approval Email Message	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. <i>See Table: Tokens for Workflow Definitions in the Keyfactor Command Reference Guide for a complete list of available tokens.</i>
Approval Email Recipients	An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"><li><code>\$(requester:mail)</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li></ul> <p> <b>Note:</b> The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>.</li></ul>

## Description

### Description

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select `$(requester)` in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable `$(requester)`.

Possible **RestRequest** parameters include:

Value	Description
Headers	<p>An object containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre>
	<p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be</p>

## Description

### Description

Value	Description
	 specified, since those are addressed elsewhere in the configuration.
Data Bucket Property	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
Verb	<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"><li>• DELETE</li><li>• GET</li><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>
Use	<p>A Boolean indicating whether Basic authentication should be used for the request (True) or not (False).</p>

## Description

### Description

Value	Description
BasicAuth	If <i>UseBasicAuth</i> is <i>False</i> , Windows authentication in the context of the Keyfactor Command application pool user will be used (see <i>Create Active Directory Service Accounts for Keyfactor Command</i> in the <i>Keyfactor Command Server Installation Guide</i> ).
BasicUsername	<p>An object indicating the username information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>
BasicPassword	<p>An object indicating the password information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>. The syntax is the same as for <i>BasicUsername</i>.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://key-factor.keyexample.-</pre>

## Description

### Description

Value	Description
	<pre>com/KeyfactorAPI/Certificates?pq.queryString=CN%20-contain- s%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://key- factor.keyexample.com/KeyfactorAPI/Certificates/\${certid}</pre> <div style="border: 1px solid #add8e6; padding: 10px;"><p> <b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p><pre>192.168.12.0/24,192.168.14.22/24</pre><p>When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.</p></div>
Content Type	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"><li>• application/json</li></ul>
Req-	A string containing the body of the REST request, if needed. For a Keyfactor API

## Description

### Description

Value	Description
request Content	<p>request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):</p> <pre>{   "Id": "\${certid}",   "Metadata": {     "RevocationComment": "\${cmnt}"   } }</pre> <p> <b>Note:</b> This example assumes you have a metadata field called RevocationComment.</p>

 **Tip:** Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—`$(cmnt)`—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the `$(id)`.

Possible **OAuthRestRequest** parameters include:

## Description

## Description

Value	Description
Headers	<p>An object containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre> <p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be specified, since those are addressed elsewhere in the configuration.</p>
Data Bucket Property	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i></p>

## Description

### Description

Value	Description
	<p> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
Verb	<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"><li>• DELETE</li><li>• GET</li><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>
client_id	<p>A string indicating the ID of the identity provider client that should be used to authenticate the session (see <a href="#">Authenticating to the Keyfactor API on page 3</a>).</p>
client_secret	<p>An object indicating the secret of the identity provider client that should be used to authenticate the session (see <a href="#">Authenticating to the Keyfactor API on page 3</a>).</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider.</li></ul>

## Description

### Description

Value	Description
	<p>See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
Token Endpoint	<p>A string container the URL of the token endpoint for your identity provider. For example:</p> <pre>https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/token</pre> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p>
Scope	<p>One or more scopes that are submitted with the token request, if desired. Multiple scopes should be separated by spaces.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
Audience	<p>An audience value that is submitted with the token request, if desired.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://key-</pre>

## Description

### Description

Val-  
ue

Description

```
factor.keyexample.-  
com/KeyfactorAPI/Certificates?pq.queryString=CN%20-contain-  
s%20%22apprvr14%22%20AND%20CertStorePath%20-ne%20NULL
```

Or, with tokens:

```
https://key-  
factor.keyexample.com/KeyfactorAPI/Certificates/${certid}
```

**Note:** To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR\_BLOCKED\_OUTBOUND\_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:

```
192.168.12.0/24,192.168.14.22/24
```

When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.

Con-  
tent  
Typ-  
e

A string indicating the content type for the request. Supported values are:

- application/json

## Description

### Description

Value	Description
-------	-------------

Request Content	A string containing the body of the REST request, if needed. For a Keyfactor API request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):
-----------------	---

```
{
  "Id": "${certid}",
  "Metadata":{
    "RevocationComment": "${cmnt}"
  }
}
```

**Note:** This example assumes you have a metadata field called RevocationComment.

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—`$(cmnt)`—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the `$(id)`.

An array of objects containing data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step (see *ExtensionName*). Possible **RequireApproval** values are:

## Description

### Description

Value	Description
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.
Signal Name	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .

**Important:** If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances.

An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:

Value	Description
Id	A string indicating the Keyfactor Command reference GUID of the condition.
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).

An object indicating the next step in the workflow. Possible values are:

## Description

### Description

Value	Description
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.

An integer indicating the version number of the workflow definition. If this version number does not match the *PublishedVersion*, changes have been made to the workflow definition that have not yet been published.

An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

## Description

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.40.10 POST Workflow Definitions Definition ID Publish

The POST `/Workflow/Definitions/{definitionid}/Publish` method is used to mark the most recent version of the workflow definition with the specified GUID as the published, active, version. When a definition is published, all new or restarted workflow instances (see [Workflow Instances on page 1765](#)) will be able to use the updated version of the workflow. This method returns HTTP 200 OK on a success with details about the workflow definition.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
`/workflows/definitions/modify/`

Table 721: POST Workflow Definitions {definitionid} Publish Input Parameters

Name	In	Description
definitionId	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow definition to publish. Use the <code>GET /Workflow/Definitions</code> method (see <a href="#">GET Workflow Definitions on page 1671</a> ) to retrieve a list of all the workflow definitions to determine the GUID.

Table 722: POST Workflow Definitions {definitionid} Publish Response Data

Description
A string indicating the Keyfactor Command reference GUID of the workflow definition.
A string indicating the display name defined for the workflow definition.
A string indicating the description for the workflow definition.
A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.

## Description

A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be *false*.

A string indicating the type of workflow definition. The currently supported types are:

- **CertificateEnteredCollection**

The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.

For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.

- **CertificateLeftCollection**

The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.

For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.

- **Enrollment (Including Renewals)**

## Description

The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

- **Revocation**

The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.

An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:

## Description

A string indicating the Keyfactor Command reference GUID of the workflow definition step.

A string indicating the display name for the step.

A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.

## Description

### Description

A string indicating the type of step. The currently supported types are:

- **Email**

Send an email message. This is a separate email message from those typically sent as part of a *Require Approval* step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.

- **PowerShell**

Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:

- ConvertFrom-Csv
- ConvertFrom-Json
- ConvertFrom-Markdown
- ConvertFrom-SddlString
- ConvertFrom-StringData
- ConvertTo-Csv
- ConvertTo-Html
- ConvertTo-Json
- ConvertTo-Xml
- ForEach-Object
- Get-Command
- Where-Object

## Description

### Description

- **CustomPowerShell**

Run a PowerShell script that has been imported into the Keyfactor Command database. All scripts in the database that have been configured with the workflow category will be available for use. See *Extension/Scripts* in the *Keyfactor API Reference Guide* for adding scripts to the database.

- **RequireApproval**

Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an *Email* type step for this.

**Important:** Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration *Authorization Methods Tab* in the *Keyfactor Command Reference Guide*.

**Note:** The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request.

**Tip:** The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see *Issued Request Alert Operations* in the *Keyfactor Command Reference Guide*).

- **RESTRequest**

Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file.

## Description

### Description

- **OAuthRESTRequest**

Run a REST (API) request using an identity provider other than Active Directory and Token authentication. The REST request contents are embedded within the step. It does not call out to an external file.

- **EnrollmentAgent (Enrollment Only)**

On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.

For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the *Enrollment Agent* template or the *Enrollment Agent (Computer)* template) and must have a Certificate Request Agent EKU. Note that the built-in *Enrollment Agent* and *Enrollment Agent (Computer)* templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.

**Important:** This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.

- **SubjectFormatter (Enrollment Only)**

On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the *Build from this Active Directory information* option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template, which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the

## Description

### Description

subject as *Build from this Active Directory information* must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.

**Important:** The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the *Keyfactor Windows Enrollment Gateway Installation and Configuration Guide*.

- **EnrollStep**

Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step.

- **NOOPStep**

An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow.

- **RevokeStep**

Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.

**Tip:** For steps that send email messages, the SMTP settings and sender information come from the standard Keyfactor Command SMTP configuration (see [SMTP on page 1424](#)) and are not configured individually in the workflow steps.

A Boolean indicating whether the step is enabled to run (true) or not (false).

## Description

### Description

An object containing the configuration parameters for the workflow definition step. These will vary depending on the type of workflow and the type of step (see *ExtensionName*).

**Note:** There are no ConfigurationParameters for steps of type *SubjectFormatter*, *EnrollStep*, *NOOPStep*, or *RevokeStep*.

Possible **CustomPowerShell** parameters include:

Value	Description
Script Parameters	An object defining any parameters to be used in the PowerShell script.
Script Name	<p>A string containing the Keyfactor Command reference name of PowerShell script as stored in the Keyfactor Command database (see <a href="#">Extensions Scripts on page 849</a>).</p> <p>A sample PowerShell script (CustomPowershellExample.ps1) is provided in the \ExtensionLibrary\net6.0\Workflow directory on the Keyfactor Command server under the install directory. By default, this is:</p> <pre>C:\Program Files\Keyfactor\Keyfactor Platform \ExtensionLibrary\net6.0\Workflow</pre>

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.

Possible **Email** parameters include:

## Description

### Description

#### Description

A string indicating the subject line for the email message that will be delivered when the workflow definition step is executed.

A string indicating the email message that will be delivered when the workflow definition step is executed. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. For example, for an enrollment pending request notification:

```
"Hello, \n\nA certificate using the $(template) template was requested by
$(requester:displayname) from $(CA) on $(subdate). The certificate details
include: \n\n<table> \n<tr><th>Certificate
Details</th><th>Metadata</th></tr> \n<tr><td>CN: $(request:cn)</td><td>App
Owner First Name: $(metadata:AppOwnerFirstName)</td></tr> \n<tr><td>DN:
$(request:dn)</td><td>App Owner Last Name: $(metadata:Ap-
pOwnerLastName)</td></tr> \n<tr><td>SANS: $(sans)</td><td>App Owner Email
Address: $(metadata:AppOwnerEmailAddress)</td></tr> \n<tr><t-
d>&nbsp;</td><td>Business Critical: $(metadata:BusinessCritical)</td></tr>
\n\nPlease review this request and issue the certificate as appropriate by
going here: \n\n$(reviewlink) \n\nThanks! \n\nYour Certificate Management
Tool\n"
```

## Description

### Description

### Description

See *Table: Tokens for Workflow Definitions* in the *Keyfactor Command Reference Guide* for a complete list of available tokens.

**Note:** The `$(requester:displayname)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

An array of strings containing the recipients for the workflow definition email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:

- `$(requester:mail)`

The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.

**Note:** The `$(requester:mail)` substitutable special text token is only supported in environments using Active Directory as an identity provider.

- Your custom email-based metadata field, which would be specified similarly to `$(metadata:AppOwnerEmailAddress)`.

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select `$(requester)` in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable `$(requester)`.

## Description

### Description

Possible **EnrollmentAgent** parameters include:

Value	Description
Enrollment Agent Cert	A string containing the base-64-encoded representation of the enrollment agent certificate with private key (in PKCS#12 format) that will be used to sign the CSR. This can be either a user certificate or a computer certificate and must have a Certificate Request Agent EKU.
Enrollment Agent Cert Password	<p>An object indicating the password information used to secure the private key of the enrollment agent certificate.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>

Possible **PowerShell** parameters include:

Value	Description
Script Parameters	An object defining any parameters to be used in the PowerShell script. The key is the name of a custom parameter defined by you and the value is the initial value that should be set for that parameter before the PowerShell is executed, if any. Tokens are supported in the <i>value</i> .
Script Content	A string containing the PowerShell commands to execute. This should be the actual contents of the PowerShell script (the PowerShell commands and supporting components), not a path and filename to an external file.

## Description

### Description

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.

Possible **RequireApproval** parameters include:

Value	Description
Minimum Approvals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.
Denial Email Subject	A string indicating the subject line for the email message that will be delivered if the request is denied.
Denial Email Message	A string indicating the email message that will be delivered if the request is denied. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. <i>See Table: Tokens for Workflow Definitions in the Keyfactor Command Reference Guide for a complete list of available tokens.</i>
Denial Email Recipients	An array of strings containing the recipients for the denial email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"><li>• \$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li></ul>

**Note:** The \$(requester:mail) substitutable special text token is

## Description

### Description

Value	Description
	 only supported in environments using Active Directory as an identity provider. <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>.</li></ul>
Approval Email Subject	A string indicating the subject line for the email message that will be delivered if the request is approved.
Approval Email Message	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. <i>See Table: Tokens for Workflow Definitions in the Keyfactor Command Reference Guide for a complete list of available tokens.</i>
Approval Email Recipients	An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include: <ul style="list-style-type: none"><li><code>\$(requester:mail)</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li></ul>  <b>Note:</b> The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider. <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>.</li></ul>

## Description

### Description

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select `$(requester)` in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable `$(requester)`.

Possible **RestRequest** parameters include:

Value	Description
Headers	<p>An object containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre>
	<p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be</p>

## Description

### Description

Value	Description
	 specified, since those are addressed elsewhere in the configuration.
Data Bucket Property	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
Verb	<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"><li>• DELETE</li><li>• GET</li><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>
Use	<p>A Boolean indicating whether Basic authentication should be used for the request (True) or not (False).</p>

## Description

### Description

Value	Description
BasicAuth	If <i>UseBasicAuth</i> is <i>False</i> , Windows authentication in the context of the Keyfactor Command application pool user will be used (see <i>Create Active Directory Service Accounts for Keyfactor Command</i> in the <i>Keyfactor Command Server Installation Guide</i> ).
BasicUsername	<p>An object indicating the username information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>Due to its sensitive nature, this value is not returned in responses.</p>
BasicPassword	<p>An object indicating the password information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>. The syntax is the same as for <i>BasicUsername</i>.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://key-factor.keyexample.-</pre>

## Description

### Description

Value	Description
	<pre>com/KeyfactorAPI/Certificates?pq.queryString=CN%20-contain- s%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://key- factor.keyexample.com/KeyfactorAPI/Certificates/\${certid}</pre> <div style="border: 1px solid #add8e6; padding: 10px;"><p> <b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p><pre>192.168.12.0/24,192.168.14.22/24</pre><p>When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.</p></div>
Content Type	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"><li>• application/json</li></ul>
Req-	A string containing the body of the REST request, if needed. For a Keyfactor API

## Description

### Description

Value	Description
request Content	<p>request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):</p> <pre>{   "Id": "\${certid}",   "Metadata":{     "RevocationComment": "\${cmnt}"   } }</pre> <p> <b>Note:</b> This example assumes you have a metadata field called RevocationComment.</p>

 **Tip:** Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—`$(cmnt)`—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the `$(id)`.

Possible **OAuthRestRequest** parameters include:

## Description

### Description

Value	Description
Headers	<p>An object containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre>
Data Bucket Property	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i></p>

## Description

### Description

Value	Description
	<p> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
Verb	<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"><li>• DELETE</li><li>• GET</li><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>
client_id	<p>A string indicating the ID of the identity provider client that should be used to authenticate the session (see <a href="#">Authenticating to the Keyfactor API on page 3</a>).</p>
client_secret	<p>An object indicating the secret of the identity provider client that should be used to authenticate the session (see <a href="#">Authenticating to the Keyfactor API on page 3</a>).</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"><li>• Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the secret information from a PAM provider.</li></ul>

## Description

### Description

Value	Description
	<p>See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
Token Endpoint	<p>A string container the URL of the token endpoint for your identity provider. For example:</p> <pre>https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/token</pre> <p>For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p>
Scope	<p>One or more scopes that are submitted with the token request, if desired. Multiple scopes should be separated by spaces.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
Audience	<p>An audience value that is submitted with the token request, if desired.</p> <p>This value is not used for Keyfactor Identity Provider.</p>
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://key-</pre>

## Description

### Description

Value	Description
	<pre>factor.keyexample.- com/KeyfactorAPI/Certificates?pq.queryString=CN%20-contain- s%20%22apprvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://key- factor.keyexample.com/KeyfactorAPI/Certificates/\$(certid)</pre> <div><p> <b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p><pre>192.168.12.0/24,192.168.14.22/24</pre><p>When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.</p></div>
Content Type	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"><li>• application/json</li></ul>

## Description

### Description

Value	Description
-------	-------------

Request Content	A string containing the body of the REST request, if needed. For a Keyfactor API request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):
-----------------	---

```
{
  "Id": "${certid}",
  "Metadata":{
    "RevocationComment": "${cmnt}"
  }
}
```

**Note:** This example assumes you have a metadata field called RevocationComment.

**Tip:** Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—`$(cmnt)`—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the `$(id)`.

An array of objects containing data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step (see *ExtensionName*). Possible **RequireApproval** values are:

## Description

### Description

Value	Description
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.
Signal Name	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .

**Important:** If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances.

An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:

Value	Description
Id	A string indicating the Keyfactor Command reference GUID of the condition.
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).

An object indicating the next step in the workflow. Possible values are:

## Description

### Description

Value	Description
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.

An integer indicating the version number of the workflow definition. If this version number does not match the *PublishedVersion*, changes have been made to the workflow definition that have not yet been published.

An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

## Description

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

## 2.6.41 Workflow Instances

The Workflow Instances component of the Keyfactor API includes methods necessary to programmatically retrieve, restart, delete and submit data into workflow instances.

Table 723: Workflow Instances Endpoints

Endpoint	Method	Description	Link
/{{instanceId}}	DELETE	Delete the workflow instance with the specified GUID.	<a href="#">DELETE Workflow Instances Instance Id on the next page</a>
/{{instanceId}}	GET	Retrieve the workflow instance with the specified GUID.	<a href="#">GET Workflow Instances Instance ID on the next page</a>
/	GET	Retrieve a list of the workflow instances.	<a href="#">GET Workflow Instances on page 1789</a>
/My	GET	Retrieve the workflow instances created by the user making the API request.	<a href="#">GET Workflow Instances My on page 1793</a>
/AssignedToMe	GET	Retrieve the workflow instances assigned to the user making the API request.	<a href="#">GET Workflow Instances AssignedToMe on page 1797</a>
/{{instanceId}}/Stop	POST	Rejects a workflow instance,	<a href="#">POST Workflow</a>

Endpoint	Method	Description	Link
		preventing it from continuing.	<a href="#">Instances Instance Id Stop on page 1801</a>
/instanceid/Signals	POST	Input data to the workflow instance with the specified GUID.	<a href="#">POST Workflow Instances Instance ID Signals on page 1802</a>
/instanceid/Restart	POST	Restart the specified workflow instance after a failure.	<a href="#">POST Workflow Instances Instance Id Restart on page 1805</a>

### 2.6.41.1 DELETE Workflow Instances Instance Id

The DELETE /Workflow/Instances/{instanceid} method is used to delete the workflow instance with the specified GUID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/workflows/instances/manage/

Table 724: DELETE Workflow Instances {instanceid} Input Parameters

Name	In	Description
instanceid	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow instance to delete.  Use the <i>GET /Workflow/Instances</i> method (see <a href="#">GET Workflow Instances on page 1789</a> ) to retrieve a list of all the workflow instances to determine the GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.41.2 GET Workflow Instances Instance ID

The GET /Workflow/Instances/{instanceid} method is used to retrieve the initiated workflow with the specified instance GUID. Both in progress and completed workflows will be returned. This method returns HTTP 200 OK on a success with details about the workflow instance.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/workflows/instances/read/

OR

/workflows/instances/read/pending/

OR

/workflows/instances/read/mine/

Users with */mine/* or */pending/* will only be able to retrieve the workflow instances created by them (*/mine/*) or assigned to them (*/pending/*) unless they also have the higher level just */read/*.

Table 725: GET Workflow Instances {instanceld} Input Parameters

Name	In	Description
instanceld	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow instance to retrieve.  Use the <i>GET /Workflow/Instances</i> method (see <a href="#">GET Workflow Instances on page 1789</a> ) to retrieve a list of all the workflow instances to determine the GUID. Note that the <b>integer</b> workflow IDs (returned with <i>GET /Workflow/Instances/{instanceld}</i> ) cannot be used with the API; only the <b>GUID</b> from <i>GET /Workflow/Instances</i> can be used in this case.

Table 726: GET Workflow Instances {instanceId} Response Data

Name	Description				
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.				
Status	A string indicating the current status of the workflow instance. The possible statuses are: <ul style="list-style-type: none"> <li>• CanceledForRestart</li> <li>• Complete</li> <li>• Failed</li> <li>• Rejected</li> <li>• Running</li> <li>• Suspended</li> </ul>				
Current Step ID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.				
Status Message	A string indicating the current status message for the workflow instance. Possible status messages vary and may include: <ul style="list-style-type: none"> <li>• Access is denied</li> <li>• Awaiting # more approval(s) from approval roles.</li> <li>• Either the credentials are invalid, or the CA on [CA hostname] is not running</li> <li>• Issued</li> <li>• Issued. The private key was successfully retained.</li> <li>• Post-process Failed: [Message indicating reason for failure generally from the CA]</li> <li>• Pre-process failed: [Message indicating details of the failure]</li> <li>• Revoked</li> <li>• Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure]</li> <li>• Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure]</li> <li>• Step [custom step name] failed: [Message indicating details of the failure]</li> <li>• Taken Under Submission. The certificate template requires manager approval, and is marked as pending.</li> <li>• Workflow rejected by user with Id #.</li> </ul>				
Signals	An array of objects containing the data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step. Possible <b>RequireApproval</b> values are: <table border="1" data-bbox="354 1556 1404 1717"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SignalName</td> <td>A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i>.</td> </tr> </tbody> </table>	Value	Description	SignalName	A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i> .
Value	Description				
SignalName	A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i> .				

Name	Description										
	<table border="1"> <thead> <tr> <th data-bbox="354 275 613 338">Value</th> <th data-bbox="613 275 1396 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="354 338 613 432">StepSignalId</td> <td data-bbox="613 338 1396 432">A string indicating the Keyfactor Command reference GUID of the signal in the step.</td> </tr> <tr> <td data-bbox="354 432 613 680">SignalReceived</td> <td data-bbox="613 432 1396 680"> <p>A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false).</p> <p>For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.</p> </td> </tr> </tbody> </table>	Value	Description	StepSignalId	A string indicating the Keyfactor Command reference GUID of the signal in the step.	SignalReceived	<p>A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false).</p> <p>For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.</p>				
Value	Description										
StepSignalId	A string indicating the Keyfactor Command reference GUID of the signal in the step.										
SignalReceived	<p>A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false).</p> <p>For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.</p>										
Defin- ition	<p>An object containing the workflow definition. Workflow definition data includes:</p> <table border="1"> <thead> <tr> <th data-bbox="354 758 542 821">Name</th> <th data-bbox="542 758 1396 821">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="354 821 542 926">Id</td> <td data-bbox="542 821 1396 926">A string indicating the Keyfactor Command reference GUID of the workflow definition.</td> </tr> <tr> <td data-bbox="354 926 542 1020">Display Name</td> <td data-bbox="542 926 1396 1020">A string indicating the display name defined for the workflow definition.</td> </tr> <tr> <td data-bbox="354 1020 542 1083">Version</td> <td data-bbox="542 1020 1396 1083">An integer indicating the version number of the workflow definition.</td> </tr> <tr> <td data-bbox="354 1083 542 1726">Workflow Type</td> <td data-bbox="542 1083 1396 1726"> <p>A string indicating the type of workflow definition. Current Step Display Name	A string indicating the display name defined for the workflow instance step.				
Current Step Unique Name	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.				
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <p style="background-color: #f0f0f0; padding: 5px; border-radius: 5px;">"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</p> <p>Or</p> <p style="background-color: #f0f0f0; padding: 5px; border-radius: 5px;">"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</p>				
Last Modified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.				
Start	A string indicating the date and time when the instance was initiated.				

Name	Description																												
Date																													
Initial Data	<p>An object containing the data included in the workflow instance when the workflow was initiated. Initial workflow instance data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Operation Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Certificate Authority</td> <td>Enrollment and Revocation</td> <td>A string indicating the certificate authority that will be used to enroll against, for enrollment requests, or that issued the certificate, for revocation requests in <i>hostname\logical name</i> format.</td> </tr> <tr> <td>Certificate Id</td> <td>Certificate Collection and Revocation</td> <td>An integer indicating the Keyfactor Command reference ID for the certificate.</td> </tr> <tr> <td>Serial Number String</td> <td>Revocation</td> <td>A string indicating the serial number of the certificate being revoked.</td> </tr> <tr> <td>Thumbprint</td> <td>Revocation</td> <td>A string indicating the thumbprint of the certificate being revoked.</td> </tr> <tr> <td>Revoke Code</td> <td>Revocation</td> <td> <p>An integer containing the specific reason that the certificate is being revoked. Value	Description																						
3	Affiliation Changed																						
4	Superseded																						
5	Cessation of Operation																						
6	Certificate Hold																						
7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold																						
The default is <i>Unspecified</i> .																							
Effective Date	Revocation	A string containing the date and time when the certificate will be revoked.																					
Comment	Revocation	A string containing a freeform reason or comment on why the certificate is being revoked.																					
Delegate	Revocation	A Boolean indicating whether delegation is enabled for the certificate authority that issued the certificate (true) or not (false).																					
Operation Start	Revocation	A string indicating the time at which the revocation workflow was initiated.																					
Template	Enrollment	A string indicating the certificate template short name used for the enrollment request.																					
Include Chain	Enrollment	A Boolean indicating whether to include the certificate chain in the enrollment response (true) or not (false).																					
SANs	Enrollment	An object indicating the subject alternative names (SANs) for the certificate requested in the enrollment, each type an array of strings. Possible values for the key are:

Name	Description															
		The default is <i>Unspecified</i> .														
Effective Date	Revocation	A string containing the date and time when the certificate will be revoked.														
Comment	Revocation	A string containing a freeform reason or comment on why the certificate is being revoked.														
Delegate	Revocation	A Boolean indicating whether delegation is enabled for the certificate authority that issued the certificate (true) or not (false).														
Operation Start	Revocation	A string indicating the time at which the revocation workflow was initiated.														
Template	Enrollment	A string indicating the short certificate template name used for the enrollment request.														
Include Chain	Enrollment	A Boolean that indicates whether to include the certificate chain in the enrollment response (true) or not (false).														
SANs	Enrollment	<p>An object indicating the subject alternative names (SANs) for the certificate requested in the enrollment, each type an array of strings. Possible values for the key are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> <tr> <td>directory</td> <td>Directory Name</td> </tr> <tr> <td>uri</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>ip4</td> <td>IP v4 Address</td> </tr> <tr> <td>ip6</td> <td>IP v6 Address</td> </tr> </tbody> </table>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address
Value	Description															
rfc822	RFC 822 Name															
dns	DNS Name															
directory	Directory Name															
uri	Uniform Resource Identifier															
ip4	IP v4 Address															
ip6	IP v6 Address

Value	Description																		
registered id	Registered ID (an OID)																		
ms_ ntprincipal name	MS_ NTPrincipal Name (a string)																		
ms_ ntds replication	MS_ NTDS Replication (a GUID)																		
		<p>For example:</p> <pre> "SANs": {   "dns": [     "dnssan1.keyexample.com",     "dnssan2.keyexample.com",     "dnssan3.keyexample.com"   ],   "ip4": [     "192.168.2.73"   ] } </pre>																	
Additional Attributes	Enrollment	An object indicating values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process.																	
Metadata	Enrollment	An object indicating values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field.																	
Format	Enrollment	A string indicating the desired output format for the certificate. A value of STORE indicates that the certificate is intended to be delivered into one or more certificate stores.																	
Custom Name	Enrollment	A string indicating a custom friendly name for the certificate.

Name	Operation Type	Description								
Key Status	Enrollment	An integer indicating the status of the private key retention for the certificate within Keyfactor Command. Possible values are: <ul style="list-style-type: none"> <li>• 0—Unknown</li> <li>• 1—Saved</li> <li>• 2—Expected</li> <li>• 3—NoRetention</li> <li>• 4—Failure</li> <li>• 5—Temporary</li> </ul>								
Private Key Converter	Enrollment	An internally used Keyfactor Command field.								
Reference Id	A integer indicating the Keyfactor Command reference ID for the workflow instance.									

 **Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.41.3 GET Workflow Instances

The GET /Workflow/Instances method is used to retrieve the list of workflows that have been initiated. Both in progress and completed workflows are included. This method returns HTTP 200 OK on a success with details about the workflow instances.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/workflows/instances/read/

Table 727: GET Workflow Instances Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Workflow Instances Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• DefinitionId (workflow definition ID)</li> <li>• Id (workflow instance GUID)</li> <li>• InitiatingUserName (DOMAIN\username)</li> <li>• LastModified</li> <li>• ReferenceId (workflow instance integer ID)</li> <li>• StartDate</li> <li>• Status</li> <li>• Title</li> <li>• WorkflowType</li> </ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CurrentStepDisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 728: GET Workflow Instances Response Data

Name	Description						
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.						
Status	A string indicating the current status of the workflow instance. The possible statuses are: <ul style="list-style-type: none"> <li>• CanceledForRestart</li> <li>• Complete</li> <li>• Failed</li> <li>• Rejected</li> <li>• Running</li> <li>• Suspended</li> </ul>						
Current Step ID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.						
Status Message	A string indicating the current status message for the workflow instance. Possible status messages vary and may include: <ul style="list-style-type: none"> <li>• Access is denied</li> <li>• Awaiting # more approval(s) from approval roles.</li> <li>• Either the credentials are invalid, or the CA on [CA hostname] is not running</li> <li>• Issued</li> <li>• Issued. The private key was successfully retained.</li> <li>• Post-process Failed: [Message indicating reason for failure generally from the CA]</li> <li>• Pre-process failed: [Message indicating details of the failure]</li> <li>• Revoked</li> <li>• Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure]</li> <li>• Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure]</li> <li>• Step [custom step name] failed: [Message indicating details of the failure]</li> <li>• Taken Under Submission. The certificate template requires manager approval, and is marked as pending.</li> <li>• Workflow rejected by user with Id #.</li> </ul>

Current Step Display Name	A string indicating the display name defined for the workflow instance step.								
Current Step	A string indicating the unique name defined for the workflow instance step. This value is								

Name	Description
Unique Name	unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <p>"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</p> <p>Or</p> <p>"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</p>
Last Modified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.
Start Date	A string indicating the date and time when the instance was initiated.
Reference Id	A integer indicating the Keyfactor Command reference ID for the workflow instance.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

#### 2.6.41.4 GET Workflow Instances My

The GET /Workflow/Instances/My method is used to retrieve the list of initiated workflows created by the user making the API request—as a result of enrolling for a certificate, for example, or revoking a certificate. This method returns HTTP 200 OK on a success with details about the workflow instances.

**Note:** If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/workflows/instances/read/  
OR  
/workflows/instances/read/mine/

Table 729: GET Workflow Instances My Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Workflow Instances Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• DefinitionId (workflow definition ID)</li><li>• Id (workflow instance GUID)</li><li>• InitiatingUserName (DOMAIN\username)</li><li>• LastModified</li><li>• ReferenceId (workflow instance integer ID)</li><li>• StartDate</li><li>• Status</li><li>• Title</li><li>• WorkflowType</li></ul>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Current Step Display Name	A string indicating the display name defined for the workflow instance step.								
Current Step	A string indicating the unique name defined for the workflow instance step. This value is								

Name	Description
Unique Name	unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <p>"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</p> <p>Or</p> <p>"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</p>
Last Modified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.
Start Date	A string indicating the date and time when the instance was initiated.
Reference Id	A integer indicating the Keyfactor Command reference ID for the workflow instance.

**Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.41.5 GET Workflow Instances AssignedToMe

The GET /Workflow/Instances/AssignedToMe method is used to retrieve the list of initiated workflows awaiting input from the user making the API request. This method returns HTTP 200 OK on a success with details about the workflow instances.

**Note:** If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/workflows/instances/read/

OR

/workflows/instances/read/pending/

Table 731: GET Workflow Instances AssignedToMe Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Workflow Instances Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• DefinitionId (workflow definition ID)</li><li>• Id (workflow instance GUID)</li><li>• InitiatingUserName (DOMAIN\username)</li><li>• LastModified</li><li>• ReferenceId (workflow instance integer ID)</li><li>• StartDate</li><li>• Status</li><li>• Title</li><li>• WorkflowType</li></ul>

Display Name	A string indicating the display name defined for the workflow definition.	Version	An integer indicating the version number of the workflow definition.	Workflow Type	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> <li> <b>CertificateEnteredCollection</b>            The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.             For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.         </li> <li> <b>CertificateLeftCollection</b>            The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.             For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.         </li> <li> <b>Enrollment (Including Renewals)</b>            The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.         </li> <li> <b>Revocation</b>            The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.         </li> </ul>
Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
Display Name	A string indicating the display name defined for the workflow definition.										
Version	An integer indicating the version number of the workflow definition.										
Workflow Type	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> <li> <b>CertificateEnteredCollection</b>            The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.             For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.         </li> <li> <b>CertificateLeftCollection</b>            The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.             For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.         </li> <li> <b>Enrollment (Including Renewals)</b>            The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.         </li> <li> <b>Revocation</b>            The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.         </li> </ul>										

Name	Description
Current Step Display Name	A string indicating the display name defined for the workflow instance step.
Current Step Unique Name	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <pre>"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</pre> <p>Or</p> <pre>"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</pre>
Last Modified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.
Start Date	A string indicating the date and time when the instance was initiated.
Reference Id	A integer indicating the Keyfactor Command reference ID for the workflow instance.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

### 2.6.41.6 POST Workflow Instances Instance Id Stop

The POST `/Workflow/Instances/{instanceId}/Stop` method is used to stop the workflow instance with the specified GUID, preventing it from continuing. This endpoint returns 204 with no content upon success.

 **Note:** Only workflow instances with a Status of *Suspended* can be stopped.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:  
/workflows/instances/manage/

Table 733: POST Workflow Instances {instanceid} Stop Input Parameters

Name	In	Description
instanceid	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow instance to stop.  Use the <i>GET /Workflow/Instances</i> method (see <a href="#">GET Workflow Instances on page 1789</a> ) to retrieve a list of all the workflow instances to determine the GUID.

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.41.7 POST Workflow Instances Instance ID Signals

The POST */Workflow/Instances/{instanceid}/Signals* method is used to input signals to the workflow instance with the specified GUID. This endpoint returns 204 with no content upon success.

**Note:** If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

**Note:** A locking conflict may occur if two (or more) users attempt to provide input to a workflow instance (e.g. approve a request) at exactly the same time. If this happens, input from only one of the users will be reflected in the Management Portal, and the workflow instance will not be moved along to the next step if it should have been with input from the two users. The other input is still accepted, however, and there is a scheduled task that runs daily and attempts to continue all suspended workflows that may be eligible to continue but have not done so due to locking conflicts.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

The user executing the request must hold at least one security role ID configured in the workflow definition step for which signal data is being input.

Table 734: POST Workflow Instances {instanceid} Signals Input Parameters

Name	In	Description						
instanceId	Path	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow instance to which to input a signal.</p> <p>Use the <a href="#">GET /Workflow/Instances</a> method (see <a href="#">GET Workflow Instances on page 1789</a>) to retrieve a list of all the workflow instances to determine the GUID.</p>						
SignalKey	Body	<p><b>Required.</b> A string indicating the key for the signal. This is made up of the unique name for the step within the definition plus the signal type, separated by a period (UniqueName.SignalType). For a Require Approval step, the key input type will be <i>ApprovalStatus</i>, so the full <i>SignalKey</i> will look something like:</p> <pre>RequireApproval1.ApprovalStatus</pre> <p>Use the <a href="#">GET /Workflow/Definitions/{definitionid}</a> method (see <a href="#">GET Workflow Definitions Definition ID on page 1617</a>) to return workflow details including the workflow steps to determine the <i>UniqueName</i> of the step for which you want to input a signal or one of the GET methods for workflow instances (see <a href="#">GET Workflow Instances on page 1789</a>, <a href="#">GET Workflow Instances AssignedToMe on page 1797</a>, or <a href="#">GET Workflow Instances My on page 1793</a>) to return the <i>CurrentStepUniqueName</i>.</p>						
Data	Body	<p><b>Required.</b> An object providing the input information for the signal. The key(s) will vary depending on the signal. <b>RequireApproval</b> signal data values are:</p> <table border="1"> <thead> <tr> <th>Key</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>Approved</td> <td><b>Required.</b> A Boolean indicating whether the request is approved (true) or denied (false).</td> </tr> <tr> <td>Comment</td> <td>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</td> </tr> </tbody> </table> <p>For example, to approve a Require Approval step called <i>RequireApproval1</i> with a comment:</p> <pre>{   "SignalKey": "RequireApproval1.ApprovalStatus",   "Data": {     "Approved": "True",</pre>	Key	Value	Approved	<b>Required.</b> A Boolean indicating whether the request is approved (true) or denied (false).	Comment	A string containing a comment to associate with the signal. The maximum comment length is 500 characters.
Key	Value							
Approved	<b>Required.</b> A Boolean indicating whether the request is approved (true) or denied (false).							
Comment	A string containing a comment to associate with the signal. The maximum comment length is 500 characters.							

Name	In	Description
		<pre data-bbox="553 275 1411 453"> "Comment": "Here is my comment." } } </pre>

**Tip:** See the *Keyfactor API Reference and Utility* [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

### 2.6.41.8 POST Workflow Instances Instance Id Restart

The POST `/Workflow/Instances/{instanceId}/Restart` method is used to restart the workflow instance with the specified GUID. This can be used either after it has reached a failed state and the failure has been corrected (e.g. a CA was not responding when an enrollment was attempted or a PowerShell script failed to run to completion) or midstream while it's still active but in a suspended state waiting for signals to introduce a new version of the workflow definition. The workflow instance will restart from the beginning. This endpoint returns 204 with no content upon success.

**Note:** Only workflow instances with a Status of *Failed* or *Suspended* can be restarted.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- `/workflows/instances/manage/`
- `/workflows/instances/read/`

Table 735: POST Workflow Instances {instanceid} Restart Input Parameters

Name	In	Description
instanceid	Path	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow instance to restart.</p> <p>Use the <a href="#">GET /Workflow/Instances</a> method (see <a href="#">GET Workflow Instances on page 1789</a>) to retrieve a list of all the workflow instances to determine the GUID.</p> <div style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px; background-color: #e6f2ff;"> <p> <b>Note:</b> When you restart an instance, it will be issued a new instance ID.</p> </div>
version	Body	An integer indicating the version number of the workflow definition. If no version is specified, the workflow will be restarted using the most recently published version.

 **Tip:** See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

## 2.7 API Change Log

In this section you will find the change history for the Keyfactor API endpoints for the supported versions of Keyfactor Command.

### 2.7.1 v11 API Change Logs

Find the change logs for Keyfactor API major release 11.0 and subsequent 11.x incremental releases on the following pages.

#### 2.7.1.1 API Change Log v11.0

API changes for this release of Keyfactor Command.

Table 736: API Change Log v11.0

Endpoint	Methods	Action	Notes
AppSetting	GET, PUT	Added	
AppSetting/ {id}	GET	Added	
AppSetting/ {id}/ Set	PUT	Added	
AppSetting/ {name}/ Set	PUT	Added	
Certificate Authority/ SourceCount	GET	Added	
Certificate Authority/ ConfigurationTenants	GET	Added	
Certificate Authority/ HealthMonitoring/ Schedule	GET	Added	
Certificate Authority/ AlertRecipients/ CAHealth Recipients	GET	Added	
Certificate Authority/ AlertRecipients/ CAHealth Recipients	POST	Added	
Certificate Authority/ AlertRecipients/ CAThreshold Recipients	GET	Added	
Certificate Authority/ AlertRecipients/ CAThreshold Recipients	POST	Added	
Certificate Authority/ AlertRecipients/ CAHealth Recipients/ {id}	DELETE	Added	
CertificateAuthority/ AlertRecipients/ CAHealth Recipients/ {id}	GET	Added	
Certificate Authority/	PUT	Added	

Endpoint	Methods	Action	Notes
AlertRecipients/ CAHealth Recipients/ {id}			
Certificate Authority/ AlertRecipients/ CAThreshold Recip- ients/ {id}	DELETE	Added	
Certificate Authority/ AlertRecipients/ CAThreshold Recip- ients/ {id}	GET	Added	
Certificate Authority/ AlertRecipients/ CAThreshold Recip- ients/ {id}	PUT	Added	
Certificate Authority/ Import	POST	Added	
Certificate Authority/ ConfigurationTenants	GET	Changed	The endpoint is now renamed to GET /CertificateAuthority/AvailableForests and the definition is changed to: Returns a list of available forests that are in Active Directory.
Certificates/ CSV	GET	Added	
Certificates/ Iden- tityAudit/ {id}	GET	Added to V2 definitions	This API endpoint is available in both the V1 and V2 definitions in the Keyfactor API Reference and Utility and acts exactly the same in both.
Certificate Collections/ {id}/ Permissions	POST	Removed	Instead use POST Security/Roles/ {id}/Permissions/Collection.
Certificate Collections/ {id}	DELETE	Added	
Certificate Collections/ NavItems	GET	Added	
Certificate Collections/ CollectionList	GET	Added	

Endpoint	Methods	Action	Notes
Certificate Collections/ {id}/ Favorite	PUT	Added	
Certificate Stores/ Server	GET, POST, PUT	Deprecated	
Certificate Store Types	GET	Changed	<p>The API will return ALL certificate store types if at least one of these conditions are met:</p> <ul style="list-style-type: none"> <li>• The end-user has one of the /certificate_stores/read/ global permissions.</li> <li>• The end-user has permission to at least one certificate store container.</li> </ul>
Component Installation/ {id}	DELETE	Added	
Component Installation/	GET	Added	
Event Handler Registration/ {id}	GET, DELETE, PUT	Added	
Event Handler Registration/	GET, POST	Added	
Extensions/ Scripts/ {id}	DELETE, GET	Added	
Extensions/ Scripts	GET, POST, PUT	Added	
Identity Providers/ {id}	GET, PUT	Added	
Identity Providers	GET	Added	
Identity Providers/ Types	GET	Added	
Permissions	GET	Added	
Permission Sets/ {id}	GET, DELETE	Added	
Permission Sets	GET, POST, PUT	Added	
Scheduling	POST	Added	

Endpoint	Methods	Action	Notes
Security/ Containers/ {id}/ Roles	GET, POST	Added	
Security/ Audit/ Collec- tions/ {id}	GET	Added	
Security/ Claims/ {id}	GET, DELETE	Added	
Security/ Claims	GET, POST, PUT	Added	
Security/ Claims/ Roles	GET	Added	
Security/ Identities	GET	Changed	The non-working query string field has been removed.
Security/ Roles/{id}/ Permissions/ Pam Providers	GET, PUT	Added	
Security/ Roles (V1) Security/ Roles/ {id} (V1) Security/ Roles/ {id}/ Identities(V1) Security/ Roles/ {id}/ copy(V1)	GET, POST, PUT	Deprecated in V1	All SecurityRoles API endpoints (except DELETE /{id}) have been deprecated from the V1 API, as they only work against Active Directory users. There are new Security/Roles endpoints in the V2 API
Security/ Roles(V2) Security/ Roles/ {id}(V2)	GET, POST, PUT	Added in V2	Security/ Roles API endpoints have been recreated in V2 API to work with both OAUTH and AD users.
Templates/ {id}	GET	Changed	Now returns an object with a TemplatePolicy property and a KeyAl- gorithms property that show the policies and algorithms the template supports.
Templates/ Import	GET, POST	Changed	Now supports multiple algorithms.
Templates/ Settings	GET, PUT	Changed	The Template Policy property used to update global application settings now contains four properties: ECDSA, RSA, Ed448, and Ed25519. These replace the AllowEd448, AllowEd25519, RSAVal- idCurves, and ECCValidCurves.

### 2.7.1.2 API Change Log v11.1

API changes for this release of Keyfactor Command.

Table 737: API Change Log v11.1

Endpoint	Methods	Action	Notes
/Workflow/Definitions/Steps/{extensionName}	GET	Update	Include Scope and Audience in response for steps of type OAuth REST Request.
/Workflow/Definitions/{definitionId}	GET	Update	Include Scope and Audience in response for steps of type OAuth REST Request.
/Workflow/Definitions/{definitionId}	PUT	Update	Include Scope and Audience in response for steps of type OAuth REST Request.
/Workflow/Definitions/Steps	GET	Update	Include Scope and Audience in response for steps of type OAuth REST Request.
/Workflow/Definitions/{definitionId}/Steps	PUT	Update	Include Scope and Audience in request and response for steps of type OAuth REST Request.
/Workflow/Definitions/{definitionId}/Publish	POST	Update	Include Scope and Audience in response for steps of type OAuth REST Request.
/SSL/Networks	GET	Fixed	SslAlertRecipients now returns expected values.
/SSL/Networks	GET	Fixed	AutoMonitor has been removed from results since it was returning incorrect values.

### 2.7.1.3 API Change Log v11.2

API changes for this release of Keyfactor Command.

Table 738: API Change Log v11.2

Endpoint	Methods	Action	Notes
/Enrollment/PFX/Replace	POST	Fixed	Orchestrator jobs will be queued to replace the certificate in the store or indicate that the replace job failed.
/Certificates/Import	POST	Fixed	Returns the certificate thumbprint in hexadecimal.

## 2.7.2 v10 API Change Logs

Find the change logs for Keyfactor API major release 10.0 and subsequent 10.x incremental and hot fix releases on the following pages.

### 2.7.2.1 API Change Log v10.0

API changes for this release of Keyfactor Command.

Table 739: API Change Log v10.0

Endpoint	Methods	Action	Notes
/Agents/ {id}	GET	Add	
/Agents/ Reset	POST	Add	
/Agent Blueprint	GET	Add	
/Agent Blueprint/ {id}	GET, DELETE	Add	
/Agent Blueprint/ {id}/ Jobs	GET	Add	
/Agent Blueprint/ {id}/ Stores	GET	Add	
/Agent BluePrint/ ApplyBlueprint	POST	Add	
/Agent BluePrint/ Generate BluePrint	POST	Add	
/Alerts/ Denied	GET, PUT, POST	Add	
/Alerts/ Denied/ {id}	GET, DELETE	Add	
/Alerts/ Expiration	GET, PUT, POST	Add	
/Alerts/ Expiration/ {id}	GET, DELETE	Add	
/Alerts/ Expiration/ Schedule	GET, PUT	Add	
/Alerts/ Expiration/ Test	POST	Add	
/Alerts/ Expiration/ TestAll	POST	Add	
/Alerts/ IssuedAlerts	GET, PUT, POST	Add	
/Alerts/ IssuedAlerts/ {id}	GET, DELETE	Add	

Endpoint	Methods	Action	Notes
/Alerts/ Issued/ Schedule	GET, PUT	Add	
/Alerts/ KeyRotation	GET, PUT, POST	Add	
/Alerts/ KeyRotation/ {id}	GET, DELETE	Add	
/Alerts/ KeyRotation/ Schedule	GET, PUT	Add	
/Alerts/ KeyRotation/ Test	POST	Add	
/Alerts/ KeyRotation/ TestAll	POST	Add	
/Alerts/ Pending	GET, PUT, POST	Add	
/Alerts/ Pending/ {id}	GET, DELETE	Add	
/Alerts/ Pending/ Schedule	GET, PUT	Add	
/Alerts/ Pending/ Test	POST	Add	
/Alerts/ Pending/ Test/ {id}	POST	Add	
/Certificate Authorities	GET	Update	Schedules are now included in the results.
/Certificate Authorities	POST	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/Certificate Authorities/ {id}	PUT	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/Certificate Authorities/ {id}	DELETE	Update	Deletion is now prevented if schedules are associated.

Endpoint	Methods	Action	Notes
/Certificate Collections	POST	Update	Query parameter no longer needed when a valid CopyFromId is provided.
/Certificate Collections/{id}/Permissions	POST	Deprecated	Replaced by /Security/Roles/{id}/Permissions/Collection.
/Certificates/Analyze	POST	Add	
/Certificates/IdentityAudit/{id}	GET	Add	
/Certificate Store Containers	POST	Add	
/Certificate Store Containers/{id}	PUT, DELETE	Add	
/Certificate Stores/Server	GET, POST, PUT	To Be Deprecated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/Certificate Stores	GET, POST, PUT	Updated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/Enrollment/PFX (v2)	POST	Add	
/Enrollment/Settings/{id}	GET	Add	
/JobTypes/Custom	POST	Update	DefaultValue property is no longer required, validation is now performed on the JobTypeFields/DefaultValue property, validation prevents names containing spaces.
/JobTypes/Custom/{id}	DELETE	Update	Includes validation so that deletion is prevented if at least one associated

Endpoint	Methods	Action	Notes
			approved orchestrator implements the capability.
/MacEnrollment	GET, PUT	Add	
/Monitoring/ Revocation	GET, POST	Update	Renamed from /Workflow/RevocationMonitoring
/Monitoring/ Revocation/ {id}	GET, PUT, DELETE	Update	Renamed from /Workflow/RevocationMonitoring/{id}
/Monitoring/ Revocation/ Test	POST	Add	
/Monitoring/ Revocation/ TestAll	POST	Add	
/Orchestrators/ JobHistory	GET	Update	Added JobId field.
/Orchestrators/ ScheduledJobs	GET	Add	
/Orchestrator Jobs/ Reschedule	POST	Add	
/Orchestrator Jobs/ Unschedule	POST	Add	
/Orchestrator Jobs/ Acknowledge	POST	Add	
/Security/ Identities/ {id}	GET	Add	
/Security/ Roles/ {id}/ Identities	GET, POST	Add	
/Security/ Roles/ {id}/ Containers	GET, POST	Add	
/Security/ Roles/ {id}/ Copy	POST	Add	
/Security/ Roles/ {id}/ Permissions	GET	Add	

Endpoint	Methods	Action	Notes
/Security/ Roles/ {id}/ Permissions/ Global	GET, POST, PUT	Add	
/Security/ Roles/ {id}/ Permissions/ Collections	GET, POST, PUT	Add	Replaced the /CertificateCollections/ {id}/Permissions endpoint functionality.
/Security/ Roles/ {id}/ Permissions/ Containers	GET, POST, PUT	Add	Returns only containers that have a permission set for the selected security role.
/SMTP	GET, PUT	Add	
/SMTP/ Test	POST	Add	
/Templates	GET, PUT	Update	Includes template-specific policy information.
/Templates/ {id}	GET	Update	Includes template defaults.
/Templates/ Settings	GET, PUT	Update	Includes global template policies.
/Template/ Subject Parts	GET	Add	
/Templates/ Global/ Settings	GET, PUT	Add	
/Templates/ Import	POST	Add	
/Workflow/ Certificates/ Pending	GET	Update	Now supports query fields of Requester and RequestType.
/Workflow/ Definitions/ Steps/ {extensionName}	GET	Add	
/Workflow/ Definitions/ {definitionId}	GET, PUT, DELETE	Add	
/Workflow/ Definitions	GET, POST	Add	
/Workflow/ Definitions/ Steps	GET	Add	

Endpoint	Methods	Action	Notes
/Workflow/ Definitions/ Types	GET	Add	
/Workflow/ Definitions/ {definitionId}/ Steps	PUT	Add	
/Workflow/ Definitions/ {definitionId}/ Publish	POST	Add	
/Workflow/ Instances/ {instanceId}	GET, DELETE	Add	
/Workflow/ Instances	GET	Add	
/Workflow/ Instances/ My	GET	Add	
/Workflow/ Instances/ AssignedToMe	GET	Add	
/Workflow/ Instances/ {instanceId}/ Stop	POST	Add	
/Workflow/ Instances/ {instanceId}/ Signals	POST	Add	
/Workflow/ Instances/ {instanceId}/ Restart	POST	Add	

### 2.7.2.2 API Change Log v10.1

API changes for this release of Keyfactor Command.

Table 740: API Change Log v10.1

Endpoint	Methods	Action	Notes
/Templates	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/{id}	GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/Settings	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.

### 2.7.2.3 API Change Log v10.2

API changes for this release of Keyfactor Command.

Table 741: API Change Log v10.2

Endpoint	Methods	Action	Notes
/Security/My	GET	Add	Returns all the security roles and global permissions for the requesting user.
/Enrollment/CSR	POST	Update	The workflow instance ID has been added to the response.
/Enrollment/CSR	POST	Update	A new PrivateKey input field has been added to support private key retention on CSR enrollment.
/Enrollment/PFX	POST	Update	The workflow instance ID has been added to the response.
/Certificates/Analyze	POST	Update	The endpoint requires Global Certificates-Read or Certificates-Import permissions.

### 2.7.2.4 API Change Log v10.3.1

API changes for this release of Keyfactor Command.

Table 742: API Change Log v10.3.1

Endpoint	Methods	Action	Notes
/Reports/{id}/Schedules	POST	Fixed	Reports can be scheduled when the user scheduling the report only has permission to view one certificate collection.

### 2.7.2.5 API Change Log v10.4

API changes for this release of Keyfactor Command.

Table 743: API Change Log v10.4

Endpoint	Methods	Action	Notes
/Enrollment/ CSR	POST	Fixed	Includes SANs entered outside the CSR only when the <i>Allow CSR SAN Entry</i> application setting is set to true. SANs entered outside the CSR replace SANs in the CSR rather than appending to SANs from the CSR.
/Workflow/Instances	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/AssignedToMe	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/ My	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/{instanceId}	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.

### 2.7.2.6 API Change Log v10.4.3

API changes for this release of Keyfactor Command.

Table 744: API Change Log v10.4.3

Endpoint	Methods	Action	Notes
/CertificateAuthority/Test	POST	Fixed	EJBCA version 8 is supported.
/Enrollment/Renew	POST	Fixed	EJBCA version 8 is supported.
/Templates/Import	POST	Fixed	EJBCA version 8 is supported.

### 2.7.2.7 API Change Log v10.4.5

API changes for this release of Keyfactor Command.

Table 745: API Change Log v10.4.5

Endpoint	Methods	Action	Notes
/CSRGeneration/Generate	POST	Update	3072-bit RSA keys are supported.
/Enrollment/CSR	POST	Update	3072-bit RSA keys are supported.
/Enrollment/PFX	POST	Update	3072-bit RSA keys are supported.
/Enrollment/Renew	POST	Update	3072-bit RSA keys are supported.

### 2.7.2.8 API Change Log v10.4.6

API changes for this release of Keyfactor Command.

Table 746: API Change Log v10.4.6

Endpoint	Methods	Action	Notes
/Enrollment/ CSR	POST	Fixed	Includes SANs entered outside the CSR only when the <i>Allow CSR SAN Entry</i> application setting is set to true.  SANs entered outside the CSR replace SANs in the CSR rather than appending to SANs from the CSR.
/Workflow/ Instances	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/ Instances/ AssignedToMe	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/ Instances/ My	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/ Instances/ {instanceId}	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.

## 2.7.3 v9 API Change Logs

Find the change logs for Keyfactor API major release 9.0 and subsequent 9.x incremental releases on the following pages.

### 2.7.3.1 API Change Log v9.0

API changes for Keyfactor Command version 9.0 Major release

Table 747: API Change Log v9.0

Endpoint	Method	Action	Notes
/Agents/Approve	POST	Add	
/Agents/Disapprove	POST	Add	
/CertificateCollections	PUT	Add	
/CertificateCollections/ Copy	POST	Add	
/Certificates/{id}/ History	GET	Add	
/Certificates/{id}/ Security	GET	Add	
/Certificates/{id}/ Validate	GET	Add	
/Certificates/ Locations/ {id}	GET	Add	
/Certificates/ Metadata/ Compare	GET	Add	
/Certificates/ Metadata/ All	PUT	Add	
/Certificates/ RevokeAll	POST	Add

### 2.7.3.2 API Change Log v9.1

API changes for Keyfactor Command version 9.1 incremental release

Table 748: API Change Log v9.1

Endpoint	Methods	Action	Notes
/CertificateStores/ {id}/ Inventory	GET	Add	
/Enrollment/ PFX/ Replace	POST	Fix	SuccessfulStores collection now only includes Ids of stores that were successfully processed.
/Enrollment/ PFX/ Deploy	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertStoreTypes	POST/PUT	Update	EntryParameters can now be set via these methods.
/CertificateStores/ Certificates/ Add	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateStores/ Certificates/ Remove	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateCollections/ {id}/ Permissions	GET	Deprecate	

### 2.7.3.3 API Change Log v9.2

API changes for Keyfactor Command version 9.2 incremental release

Table 749: API Change Log v9.2

Endpoint	Methods	Action	Notes
/Certificates	GET	Fix	No longer fails if a collection id is not provided.
/OrchestratorJobs/ JobHistory	GET	Fix	Request no longer fails for 'Dynamic' job types.
/Reports/ Schedules/ {id}	DELETE	Fix	Response code is now 200 when the user role does not have <i>Modify – Report</i> permission.

### 2.7.3.4 API Change Log v9.3

API changes for Keyfactor Command version 9.3 incremental release

Table 750: API Change Log v9.3

Endpoint	Methods	Action	Notes
/JobTypes/Custom	POST	Fix	No longer requires default field values.

### 2.7.3.5 API Change Log v9.4

API changes for Keyfactor Command version 9.4 incremental release

Table 751: API Change Log v9.4

Endpoint	Methods	Action	Notes
/Workflow/Certificates/Pending	GET	Update	Now returns the associated metadata.

### 2.7.3.6 API Change Log v9.5

API changes for Keyfactor Command version 9.5 incremental release

Table 752: API Change Log v9.5

Endpoint	Methods	Action	Notes
/Enrollment/PFX	POST	Update	No longer requires a certificate authority name to be provided.

### 2.7.3.7 API Change Log v9.6

API changes for Keyfactor Command version 9.6 incremental release.

No API endpoint changes were made in this release.

### 2.7.3.8 API Change Log v9.7

API changes for Keyfactor Command version 9.7 incremental release

Table 753: API Change Log v9.7

Endpoint	Methods	Action	Notes
/KeyfactorAPI/License	GET	Add	

### 2.7.3.9 API Change Log v9.8

API changes for Keyfactor Command version 9.8 incremental release.

No API endpoint changes were made in this release.

### 2.7.3.10 API Change Log v9.9

API changes for Keyfactor Command version 9.9 incremental release

Table 754: API Change Log v9.9

Endpoint	Methods	Action	Notes
/Reports/<any>	GET	Fix	Spaces within the sortField no longer results in an exception.
/Reports/{id}/Schedules	GET	Fix	An invalid sortField no longer results in an exception.
/Agents	GET	Update	New query parser to support the AgentId GUID.

# 3.0 Glossary

## A

---

### AIA

The authority information access (AIA) is included in a certificate--if configured--and identifies a location from which the chain certificates for that certificate may be retrieved.

### AnyAgent

The AnyAgent, one of Keyfactor's suite of orchestrators, is used to allow management of certificates regardless of source or location by allowing customers to implement custom agent functionality via an API.

### AnyGateway

The Keyfactor AnyGateway is a generic third party CA gateway framework that allows existing CA gateways and custom CA connections to share the same overall product framework.

### API

A set of functions to allow creation of applications. Keyfactor offers the Keyfactor API, which allows third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command.

### Argument

A parameter or argument is a value that is passed into a function in an application.

### Authority Information Access

The authority information access (AIA) is included in a certificate--if configured--and identifies a location from which the chain certificates for that certificate may be retrieved.

## B

---

### Bash Orchestrator

The Bash Orchestrator, one of Keyfactor's suite of orchestrators, is used to discover and manage SSH keys across an enterprise.

### Blueprint

A snapshot of the certificate stores and scheduled jobs on one orchestrator, which can be used to create matching certificate stores and jobs on another orchestrator with just a few clicks.

## C

---

### CA

A certificate authority (CA) is an entity that issues digital certificates. Within Keyfactor Command, a CA may be a Microsoft CA or a Keyfactor gateway to a cloud-based or remote CA.

### Certificate Authority

A certificate authority (CA) is an entity that issues digital certificates. Within Keyfactor Command, a CA may be a Microsoft CA or a Keyfactor gateway to a cloud-based or remote CA.

### Certificate Revocation List

A Certificate Revocation List (CRL) is a list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted.

### Certificate Signing Request

A CSR or certificate signing request is a block of encoded text that is submitted to a CA when enrolling for a certificate. When you generate a CSR within Keyfactor

Command, the matching private key for it is stored in Keyfactor Command in encrypted format and will be married with the certificate once returned from the CA.

### CN

A common name (CN) is the component of a distinguished name (DN) that represents the primary name of the object. The value varies depending on the type of object. For a user object, this would be the user's name (e.g. CN=John Smith). For SSL certificates, the CN is typically the fully qualified domain name (FQDN) of the host where the SSL certificate will reside (e.g. server-name.keyexample.com or www.keyexample.com).

### Collection

The certificate search function allows you to query the Keyfactor Command database for certificates from any available source based on any criteria of the certificates and save the results as a collection that will be available in other places in the Management Portal (e.g. expiration alerts and certain reports).

### Common Name

A common name (CN) is the component of a distinguished name (DN) that represents the primary name of the object. The value varies depending on the type of object. For a user object, this would be the user's name (e.g. CN=John Smith). For SSL certificates, the CN is typically the fully qualified domain name (FQDN) of the host where the SSL certificate will reside (e.g. server-name.keyexample.com or www.keyexample.com).

### Configuration Tenant

A grouping of CAs. The Microsoft concept of forests is not used in EJBCA so to

accommodate the new EJBCA functionality, and to avoid confusion, the term forest needed to be renamed. The new name is configuration tenant. For EJBCA, there would be one configuration tenant per EJBCA server install. For Microsoft, there would be one per forest. Note that configuration tenants cannot be mixed, so Microsoft and EJBCA cannot exist on the same configuration tenant.

### CRL

A Certificate Revocation List (CRL) is a list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted.

### CSR

A CSR or certificate signing request is a block of encoded text that is submitted to a CA when enrolling for a certificate. When you generate a CSR within Keyfactor Command, the matching private key for it is stored in Keyfactor Command in encrypted format and will be married with the certificate once returned from the CA.

## D

---

### DER

A DER format certificate file is a DER-encoded binary certificate. It contains a single certificate and does not support storage of private keys. It sometimes has an extension of .der but is often seen with .cer or .crt.

### Distinguished Name

A distinguished name (DN) is the name that uniquely identifies an object in a directory. In the context of Keyfactor Command, this directory is generally Active Directory. A DN is made up of attribute=value pairs,

separated by commas. Any of the attributes defined in the directory schema can be used to make up a DN.

## DN

A distinguished name (DN) is the name that uniquely identifies an object in a directory. In the context of Keyfactor Command, this directory is generally Active Directory. A DN is made up of attribute=value pairs, separated by commas. Any of the attributes defined in the directory schema can be used to make up a DN.

## DNS

The Domain Name System is a service that translates names into IP addresses.

---

## E

### ECC

Elliptical curve cryptography (ECC) is a public key encryption technique based on elliptic curve theory that can be used to create faster, smaller, and more efficient cryptographic keys. ECC generates keys through the properties of the elliptic curve equation instead of the traditional method of generation as the product of very large prime numbers.

### Endpoint

An endpoint is a URL that enables the API to gain access to resources on a server.

### Enrollment

Certificate enrollment refers to the process by which a user requests a digital certificate. The user must submit the request to a certificate authority (CA).

## EOBO

A user with an enrollment agent certificate can enroll for a certificate on behalf of another user. This is often used when provisioning technology such as smart cards.

---

## F

### Forest

An Active Directory forest (AD forest) is the top most logical container in an Active Directory configuration that contains domains, and objects such as users and computers.

---

## G

### Gateway Connector

The Keyfactor Gateway Connector is installed in the customer forest to provide a connection between the on-premise CA and the Azure-hosted, Keyfactor managed Hosted Configuration Portal to provide support for synchronization, enrollment and management of certificates through the Azure-hosted instance of Keyfactor Command for the on-premise CA. It is supported on both Windows and Linux.

---

## H

### Host Name

The unique identifier that serves as name of a computer. It is sometimes presented as a fully qualified domain name (e.g. server-name.keyexample.com) and sometimes just as a short name (e.g. servername).

### Hosted Config Portal

The Keyfactor Hosted Configuration Portal is used to configure connections between on-premise instances of the Keyfactor

Gateway Connector and on-premise CAs to make them available to Azure-hosted instance of Keyfactor Command. The portal is Azure-hosted and managed by Keyfactor.

### Hosted Configuration Portal

The Keyfactor Hosted Configuration Portal is used to configure connections between on-premise instances of the Keyfactor Gateway Connector and on-premise CAs to make them available to Azure-hosted instance of Keyfactor Command. The portal is Azure-hosted and managed by Keyfactor.

### Hostname

The unique identifier that serves as name of a computer. It is sometimes presented as a fully qualified domain name (e.g. server-name.keyexample.com) and sometimes just as a short name (e.g. servername).

## J

---

### Java Agent

The Java Agent, one of Keyfactor's suite of orchestrators, is used to perform discovery of Java keystores and PEM certificate stores, to inventory discovered stores, and to push certificates out to stores as needed.

### Java Keystore

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

### JKS

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based

applications for authentication and encryption.

## K

---

### Key Length

The key size or key length is the number of bits in a key used by a cryptographic algorithm.

### Key Pair

In asymmetric cryptography, public keys are used together in a key pair with a private key. The private key is retained by the key's creator while the public key is widely distributed to any user or target needing to interact with the holder of the private key.

### Key Size

The key size or key length is the number of bits in a key used by a cryptographic algorithm.

### Key Type

The key type identifies the type of key to create when creating a symmetric or asymmetric key. It references the signing algorithm and often key size (e.g. AES-256, RSA-2048, Ed25519).

### Keyfactor CA Management Gateway

The Keyfactor CA Management Gateway is made up of the Keyfactor Gateway Connector, installed in the customer forest to provide a connection to the local CA, and the Azure-hosted and Keyfactor managed Hosted Configuration Portal. The solution is used to provide a connection between a customer's on-premise CA and an Azure-hosted instance of Keyfactor Command for synchronization, enrollment, and management of certificates.

### Keyfactor Gateway Connector

The Keyfactor Gateway Connector is installed in the customer forest to provide a connection between the on-premise CA and the Azure-hosted, Keyfactor managed Hosted Configuration Portal to provide support for synchronization, enrollment and management of certificates through the Azure-hosted instance of Keyfactor Command for the on-premise CA. It is supported on both Windows and Linux.

### Keyfactor Universal Orchestrator

The Keyfactor Universal Orchestrator, one of Keyfactor’s suite of orchestrators, is used to interact with servers and devices for certificate management, run SSL discovery and management tasks, and manage synchronization of certificate authorities in remote forests. With the addition of custom extensions, it can provide certificate management capabilities on a variety of platforms and devices (e.g. Amazon Web Services (AWS) resources, Citrix\NetScaler devices, F5 devices, IIS stores, JKS keystores, PEM stores, and PKCS#12 stores) and execute tasks outside the standard list of certificate management functions. It runs on either Windows or Linux servers or Linux containers.

### Keystore

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

## L

---

### Logical Name

The logical name of a CA is the common name given to the CA at the time it is created. For Microsoft CAs, this name can

be seen at the top of the Certificate Authority MMC snap-in. It is part of the FQDN\Logical Name string that is used to refer to CAs when using command-line tools and in some Keyfactor Command configuration settings (e.g. ca2.keyexample.-com\Corp Issuing CA Two).

## M

---

### MAC Agent

The MAC Agent, one of Keyfactor’s suite of orchestrators, is used to manage certificates on any keychains on the Mac on which the Keyfactor MAC Agent is installed.

### Metadata

Metadata provides information about a piece of data. It is used to summarize basic information about data, which can make working with the data easier. In the context of Keyfactor Command, the certificate metadata feature allows you to create custom metadata fields that allow you to tag certificates with tracking information about certificates.

## O

---

### Object Identifier

Object identifiers or OIDs are a standardized system for identifying any object, concept, or “thing” with a globally unambiguous persistent name.

### OID

Object identifiers or OIDs are a standardized system for identifying any object, concept, or “thing” with a globally unambiguous persistent name.

## Orchestrator

Keyfactor orchestrators perform a variety of functions, including managing certificate stores and SSH key stores.

## P

---

### P12

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

### P7B

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

### P7C

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

## Parameter

A parameter or argument is a value that is passed into a function in an application.

## PEM

A PEM format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PEM certificates always begin and end with entries like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. PEM certificates can contain a single certificate or a full certificate chain and may contain a private key. Usually, extensions of .cer and .crt are certificate files with no private key, .key is a separate private key file, and .pem is both a certificate and private key.

## PFX

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

## PKCS #7

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

## PKCS#12

A PFX file (personal information exchange format), also known as a PKCS#12 archive,

is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

## PKI

A public key infrastructure (PKI) is a set of roles, policies, and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

## Private Key

Private keys are used in cryptography (symmetric and asymmetric) to encrypt or sign content. In asymmetric cryptography, they are used together in a key pair with a public key. The private or secret key is retained by the key's creator, making it highly secure.

## Public Key

In asymmetric cryptography, public keys are used together in a key pair with a private key. The private key is retained by the key's creator while the public key is widely distributed to any user or target needing to interact with the holder of the private key.

## Public Key Infrastructure

A public key infrastructure (PKI) is a set of roles, policies, and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

## R

---

### Rogue Key

A rogue key, in the context of Keyfactor Command, is an SSH public key that appears in an `authorized_keys` file on a

server managed by the SSH orchestrator without authorization.

## Root of Trust

A root of trust (RoT) is a source within a cryptographic system that can always be trusted. It is typically a hardened hardware module. HSMs (hardware security modules) and TPMs (trusted platform modules) are examples of RoTs.

## RoT

A root of trust (RoT) is a source within a cryptographic system that can always be trusted. It is typically a hardened hardware module. HSMs (hardware security modules) and TPMs (trusted platform modules) are examples of RoTs.

## RPC

Remote procedure call (RPC) allows one program to call a function from a program located on another computer on a network without specifying network details. In the context of Keyfactor Command, RPC errors often indicate Kerberos authentication or delegation issues.

## rsyslog

Rsyslog is an open-source software utility used on UNIX and Unix-like computer systems for forwarding log messages in an IP network.

## S

---

## SAN

The subject alternative name (SAN) is an extension to the X.509 specification that allows you to specify additional values when enrolling for a digital certificate. A variety of SAN formats are supported, with DNS name being the most common.

### server name indication

Server name indication (SNI) is an extension to TLS that provides for including the host-name of the target server in the initial handshake request to allow the server to respond with the correct SSL certificate or allow a proxy to forward the request to the appropriate target.

### SMTP

Short for simple mail transfer protocol, SMTP is a protocol for sending email messages between servers.

### SNI

Server name indication (SNI) is an extension to TLS that provides for including the host-name of the target server in the initial handshake request to allow the server to respond with the correct SSL certificate or allow a proxy to forward the request to the appropriate target.

### SSH

The SSH (secure shell) protocol provides for secure connections between computers. It provides several options for authentication, including public key, and protects the communications with strong encryption.

### SSL

TLS (Transport Layer Security) and its predecessor SSL (Secure Sockets Layer) are protocols for establishing authenticated and encrypted links between networked computers.

### Subject Alternative Name

The subject alternative name (SAN) is an extension to the X.509 specification that allows you to specify additional values when enrolling for a digital certificate. A variety of

SAN formats are supported, with DNS name being the most common.

## T

---

### Template

A certificate template defines the policies and rules that a CA uses when a request for a certificate is received.

### TLS

TLS (Transport Layer Security) and its predecessor SSL (Secure Sockets Layer) are protocols for establishing authenticated and encrypted links between networked computers.

### Trusted CA

A certificate authority in the forest in which Keyfactor Command is installed or in a forest in a two-way trust with the forest in which Keyfactor Command is installed.

## U

---

### Untrusted CA

A certificate authority in a forest in a one-way trust with the forest in which Keyfactor Command is installed or in a forest that is untrusted by the forest in which Keyfactor Command is installed. Non-domain-joined standalone CAs also fall into this category.

## W

---

### Web API

A set of functions to allow creation of applications. Keyfactor offers the Keyfactor API, which allows third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command.

## Windows Orchestrator

The Windows Orchestrator, one of Keyfactor's suite of orchestrators, is used to manage synchronization of certificate authorities in remote forests, run SSL discovery and management tasks, and interact with Windows servers as well as F5 devices, NetScaler devices, Amazon Web Services (AWS) resources, and FTP capable devices, for certificate management. In addition, the AnyAgent capability of the Windows Orchestrator allows it to be extended to create custom certificate store types and management capabilities regardless of source platform or location.

## Workflow

A workflow is a series of steps necessary to complete a process. In the context of Keyfactor Command, it refers to the workflow builder, which allows you automate event-driven tasks when a certificate is requested or revoked.

## X

---

### x.509

In cryptography, X.509 is a standard defining the format of public key certificates. An X.509 certificate contains a public key and an identity (e.g. a host name or an organization or individual name), and is either signed by a certificate authority or self-signed. When a certificate is signed by a trusted certificate authority it can be used to establish trusted secure communications with the owner of the corresponding private key. It can also be used to verify digitally signed documents and emails.
